Much has been ſaid on the neceſſity of ſtudying the natural propenſity of the pupil, and of directing him to thoſe peculiar ſtudies to which he appears particularly adapted by nature. But this is a very difficult and uncertain ſpeculation, both in the parent and preceptor. The appearances from which they have to judge, are often deceitful. A boy, during three or four years continuance at ſchool, will appear ſtupid, and will make little proficiency. Keep him there another year, and perhaps his parts burſt forth on a ſudden; his emulation becomes ſtrongly excited: he feels a pleaſure in his progreſs, and ſoon outſtrips thoſe who went before him. This revolution we often ſee take place. On the other hand, he who is cried up as a prodigy of infant genius, ſometimes becomes dull, contracts an averſion to books, and finally arrives at no valuable attainment. The mental faculties, in different conſtitutions, diſplay themſelves earlier or later, according to ſome internal organization, as difficult to be detected as explained by human ſagacity. The parent, therefore, ſhould follow the dictates of common ſenſe and prudence in the diſpoſal of his child, and leave the reſult to Providence.

From the time of Quintilian to the preſent day, it has been a queſtion of conſiderable debate, whether public or private education is the moſt conducive to valuable improvement. Thoſe who prefer the education of public ſchools, have to dread the licentiouſneſs which is too often found in them. The prevailing manners of the age, and of the world at large, are apt to inſinuate themſelves into thoſe ſeminaries of learning, which, by their ſecluſion from the world, might be ſuppoſed to be exempted from its corruptions. Still, however, the boy who is kept at home, cannot be at all hours under the immediate eye of his parent or his inſtructor. It muſt therefore happen, by chance, neceſſity, or neglect, that he will often aſſociate with menial ſervants, from whoſe example he will be liable to catch not only meanneſs of ſpirit, but vice and vulgarity. Yet ſuppoſing him to be fortunately reſtrained from ſuch communication, the examples he will ſee in the world, and the temptations he will meet with in an intercourſe with various company at too early an age, will affect his heart, and cauſe it to beat with impatience for emancipation from that reſtraint, which muſt be removed at the approach of manhood. Then will his paſſions break forth with additional violence, as the waters of a ſtream which have been long confined. The ſweets of liberty never before taſted, and the allurements of vice never before withſtood, become too powerful for reſiſtance, at an age when the paſſions are ſtrong, reaſon immature, and experience entirely deficient.

After all the confinement and trouble of a domeſtic education, the pupil is yet to be ſent to the univerſity. There he will aſſociate with young men who have been educated at ſchools; and if they have any vices, he will be in much greater danger of moral infection, and will ſuffer worſe conſequences from it, than if he had not been ſecluded from boys at a boyiſh age. He will appear awkward, and unacquainted with their manners; and hence neglected, if not deſpiſed. His ſpirit, if he poſſeſſes any, will not ſubmit to contempt; and perhaps he will imitate, and at length ſurpaſs, their irregularities, in order to gain a welcome reception among them. That conduct which can acquire dignity and eſteem at the univerſity, muſt ariſe from a degree of wiſdom and experience, as well as of moral rectitude, rarely poſſeſſed by him who has been educated in a cloſet. And with reſpect to literary improvement, a boy of parts will generally be found a better ſcholar, if educated at a ſchool, than at home. In a ſchool many circumſtances co-operate to force his own perſonal exertion, on which depends the increaſe of mental ſtrength, and conſequently of improvement, more than on the inſtruction of the beſt private preceptor. The arguments in ſupport of this opinion muſt be common, for their truth is obvious. Emulation cannot be excited without rivals; and without emulation, inſtruction will be always a tedious, and often a fruitleſs, labour. It is this which warms the paſſions on the ſide of all that is excellent, and often counterbalances the weight of temptations to vice and idleneſs. The boy of an ingenuous mind, who ſtands at the head of his claſs, ranks, in the *microcoſm* of a ſchool, as a hero, and his feelings are ſcarcely leſs elevated. He will ſpare no pains to maintain his honourable poſt; and his competitors, if they have ſpirit, will be no leſs aſſiduous to ſupplant him. No ſeverity, no painful confinement, no harſh menaces, will be neceſſary. Emulation alone will effect in the beſt manner the moſt valuable purpoſes; and at the ſame time will cauſe, in the boſom of the ſcholar, a pleaſure truly enviable. The ſchool-boy too has the beſt chance of acquiring that confidence and ſpirit which are neceſſary to diſplay valuable attainments. Exceſſive diffidence, baſhfulneſs, and indolence, retard the acquiſition of knowledge, and deſtroy its due effect when acquired. They are the cauſe of pain to their poſſeſſors, and commonly do injuſtice to their real abilities. It is one circumſtance in public ſchools, which tends to give the ſcholars a due degree of confidence, that public examination or election days are uſually eſtabliſhed in them; when, beſides the examination, which, if undergone with credit, inſpires courage, orations are ſpoken before numerous auditors. This greatly contributes to remove that timidity, which has ſilenced many able perſons brought up for the bar and the pulpit, not to mention a ſimilar defect in the important

portant qualifications of the ſenator. In ſhort, it is a ſelf-evident fact, that the ſociety of a ſchool is of great uſe in awakening the dormant faculties, in producing a vigorous and active mind, and in preparing the young citizen for the world, by enuring him to preparatory ſcenes, ſimilar to thoſe which lie before him in life.

The formation of connexions which may contribute to future advancement, and of friendſhips which cannot eaſily be diſſolved, has always been a powerful argument in ſupport of the preference of public ſchools. Such connexions and ſuch friendſhips have been, and may be, formed. The opportunity which public ſchools afford, is certainly an additional circumſtance in recommendation of them. Thoſe diſintereſted friendſhips which are thus formed, ariſing from a real congeniality of ſentiments and taſte, certainly contribute much to comfort, and often to advancement. Experience proves, that they are more durable than the intimacies which are contracted at any ſubſequent period.

A great degree of bodily exerciſe is neceſſary for boys. Nature has taken care to provide for this neceſſity, by giving them a propenſity to play. But they never enter into the puerile diverſions with proper ſpirit, but with boys. He then who is ſent to ſchool, has the beſt opportunity of anſwering the intentions of nature, in taking that conſtant exerciſe which at once contributes to ſtrength of body and vivacity of mind. Placed in a little ſociety of members like himſelf, he finds ample ſcope for the exertion of his various powers and propenſities. He has friends and playfellows conſtantly at hand; and the buſy ſcene paſſing before him, is a never-failing ſource of amuſement. The private pupil all this while languiſhes in ſolitude, deprived of many of theſe advantages, or enjoying them imperfectly. He feels but little emulation; he contracts diffidence; he makes few friendſhips, for want of opportunity; he is ſecluded from the moſt healthy exerciſes; and his early youth, the pleaſant ſpring of life, is ſpent in a painful confinement. Yet there are circumſtances which will render private education the moſt proper. Theſe are, uncommon meekneſs of diſpoſition, bodily infirmity, defect of the ſenſes, and great deformity. Boys labouring under theſe misfortunes ſhould be treated like thoſe tender plants, which, unable to bear the weather, can only thrive in the green-houſe: but be it always remembered, that the oak flouriſhes beſt in an open expoſure.

In private tuition, the great object ſhould be, to ſecure as many of the advantages of a public education, with as few of its inconveniencies, as poſſible. It is therefore adviſable, that the plan of public education be followed, as cloſely as the difference of circumſtances will admit. It ſhould be recollected, that a thouſand whimſical modes are purſued by private tutors. They are generally ſuch as the inventors and adopters warmly recommend. Both are ſincere in their recommendation; for we naturally love our own inventions, and the objects of our adoption. Novelty has alſo that irreſiſtible charm, which induces parents to enter their ſons, with eagerneſs, on a plan which has the appearance of improvement and innovation. But as education is an affair of high importance, no ſcheme ought to be generally purſued which has not received the ſanction of experience. The welfare of the community is at ſtake, when a general change is introduced in the forms of education.

A private tutor certainly poſſeſſes peculiar opportunities for the infuſion of moral and religious principles, and peculiar advantages for the reſtriction of his pupil from the contagion of vicious example. We ſincerely wiſh that theſe opportunities and advantages may never be neglected, and that private tuition may prove, what it has claimed, the power of producing better men, if not better ſcholars, than are uſually formed in a public ſchool. We are the more induced to expreſs this wiſh at preſent, becauſe private tuition ſeems lately to have prevailed in this country, more than ever; and yet, it is confeſſed, that profligacy of manners was never more conſpicuous. It has indeed been the cuſtom among the richer orders, to endeavour to combine the advantages of a public and private education, by placing their ſons at a celebrated ſchool, and at the ſame time under the care of a private tutor, reſident in the ſchool, or in its neighbourhood. The buſineſs of the private tutor is often, in this caſe, little more than to make the boy's exerciſes for him. If the diſcipline of the ſchool is duly maintained, the aſſiſtance is unneceſſary. We do not find that the great ſcholars, produced a century ago, had any other aid than that afforded in a good ſchool, ſeconded by their own aſſiduity. Very weak boys will indeed want leading-ſtrings, or crutches; but the boy of parts derives new ſtrength from being accuſtomed to confide in his own efforts. A private tutor, whoſe whole employment conſiſts in removing the difficulties attending the diſcipline of a great ſchool, is unintentionally a promoter of idleneſs, and of ſuperficial knowledge. The opulent and luxurious often wiſh for ſuperior learning, and would moſt readily buy it, if it were to be purchaſed without labour or confinement. But this is not to be bought; it is to be earned by long and perſevering induſtry. Aſſiſtance may indeed be procured in abundance by means of riches; but it happens in this caſe, that they who proceed with the leaſt extraneous aid, proceed with the greateſt ſucceſs.

Whether the mode of education be under a private tutor, or at a public ſchool, a thorough knowledge of the elements of grammar is the firſt thing to be acquired. If a grammatical foundation be not laid deep, at an early age, it will not often be laid in ſuch a manner as to bear a large ſuperſtructure. Parents, indeed, who have not had a claſſical education themſelves, and who are unacquainted with the true means of obtaining its advantages, and perhaps with the nature of them, are apt to be impatient in the expectation of great and early proficiency in their children. There are not wanting thoſe who are ready to take advantage of credulity in this, as well as in other very important matters. They generally produce wonderful ſtories of premature improvement. But "thoſe who tell or receive theſe ſtories," ſays the ſolid Johnſon, "ſhould conſider, that nobody can be taught faſter than he can learn. The ſpeed of the beſt horſeman muſt be limited by the power of his horſe." Yet when a boy begins to learn Latin, the parents immediately expect him to ſhew ſome evident ſuperiority over others in all the puerile purſuits. Perhaps he appears inferior to them. His attention to his grammar may cauſe a temporary neglect of leſs important, but more ſhining, attainments. What he is learning has nothing of ſhow in it. It makes no appearance in the eyes of the ſuperficial. It is, as Quintilian obſerves, like the foundation of a building, which, though the moſt important part, lies concealed under the earth. Parents muſt not therefore expect the crop in the ſeaſon of planting. They muſt form an analogical argument, from conſidering the nature of vegetables. Thoſe are ſeldom the moſt valuable, durable, or beautiful, which emerge from the ground, or expand their bloſſom, at a very early ſeaſon. But others, which are ſcarcely ſeen at the firſt approach of ſpring, are often, during their apparent inaction, ſpreading their roots deeply and widely, in order to diſplay, at a maturer period, a profuſe luxuriance.

In order to inſure this firm and durable culture, it is not enough to be alone attentive to grammar inſtruction. Opportunities muſt be given to the ſtudent to diſplay his attainments. He muſt learn to reduce theory to practice. He muſt exemplify his rules. He muſt be exerciſed in *thinking*. He muſt be accuſtomed to ſolitary ſtudy, and a habit muſt be formed of literary labour. For all theſe reaſons, it has been the cuſtom of our beſt ſchools to exact from the ſcholars a written exerciſe, to be brought every morning on entrance into the ſchool. Under proper regulations, and duly attended to both by the inſtructor and the pupil, this practice has been productive of effects

greatly beneficial. And let it be remembered that half the uſual labour, and half the uſual time, will produce more than double the improvement, if ſuch methods are practiſed from the firſt, as tend to give the ſcholar clear ideas. It is alſo material that the books ſelected both for private reading and ſcholaſtic ſtudy, in the courſe of his progreſs, ſhould be ſuch as have an immediate relation to the exerciſes to be performed. The beſt models of compoſition muſt be placed before the eyes of the ſtudent at all times, but more particularly while he is engaged in the work of imitation. And to imitate well a Virgil, a Cicero, a Pope, and an Addiſon, indicates a mind which has imbibed a portion of their mental excellence. No method is ſo likely to cauſe this moſt deſirable participation of their ſpirit, as repeated and continued efforts to exhibit, in juvenile exerciſes, ſome reſemblance of their ſentiments and their ſtyle. This aſſiduous and unremitted attention to exerciſes may, perhaps, be conſidered by the ſuperficial as too great a taſk, and as too ſevere an exaction. But if parents or preceptors will not ſuffer their ſons or ſcholars to ſubmit to it, they muſt not expect any great and laſting effects from that which is commonly called a good education. How few, indeed, do we ſee bring a knowledge of the ancient languages from their ſchools, ſufficiently extenſive or profound to be uſeful in any great degree, or even to be retained by them throughout their lives! What is the cauſe? Undoubtedly, an indolence in themſelves, and a too great indulgence in their ſuperintendents or parents, who will not let them ſubmit to any degree of application which is painful. But ſuch is the appointed condition of human affairs, that no object, really and durably valuable, can be gained without labour and difficulty. This is the price at which Providence has decreed that the ſatisfaction and advantages ariſing from the poſſeſſion of any extraordinary degree of excellence ſhall be purchaſed. Yet the labour of compoſition is not always painful, eſpecially when boys take delight in compoſing themes and verſes. The natural pleaſure of invention, and the conſciouſneſs of increaſing ſtrength of mind, alleviates greatly the labour of the work; and the praiſes and encouragement they receive, will generally give their ingenuous minds a glow of delight, which none of their uſual diverſions can confer. When once a boy feels an emulation to excel in his compoſitions, his improvement is ſecure.

Much has been ſaid with regard to the utility of teaching boys to compoſe *Latin verſe*. When a boy is deſigned to fill a ſubordinate ſphere in commercial or active life, to trouble him with Latin verſification, is perhaps to waſte his valuable time. Yet it is confeſſedly the beſt method of giving a ſtudent a refined taſte for claſſical expreſſion. The neceſſity of compoſing Latin verſe, renders a ſcholar more careful in remarking and ſelecting elegancies, than he would be, if he were only to read, without imitating, a Horace or a Virgil. In ſome very popular ſchools, Latin verſe is perhaps attended to as an exerciſe too conſtantly, and too indiſcriminately. For the ſake of gaining prizes, and for other leſs defenſible reaſons, it is made, by ſome, the firſt object; which it certainly ought not to be. Boys who happen to have no taſte for it, however excellent their capacities in other reſpects, have, at thoſe ſchools, no encouragement. A common method is, to ſuffer boys at firſt to write verſes formed of words combined, without regard to meaning or grammatical conſtruction, but, at the ſame time, with a cloſe attention to the rules of proſody. This method contributes to facilitate the purſuit, though it is not univerſally approved. It ſhould not indeed be continued very long; but it is an excellent mode of introduction to an art which is obviouſly attended with ſome difficulty. Inſtructors differ much in opinion reſpecting the propriety of allowing a *Gradus ad Parnaſſum*, from an idea that it retards advancement by indulging indolence. But this is certain; if we forbid the uſe of the *Gradus* in a place of education, the prohibition will be fruſtrated by the clandeſtine introduction of it. It is a book eaſily procured, and boys in the ſenior claſſes will not be without it; and there are inſtances of many who have received great improvement from it. When the pupil poſſeſſes an uncommon ſhare of parts, he will aſcend Parnaſſus without this *ſtep* to help him; and it is reaſonable to conclude that the improvement made without it, will be more permanent and ſolid. But the misfortune is, that the art appears ſo difficult at firſt, that the greater part of boys are likely to be deterred and diſguſted, if they are denied this aſſiſtance.

When the quantity of words is pretty well known, it is a good method to place the words of one of Martial's Epigrams, or of any beautiful paſſage in the Latin poets, out of their metrical order, and to require the ſcholar to form them into verſes. In theſe exerciſes it is alſo beſt to call forth the early powers of the boy's invention. As ſoon, therefore, as he can write hexameters and pentameters, let him have a ſubject given him. Let him be made acquainted with the nature of an epigram. Let him be told, it is to conſiſt of one thought. The ſearch after this thought is attended with many collateral advantages. The mind in purſuit of it often ranges, as well as it can, through the moral and phyſical world. Men, manners, and things, whatever he has read, heard, or ſeen, come under the ſtudent's conſideration. A great improvement is derived to the mental powers from this practice, and, at the ſame time, a habit of reflection gained, and knowledge of various kinds extended and confirmed. Let any one impartially examine the *Luſus Weſtmonaſterienſes*, *Muſæ Etonenſes*, and ſeveral other publications, as well as manuſcripts of this ſort, and he will ſee the juſtneſs of the obſervation. Epigrams, odes, and various poematia, ſhould alternately conſtitute exerciſes in the higher claſſes. Accuracy, copiouſneſs of invention, a depth of thought, an elegance of ſtyle, and many other advantages, may be derived from this method to every kind of writing in which the ſcholar afterwards employs himſelf. The moſt unpromiſing talents often ſucceed, when called forth by the example of others, whether invited by opportunity, or urged by neceſſity. Parents ſhould not, therefore, give up their ſons upon very early unfavourable appearances. Many a child has been ſent to ſea, or put to ſome mechanical employ, who might have ſhone eminently in letters, if his parents had not been inclined to deſpair too ſoon, from their ignorance of the nature and the operations of the human mind, and from their inattention to the biographical accounts of eminent literati.

The next acquiſition ſhould be that of writing *Latin proſe*, which, conſidered merely as an exerciſe, naturally contributes to increaſe, and to confirm, an intimate knowledge of the language. He who can write a language, will not often be at a loſs in reading the authors written in it. He will underſtand the delicacies and the beauties of the language, both when he conſiders it in its ſingle and ſeparate words, and when he views it in conſtruction. When words and ideas paſs immediately under the pen, in the act of compoſition, they are conſidered more diſtinctly and maturely than when they are only peruſed in a volume. Beſides this advantage, to be able to write Latin, qualifies the ſtudent to correſpond with the learned in all countries. Latin letters ſhould therefore form one of the evening exerciſes in the higheſt claſſes at ſchool; for which Cicero affords admirable models. Latin has long been the univerſal language of learning. The books which, from their extenſive ſubject, ſeem to intereſt mankind at large, have uſually been written in Latin; and ſcientific ſubjects of all kinds are ſtill often diſcuſſed in Latin: it would therefore appear unbecoming a ſcholar to be unable to expreſs his ideas in a language, in which learned foreigners not only write, but frequently converſe. And if the ſtudent proceeds to either of our Engliſh univerſities, and really wiſhes to be a ſcholar, he muſt acquire the habit of compoſing Latin themes, Latin declamations,

declamations, Latin lectures, &c. which are conſtantly required of academical ſtudents. It is true that the idler and man of faſhion generally procure theſe exerciſes from friends, from books, or from collections of old compoſitions; but, though they may paſs through the forms of an univerſity by ſuch means, they never acquire credit, or acquit themſelves to their own ſatisfaction. And, if they take the degree of maſter of arts in one of our univerſities, they are bound by their oaths to recite publicly in the ſchools Latin declamations of their own compoſition. It is another argument in favour of the Latin exerciſes in our ſeminaries, that it has a natural tendency to improve the ſtudent in Engliſh compoſition. He who has been accuſtomed to make Cicero his model, will inſenſibly exhibit ſomething of his beauty, in whatever language he can compoſe with facility. That habit of accuracy, and that care in the collocation of words, which is required in Latin works, will inſenſibly extend its good effects to every production. To write Latin in youth, is an excellent preparation for that vernacular compoſition, which ſome of the profeſſions indiſpenſably require. It ought therefore to be continued in our ſchools; but it will not often be attended with ſucceſs, unleſs the pupil remains there long, and applies cloſely under the inſpection of an experienced inſtructor. Much practice and long habit are neceſſary, to give excellence and facility. Therefore, where boys are intended to acquire only a ſuperficial knowledge, and to be removed early from their ſeminary to the warehouſe and accompting-houſe, or to be introduced into any mode of active life incompatible with contemplation, they will not then be able to acquire an eaſe in Latin compoſition, nor will it be neceſſary.

With reſpect to the ſtyle which is chiefly to be imitated, we ſhall not heſitate to recommend that of Cicero. His more diffuſe and Aſiatic manner is not to be imitated. But the ſtyle of his Letters, his Offices, his Philoſophical Converſations, his book on the Orator, his treatiſe on Friendſhip and on Old Age, with a few of his Orations, abounds with ſweets, from which the induſtrious bee may load himſelf with honey. Some, indeed, recommend as models, the ſtyles of Quintilian and Tacitus. Theſe are excellent in their kind; but they have not the grace and dignity of Cicero. They pleaſe and ſtrike a mature taſte, but they are not well adapted to allure a young ſtudent to the labour of imitation.

Under a miſtaken notion of facilitating the progreſs of the young pupil, *tranſlations* of the claſſic authors are now permitted to be uſed in many reſpectable modern ſchools; but we think, with manifeſt diſadvantage to the future reputation and acquirements of a ſcholar; and we might with great truth add, that few cauſes have contributed more to impede the ſcholar's progreſs, than the general adoption of this accommodating mode. The human mind is naturally remiſs, but particularly ſo at the early ſeaſon in which education is commenced. At all times it is averſe from unneceſſary labour, and rejoices to facilitate the means of arriving at its end. When, therefore, a tranſlation is preſented to the eye on the ſame page with the original, it is not likely, that for the ſake of a remote advantage, it ſhould neglect preſent eaſe; that it ſhould turn from the meaning which is offered to its notice, and willingly purſue an original tranſlation to be formed from the mazes of a lexicon. Yet there are ſome reſpectable authors who contend, that "if the claſſic authors were publiſhed with interlineary tranſlations, it would be a great ſervice done to the public." Perhaps after a ſtudent has learned one language very accurately, he may acquaint himſelf ſuperficially, in a ſhort time, with others, by means of tranſlations. But to boys, who always uſe them without judgment, they are certainly pernicious. The boy learns to conſtrue his leſſon by the Engliſh printed at its ſide, and takes care to remember it during the half hour he repeats it to his inſtructor; after which he will let it ſlip away without reluctance, conſcious that his collateral tranſlation will enable him to go through the ſame buſineſs on the morrow, without puniſhment, and alſo without the valuable acquiſition of learning to ſtrengthen and impreſs the memory.

The exertion of mind requiſite in learning to conſtrue a leſſon *without* a tranſlation, is one of the moſt deſirable conſequences derivable from the leſſon itſelf. A habit of attention is acquired by it; conjectural ingenuity called forth; a degree of penetration, and patience of literary labour, a moſt deſirable acquiſition, inſenſibly produced. Whatever difficulty it may be attended with, will be overcome by the boy who poſſeſſes parts; and he who poſſeſſes none, will never make any valuable proficiency with or without theſe indulgent aſſiſtances. He may indeed be allured by them to throw away his time, and reap nothing in return but diſgrace. It will not be controverted, that good Greek ſcholars have ſeldom been ſo numerous as good Latiniſts. What ſhall we aſſign as the cauſe? Greek is not more difficult in its elements than Latin. Its authors are equally, perhaps more, inviting. It is uſually entered on at a leſs puerile age than Latin, at an age when the underſtanding has acquired ſtrength enough to overcome grammatical difficulty. Nothing has impeded the equal advancement of Greek ſtudies, of late at leaſt, but the univerſal practice of publiſhing all Greek books with a Latin tranſlation. Upon this occaſion Bruyere has remarked, that "the ſtudy of the original text can never be ſufficiently recommended. It is the ſhorteſt, ſureſt, and moſt agreeable, way to all ſorts of learning. Draw from the ſpring head, and take not things at ſecond-hand. Let the writings of the great maſters be never laid aſide: dwell upon them, ſettle them in your mind, and cite them upon occaſion: make it your buſineſs thoroughly to underſtand them in their full extent, and in all their circumſtances: acquaint yourſelves fully with the principles of original authors: bring them to a conſiſtency, and then do you yourſelf make your deductions. In this ſtate were the firſt commentators; and do not you reſt until you bring yourſelf to the ſame. Content not yourſelf with thoſe borrowed lights; nor guide yourſelf by their views, but where your own fails you, and leaves you in the dark. Their explications are not yours, and will give you the ſlip. On the contrary, your own obſervations are the product of your own mind; where they will abide, and be ready at hand upon all occaſions, in converſe, conſultation, and diſpute. Loſe not the pleaſure it is to ſee that you were not ſtopped in your reading, but by difficulties that are invincible, where the commentators and ſcholiaſts themſelves are at a ſtand, and have nothing to ſay; thoſe copious expoſitors of other places, who, with a vain and pompous overflow of learning, poured out on paſſages plain and eaſy in themſelves, are very free of their words and pains where there is no need. Convince yourſelf fully, by thus ordering your ſtudies, that it is nothing but men's indolence, which hath encouraged pedantry to cram, rather than enrich, libraries, and to bury good authors under heaps of notes and commentaries; and you will perceive that ſloth hath acted, in this inſtance, againſt itſelf and its own intereſt, by multiplying reading and enquiries, and increaſing the pains it endeavoured to avoid." Some candid editors have been ſenſible of this truth, and have added tranſlations with apparent regret. Their conviction has been overruled by a ſpecies of argument very forcible on theſe occaſions, "that without concomitant tranſlations, Greek books have ceaſed to be a ſaleable commodity." When Greek ſcholars were ſcarce in Europe, a few tranſlations contributed to facilitate the introduction of the language: this expediency introduced the cuſtom, which is not likely to be aboliſhed, though it is moſt inimical to Grecian literature, and, for that reaſon, to the prevalence of a good taſte. The Greek poets, as well as the philoſophers and hiſtorians, have been read and criticiſed by thoſe who could only read them in the lame ſtyle of a literal tranſlation, who acquieſced in ſo wretched a ſubſtitute for the original, but who probably would have

ſtudied the Greek, and underſtood it, had they not been led aſtray in their youth by that powerful incitement to indolence, *a collateral tranſlation.*

To the uſe of tranſlations, and to the various modes of facilitating puerile ſtudies, we may venture to attribute the decline of ſolid learning, and of that juſt taſte which the ancient models tended to eſtabliſh. Together with tranſlations, it would be wiſe to baniſh theſe editions in which the order of conſtruction is given on the ſame page with the text. It tends vaſtly to enervate the mind, by rendering exertion unneceſſary. The moſt unexceptionable method of rendering the claſſics eaſy to the younger ſcholars, is to ſubjoin, as is ſometimes practiſed, a vocabulary at the end of the volume. Even the interpretation in the editions *in uſum Delphini*, which are univerſally uſed, tends rather to corrupt the ſtyle, and to vitiate the taſte, by drawing off the attention from the elegant language of a Virgil, to the bad Latin of a modern commentator. The young ſtudent cannot therefore too early be taught to exert his own powers, and to place a modeſt confidence in their operation. This will increaſe their native vigour, and give him ſpirit to extend them as far as they will go on every proper emergency. Accuſtomed to depend upon himſelf, he will acquire a degree of courage neceſſary to call forth that merit which is often diminiſhed in value to its diffident poſſeſſor, and totally loſt to mankind. The little ſuperficial learning of him who has been uſed to the facilitating inventions, may be compared to a temporary edifice, built for a day; while the hard-earned knowledge of the other may be ſaid to reſemble a building, whoſe foundations are deep and ſtrong, and equally to be admired for dignity and duration.

It is agreed on all hands, that no faculty of the mind is capable of more improvement than the memory, and none more in danger of decay by diſuſe. Every practice which tends to ſtrengthen it, ſhould be encouraged and continued; and it is therefore a very judicious inſtitution in our grammar ſchools, obſerved from the earlieſt times, which obliges the ſcholars to commit large portions of the beſt claſſics to memory. That the taſk is laborious, is no valid objection. Labour ſtrengthens both the mind and body; and what is acquired by labour, will not eaſily be loſt. The impreſſion it makes is deep and laſting. But, in truth, it is not ſo laborious a taſk to a boy as it may appear to a parent, or to any other adult, who has had neither experience nor obſervation in this department. The memory of boys in general is abundantly capacious. If it is not filled with valuable furniture, it will be crowded with lumber. It will be the repoſitory of trifles, of vanities, and perhaps of vices. How much more deſirable, that it ſhould be ſtored with fine ſentiments and beautiful diction, ſelected from the nobleſt writers whom the world ever produced! Honour, ſpirit, liberality, will be acquired, by committing to memory the thoughts and words of heroes and of worthies, who eminently ſhone in every ſpecies of excellence. Its effects in poliſhing and refining the taſte, are too obvious to be called in queſtion. There are abundant inſtances of its peculiar influence in embelliſhing the mind, and giving it a gracefulneſs which no other ornaments can ſupply. As ſoon, therefore, as the grammar is perfectly learned by heart, the paſſages of the beſt claſſics, conſtrued as a leſſon on the day, ſhould be given as a taſk to be learned *memoriter* at night. Habit will render it no leſs eaſy than it is beneficial.

It cannot be denied, that nature has made a difference in diſpenſing the power of retaining ideas. If we may believe ſome accounts, ſhe has ſometimes formed prodigies in this ſpecies of excellence. Muret relates, that he recited words to the number of thirty-ſix thouſand, ſome of them without meaning, to a young man, who repeated them all immediately, from the beginning to the end, and from the end to the beginning, in the ſame order, without a moment's heſitation or a ſingle miſtake. Miraculous, and even incredible, as this may appear, Muret tells us, there were innumerable witneſſes to the truth of the fact, and mentions many names of reſpectable perſons who were preſent at the repetition. Many other inſtances might be ſelected from authors of allowed veracity; but they are ſo different from that which falls within the experience of mankind in general, as ſcarcely to gain credit. If they are true, they afford encouraging motives for the cultivation of a faculty, which has ſometimes been advanced to ſo high a degree of perfection. In giving great attention to the cultivation of the memory, there is danger leſt it ſhould be overladen with minute objects; a circumſtance highly injurious, eſpecially in the courſe of education. Let it therefore be conſidered, that a good memory, according to a ſimilitude of Eraſmus, reſembles a net ſo made as to confine all the great fiſh, but to let the little ones eſcape.

With reſpect to learning Greek, it is often thought totally ſuperfluous: yet it is a language that contributes greatly to adorn the gentleman, while it is eſſential in a ſcholar. It will infallibly lead him to the fountain-head of claſſical information. It will enable him to judge of compoſition with taſte. It will point out to him, with preciſion, the meaning of many words in the Engliſh language, which are daily uſed, and of far the greater number of technical terms in every art and ſcience. The Greek authors are indeed ſo celebrated, and have been ſo univerſally read, that one would think no man of letters, who poſſeſſes ſenſe and ſpirit, would voluntarily forego the opportunity of learning Greek, in order to peruſe them in their native language. Homer has always kept his place as the nobleſt writer whom the world ever produced. They who think they ſhall diſcover his tranſcendent excellence in any tranſlation, are greatly deceived. The preſent age is too much diſpoſed to purſue compendious methods of education, which terminate in external and ſhallow attainments. And, unleſs a timely check is given, the next age will be led to neglect ſolid improvements ſtill more than the preſent; for, as ſolid improvements become leſs generally underſtood, they will be leſs generally eſteemed.

When a proper knowledge of the grammar has been acquired, and the declenſions of the nouns and pronouns, and the formation of the verbs, are once learned, the ſcholar ſhould begin to read one of the chapters in St. John's Goſpel in the Greek Teſtament. The Greek of this evangeliſt is remarkably *eaſy*; and, when ten or twelve chapters ſhall have been carefully read, let the ſtudent begin St. Luke, whoſe Greek is allowed to be *better* than St. John's. When the greater part of St. Luke ſhall have been read, and its grammatical conſtruction and its particular words analyſed, let the ſcholar begin ſome work of Xenophon, ſtill repeating a portion of his grammar every morning. This will ſoon pave the way to Demoſthenes and Homer; and when theſe are once underſtood, which with diligence and good abilities, may be very ſoon accompliſhed, the ſcholar will be able of himſelf to purſue his ſtudies in the Greek language, as far as he may chooſe to proceed. The pleaſure he will feel when once he enters deeply into the fine authors of ancient Greece, will lead him to prefer them to all others. He will then find, that the preference given to them by all preceding ages, is not the effect of mere partiality; but is derived from their native excellence, and from the opportunity thereby afforded of enlarging and ennobling the human mind.

There are many who acknowledge the excellence of the Greek language, that are deterred from the purſuit of it by ideas of its difficulty. This ariſes from its being a very copious language; and becauſe it requires much and various reading, to gain a competent knowledge of the primitive or radical words. Yet the Greek roots have been computed not much to exceed three thouſand. It is alſo a language which abounds in compounds and derivatives, the meaning of which may be eaſily known by knowing the ſimple and original words. He who has acquainted himſelf with a ſmall number of the moſt uſeful

radicals,

radicals, will be able, with a little ſagacity, to diſcover the meaning of many words in a book written on a familiar and obvious ſubject. By reading ſuch a book, he will probably find his knowledge of original words in ſome degree increaſed. He goes on to one leſs eaſy. His knowledge of the language is enlarged by inſenſible gradations, and he at laſt acquires a deep and a maſterly ſkill, by perſeverance indeed, but without much painful labour. Eraſmus, in the earlier part of his life, carefully ſtudied the Greek and Latin grammar, read lectures upon them, and tranſlated Greek books into Latin. This was laying a right foundation for criticiſm and philoſophy; and it were to be wiſhed that our young ſtudents would follow his example. "Be you ever ſo ingenious or induſtrious, (ſays Dr. Jortin,) yet if you neglect to cultivate and to preſerve this humble part of knowledge, you will be perpetually ſtumbling when you tread on claſſic ground; when you attempt to explain, to tranſlate, or to correct ancient authors, or to diſcuſs any learned ſubject, or to compoſe a few pages in proſe or in verſe."

Many parents are apt to imagine, that, while their ſons are learning Latin and Greek, they are making no improvement in Engliſh. They are, however, greatly deceived. It is impoſſible to learn the Latin grammar, without acquiring a valuable knowledge of grammar in general, and conſequently of the Engliſh grammar. But it muſt be confeſſed, that many particulars of the Engliſh grammar cannot be learned, but by a particular application to it; and, it is certain, that this has been long neglected in the moſt approved ſchools. Engliſh, undoubtedly, ought to form a great part of an Engliſh gentleman's education; and if a boy has made a good proficiency in claſſical learning, he will be able of himſelf to compenſate the want of particular inſtruction in this point, if he chuſes to apply to it. Good ſenſe, good company, and the reading of good authors, with a knowledge of grammar in general, will commonly make a ſcholar completely maſter of his own language. To comprehend it, however, among the other objects of ſcholaſtic purſuit, contributes to render a plan of education more complete. It is alſo the more deſirable; ſince it has been found that many boys, who, though they could write Latin grammatically, were unable, for want of this part of inſtruction, to compoſe an Engliſh letter on a familiar ſubject without incorrectneſs, much leſs with elegance; and even ſome celebrated writers in Engliſh have made egregious miſtakes in Engliſh grammar. It has been the opinion of ſome, that Engliſh ſhould be learned before Latin; and biſhop Lowth ſeems to recommend it ſtrongly; but he recommends it in a Preface to his Engliſh Grammar; and it is natural to go great lengths in recommending the importance of any book, art, or ſcience, which we have been particularly employed in improving or promoting. Quintilian, whoſe judgment may in general be fully depended upon, ſays, *A Græco ſermone puerum incipere malo: quia Latinus, qui pluribus in uſu eſt, vel nobis nolentibus ſe præbet.* One's own language will come ſpontaneouſly. Not ſo the Latin, or any foreign language. And it would be imprudent to employ an age when the memory is moſt tenacious, and when the mind is confeſſedly beſt diſpoſed to acquire foreign languages, in learning what will come of itſelf, to the neglect of that which is highly valuable, and which, if neglected entirely in youth, is uſually neglected for life. They may indeed be ſtudied at the ſame time, and will be mutually aſſiſtant. In the mean time let all violations of grammar, and all vulgariſms, ſoleciſms, and barbariſms, in the converſation of boys, and alſo in their moſt familiar letters, be rigidly noticed and corrected.

To confirm their improvements in Engliſh, boys ſhould compoſe in it, as ſoon as they are capable of invention. Indeed, this is uſually done in public ſchools, and the advantages of it are univerſally felt, not only in the walks of learning, but in the mercantile and civil departments. Many boys go to public ſchools, who are deſigned for commercial life. The little Latin they learn by the age of thirteen or fourteen, when they ſometimes leave the ſchool for the accompting-houſe, may not be of great ſervice to them; but the habit of compoſing in Engliſh, will enable them to write letters with eaſe and with accuracy; an acquiſition for which they will be obliged to their ſchool as long as they live; an acquiſition, which will ſerve, diſtinguiſh, and adorn, them more than any of the accompliſhments which are merely ornamental. It is certainly proper to comprehend, in the plan of inſtruction in Engliſh, the doctrine of Engliſh verſification, as well as of proſaic compoſition. The various metres ſhould be explained; and ſuch a manner of reading them pointed out, as tends to diſplay their beauty and their melody. It may indeed be extremely advantageous to advance a ſtep higher, and endeavour to infuſe into the higher claſſes not only a grammatical, but a *critical* knowledge of the language, and its authors. To the ſenior boys the beauties and defects of ſtyle ſhould be ſhewn. The opinions of judicious critics on our poets, hiſtorians, orators, and moraliſts, ſhould be laid before them and diſcuſſed. They ſhould be taught, not to read every thing that falls into their hands, but to ſelect their books with judgment, and to aſſign the reaſons for their preference. They will thus acquire not only grammatical accuracy, but taſte; a quality, which will furniſh them, during life, with pleaſure pure and refined; to be able to reliſh which, beſides the exalted ſatisfaction of it, will characteriſe the true gentleman independently of fortune.

Young men who are deſigned for a commercial life, ſhould, with their Engliſh, be well inſtructed in the higher departments of arithmetic. This, we fear, is too much neglected in England, as being unconnected with the common views of a claſſical education, which is to inculcate the refined taſte and elevated ideas of the moſt renowned perſonages of the ancient ſchools. Arms and arts were the chief objects of attention in the ſchools of Rome; but Great-Britain, from her ſituation and connections, is naturally commercial. Commerce, with us, has acquired a dignity unknown in ancient times, and in other countries of Europe. They who have been engaged in it have added a grace to it by the liberality of their education and the generoſity of their minds. This has introduced them to the company of thoſe to whom their fortunes made them equal; and they have appeared in the ſenate, and in ſociety, with peculiar grace and importance.

The value of a legible and expeditious hand, and the utility of arithmetic as a ſcience, have never been fairly appreciated by claſſical teachers. Arithmetic, when ſtudied as a ſcience, and expanded by the rules of algebra, aſſumes new grace, and furniſhes a fine exerciſe for the mind in its favourite employment, the purſuit of truth. Herein we ſee the riſe of all the mathematical ſciences, ſo eſſential to a liberal education. Nor can we believe there is any one now, but muſt acknowledge that a mind, properly furniſhed with ſuch enlightened ſpeculations, is qualified to excel in every ſuperior ſcene of life. Far more honourable they ſurely are, than the arts of leaping a horſe, or of wielding a ſword; accompliſhments uſually aſſigned our youth of diſtinction, and for the ſake of which alone they are often ſent into diſtant countries, as if there were nothing to be taught them at home, nor any thing in a gentleman worth cultivating, but his body. We would not undervalue theſe bodily acquirements; for perfection of every ſort is certainly worth aiming at; but we would wiſh them to be rated as much below the mental, as the body itſelf is inferior to the ſoul. Facility in writing, and expertneſs in calculation, are abſolutely neceſſary to the merchant; and are highly uſeful to all. But theſe are not to form the whole education of a merchant, nor even the chief part of it. The propoſed end of a mercantile life is the accumulation of money. And what is the uſe of money but to contribute to the enjoyment of life? Yet a rich man, without liberal

ral ideas, and without ſome ſhare of learning, would be an unfit companion for thoſe in the rank to which he is advanced; a melancholy conſideration, that after all the toils and cares of buſineſs, when he has acquired a princely fortune, he muſt be excluded from the ſociety of men of equal condition, but ſuperior education, or appear ridiculous in it; that he muſt be unfit for parliamentary or civil employments, though the influence of money may procure him admiſſion to them all! Thoſe, therefore, who are intended for a genteel line of commercial purſuits, ſhould beſtow at leaſt as much attention on the cultivation of their minds, as on the mechanical attainments above-mentioned: and there is time enough for the accompliſhment of both purpoſes, in the courſe of an education properly conducted, and long enough continued.

We need not uſe argument in recommending the ſtudy of French and geography to the intended merchant. Their obvious utility is univerſally underſtood. It is well known, and much to be lamented, that the ſhafts of wit and ridicule have often been ſucceſsfully thrown at city magiſtrates, and other public characters, whoſe offices ought to ſecure reſpect. This unfortunate circumſtance has been entirely owing to that defect in their education, which their wealth could never compenſate. Parents, therefore, who educate their ſons for the accompting-houſe, ſhould recollect, that they are not to remain there always: but ſhould let their minds be early imbued with ſuch a portion of genuine and elegant learning, as will remain with them, and conſtitute them gentlemen, *whatever may be their employment*.

The French language, now ſo eſſential to the acquirements of every man of the world, as well as to the merchant, abounds with authors elegant, lively, learned, and claſſical. To be ignorant of it, is therefore to cut off a copious ſource of amuſement and information. Perhaps the greater number of parents wiſh their ſons to learn French, chiefly that they may be enabled to ſpeak the language. This is certainly a valuable attainment; but an ability to read and taſte the beauties of the celebrated French writers, is alſo highly valuable. To learn to ſpeak French with real elegance and with fluency, it will be neceſſary to give it great attention, or to reſide ſome time among the natives of France. To read it with eaſe and critical accuracy, may be ſoon acquired with moderate application; and it is, in every reſpect, a very eligible and valuable acquiſition. Italian is alſo very deſirable to a ſcholar; but it is not uſually taught in ſchools. He that underſtands French and Latin will ſoon be able to teach it himſelf, for it is very eaſy to read and underſtand it, if not to ſpeak it. Let the ſtudent read a chapter or two every other day, for two or three months, in an Italian Teſtament, and he will ſoon be able to read Guicciardini, and other introductory Italian authors.

The ornamental accompliſhments, ſo far as there is room for them without breaking in upon others, are not to be neglected in the regular courſe of a polite education. They furniſh engagement for the time; filling up the ſpaces which would be otherwiſe worſe employed, they find matter for the judgment to work upon, exerciſe the faculties, and keep them ſteady to one regular purſuit; they procure credit to the poſſeſſor, *make men ſociable by being able to give mutual entertainment*, and thereby introduce opportunities of doing one another more important ſervices, by bringing them into better confidence and knowledge of their reciprocal wants. Though they terminate only in pleaſure, yet the amuſements of life, when to be had without an after-reckoning, are an object well worth the ſtriving for. Boys therefore ſhould be taught to value external graces only in a ſubordinate degree; and great care ſhould be taken, that they may not be viewed in ſo favourable a light as to appear capable of becoming the ſubſtitutes of moral and intellectual excellence. When the boy is once taught to eſteem religion, learning, truth, benevolence, and a power of becoming uſeful to himſelf and others, as they ought to be eſteemed as qualities which do honour to human nature, and exceed all the little arts of pleaſing by external deportment, as much as a reaſonable nature exceeds the beſtial; then let him be introduced to the ſtudy of thoſe arts, whoſe true uſe and end are to make virtue appear ſtill more amiable. When we take a view of the ſeparate parts that conſtitute perſonal elegance, we immediately know the ſeeds that are proper to be cheriſhed in the infant mind, to bring forth the beauteous production. The virtues ſhould be cultivated early with ſacred care. Good-nature, modeſty, affability, and a kind concern for others, ſhould be carefully inculcated; and an eaſy unconſtrained dominion acquired by habit over the paſſions. A mind thus finely prepared, is capable of the higheſt luſtre of elegance; which is afterwards attained with as little labour as our firſt language, by only aſſociating with graceful people of different characters, from whom an habitual gracefulneſs will be acquired, that will bear the natural unaffected ſtamp of our own minds: in ſhort, it will be our own character and genius ſtripped of its native rudeneſs, and enriched with beauty and attraction. With theſe ideas in his mind, let the boy learn to dance. It will contribute to his health and to his growth. It will give the human form, in the embelliſhment of which nature has beſtowed peculiar care, the power of diſplaying its natural beauty and ſymmetry. It will ſtrengthen the limbs, and render them fit for their proper exertion. A ſkill in the art, independent of other advantages, is deſirable, as it enables young people to join in a diverſion, which, in decent company, is no leſs innocent than pleaſing.

Fencing, as a gymnaſtic art, is highly uſeful in ſtrengthening the body. In ſeveral walks of life, cuſtom hath rendered it eſſentially requiſite. If the ſcholar chooſes to purſue it, and has a convenient opportunity, he ſhould not neglect it; ſince it furniſhes an excellent mode of bodily exerciſe, after the labour of the mind in a ſedentary employment. The learning of the military exerciſe, which is now very common, is alſo, in ſeveral points of view, beneficial. It gives a manlineſs of mien, it renders the body erect, and the limbs robuſt; and it qualifies youth to defend their country in an effectual manner, when called out by an emergency. It may likewiſe have an indirect influence, in inſpiring manly ſentiments, and inſinuating a love of order.

Muſic furniſhes a ſweet amuſement to the man of letters. Boys are not often initiated in it at ſchools. With great propriety, they are uſually left to follow, in this particular, the impulſe of their genius or their inclination. Without the co-operation of theſe, no valuable proficiency is ever made in performing on a muſical inſtrument. Scarcely any art is purſued, *invitâ Minervâ*, or without a natural turn for it, ſo unſucceſsfully as muſic. And indeed to arrive at any great excellence in it, requires more time and attention, than can well be beſtowed by him who follows any other purſuit with ardour. The lover of muſic, who has full employment of another kind, and who has not any very remarkable degree of genius for muſic, ſhould content himſelf with hearing ſkilful performers; opportunities for which abound in this cultivated age and nation.

Drawing is frequently taught at ſchools; not often with any ſingular ſucceſs. It is, however, a very convenient as well as agreeable accompliſhment; and, where a genius for it evidently appears, no care ſhould be ſpared in its cultivation. In general, whatever ornamental accompliſhments the ſtudent may wiſh to purſue, he ſhould call to mind what has often been repeated with a ſigh, that life is ſhort, and art long. A paſſion which parents of the preſent age are apt to run into is, to make children learn all things; the languages, the ſciences; muſic, the exerciſes, and painting. Thus the child ſoon becomes a talker in all, but a maſter in none. He thus acquires a ſuperficial fondneſs for every thing, and only ſhews his

ignorance, when he attempts to exhibit his ſkill. Much time and much attention muſt not therefore be beſtowed, in the contracted ſpace of human life, on objects which afford no permanent pleaſure, and no real advantage of any kind to the individual, or to ſociety. It is indeed far better to conſume time in employments merely innocent, than in vice or in malignant actions: but true, permanent, and heart-felt, happineſs is to be derived from a benevolent conduct, and from uſeful exertions. Ornamental qualifications, and amuſing attainments, may pleaſe, indeed, during a ſhort period of youth; but, alas! the old age, which has no more than theſe to ſupport and recommend it, would be ridiculouſly contemptible, if it were not truly pitiable. Men are too little inclined to look ſo far before them, and to provide for that period, which, if it is deſtitute of rational amuſement, and of ſolid improvements, muſt be ſpent either in a ſtate of ſtupid inſenſibility, or in wretchedneſs. If the antediluvian duration of life ſtill continued, what accompliſhment is there at which an ingenuous mind would not aſpire? But to ſpend the greateſt portion of threeſcore years and ten, in trifling or uſeleſs purſuits, is pitiable folly.

Introducing boys into company, and inſiſting too much on the ſhining and external accompliſhments, is a faſhionable error with many parents. When leſs attention was paid to thoſe exterior accompliſhments which qualify young men to bear a part in the converſation of their ſeniors, when they were kept cloſe at ſchool, and were ſeldom brought into company, or at leaſt allowed to ſay but little in company, ſo that they had but little ſociety except with their parents and ſchool-fellows, they contracted a baſhfulneſs, which, by diſqualifying them from appearing to advantage in what is called polite company, made them rather ſhun it. By this means a great deal of very valuable time was ſaved; and having no road of ambition open to them, but that of excelling in their ſtudies, they of courſe applied their time, and bent their application, that way; ſo that they were poſſeſſed of the underſtanding, and had acquired the knowledge, of men, when they exhibited nothing but the appearance of boys. Of theſe two extremes, bringing them too early and too much into mixed company, or keeping them entirely out of it, we rather prefer the latter than the former; becauſe external accompliſhments are certainly of leſs value than internal ones, and becauſe the former can be acquired when the latter cannot. The elements of knowledge can only be acquired to any good purpoſe in early life, becauſe they depend chiefly on memory, which is peculiarly quick and retentive in youth, and the exerciſe of it is peculiarly irkſome in riper years.

At a very early age, the pupil ſhould be introduced to a knowledge of geography. The uſe of maps ſhould be familiarly explained; and then the pupil will be well able to inform himſelf of the ſituation of principal places, and of ſuch as occur moſt frequently in reading the claſſics and the Roman hiſtorians. Ancient geography ſhould at firſt engroſs his attention. The ſame method ſhould ſoon after be uſed, to introduce him to a general idea of the modern. The facility and the uſe of this ſcience, will induce the judicious ſtudent to make a great progreſs in it. He will therefore ſtudy modern geography, even with more accuracy than the ancient. Frequent and attentive inſpection of maps will avail him moſt in this purſuit, throughout all its parts. There is a great abundance of treatiſes on this eaſy ſcience. Cellarius ſhould be given to the ſchool-boy as a guide to ancient geography; and Pinkerton as a guide to modern. In that new and accurate compilation he will find a great number of particulars, not merely geographical, which ought to be known to every individual. Though d'Anville's Geography is ſeldom uſed in ſchools, yet the ſcholar ought to be informed, that his maps are held in the higheſt eſteem. Their price alone prevents them from being univerſally received. Mathematical geography, or that part of it which is connected with aſtronomy, may be deferred till the pupil arrives at a maturer age, unleſs he diſplays a very early genius and inclination for mathematics. The drawing of maps, and other minute labours in the purſuit of geography, may be deſirable to a perſon who is deſigned for ſome employment connected with ſurveying or navigation, but are an unneceſſary toil to the liberal ſcholar.

With reſpect to mathematical ſcience, and thoſe which depend upon it, they cannot often be purſued at claſſical ſchools, conſiſtently with other ſtudies more immediately neceſſary in early youth. Perhaps they ought to be attended to at the univerſity, rather than at ſchool. Aſtronomy, and natural and experimental philoſophy in all its branches, will alſo be more properly comprehended in the courſe of academical ſtudies. The laws of England muſt alſo be comprehended among the academical purſuits. The excellent inſtitution of the Vinerian profeſſorſhip is a noble acquiſition to the glories of Oxford. But Blackſtone's Commentaries, the firſt fruits of that eſtabliſhment, have almoſt rendered ſubſequent lectures unneceſſary. Theſe well read will be quite ſufficient for the liberal ſcholar, who ſtudies not the ſubject with a view to qualify himſelf for a practical profeſſion. The lectures read in the univerſities on mathematical ſubjects, are admirably well fitted to accompliſh the ingenious pupil in theſe delightful and improving ſciences. In thoſe places, a large and coſtly apparatus is always at hand, and the profeſſors who read lectures, are, for the moſt part, men of great and ſolid merit, with little oſtentation. Yet if a boy has a peculiar turn for mathematics, it ſhould be early cultivated; as, indeed, ſhould all very predominant tendencies to peculiar excellence. Intervals may be found, in a courſe of claſſical ſtudy, for improvement in mathematical knowledge; and Euclid's Elements will very ſucceſsfully prepare the way for a future progreſs in the univerſity. Theſe elements, it has been well obſerved, conſtitute the beſt introduction to rational logic, or the art of reaſoning juſtly and accurately in life and in learning. As matters of taſte, they alſo form moſt delightful ſubjects; for intellectual truth is the moſt beautiful object which the mind can contemplate.

But it muſt be remembered, that the moſt important views in education are to open the mind for the reception of general knowledge, and to prepare it, in particular, for the reception of that ſpecies and degree of knowledge which is required in the ſphere deſtined for the exertion of its activity. It is not the buſineſs of the ſchool to complete, but to prepare. Thoſe inſtructors therefore do well, who point out the various avenues of learning, and, by leading their pupils into each, enable them to proceed alone in the years of maturity. As many avenues as can well be comprehended, without impeding the progreſs of the ſcholar, muſt be opened for his view, and for his admiſſion. Among theſe, hiſtory is with great propriety included. But it is a moſt extenſive field; and great care muſt be taken leſt the boy ſhould be diſcouraged and confuſed by the immenſity of the proſpect. His attention ſhould be confined to the more ſtriking parts of ancient hiſtory, and to that of his own country. But particular regard ſhould be paid to the Greek and Roman hiſtories, not only for the neceſſary and ornamental knowledge which they furniſh, but alſo for the noble, manly, and generous, ſentiments which they tend to inſpire. He who, in his early age, has been taught to ſtudy and revere the characters of the ſages, heroes, ſtateſmen, and philoſophers, who adorn the annals of Greece and Rome, will neceſſarily imbibe the moſt liberal notions. He will catch a portion of that generous enthuſiaſm, which has warmed the hearts, and directed the conduct, of the benefactors and ornaments of the human race.

There has long been a juſt complaint that men, whoſe attainments in learning have rendered them highly reſpectable, have not been able to diſplay their knowledge with any great credit to themſelves, or advantage to others,

from a defect or a fault in their mode of elocution. It is therefore become a very desirable object in education to enable boys to speak well. If the boy is designed for the church, or the law, it is absolutely necessary. If he is designed for no particular profession, yet a clear and correct utterance is a valuable acquisition. A part of the time spent at school should always be devoted to the pursuit of this useful, elegant, and manly, accomplishment. The proper mode, then, of pursuing it, is all that claims our present examination. At the age of thirteen, provided the boy is sufficiently advanced in the classics, he should enter on the art of speaking. There are many books written on it, and many rules are usually given to the student, previously to his entrance on the practice. Natural sense and natural taste, a good ear, and well-formed organs of speech, under the guidance of a skilful instructor, will effectually accomplish this purpose, without any painful attention to dry and unentertaining rules of art, which often give an appearance of difficulty to pursuits in themselves easy and pleasant.

Once in every week, scholars of the age and qualifications already specified, should rehearse, in the hearing of all the boys in a school, seated in form as auditors, some celebrated passage from Demosthenes, Plato, Homer, Cicero, Livy, Virgil, Milton, Shakespeare, Pope, or Addison. We totally disapprove the practice of school-boys' speaking their own declamations; unless it be occasionally, and as an honorary reward for a good composition. A fine piece of writing contributes greatly to facilitate a fine utterance. Few boys can write such a Latin or English declamation as is proper to display, to advantage, the graces of elocution. It may also be noted, that learning by heart the most beautiful passages of the finest authors, is a very great collateral advantage attending the study of the art of speaking. The first object is, to habituate the scholar to speak slowly and distinctly. Let some months be employed in obtaining these primary and important points; for a flow and distinct utterance is a valuable attainment. One of the best methods of introducing it, is, to insist, during the exercise, that every syllable, but especially the last, shall clearly, and almost separately, strike the ear. Boys are apt to drop the last syllable. They must not however dwell upon it too long. Caution is necessary, to prevent the slow and distinct manner from degenerating to the heavy and the sluggish. But this seldom happens. Boys of parts are generally too voluble: they oftener want the bridle than the spur. During this process, all monotony, and, indeed, all disagreeable tones whatever, must be carefully corrected. For if they are suffered to grow into a habit, the difficulty of removing them becomes great indeed. When a slow and distinct utterance is thus obtained, the graces of elocution will claim the pupil's attention. And here let the instructor carefully avoid teaching a bold, an affected, and a theatrical, manner. Modesty, whatever some injudicious parents may think, is one of the most becoming graces of a boy. When he speaks in public, it is one of the finest rhetorical ornaments that can be used. The best writers on the subject of rhetoric have prescribed the appearance of modesty, even in men. It is not therefore wonderful, that the want of it in boys (and it must always be wanting where a theatrical manner is adopted) should give disgust. A loud rant, and a violent tone of voice, can never please in a boy, unless, indeed, he is acting a play. But as few boys are sent to school to be prepared for a theatrical life, the theatrical manner ought to be exploded from the schools. The classical manner should alone prevail in every seminary devoted to ancient learning; for there, if ancient learning is properly understood and cultivated, taste and grace in speaking must prevail.

It is usual in many schools to act English plays. The exercise may possibly improve the boys in utterance, but there are many inconveniences attending it. The various preparations, and the rehearsals, break in greatly upon the time which ought to be spent in classical and grammatical study. Nor is the loss of time the only evil. The boy's attention becomes engrossed by his part, which he is to perform before a large and mixed audience. The hope of applause, the dread of disgrace, all conspire to captivate his imagination, and to make him lay aside his lexicon and grammar. Some moral corruption may also arise from several circumstances unavoidable in the representation. The theatrical mode of speaking, too, which has been acquired by it, has seldom pleased good judges. Perhaps some improvement may arise from acting a play of Terence or Sophocles; but it cannot be desirable, that a boy should acquire that love and habit of declaiming, which may introduce him to spouting-clubs or disputing societies. Nor can it be supposed, that elegance of style, of sentiment, or of utterance, is often found in such unselected associations.

Having rejected the forward, the pompous, and the declamatory, style, the pupil should aim at the classical: we mean a clear, distinct, emphatic, and elegant, utterance, without affectation. To a vulgar and an illiterate audience, however, vehemence of action, and loudness of voice, often appear more truly eloquent than the graceful oratory of an Athenian. To speak well, depends more on the corporal endowments, than many other accomplishments. Whatever learning and judgment the mind may have acquired, yet unless nature has formed the organs of speech in perfection, and unless she has given a considerable degree of bodily strength to the student, he will seldom become a distinguished speaker. Art and care may, however, assist him; and, if they enable him to speak slowly and distinctly, they will have done him great service. To constitute a distinguished orator, Nature must have done much more than have furnished perfect organs of speech. She must have given exquisite sensibility. This, with cultivation under an instructor, who likewise possesses both sensibility and perfect organs, will infallibly produce that noble accomplishment which has charmed mankind, and occasioned some of the greatest events in their history. This invaluable acquisition should therefore be sedulously pursued by all who are designed to fill that office, which is instituted to instruct their fellow-creatures in moral and religious truth. The neglect of this important part of education has brought the regular professors of religion into contempt among the lower orders of the people; among those who, for want of other opportunities, stand most in need of instruction from the pulpit. It has given a great advantage to the sectaries, and persons irregularly educated, who spare no endeavours to acquire that forcible and serious kind of delivery, which powerfully affects the devout mind. The consequence is natural, though lamentable. Tabernacles are crowded, and churches deserted. This is the first and most to be regretted *evil* of a partial or inadequate progress in the powers of elocution. The next is the depravation in the present state of the eloquence of the bar. With sorrow be it spoken, that this profession has greatly degenerated from that liberal oratory which immortalized a Cicero, and which was designed to defend the cause of the fatherless and the widow, and to protect the injured, by lending truth the assistance of abilities. Instead of this noble exertion of the oratorical powers, we now too commonly see indelicacy and want of candour mark the modern pleader. The unmanly advantage too which he takes of his situation, to make free with respectable characters, often degrades him below the rank of a scholar, a man of humanity, a Christian, and a gentleman.

A good education commonly inspires a good *taste*; or that delicate faculty which is sensibly delighted with all that is beautiful and sublime, and disgusted with all that is coarse or inelegant. To read without taste, is like travelling through a delightful country, without remarking the richness and variety of the prospects. From such an excursion, more fatigue must arise than pleasure. Indeed, the classics are entirely the objects of taste; and he who

who reads them without it, miſpends his time. Hence the neceſſity of cultivating this amiable quality; and we believe that all men, not remarkably deficient in intellect, are by nature furniſhed with ſo much of this diſcerning power as eaſily to admit of valuable improvement. Even they who poſſeſs the fineſt natural ſenſibility of literary beauty and deformity, will find their taſte greatly improved by proper cultivation. It is certain, that, if from ſome unfortunate circumſtance, it happens that a mind endowed with this natural power in a remarkable degree, is confined in a youthful age to bad models or injudicious inſtructors, it will ſcarcely ever arrive at that perfection, of which nature gave it a capacity. Rules, therefore, and precautions, are often found uſeful. In this place, however, it will be only neceſſary to give one general rule. It is, that from the age of nine to nineteen, the pupil be not permitted to read any book whatever, which is not univerſally known and allowed to be written according to the moſt approved and claſſical taſte. At an early age, the mental like the animal taſte delights in that improper food, from which it is more likely to derive an atrophy, than to acquire nouriſhment. But when, during ten of the moſt ſuſceptible years, none but the beſt models are preſented to the mental eye, it muſt perceive, and learn to admire, the form of beauty. The buſineſs will alſo be greatly facilitated, if the inſtructor feels the excellencies which he reads with his pupil, and poſſeſſes the talent of impreſſing them upon him in a lively and forcible manner. If he is not remarkably happy in ſenſibility, yet if the pupil is ſo, the end will often be accompliſhed; for the beauties of the truly claſſical writer are ſuch, as to make their own way to the feelings of the ſenſible. Let them but be well underſtood, and kept conſtantly before him, and the taſte muſt be improved.

Boys ſometimes, from a redundancy of imagination, as well as a deficiency of judgment, are apt to admire too much the florid ſtyle of compoſition. In their imitation of it, they commonly fall into the turgid and bombaſt. Whenever this appears in a theme, or copy of verſes, let ſome paſſage be read on a ſimilar ſubject, if it can be found, from the works of a Pope, an Addiſon, or any other juſtly admired writer. They will ſoon ſee the deformity of their own ſtyle, when contraſted with theſe. But care ſhould be taken, that a boy be not diſcouraged; for his fault is the ebullition of genius. A dull boy cannot riſe to ſo elevated an error. Let the pupils, if poſſible, be led to an elegant ſimplicity in manner, dreſs, and ſentiment, as well as criticiſm and compoſition. Let them be taught, that though falſe and glaring ornaments, in all theſe, may attract momentary and ſuperficial admiration, yet that valuable and permanent gracefulneſs is the reſult of an adherence to truth and nature. Falſe and affected taſte involves its poſſeſſor in ridicule. But true taſte, the reſult of fine feelings and a cultivated underſtanding, opens the ſource of a thouſand pleaſures unknown to the vulgar, and adds the laſt poliſh and moſt brilliant luſtre to the human intellect. Study without taſte, is often irkſome labour; with taſte, it confers a happineſs beyond the reach of fortune, and ſuperior to the ordinary condition of humanity.

To the boy whoſe lot may be to poſſeſs a fortune, which his friends wiſh him to adorn, and to him who is deſigned for a profeſſion, we ſtrongly recommend the cultivation of a poetical talent, if he really poſſeſſes it from nature. Though he ſhould never arrive at any very diſtinguiſhed eminence in poetical compoſition, yet the attempt, while he is at ſchool, will add an elegance to his mind, and naturally lead him to give a cloſer attention to the beauties of the claſſical poets. It will not be a painful taſk. It will be his moſt delightful amuſement. It will give him ſpirits in his purſuits: for poetry, like muſic, is one of the ſweeteſt relaxations of a learned life. The moſt ſucceſsful method we imagine to be the following: Let a living inſtructor, of taſte and judgment, ſelect proper paſſages from the moſt approved poets, and at firſt read them with the pupil. After this preparatory diſcipline, which needs not to be continued long, let the works of Milton, Shakeſpeare, and Pope, be given to him. He will improve himſelf by reading them, more than by any inſtructor with the moſt learned precepts. No other reſtraint is neceſſary, than to confine his attention for a conſiderable time to theſe great poets. Many a fine genius is lowered and ſpoiled, by attending to the little trifling compoſitions which are to be found in abundance in many of our modern miſcellanies. The *mediocres poetæ*, or the poetaſters, muſt by no means be read while the judgment is immature. The young mind is prone to imitate bad models in literature, as well as in life. The faireſt forms of things muſt be preſented to the eye of imitative genius, and a veil drawn over deformity.

One of the prime objects of a parent and an inſtructor, ſhould likewiſe be, to cauſe in a child ſuch an aſſociation of ideas as ſhall connect pleaſures, honours, and rewards, with the idea of that purſuit which is to be the purſuit of life. This end may be eaſily obtained, if the ſuperintendant of the child repreſents the object in its faireſt form, and at the ſame time vigilantly takes care, leſt the impreſſion, once recived, be effaced by the company of ignorant aſſociates. The child is deſigned to ſupport the character of the ſcholar and the gentleman, whatever may be his engagements in ſocial life. Never let his book be ſpoken of ſo as to convey the leaſt idea of diſagreeable labour. Let it be repreſented as the ſource of amuſement, fame, profit, and of every thing deſirable. It muſt be owned, great judgment and attention, much knowledge of the emotions of the human heart, conſtant vigilance, unwearied patience, and a natural talent for the buſineſs, are required to regulate the mind of a child at that very early period when ideas firſt ruſh into the ſenſorium. All theſe qualities are required in a greater degree than they are often found. Wrong aſſociations are therefore formed; and it becomes a great part of the buſineſs of a preceptor to remedy in future what it could not prevent.

At the age of ten or twelve, the taſk may be more eaſy. The mind is then not merely paſſive. It can cooperate voluntarily with its inſtructor, in rejecting, according to the dictates of judgment, all improper aſſociations of ideas, and in ſelecting all ſuch as are deſirable. At that time, then, if it cannot be accompliſhed before, the pupil ſhould be impreſſed with every idea which can render an eminence in literature amiable and honourable. In the firſt place, let him feel his chief pleaſures ariſing from his little performances in letters, whatever they may be. When he does well, let him be careſſed and rewarded; not only by his tutor or maſter, but by all who have any intercourſe with him. If he is ingenuous enough to be ſenſibly touched with praiſe, the buſineſs is half completed. The parent may congratulate himſelf. He has nothing to do but to beſtow it with judgment. The pupil's little heart will exult to receive it, and all his faculties will expand themſelves to deſerve it. The boy ſhould be taught by common converſation, not by formal precept only, to conſider greatneſs of mind as the only true grandeur, and the poſſeſſion of knowledge as the moſt ornamental accompliſhment. Not only the father, but the females of a family, if they have judgment enough for the purpoſe, muſt concur in impreſſing on the young mind ideas of literary excellence. It too often unfortunately happens, that without intending the injury, they undo all the labour of an aſſiduous inſtructor. An attention to cards, to dreſs, to faſhion, to thoſe ſcenes which perſons engaged with the world cannot eaſily avoid, will not only obliterate from the puerile mind all virtuous and deſirable ideas, but will often render it incapable of their future reception. If the idea of excellence, applauſe, and happineſs, is aſſociated with vanity in the infantine age, vanity will be purſued in manhood.

Another excellent method of inſpiring the pupil with an emulation to excel in letters, is to accuſtom him to read biography. The lives of our great poets, divines, hiſtorians, and eminent writers of every denomination, ſhould be ſelected for this purpoſe. The eulogia which are uſually paſſed on them, and which they deſerve, will fire a young mind with an ardent deſire to tread in their footſteps. If the boy can be introduced at a proper age to the company of ſome celebrated literary character, it will greatly contribute to raiſe and ſuſtain this deſirable emulation. He ſhould be taught to wiſh for the honour of ſuch an interview, and to look upon any notice taken of him by ſuch a perſon, as a noble diſtinction. At the revival of learning, it is amazing with what eagerneſs even the ſight of a man of eminent learning was ſought for by the ſtudious. They ran in crowds to meet him; and any attention paid by him to an individual, conferred an enviable happineſs. The conſequence was, that the youth who were devoted to learning, purſued it with a vigour and perſeverance which aſtoniſhes the preſent age of indolence. It was the honour and the reſpect, in which the perſons of eminent ſcholars were held, which diffuſed a generous ardour in the purſuit of letters, and produced ſtupendous effects. If that honour and reſpect is excluſively paid to rank and opulence, however ignorant and undeſerving, it is no wonder that the liberal purſuits are found to languiſh. After the important point is gained, of making the pupil feel the love of letters, and an ambition for literary fame, improvement is ſecured. He will make his own way, even under diſadvantages; but with encouragements, aſſiſtances, and opportunities, he can ſcarcely fail of arriving at, what few reach, diſtinguiſhed excellence.

On no account let a teacher excuſe the want of cloſe application. If the pupil has genius, this will improve and adorn it; if he has not, it is confeſſedly requiſite to ſupply the defect. Thoſe prodigies of genius which require not inſtruction, are rare phenomena: we read, and we hear of ſuch; but few of us have ſeen and known them. What is genius worth without knowledge? But is a man ever born with knowledge? It is true, that one man is born with a better capacity than another, for the reception and retention of ideas; but ſtill the mind muſt operate in collecting, diſcriminating, and arranging, thoſe ideas, which cannot be done effectually, without great and exemplary diligence. All that is excellent in learning depends upon it. And how can the time of a young man be better employed? It cannot be more pleaſantly; for induſtry, by preſenting a conſtant ſucceſſion of various objects, and by precluding the liſtleſſneſs of inaction, renders life at all ſtages of it agreeable, and particularly ſo in the reſtleſs ſeaſon of youth. It cannot be more innocently; for learning has a connection with virtue; and he whoſe time is fully engaged, will eſcape many vices and much miſery. It cannot be more uſefully; for he who furniſhes his mind with ideas, and ſtrengthens his faculties, is preparing himſelf to become a valuable member of ſociety, whatever place in it he may obtain; and he may be likely to obtain an exalted place: the high road to which is early riſing, and an uninterrupted application in the morning.

Improvement will alſo be greatly accelerated, if the ſtudent can be induced to devote the leiſure hours which his private tutor, or his maſter at ſchool, allows him, to private reading. At the age, then, of twelve or thirteen, let a few Engliſh books of repute be put into his hands. They ſhould be entertaining, or they will not at firſt excite his attention. They ſhould at the ſame time be claſſical, or have ſome connection with real and valuable knowledge, or they will only diſſipate his ideas, and impede his progreſs in the more eſſential purſuits. There is, however, hardly any innocent book which affords him entertainment, which will not, at the ſame time, in ſome reſpect improve him. No book can be more properly recommended at firſt, than Addiſon's Spectator. It abounds with entertainment. It furniſhes a great variety of ideas on men, manners, and learning; and the moral and religious principles it unfolds, are well adapted to tincture the young mind with the love of all that is amiable, uſeful, and innocent. Other books ſhould be allowed, at the diſcretion of a judicious ſuperintendant. New books, and the works of contemporary writers, are found to attach the mind with peculiar energy.. Hiſtorical books are highly proper; and poetry ſhould likewiſe be read at that early age, when the feelings and the imagination are all alive. No young man can ſupport with honour his character as a claſſical ſcholar, without an acquaintance with the fineſt writers of his own country, who have rivalled the moſt admired of the ancients. But theſe cannot be read, conſiſtently with purſuits more immediately neceſſary, in the ſchool, and under the eye of the inſtructor. They ſhould therefore form the amuſement of leiſure hours, and muſt be read from choice. All that the maſter and the private tutor can do in this buſineſs, if he attends to the more eſſential points, is to recommend private application, and point out the moſt expedient authors.

When the boy ſhall have arrived at the age of fifteen, and at the improvements adequate to the age, it will be highly advantageous to prevail with him to read in private, not only Engliſh, but alſo ſome eaſy Latin book. Time and habit will render it no more difficult than to read Engliſh; and the improvement in Latin will be ſoon found much greater than that which would be derived from reading it only in a ſchool, or with a private tutor. Three things are requiſite, whatever Latin book ſhall be at firſt ſelected, viz. a pure diction, an entertaining ſubject, and a perſpicuous ſtyle. When facility is gained in reading Latin, the ſtudent will of himſelf aſcend to Cicero, Terence, Livy, and all thoſe excellent writers, whom the world has long agreed to admire. When a great degree of claſſical improvement is ſecured, one or two of the beſt romances and novels may be read, for the ſake of acquainting the ſtudent with the nature of this kind of writing. *Omnes deguſtandi*, all authors are to be taſted in the courſe of a literary life; but during education, only the beſt. To form a ſound and good judgment is of the higheſt conſequence. Judgment contributes more to public and private good than genius. Let the boy's judgment then be exerciſed and ſtrengthened by being early habituated to the work of ſelection. Let him be taught to chooſe the beſt authors, and always to give reaſons for his choice. This will improve his judgment in the conduct of life; without which, parts and learning often ſerve only to precipitate ruin.

Amidſt the number of facilitating contrivances, and the various aids afforded by opulence, the mind is not ſufficiently allowed to exert its native powers. The toil of thinking is too frequently thrown upon the preceptor and the formal lecturer. Thus it happens, that many who attend lectures wherever they are to be heard, and purchaſe the aſſiſtance of thoſe who profeſs to afford it, are often, after all, leſs learned than others, who, without ſuch apparent advantages, have forced their way up to the moſt arduous heights, by native vigour and perſevering aſſiduity. Indeed, nothing is more abſurd than the common notion of inſtruction, as if ſcience were to be poured into the mind like water into a ciſtern, that paſſively waits to receive all that comes. The growth of knowledge reſembles the growth of fruit: however external cauſes may in ſome degree co-operate, it is the internal vigour and virtue of the tree that muſt ripen the juices to their full maturity.

Yet many perſons have paſſed through a ſchool, without exhibiting either inclination or ability for literary purſuits, who have afterwards ſhone in the republic of letters with diſtinguiſhed luſtre. The faculties of their minds have expanded at a later period than common, or peculiar occaſions have occurred to excite their induſtry and emulation. Others there are, who never were placed

at

at a claſſical ſchool, and have either not had, or have not availed themſelves, of other opportunities of improvement; but who, when their judgment is matured by obſervation and experience, earneſtly wiſh and endeavour to furniſh themſelves with the learning of a gentleman. They often miſcarry in their attempt, not from want of aſſiduity or of perſeverance, but from ignorance of the proper method. The firſt great error of ſtudents of this deſcription is, that they read in a deſultory manner, every thing which falls in their way. They begin with complete and extenſive treatiſes, when they ſhould proceed gradually from elementary introductions. They are uſually unacquainted with proper editions of books, and often ſpend much time and attention on publications, which, when compared with original compoſitions, are contemptible both in ſtile and in matter. They often confine their attention to Engliſh books; from an idea, that the languages are not to be learned by an adult. The conſequence of their miſtakes is, that their conceptions, though multiplied by reading, are confuſed and imperfect, and though they find amuſement from it, they derive but little ſolid advantage.

If ſuch men ſeriouſly wiſh not merely to divert themſelves with books, but to make a progreſs in learning, they muſt reſolve to read methodically; nor let any temptation interrupt their plan. They will do right to diveſt themſelves of that vulgar prejudice, which repreſents it as an inſurmountable difficulty to begin a language, or an art or ſcience, at the age of manhood. To be under the influence of this opinion, will be an effectual bar to their advancement. Let them rather call to mind the many inſtances of great improvements made in the ſciences, by thoſe who did not begin to cultivate them till they were arrived at a middle age. Hiſtory and biography furniſh numerous examples of men who have begun to ſtudy in old age, and have yet made a great proficiency. The injury which the health, the eyes, and the ſpirits, unavoidably ſuſtain from a long continuance of nocturnal ſtudies, ſhould induce every perſon to avoid the lucubrations of midnight. Early riſing contributes to health and cheerfulneſs, while it furniſhes the fineſt opportunities for ſtudy.

It is not uncommon to find perſons, who, though they have been good ſcholars at their ſchool, and have made a great proficiency in learning in the juvenile age, have forgotten it amidſt the pleaſure and the buſineſs of an active manhood. When the buſy ſcene is paſſed, they call to mind thoſe ſweets of literary purſuits which they formerly enjoyed, and wiſh to taſte them once more. They are at a loſs for ſomething to fill agreeably thoſe vacuities of time, which were lately occupied in active employments. They therefore endeavour to recal what they acquired in their youth. Perhaps the beſt advice which can be given to perſons under theſe circumſtances, is, that they purſue the eaſieſt, the moſt entertaining, and the moſt compendious methods. Difficulty will diſguſt and impede them. Amuſement is the end propoſed by them; and the means which lead to it muſt, if poſſible, be rendered amuſing. As they have once been acquainted with the elementary parts, they will recollect what is eſſential in them without much labour. If they wiſh, for inſtance, to recal their knowledge of Latin, they ſhould begin at once with reading an eaſy author, and gradually aſcend to the higheſt claſſics. If they poſſeſs natural abilities, they will find themſelves improve by this method with great rapidity.

But in general, though not without many exceptions, it would perhaps be better for perſons advanced beyond the meridian of life, not to attempt learning, or recovering what they have forgotten, in the Latin or the Greek languages. Amuſement is their principal object, and they may derive it in ſufficient variety in Engliſh. But in Engliſh they ſhould read with ſome method, and not, as is uſually the caſe, whatever offers itſelf, without taſte and ſelection. The pleaſure which ariſes from reading, and feeling the beauties of elegant works, is much greater than is received by an indiſcriminate and vague peruſal of every publication. Improvement ought alſo to be regarded; and ſurely more improvement, whether it be moral or intellectual, is to be derived from books of character, than from trifling, obſcure, and injudicious, compilations. Upon the whole, we cannot but earneſtly recommend to all claſſes above poverty, and the lower employments of trade and mechanics, the cultivation of a taſte for letters. Merchants and traders, even if, from unavoidable circumſtances, they have been neglected in their youth, ſhould endeavour, at a ſubſequent period, to acquire a love of reading. Retirement is their object. But how are they to enjoy this retirement? They promiſe themſelves much happineſs, but, alas! they ſeldom find it. They know not how to paſs that time, which was before ſcarcely ſufficient for their occupations. They have recourſe to the bottle and to cards. Theſe, indeed, prevent reflection for a time; but they often afford no ſolid ſatisfaction. How happy would they paſs their days of eaſe and affluence, if the tranquil purſuits of literature formed a part of their amuſement. The conſideration, that a taſte for letters is able to furniſh one of the beſt pleaſures of old age, ſhould induce parents of all ranks above the loweſt, to give children a tincture of polite learning, whatever may be their deſtination. If they are fixed in trade, and are ſucceſsful, this will enable them to enjoy a fortune. It will fill up their leiſure with ſatisfactory employment, and will better enable them to ſupport the character of gentlemen, than the opulence which gives them the name.

With reſpect to external behaviour, a ſubject on which ſo much has been lately written, the ſtudent who values the approbation of his own heart, will ever let SINCERITY be the principal of his converſation. Notwithſtanding what many urge on the art of pleaſing, a behaviour void of *artifice* will ultimately beſt pleaſe the poſſeſſor of it, and thoſe with whom he converſes throughout life. Let the ſtudent chooſe good company, with good nature, good ſenſe, and ſpirit to retort the malignant ſhafts of the ignorant, the forward, the vain, and the envious, and he will ſoon make a reſpectable figure in ſociety. Let him learn to appreciate his own value, and modeſtly aſſume his natural rank, and he will become both agreeable and eſtimable, though he ſhould never practiſe either ſimulation or diſſimulation. Deceit of any kind argues a mean and cowardly heart. It will ſoon or late be certainly detected, and when detected it muſt be deſpiſed. But the liberal ſtudent, in his intercourſe with the world, ſhould think, ſpeak, and act, nothing which is not laudable; nothing which will not bear the broadeſt daylight, and acquire a luſtre from being rendered conſpicuous. And on this ground he ought to be cautioned againſt the itch of ſcribbling, or the love of writing without the pain of thinking. Let him never take the pen in hand, nor place the paper before him, till he has beſtowed much time, and deep thought, on the ſubject which he is about to write and publiſh. To the want of this previous attention we owe the numerous productions which diſgrace letters, and die almoſt as ſoon as they are brought forth; which, like the weeds in a garden, ſpring up luxuriantly without cultivation, and only ſerve to impede the growth of ſalutary plants and pleaſant flowers. Pretenders ariſe in every department, and diſgrace it: but let the liberal and ſolid ſcholar attend to the circumſtances of time and place, in the modeſt diſplay of his attainments. It is unmanly to conceal them on proper occaſions; it is arrogance to obtrude them upon unwilling and injudicious obſervers. Modeſty is the characteriſtic of real merit, and firmneſs of conſcious dignity. The man of ſenſe will be diffident, but at the ſame time will have ſpirit to repel the inſolent attacks of ignorance and envy.

Public examinations, in our great ſchools, are highly expedient in facilitating the progreſs of education. They have of late been eſtabliſhed in many colleges; and the

ſame ſalutary conſequences will flow from the practice, if it ſhould be imitated in all the nurſeries to the univerſity. A maſter cannot beſtow an hourly attention on the younger ſcholars of a large ſeminary. It is certain, that the firſt elements may be even better taught by diligent aſſiſtants of inferior learning and abilities. Patience, attention, and temper, are the principal qualities required in teaching the accidence; for the method will be preſcribed by the book itſelf, or by the ſuperintendant. But it is indiſpenſably requiſite, that the maſter ſhould examine every claſs at leaſt once in a fortnight. The conſciouſneſs that an account is to be given of the degree of improvement made within a limited time, will cauſe a greater degree of diligence both in the ſcholars and in the aſſiſtants. Periodical examinations at ſhort intervals, will cauſe the mind to retain what it receives. The mind is prone to indolence, and will ſuffer that to eſcape, which no immediate hopes or fears induce it to preſerve. But when it foreſees the certainty of a ſtrict enquiry into its acquiſitions, it will not only retain much which it would otherwiſe loſe, but will retain it with accuracy. Periodical examinations alſo furniſh occaſion for the diſplay of excellence, and will conſequently excite a deſire to make a good appearance. Praiſes, rewards, diſgrace, and puniſhment, beſtowed as they are reſpectively merited, in the ſight of the whole ſchool, will have a better effect than when given ſeparately, and in private.

By being accuſtomed to give unpremeditated reſponſes to unexpected interrogations, the mind will acquire thoſe valuable habits, a quickneſs of recollection, and a readineſs of reply. So many, and ſo important, are the beneficial effects of this practice, that we might confidently recommend it to all, as ſecuring and increaſing valuable improvement in every ſtage of the ſcholar's progreſs, and in every part of his purſuits, while under ſcholaſtic or academical authority.

Much has been ſaid and written on the exerciſes and diverſions of a ſchool during the allotted hours of relaxation. Boys are under great reſtraint and confinement in the time of ſtudy. In the intervals of application, therefore, they ſhould have every indulgence conſiſtent with moral and perſonal ſafety. They ſhould contrive their own amuſements, and vary and diſcontinue them at their own pleaſure. They will often take violent exerciſe; but violent exerciſe is neceſſary at their age to promote growth, and is rendered more deſirable on account of the many hours which they ſpend in a ſedentary employment. They will run riſques; but by theſe they will gain experience, and a neceſſary degree of courage. Parents therefore often err, from an amiable cauſe indeed, when their ſolicitude for the ſafety of their children would debar them the enjoyment of diverſions common to their age, though attended with ſome degree of danger. In ſpite of every precaution, boys of ſpirit will engage in the uſual amuſements of their equals; and, if they have been confined, will naturally run into greater extremes than their companions. It cannot be denied, that the exerciſes and employments of the body, whatever they may be, produce a powerful effect on the diſpoſition. Some idea of the turn of mind is uſually and juſtly formed from common occupations. Thoſe of the effeminate kind ſuperinduce effeminacy; weakneſs of mind, no leſs than imbecility of body. Something ſimilar happens in puerile diverſions. The boy who has been kept in leading-ſtrings too long, and reſtrained from hardy ſports by the fondneſs of his mother, will ſcarcely ever become a man; or poſſeſs that becoming ſpirit which can enable him to act his part with propriety. Health, vigour, cheerfulneſs, and a great degree of mental ſtrength, depend on a liberal uſe of thoſe active exerciſes which conſtitute, in modern ages, the gymnaſtic part of education. We ought only to wiſh for ſo much reſtraint as may keep boys from vicious actions, from vulgar company, from a habit of quarrelling, and from feats of imminent and real danger.

The ſenior boys ought to be encouraged in athletic exerciſes, for other and more important reaſons. At the age of ſeventeen or eighteen, they ſhould be indulged, even for a moral purpoſe, in every manly ſport and exerciſe, conſiſtent with ſafety, good company, health, and economy. The propenſities to vicious pleaſures are often at that age impetuous. Nothing tends more to divert their courſe, and leſſen their influence, than a keen love of innocent amuſements, and an ardent purſuit of them continued even to fatigue.

The above reaſoning ſtrongly ſhews the neceſſity of holidays, or of the uſe of relaxation in a ſtudious life. The world is ſufficiently convinced of its utility and neceſſity. It ſends back the ſtudent with freſh ſpirits to his purſuits; and it is no leſs deſirable to the inſtructor than to the ſcholar. The employment of a ſuperintendant of a ſchool is full of care and labour; and he requires holidays for the ſake of his health, and for the regulation of his domeſtic affairs. Yet, in the greater part of ſchools, there appear by far too many holidays. There are two ſorts of holidays, which ſhould be conſidered diſtinctly; the breakings up or vacations, and the ſaints days and public feſtivals. Vacations are of indiſpenſable neceſſity: they give the parent an opportunity of becoming acquainted with his child's improvements, by placing him, during ſeveral weeks, under his immediate inſpection. They enable the boy to ſee ſomething of the world, by introducing him to his own family, and their viſitors. They contribute alike to the pleaſure of the boy, the maſter, and the indulgent parent. For this reaſon they are, and have been, univerſally adopted, in all great and eſtabliſhed ſchools. But the queſtion ariſes, how long ſhould the holidays continue, and how often be repeated? In ſome of our moſt ancient ſchools, the breakings up happened not leſs than four times a-year; and they now continue twice in the year, generally for ſix weeks. Beſides this, every red-letter day, as it is called, is religiouſly obſerved as a play-day. Upon the whole, it appears, that not above half the year is really devoted to inſtruction; yet there is not the leaſt ſhadow of a reaſon for allowing ſo large a number of holidays. Theſe abundant holidays are certainly productive of a great loſs of time, which might be more uſefully employed; beſides the forgetting of thoſe things which were already acquired, the contracting of idle and vicious habits, a diſreliſh of the employments, and an impatience of the confinement, of a well-regulated ſchool.

With reſpect to the conſtant obſervation of ſaints days in ſchools, what other reaſon can be honeſtly given for it, than the eaſe and accommodation of the maſters and uſhers? Can a boy pay a proper reſpect to a ſaint's day better, than by improving his mind, and endeavouring to acquire knowledge upon it? Are half the precious days of childhood and youth to be thrown away without improvement, becauſe they are marked with a red letter in the almanac? The practice of keeping them at ſchools indiſcriminately, as at preſent, is manifeſtly abſurd, and a relic of popery. A few ſingle holidays ſhould, however, be allowed, in the intervals between the half-yearly returns of vacation. But theſe ſhould be granted in the following manner: if any boy has performed an exerciſe of remarkable merit, or made an extraordinary proficiency, or behaved, in any reſpect, ſo as to deſerve diſtinction, let a holiday be conceded in honour of him, and let it be called his holiday. This fails not of exciting a ſpirit of emulation; and while it effectually contributes to the purpoſe of neceſſary recreation, it will alſo promote a general improvement.

Many evils are apt to reſult from negligent and improper behaviour to children at home during the holidays. There are few houſes where ſomething does not inadvertently paſs, which, though in itſelf innocent, corrupts a young and inexperienced mind. In the converſation even of perſons of judgment and virtue, ſomething will frequently drop, which may give a wrong and pernicious bias to the mind of a boy. Yet under the management of virtuous and judicious parents, the holidays may be rendered

rendered ſubſervient to valuable purpoſes. Parental authority may then interpoſe to confirm the inſtructions of the preceptor. It may inſtil religious and moral principles, which can ſcarcely fail to be well received from an affectionate father and mother. Something of graceful behaviour, and a knowledge of the world, may be acquired by ſeeing the company which viſits in the family. But let it always be remembered, that no acquiſition of this kind can compenſate the loſs of the ſober habits and ſentiments acquired in a judicious courſe of ſcholaſtic diſcipline.

As to dreſs, an unity and ſimplicity of materials ſhould be preferred; if not grave, certainly not gay; as it is more genteel, more manly, more ſuited to the ſtudious life, more expreſſive of a mind intent upon learning and inquiſitive after knowledge, and of a contempt of what the effeminate and illiterate are wont to admire. There are, it may be, times and places, wherein, if one be not too much pleaſed with fine clothes, one may be allowed to be fine without cenſure. But finery amongſt ſcholars, in a ſcholar, and whilſt he is profeſſedly in purſuit of thoſe improvements which adorn the mind, is, even in a perſon of fortune, an impropriety, if not an abſurdity. Neither is it to be conſidered as an ornament to ſpend a great deal of money. For frugality, which is ſober and temperate, which avoids as well careleſs and unneceſſary as vicious and vain expences, that there may be always wherewith to be juſt, and good, and beneficent; that there may be no want, nor temptation to do mean or wicked things through neceſſity; is one great part of a liberal education. All our academical inſtitutions have this view; they all tend this way. A plainneſs of diet, made acceptable by evening ſobriety and early riſing, and this in a moderate portion at ſtated times, is the univerſal rule of ſchools, and is of ſingular uſe, whether it be conſidered as a help to the contemplation of the ſtudious, or as a preſervative of health to the ſedentary, or as a guard to the innocence of young men whoſe paſſions are preſſing with force upon them. For any young gentleman, therefore, to diſſipate a great deal of money in ſo needleſs, ſo improper, ſo culpable, an expence, becauſe he is rich enough to afford it, or vain enough to affect it; and thereby to introduce into places of education a reluctance to comply with the frugal methods of life propoſed and required; a nicety and elegance in eating and drinking, diſpoſitions to luxury and idleneſs, and the natural conſequences thereof; is not to adorn a ſociety or perſon, but to debauch both.

With regard to the lenity and ſeverity of ſchools, reaſon informs us, that extreme rigour is not only to be reprobated for its cruelty, but likewiſe for its inutility in promoting the purpoſes of education. The heart is injured by it in a degree not to be compenſated by any improvement of the underſtanding, even if it were found to contribute to improvement. In all defects of intellect, ſuch as natural ſtupidity, or habitual depravity, it were happy if teachers would be diſintereſted, or parents impartial enough, to lay aſide all thoughts of farther inſtruction, and to deſtine their charge to ſome occupation which requires little or no preparatory diſcipline. The difficulty conſiſts in determining the exact time at which the trial ſhall be concluded. And this is a difficulty not eaſily overcome; for parental fondneſs will not eaſily be led to deſpair of a ſon's abilities; and it is, it muſt be owned, a painful taſk to convince a parent of ſo diſagreeable a truth. In ſuch a circumſtance the teacher will at leaſt act a merciful part, to let the boy proceed unmoleſted as well as he can, and not correct him for involuntary omiſſions and natural defects. He will then comply with the rule preſcribed by common ſenſe and juſtice, to do no harm where he can do no good. Parents have ſometimes ſo far overcome their feelings, by their deſire of promoting what they judged the welfare of their children, as to require ſeverity in the extreme. It is an unreaſonable demand upon a man of liberal education, whoſe diſpoſition has been ſoftened by the ſtudies of humanity. No emolument can recompenſe him for that degradation which he muſt endure by accuſtoming himſelf to inflict ſufferings on a fellow-creature at that tender age, which cannot poſſibly deſerve exceſſive rigour. The ſcriptural remark, indeed, that "he that ſpareth the rod ſpoileth the child," comes from too high an authority to be controverted. He that ſpareth a moderate uſe of the rod on proper occaſions, indiſputably does an injury to the offender, becauſe he encourages, by impunity, the repetition of his crime. But this paſſage, like moſt others, has been miſapplied; and more evil, if undeſerved ſuffering be included, has reſulted from the too liberal than from the too ſparing uſe of the rod.

Human nature is, at every ſtage of life, prone to evil; particularly prone at a time, when to inherent corruption are added imbecility of underſtanding and want of experience. Idleneſs is alſo difficult to be avoided at an age, when the effects of exertion are unknown, or too remote to affect the mind. A very young boy is commanded to commit a certain portion of his grammar to memory. The taſk he finds painful. Enticements to neglect ſurround him; and the benefit to be received by performing the taſk is diſtant, and of a nature which he cannot comprehend. Diſpoſitions the moſt amiable, and the moſt likely to ſucceed in literature, are perhaps, at the boyiſh period of life, under the ſtrongeſt temptations to idleneſs, and improper behaviour. To ſuffer a fertile ſoil to be over-run with weeds, or to lie uncultivated, is lamentable. What then can be done? Some method muſt be deviſed of influencing the hopes and fears; and this muſt be accommodated to the diſpoſition. On a meek and tender mind, very ſlight marks of diſpleaſure or approbation will produce a powerful effect; an angry look or word will ſucceed better as a corrective on ſuch an one, than ſtripes on the back of the unfeeling. On a truly ingenuous mind, praiſe and ſhame will at all times have the deſired affect. On the intermediate ſorts, thoſe who are neither remarkable for tenderneſs of feeling nor generoſity of ſentiment, and who conſtitute the common maſs, it will be ſometimes indiſpenſably neceſſary to inflict corporal puniſhment. To inveigh againſt it, is no new topic. Long and conſtant experience has decided on its abſolute neceſſity. Yet, even on the more hardened, there are a few methods which may be tried previouſly to the infliction of extreme ſeverity. They may be confined from play on a holiday; they may be debarred a meal; they may be ſent to their chamber before their companions; their battlings may be retrenched; or an additional taſk may be aſſigned. The frequency of theſe, however, deſtroys their effect; and, in many caſes, it is not poſſible to avoid the uſe of the rod. Capital offences, ſuch as immoral actions, which, from the early depravity of the human heart, often abound in ſchools, muſt meet a capital puniſhment. The greateſt degree of terror and diſgrace attends it, when inflicted with a few concomitant formalities, which ſometimes operate when the pain would be diſregarded. After all, they who are converſant with boys, know that there ſometimes ariſe individuals ſo hardened by nature or habit, that they can bear every pain with alacrity, and glory in their ſhame. For ſuch ſpirits, a ſea-life opens the only refuge.

Lenity, however amiable its motive, when ill-judged and exceſſive, is in effect cruelty. It is eaſy to enlarge in its praiſe, and almoſt any thing advanced in recommendation of it will meet with extenſive approbation. But when ſpeculation is reduced to practice, the ſober deciſions of experience muſt ſuperſede the flouriſhes of fanciful opinion. Artificial rhetoric may adorn any quality and recommend any conduct; but nothing is permanently advantageous, or can be confidently relied on, which has not the ſanction of the mother of wiſdom, *experience*. Some degree of ſeverity is, and has ever been, adopted in our beſt ſeminaries; and bodily puniſhment is appointed by the ſtatutes even of our univerſities, though,

indeed, never inflicted in the preſent age. Milton is ſaid to have been one of the laſt who underwent an academical flagellation. So generous a ſpirit as was his, it may be preſumed, could not have deſerved it; and, indeed, the kind of diſcipline is highly improper in the univerſities. But in ſchools, the general practice, as well as reaſon, may juſtify it; for it cannot be ſuppoſed, that all the maſters who have preſided in our public ſchools, have been injudicious or inhumane.

The infliction of puniſhment, however, requires great judgment, and great command of temper; judgment to proportion the degree of ſeverity to the degree of mental feeling, or want of it; and command of temper, that the cool reſult of the dictates of juſtice may not appear the effect of anger and revenge. Not to be able to command paſſion, is to ſet a bad example to the ſcholars, and to leſſen authority, by ſhewing weakneſs; for it is great weakneſs in an inſtructor to be often carried away by the impulſe of anger. He who does not check his rage, will find it grow habitual; and it will lead him to ſudden acts of injuſtice and cruelty, of which he will immediately repent, without being able to make any adequate reparation for breaking the ſpirit of an innocent and injured child. It is alſo of great importance that young perſons be accuſtomed to ſubmit, without difficulty and reluctance, to proper authority; by which is meant ſuch authority as it is for their own good, and the good of ſociety, that that they ſhould ſubmit to; becauſe that habit of ready ſubmiſſion, and the temper of mind which accompanies it, will be of unſpeakable ſervice to them, and to every ſociety of which they ſhall be members, through life. Now, this can only be enforced by the parent, or tutor, abſolutely inſiſting upon ſubmiſſion, without ever retracting what has once been peremptorily enjoined, and without ever remitting the penalty which has been once threatened for an offence, unleſs ſome ſufficient and manifeſt reaſon intervene. Mankind always yield to neceſſity, and when their ſituation is properly underſtood by them, they do it at once, and without pain. "A child, (ſays Dr. Prieſtley,) that finds it abſolutely impoſſible for him to reach the moon, will never ſtretch his hand towards it again. If he be ſhut up in a room, he will never think of puſhing againſt the wall, becauſe he never knew it give way to him; but he will go to the door, and make repeated attempts to force his way out there, becauſe he has known the door to open. It is the ſame with man in every period of life."

Whoever has had experience among young people, muſt have remarked, how early, and with what violence, the vicious propenſities of human nature diſplay themſelves. To eradicate them is difficult, and perhaps, impoſſible. But they may be reſtrained and weakened, ſo as to be rendered leſs dangerous to future felicity. There are, indeed, many moſt deſtructive vices of boys, againſt which no vigilance can ſufficiently guard. All that a preceptor can do is, to check any tendency to them when he happens to detect it, to correct all converſation and behaviour which lead to the commiſſion of them, and to take care that the pupil is obſerved in retirement as cloſely as circumſtances will allow. Some vices are ſo indelicate, as ſcarcely to admit of being mentioned. But where there is reaſon to ſuſpect any boy of being habitually guilty of ſuch, delicacy muſt not prevent a ſuperintendant from repreſenting the conſequences in colours as frightful as the imagination can conceive. This is a painful taſk, and requires great addreſs in the execution. But, difficult as it muſt be to a man of delicacy, yet it is certainly deſirable, that while he gives moral diſſuaſives againſt vice in general, he ſhould ſpecify ſome vices, and paint in lively colours the particular ill conſequences which ariſe from them. If virtue in itſelf does not appear deſirable, or vice deteſtable, yet the idea that vice will occaſion pain, diſtempers, imbecility, and premature old age, muſt have weight. Irregular and intemperate paſſions, indulged at a boyiſh age, will raiſe a tempeſt in the vernal ſeaſon of life, and cut off all hope of future eminence. The mind will ſympathize with the body, and both be reduced to a wretched ſtate of weakneſs by too early and exceſſive indulgences. Diſeaſe will infallibly follow vice, and blaſt every fair and hopeful bloſſom of youth.

The iraſcible paſſions of boys, too, are often violent. When they diſplay their effects in acts of premeditated malice and revenge, they ſhould certainly meet with correction. A judicious ſchoolman will give general admonitions on the neceſſity of reſtraining the paſſions, and, in particular caſes, will apply proper puniſhment. He will do right to repreſent malice and revenge as by no means the effects of a generous and noble ſpirit, but of a baſe and malignant heart. It will indeed be much better to bring any improper behaviour into diſgrace, than to animadvert upon it with ſeverity. Time and experience of their bad influence on perſonal happineſs and reputation, will be the moſt effectual remedies for the diſorders of the angry paſſions. Many of them gradually loſe their force as reaſon arrives at maturity, and time effects a reformation, which art could never produce. Much leſs evil happens to young perſons from the iraſcible, than from the concupiſcible, affections. Still, however, great care muſt be taken to reſtrain them, and religious arguments ſhould always and principally be applied; for the indulgence of the iraſcible paſſions particularly militates againſt the ſpirit of Chriſtianity.

Boys are apt to indulge in ſullenneſs and obſtinacy. Nothing cures ſuch diſtempers ſo effectually as ridicule. They ſhould be laughed out of theſe diſagreeable diſpoſitions, by their maſter and ſchool-fellows: and, indeed, this is one of the great advantages of public education, that boys ſhame each other from many abſurd and odious habits, which the private pupil may retain through life. The buſineſs of correcting the paſſions and bad habits of children, belongs in a particular manner to parents; but as children are often kept at ſchool, and at a diſtance, during the puerile age, it ought undoubtedly to be comprehended in the plan of ſcholaſtic education. Many conſider anger and revenge as marks of manly ſpirit, and, by ſeeming pleaſed with their moſt violent effects, by laughing at them, or by not diſcountenancing them, give them additional force. Parents ought to be ſufficiently conſiderate to ſecond the maſter's endeavours, both by precept and example, when they have their children at home. Though they may be diverted with a boy's petulance and paſſion, during the ſhort time he is with them, they ſhould not ſhew themſelves pleaſed; but ſhould conſider, that theſe beginnings will, in a few years, grow to ſuch a height, as one day to deſtroy their children's happineſs and their own. The paſſions are certainly the cauſes of the greateſt miſeries of human nature; and not to diſcourage them in boys, under all circumſtances whatever, is the extreme of cruelty.

Many parents are over anxious to initiate their ſons in what is called a *knowledge of the world*. But what is the knowledge of the world? A knowledge of its follies and its vices; a knowledge of them at a time of life when they will not appear in their true light, contemptible in themſelves, and the ſources of miſery; yet flattering and pleaſurable. To ſee theſe at a boyiſh age, before the mind is properly prepared, will not cauſe an abhorrence, but an imitation of them. To introduce boys, therefore, to ſcenes of immoral and indecent behaviour, is to educate them in vice, and to give the young mind a foul ſtain, which it will never loſe. It is uſual, in teaching this knowledge of the world, to ſpare no pains in acquainting the pupil with the tricks and deceits of mankind. At the age of fourteen or fifteen, his mind is impreſſed with the ideas of ſharpers, hypocrites, and diſſemblers. He is taught to conſider mankind in maſquerade, and to believe, that all with whom he has any intercourſe, have ſome deſign upon him. He is therefore armed with arts and tricks to counteract the attacks of his

his aſſailants. He is taught, indeed, to aſſume the appearance of good qualities; but it is not for their own ſake, but merely to facilitate deception. In the progreſs of this diſcipline, all the native ſentiments of truth and honour are of neceſſity diſcarded. Suppoſing that the deceiving arts, acquired by this mode of inſtitution, may ſerve intereſted purpoſes, yet the end is not worth the means. No wealth, no power, no popularity, can compenſate corruption of heart, and ſelf-abaſement. Such characters as have nothing but external accompliſhments to recommend them, may indeed be greatly admired and approved by vain and weak underſtandings, which penetrate no deeper than the ſurface; but they are deſpiſed by all the truly ſenſible, and pitied by all the truly good.

Boys, early initiated in the world, have uſually a forwardneſs of behaviour, and a degree of loquacity which pleaſes ſuperficial people. He who is attending to his books, and collecting ideas which will one day render him a bleſſing and an honour to all with whom he is connected, will appear dull, awkward, and unengaging, to many, in compariſon with the pert ſtripling, who has been plunged into vice and diſſipation before he knows the meaning of the words. The reception which the latter meets with in company, gives him additional ſpirits, and the deluded parents uſually triumph a-while in the conſcious ſuperiority of their judgment. In four or five years they commonly ſee and feel the effects of their folly. Their conduct, as it often undoubtedly proceeds from ignorance, is to be compaſſionated; but if ever it ariſes from affectation of ſingularity, pride, vicious principles, or careleſſneſs concerning their offspring, it deſerves the ſevereſt reprehenſion. From this cauſe it is obvious to obſerve in the world multitudes of beardleſs boys aſſuming airs of manhood, and practiſing manly vices, to obtain a title to the appellation of men. The preſent age abounds with ſuch examples. Theſe are the unhappy objects whom their injudicious parents have extruded from the foſtering wing into the wide world, before nature had given ſufficient maturity. Their emaciated looks inform the ſpectator, that a ſecret canker has preyed on the flower of their youth. Their words, their dreſs, their actions, all combine in proving that they are far advanced in the ways of vice, and have been familiarly acquainted with its conſequent miſeries. The years which ſucceed a vain, a wicked, and a moſt wretched, youth, are often ſpent in nurſing a ruined fortune and a ſhattered conſtitution.

Prudence, as well as reaſon and religion, requires that a parent ſhould do all he can to preſent his ſon to the community unſpotted. The faireſt ſide of the world ſhould be exhibited to his view. Vice in every mode and degree ſhould be concealed. Diſhoneſty, in which is comprehended all the arts which are incompatible with truth, ingenuouſneſs, and ſimplicity of manners, ſhould never be mentioned but with abhorrence. He ſhould be prepared by fixing deeply in his boſom principles of piety and moral honeſty. He ſhould be kept under the eye of a parent, or a faithful inſtructor, as long and as conſtantly as poſſible. And, when he muſt be introduced into the world at large, let his inſtructor tell him what miſeries inevitably await immoral and intemperate indulgence. With ſuch preparation, and with the bleſſing of Providence, there will be little danger, but that a young man will make valuable advances in virtue and learning, and receive their reward.

On this ſubject archbiſhop Secker has the following remarks: "An acquaintance with the world, however corrupted, may be a uſeful part of education; but then it muſt be the laſt. It gives a beautiful poliſh; but of this the beſt prepared mind will be the moſt ſuſceptible. It teaches many things; but good or bad, according as the learner is qualified to diſtinguiſh. He, whom improved good ſenſe hath enabled to obſerve upon common practice, will extract wiſdom and virtue from the vices and follies of mankind. But ſuch as are ignorant, and capable only of imitating, will of courſe admire the worſt of what they ſee; and be the more effectually ruined, the more they aim to be accompliſhed. Regular cultivation of the underſtanding, then, is what good education begins with. The earlieſt branch of this acquaintance with uſeful languages, unlocks the treaſures of ancient learning, and makes the improvement of every age and climate our own. Then the politer parts of literature moſt agreeably open the faculties, and form the taſte of young perſons; adorn our diſcourſe, and endear our company in riper years; give a grace to wiſdom and virtue; relieve the fatigue of our buſy hours, and elegantly fill up the leiſure of our vacant ones. At the ſame time, the art of juſt reaſoning opportunely comes in, to curb the licence of imagination, and direct its force; to fix the foundations of ſcience, aſcertain the degrees of probability, and unveil ſpecious error. With this guide we proceed ſecurely. Knowledge of nature opens the univerſe to our view; enables us to judge worthily of the conſtitution of things; ſecures us from the weakneſs of vulgar ſuperſtitions; and contributes, in many ways, to the health and ſecurity, the convenience and pleaſure, of human life. If from hence we go on to ſurvey mankind, a contemplation of their different ſtates in different ages, eſpecially of their ancient regulations and laws, the public wiſdom of brave and great nations, will furniſh variety of uſeful reflections to the mind, often teaching us to improve our own condition, often to be happy in it."

Boys ſhould be taught to act a juſt and an honourable part in all their little pecuniary tranſactions. Fraud and covetouſneſs appear very early. If one is thoughtleſs and extravagant, there is another ready to take advantage of his folly, and to lend ſome of his little ſtore on exorbitant intereſt. Such practices unreſtrained, ſow the ſeeds of future uſury and prodigality. Let boys therefore be obliged to give an account of their expences whenever called upon; and whenever meanneſs or fraudulent tricks are detected, let them be corrected by the infliction of diſgrace or ſevere puniſhment.

Inſtruction in religious and moral ſentiments, ought to form a principal object in every ſchool. It ſhould by no means be neglected; for, if the mind is not early tinctured with religious ideas, it will not afterwards admit them without great difficulty. Many perſons have objected to the long-eſtabliſhed method of teaching children to read, by uſing the Teſtament: they rather wiſh that they ſhould be initiated by Æſop's Fables, or ſome ſimilar book. Yet no book is ſo well adapted to this purpoſe as the Teſtament. The language is remarkably eaſy and familiar; and the matter is entertaining to children. The eaſy narrative pleaſes them, and no one inconvenience can reſult from the uſual practice. Poſſibly ſome advantages may attend it. It may impreſs on the memory many ſcriptural paſſages, which would never be properly attended to at another age. If we rely on the goſpel, we can never object to giving the young mind its firſt tincture of letters from the evangelical writings. Perhaps the growing neglect of this and other practices of our forefathers, may in ſome meaſure account for the prevalence of irreligion.

The buſineſs of a ſchool ſhould never commence or cloſe without a prayer. Boys may appear to give it little attention; and, indeed, they will not always join in ſupplication with that ſerioufneſs and ardour which is to be deſired. Yet ſometimes the mind will be in ſuch a tone, as to be greatly affected with a proper prayer, and many will catch a ſpirit of devotion. Seeds will be ſown, which, though they may lie a long while dormant, will one day ſpring up, and bear fruit in abundance. It is to be hoped, that there are no parents injudicious enough to have no regard to the religious education of their children. Religion will not only contribute to preſerve their innocence, and draw down the bleſſing of Providence, but will afford them in adverſity the beſt conſolation, and at all times a pure and lively pleaſure.

After having advanced thus far in a ſcholaſtic education, no places in the world are better adapted to the perfecting of a ſtudious life, than our noble univerſities. Much ruſt, indeed, has been contracted in them by time, many evils deeply rooted, which cannot be eradicated but by the legiſlative arm; yet, with all their imperfections, no places are able to furniſh more advantages to the real ſtudent. In them are founded ſome of the fineſt libraries on earth; not only public libraries for the general uſe of members of the univerſity, but libraries in each college, ſcarcely leſs convenient than if they were in the ſtudent's own apartment. In the univerſity at large, profeſſorſhips eſtabliſhed with ample ſtipends; in colleges, tutors and lecturers. The buildings convenient, elegant, ſpacious, airy. The apartments of ſtudents for the moſt part handſome and commodious, ſilent, retired, and in every reſpect fitted for a life of ſtudy. Delightful gardens and groves, charming walks and rural retreats. Add to all this, that the high antiquity of the places, and the many great and learned perſons who have iſſued from them, give them a moſt venerable air, and tend to animate the ſtudent with a generous emulation.

In general, boys ſhould not be ſent to the univerſity ſo young as they often are. It is dangerous to let a boy of fifteen be precipitated into the world, which is now the caſe at the univerſities. By a too early entrance, his health may be injured, his peace of mind broken, his learning impeded, and his morals depraved. Examples and opportunities for vice abound; and the inexperience, and want of reſolution, characteriſtic of boys, will render it difficult to avoid contagion. There are inſtances of thoſe who have gone through with ſafety, who entered at this early age: but they are few in compariſon with thoſe who have ſuſtained ſuch injuries as they have long and ſeverely felt. Every one, on putting on the academical dreſs, commences a MAN in his own opinion, and will often endeavour to ſupport the character by the practice of manly vices. For theſe reaſons no boy ſhould be ſent to the univerſity till he is nearly nineteen years old. An additional reaſon is, that, in four years, he may take a bachelor's degree; and four years bring him to the age at which he may go into orders, or enter with propriety into other profeſſions. But when a boy enters at fifteen, he takes his degree at nineteen, and then waits till three-and-twenty without employment. This awkward interval is not often ſpent in the univerſity, but in the employments of a ſportſman and man of pleaſure. Four years of idleneſs muſt make great havoc in his learned attainments. Let it be conſidered how much more advantageouſly the four years from fifteen to nineteen would be ſpent in a well-directed ſchool. Such a foundation would be laid in claſſical learning, as would ſcarcely ever give way, even though it ſhould ſuffer a temporary neglect. Perhaps all boys cannot wait at ſchool till nineteen, becauſe vacancies in ſcholarſhips, exhibitions, and fellowſhips, often ſummon them unexpectedly before that time. But let not parents ſuffer their ſons to incur danger of moral and mental corruption, for the ſake of adding a few pounds a year to their allowance. Where any conſiderable advantage of the pecuniary kind is to be obtained, we cannot expect, in theſe times, that it will be foregone; but every precaution muſt be uſed to obviate the ill conſequences of embarking a boy without a proper pilot, on a wide and ſtormy ocean.

Whenever the circumſtances of the parent will admit, a private tutor of character ſhould be engaged. A compenſation muſt be made him ſufficient to induce him to inſpect his pupil not only in the hours of ſtudy, but alſo of amuſement; and the pupil ſhould aſſociate with none but the private tutor, and thoſe whom he may approve. A faithful tutor, who will thus condeſcend to watch the moral conduct of his pupil, will be far more deſirable than a man of genius and learning, who will only attend to literary improvement. The college tutors are generally men of judgment, as well as learning and morals, and are well qualified to direct the ſtudent in every part of his conduct; but it is at the ſame time to be lamented, that from the number of pupils uſually allotted to one, he is incapable of paying all that attention to each, which a tender parent muſt deſire. For that reaſon a private tutor ſhould be joined with the college or official tutor, whenever it can conveniently be effected. The private tutor, it muſt be remembered, ſhould have the chief management of the pupil's finances. Scarcely any but thoſe who have reſided in the univerſity, can form an adequate idea of the many evils of every kind and degree, which would be avoided by giving a prudent private tutor full powers to ſuperintend the expences of his pupil.

We will now ſuppoſe the young ſtudent to have been educated till the age of ſeventeen, eighteen, or nineteen, in ſome reputable claſſical ſchool; and to have acquired a competent ſhare of ſchool learning. He is now to become, in a great meaſure, his own inſtructor; for, though the aſſiſtance of able tutors and profeſſors is to be ſought in the univerſities, yet he is to rely more on his own efforts, than on the external aid of any ſuperintendant. It will certainly be wiſe, to form in his mind an accurate idea of the ſcope at which he aims. A vague and deſultory application to letters may indeed amuſe him in a pleaſing and innocent manner; but it will not ſerve him ſo effectually as if he ſpent the ſame time in regular and methodical ſtudy.

There ought to be two ends in the mind of every rational ſtudent. One is, to improve and enlarge his intellectual faculties for his own ſake; from a liberal and moſt laudable deſire of exalting and meliorating his nature and capacity: and this is a moſt generous purpoſe, and furniſhes him who entertains it with ſuch ſentiments as muſt, in the firſt inſtance, give him a noble ſuperiority. The other is, to acquire the knowledge and habits which are requiſite to the performance of the duties which his profeſſion or employment renders neceſſary. Both theſe purpoſes ſhould be preſerved conſtantly in the mind's eye. He who attends to the firſt only, will probably waſte his days in contemplation, entertaining indeed and improving to himſelf, but uſeleſs to the ſociety of which he is a member, and to the advantage of which all ſtudies ought, in ſome mode, to conduce. He who attends to the ſecond only, will poſſeſs a mind comparatively narrow. He will be apt to prefer his own acquiſitions to all others, ſolely becauſe he knows not the nature and value of others. He will be in danger of falling into ſelf-conceit and pedantry. He will cut off a copious ſource of delight, and will certainly be deemed, by all who are able to judge, far inferior to the ſtudent who has added general knowledge to profeſſional dexterity.

As it is a duty we owe to ſociety, to be well qualified to perform the office which we undertake, it certainly becomes every man of principle, to beſtow his chief attention on his profeſſional qualifications, at leaſt till he has obtained in them a perfect maſtery. But there are intervals in all purſuits. A variety in our ſtudies is known to give additional vigour to the power of proſecuting them. Let the intervals be filled, and the variety ſupplied, by expatiating, from the beaten track, into the delightful regions of univerſal knowledge. It is this commixture of general knowledge with particular ſkill, which conſtitutes the characteriſtic difference between a liberal and a confined education. The one is content in paſſing along, to ſee the hedges of the highway; the other looks abroad at every proſpect, and climbs the hill, to penetrate as far as the mental horizon is extended.

Knowledge is confeſſedly not only pleaſant, but uſeful and honourable. The liberal ſtudent will therefore endeavour to collect ideas on all ſubjects which can enrich the human underſtanding. Languages, and a taſte for elegant letters, will form comparatively but a ſmall part of his literary objects. He will dedicate a great portion of his time to the ſciences properly ſo denominated. He will

will ſearch for knowledge, not only in books, but in the exchange, the warehouſe, the manufactory, the world at large. From theſe various ſources he will collect food for the mind, on which he will afterwards ruminate. He will beſtow much of his time in thinking on what he ſees, and, by digeſting it, convert it into ſolid nutriment. But, during the whole period of his intellectual excurſions, he will do right to preſerve a taſte and a knowledge of thoſe authors, whom the world has ſo long admired for their generoſity of ſentiment, and for their ſtrength and beauty of expreſſion.

On his leaving his ſchool, he will not, like many others, cloſe for ever the claſſics, which he has learned to read there; but will preſerve his acquiſitions, as the certain means of farther improvement in all elegant literature, and as being in themſelves both uſeful and ornamental. At ſchool, the claſſics can ſeldom be read ſo perfectly as to enable the ſtudent to relinquiſh the ſtudy of them, and yet retain their advantages on his departure. They muſt be read again with a critical and manly attention. Let the ſtudent, then, when he has left his ſchool, procure the beſt editions *variorum*, or of individual commentators, who have been juſtly applauded; and let him go through a courſe of claſſical reading, with the aſſiſtance of the beſt annotations, and, if neceſſary, of the beſt inſtructors.

Young men in the preſent times often depart from the diſcipline of a ſchool at too early an age. That they may be enabled to enter on philoſophy with advantage, they ought to have acquired a large ſtore of grammatical and claſſical knowledge. If they have not attained this preparatory accompliſhment at ſchool, there is great danger that they will not be able to ſupply the defect at the univerſity. They are more at liberty at the univerſity than at the ſchool; and, when young men are free from the reſtraint of authority, it is not likely that they ſhould apply themſelves, with a due degree of diligence, to thoſe elementary ſtudies which cannot but be attended with painful labour. Beſides, their age requires that theſe puerile purſuits ſhould have been already completed. The elements of grammar ſhould be perfectly underſtood; not philoſophical or univerſal grammar, but the grammars of the Engliſh, the Greek, and the Latin, languages. Univerſal grammar is a fine ſcience of itſelf; but at ſchools grammar is only taught as a preliminary ſtep to learning in general. Every one will agree, that no pupil ſhould be ſent to college, who cannot write a theme or letter, either in Latin or in Engliſh, without a ſingle grammatical error, and who cannot, at the ſame time, grammatically analyſe both the Greek and Latin claſſics, which he has learned to conſtrue or interpret.

Before a pupil enters at an univerſity conſtituted like thoſe of England, it is deſirable that he ſhould be in ſome degree acquainted with the beſt writers of Athens, Rome, and England; and it is greatly to be wiſhed, that thoſe of France were to be added. He cannot have done this without contracting a taſte and attachment for the works which he admires. And, when once this object is accompliſhed, there is no doubt but the mind will revert to them ſpontaneouſly. They will be ſought as the alleviation of ſeverer ſtudies; they will become the delight, and not the labour, of life. But, if the knowledge of the claſſics is ſuperficial, it will afford but little pleaſure, as all obſcurity and indiſtinctneſs is naturally diſguſtful; and it is well known that collegiate tutors have not authority enough to oblige the pupil to ſpend his private hours in painful ſtudy; and the temptations to nominal pleaſure are ſo great at that age, as frequently to preclude an attention to any ſtudies but ſuch as are abſolutely required, or ſuch as, from a perfect ſkill in them, afford an eaſy pleaſure. Ignorance is of itſelf a great evil, but its wretchedneſs is abundantly increaſed by the moral miſchief to which it often leads. The mind, unfurniſhed with an ability to employ itſelf in laudable and innocent purſuits, ſeeks a ſcope for its natural activity in vicious, in trifling, and in expenſive, amuſement. It may then be juſtly concluded, that he who ſends a boy to a univerſity without a ſufficient quantity of ſchool-learning to enable him to proceed ſtill farther with eaſe, will have to criminate himſelf as well as his ſon, when he finds his expectations of future proficiency greatly diſappointed.

Abilities, application, and inſtruction, may have co-operated in promoting a ſcholar's improvement; and yet he may be ſtopped in the career of his progreſs, by the interference of an unruly deſire. Love, or a groſſer paſſion, indulged at too early a period, will divert all attention from books, and, perhaps, fix the mind ſo firmly, as that it ſhall become ſtationary for life. Quintilian aſſiſts, that the future orator muſt be a good man. Goodneſs, according to his amiable and judicious doctrine, is no leſs neceſſary than intellectual vigour. To become a diſtinguiſhed ſcholar, it is neceſſary to abſtain from exceſſive, though innocent, indulgences, and to command the paſſions, whenever they are likely to become ſo ſtrong as to engroſs the attention, and to render the love of books a ſecondary attachment.

As the government of the paſſions is highly favourable to advancement in literature, ſo is advancement in literature to the government of the paſſions. Indeed, among a thouſand advantages attending literary application in youth, it is a principal one, that a young man is diverted from ſuch thoughts and tendencies as uſually involve him in guilt, and all its wretched conſequences. If the mind is filled with literary ideas, and warmed with ſcientific purſuits, there will be little inclination and opportunity for trifling and vicious employments. No remark has been more repeatedly made, than that "idleneſs is the root of all evil." But in what ſhall he employ himſelf, whoſe fortune precludes the neceſſity of an attention to trade, and whoſe rank renders mechanical induſtry unbecoming and improper? In what, but in the improvement of his mind, the accumulation of knowledge, the refinement of taſte? Thouſands have derived from ſtudy, not only thoſe qualities which adorn and aggrandize a character, but thoſe habits of harmleſs induſtry, which have preſerved them from the pollutions of vice. And, even with reſpect to a virtuous paſſion, at a very early age, though it may certainly ariſe in the moſt amiable hearts, yet it is deſirable, if it be poſſible, that it may be moderated till a competent ſhare of learning is obtained; for love, like all other ſtrong paſſions, is tyrannical. Love will not ſuffer the mind to acknowledge any other ſovereign; nor give his attention, in a due degree, to ſtudy. His application, if he be capable of any, will probably be unequal, deſultory, and unfruitful.

To honourable love ſucceed the cares of a family, and the interruptions of various domeſtic engagements. Theſe are, indeed, ſuch as, at a proper period, claim a great ſhare of every prudent man's attention. But when they are engaged in during a ſtate of minority, and before a competent education is completed, little elſe than miſery can enſue. For they require that judgment which is not yet mature; and they often enforce the practice of a profeſſion, for the honourable and ſucceſsful practice of which the mind is not duly prepared. Anxiety may excite practical induſtry; but it is by no means favourable to contemplation. Juvenal accounts for the mediocrity of the poets who wrote in his age, by alleging their diſtreſſes. He who is to produce a ſublime poem, ſays he, muſt be free from ſolicitude; nor is it likely that he ſhould arrive at any other degree of excellence than is neceſſary to acquire gain, whoſe mind is engroſſed in early youth with the care of providing for a family, or in avoiding the preſent pain of cold and hunger.

All thoſe, therefore, who wiſh to raiſe themſelves by a liberal profeſſion, will take care to ſecure a government over their own conduct, ſo as to avoid, in their minority, thoſe connections which may afterwards be ſought with the utmoſt propriety. To the ſciences let their firſt years be faithfully devoted. They will ſcarcely ever find

ſo convenient a ſeaſon during their exiſtenee. In the manly period, ambition and other objects importunately demand a principal ſhare of attention. In youth, their ſenſibilities are all in vigour, they have no official employment, and every circumſtanee unites to favour, unleſs paſſion ſhould gain the aſcendancy, an application to ſcience and philoſophy. And let the young man inſpect the living world. Who are thoſe who ultimately make the moſt honourable figure in it, and ſucceed, to the beſt advantage, in thoſe profeſſions where merit is allowed to make its way to eminenee? Thoſe, ſurely, who devoted themſelves, during a long time, to the ſtudy of the profeſſion which they practiſe; not thoſe who were contented with elementary attainments, who precipitately involved themſelves in love, and its conſequences; and who began the practice of ſome profeſſion before they had obtained the theory. There are, indeed, always ſome inſtances to the contrary; for great genius will break through all obſtacles, in its aſcent to excellence; but, in general, it will be found true, that thoſe who have left their books too early, and involved themſelves in ſtrong attachments, much more thoſe who have been embarraſſed in the miſeries of vice, are but ſuperficially qualified in every thing which can claim the name of real knowledge.

A very great part of thoſe who receive a liberal education, conſiſts of ſuch as are in expectation of places or preferment from family or parliamentary connections. The general object of ſuch perſons is to go through the forms of education, with little ſolicitude coneerning the eſſence. Thus, if there is a good living waiting for them, they find it neeeſſary to procure orders, which cannot be done with credit, but in the regular way; they go to ſchool, enter at college, ride, hunt, ſhoot, and enjoy themſelves in a genteel ſtile, till they have arrived at the proper age. After a certain number of terms kept, if their conduct has been ſueh as, in the civil world, would eſcape criminality, a teſtimonium is readily granted, a title procured without any difficulty, and the ordination follows in courſe. Little learning having been required or acquired, the ſtudent is at a loſs to ſpend his time in any thing but ſporting and drinking; and often paſſes a life not very honourable or comfortable to himſelf, and extremely diſgraceful to his profeſſion. It has often been ſaid, that when a boy knows that there is an ample proviſion for him, it is a misfortune. It certainly is ſo, when it prevents him from paying that degree of attention to the improvement of his mind, which is neceſſary to the higheſt ſtate of ſelf-enjoyment, as well as to ſocial utility. Indeed, as a young man who is provided for by his parents or friends, is free from the anxiety under which others labour, who have no ſuch ſecurity to depend upon, he is more particularly obliged to devote his attention to the eulture of his mind. He has alſo better opportunities for improvement. He may employ all his time in ſuch purſuits, which he certainly could not do with prudence, if he were under the neceſſity of labouring for a precarious ſubſiſtence.

Much of the diſgrace which has fallen on the ſacred profeſſion, ariſes from the want of due qualifications in the profeſſors. Perſons who have livings in their families, or who have patrons among the great, are too little anxious in the purſuit of learning. They often know not its value, but, from want of an improved taſte, become mere men of the world, and votaries of that vanity and folly, to oppoſe which, their profeſſion was originally inſtituted, and is ſtill rewarded. To ſuch perſons we recommend a particnlar attention, not only to the ſcience or ſtudy more immediately connected with the practice of their profeſſion; but alſo to philoſophy, to the Belles Lettres, and to every part of uſeful and valuable erudition. It is the mark of a mean mind to avoid ſuch liberal purſuits, becauſe, in a pecuniary view, they are not abſolutely neceſſary. A generous ſpirit purſues excellence for its own ſake; and is even pleaſed and encouraged in its progreſs, by the conſideration that its induſtry is ſpontaneous and entirely diſintereſted.

There is, perhaps, no obſtacle to improvement in morals and learning, greater than that which ariſes from a wiſh to be admired as *a man of the world*. A youth no ſooner leaves his ſchool, than he feels himſelf tranſported with his liberty, and knows not how to reſtrain his joy within the bounds of moderation. He pants for diſtinction; and, if he ſought it by reaſonable methods, his ambition would do him honour: but he aims at nothing but pleaſure and faſhion; and, in purſuit of this, not only neglects the admonitions of reaſon, but alſo of common prudence. He runs into expences which his fortune will not bear; and aſſumes airs of importance which his ſituation will by no means juſtify. Improvement in learning, in good morals, in diſcreet behaviour, is the leaſt of his cares. If he can be taken notice of by the illuſtrious perſonages who ſhine at gaming-tables, in ſtables, on the turf, or at the aſſembly, he willingly relinquiſhes all concern with literary and philoſophical employments.

Whoever is aequainted with the univerſities will know, that theſe remarks are founded on actual obſervation. It is impoſſible to walk the ſtreets, or to enter a coffee-houſe, without meeting young men who ought to be engaged in ſtudy; but who ridicule all ſerious things, and affect the character of libertines. They are uſually in the dreſs of ſportſmen; and their language is ſuch as is heard in the camp, or at Newmarket. A degree is nothing in compariſon with the honourable diſtinction of being in danger of *ruſtication* for a debauch. To break the windows of a college, to play at cards on Sundays, or to read novels, and blaſpheme in chapel, are the methods whieh young men of ſpirit have recently adopted to diſplay their fire. Now, the engaging in ſueh feats is conſidered by many as a proof of ſenſe as well as ſpirit. But it is in truth a weakneſs, which renders the young man fearful of incurring the deriſion of the profligate, and which induces him to ſacrifice, for the applauſe of ſuch perſons, the ſubſtantial qualifications which would adorn and felicitate every ſubſequent period of his life. It muſt be owned, that it is difficult for a young man to preſerve a ſingularity in the midſt of the ridieule of the audacious. There is a falſe ſhame which induces him to comply with what his judgment diſapproves, through a fear of beeoming the laughing-ſtock of thoſe whom he might juſtly deſpiſe. With good prineiples, and a ſincere deteſtation of vice, he gradually falls into extreme irregularity. His compliance at firſt is cauſed by good-nature, or by a fear of offending. But he is allured from one ſtep to another, till at laſt he arrives at that melancholy ſtate, which glories in every thing of which it ought to be aſhamed. He now derides his tutors, his parents, his books, and takes delight in ſuch things only as have a tendency to involve him in vice and extravagance. He lives, perhaps, long enough to ſee his folly, but is not able to retract or avoid its conſequences. His character is injured, and his opportunities of improvement loſt.

It is not to be expected or deſired that a young man ſhould be a cynic. His wiſh to accommodate himſelf to the manners of thoſe with whom his age and his purſuits lead him to aſſociate, is amiable; but yet ſomething muſt be done to prevent him from being led, by his good nature, to his ruin. Suppoſe him, then, to purſue a conduct in ſome reſpects ſimilar to the following: Let him avoid all moroſeneſs, and cultivate every pleaſing and graceful quality. The pretenders to ſpirit will then have no advantage over him in the external recommendation of an agreeable appearance and behaviour. In every thing innocent and indifferent, he will comply with the wiſhes of his companions, and give them no offence when he can poſſibly avoid it. He will be aſſiduous in cultivating their benevolence, from a conviction that a ſtate of amity is the moſt conducive to happineſs; and alſo, from a wiſh to ſerve them, by uſeful ſuggeſtions, which cannot be done when the avenues are totally ſhut againſt

advice

advice by prejudice and averſion. But at the ſame time he will poſſeſs and diſplay a firmneſs of mind, which in the end cannot fail of overcoming an ill-grounded audacity. His true ſpirit will cauſe their falſe ſpirit to evaporate as the culinary fire is extinguiſhed by the rays of the ſun. Real merit, true genius, unaffected courage, are always diſtinguiſhed by an air of moderation. They make few pretenſions; they are content with being excellent; and leave their gold to find its proper eſteem, by its nature, weight, and luſtre. The tinſel glitters on the tawdry veſtment, and fools admire; but let it be the care of every one who aſpires at the excellence of a worthy and liberal character, to adorn himſelf with ſolid and uſeful ornaments, which will ſecure him the eſteem of all judicious men, while children and weak perſons only are caught by the brilliancy of falſe ſpangles and ſuperficial embroidery.

In barbarous ages and countries, in which all orders are nearly on an equality in point of mental improvement, rank and titles may, perhaps, give an enviable diſtinction, independently of perſonal character. But, where learning and civilization are univerſally diffuſed, as in this country, the want of perſonal character will deprive the great of the power to excite general eſteem. No opinion can therefore be advanced more injurious to the poſſeſſors of civil honours, than that which tends to prevent a due cultivation of their minds, becauſe they are elevated above the neceſſity of profeſſional ſkill and labour. It has been common in England to beſtow great attention on the education of the younger ſons in great families, and to neglect the heir. And from this moſt egregious abſurdity it has happened, that the poſſeſſors of fortunes, thoſe whoſe actions are of the moſt importance in their conſequences, have been totally unqualified to ſupport their hereditary dignity. Many of them have been diſtinguiſhed only by weakneſs, wickedneſs, inſolence, and a title. Surely nothing can be more reaſonable than that a ſingular degree of diligence ſhould be exerted in the education of men who are to draw the notice of the world upon them by the luſtre of a peerage, and to ſit in the ſenate-houſe as hereditary lawgivers. If the order of nobility conſulted little elſe than the preſervation of its own dignity, it would act moſt prudently in requiring, in its ſucceſſors, a peculiar degree of improvement. All civil honour depends on public eſteem; and, though cuſtom and uſage may preſerve an external reſpect for titles during a long time, yet they will certainly fall into contempt, when at laſt they ſhall be diſcovered to be nothing but deluſive pageantry, when it ſhall appear that they ſerve as the ſubſtitutes of merit; and that they give men the preſumption and pride of excellence, without the reality.

Internal dignity, correſponding with external, cannot but carry with it great influence. Reſpect is naturally paid to titles and rank; but, when it is found that they are juſtly due to the merit of him who is inveſted with them, they command a degree of veneration. Let young men of faſhion therefore endeavour to become men of competent learning alſo; for the minds of the great have more influence in the regulation of affairs, than thoſe of the lower orders; and it is therefore a moſt valuable object, to ſecure to the great a ſolid and comprehenſive education.

As to the ſubject of foreign travel, for the finiſh of a liberal education, many authors have largely deſcanted upon it. With reſpect to its utility, there can be no doubt but that a mind, properly prepared, will derive from it great and laſting advantages. It muſt open ſources of knowledge, and furniſh opportunities of reflection, which cannot be obtained by him who never leaves his own country. But this ſtep muſt not be taken too early. A great degree of mental maturity, and of acquired knowledge, is neceſſary to enable the mind to derive advantage, and avoid inconvenience, from viſiting a foreign nation. To expect that boys ſhould make obſervations on men and manners, ſhould weigh and compare the laws, inſtitutions, cuſtoms, and characteriſtics, of various people, is to expect an impoſſibility. It is no leſs abſurd to ſuppoſe, that boys will not be ſtruck and captivated with vanity and trifles. Parents, in our age and country, are impatient to thruſt their ſons into the world, to puſh them into the ſenate before they have a beard, and to urge them to offices of command in the army and in the navy, almoſt as ſoon as they come from the nurſery. Many evils, national as well as private, are the conſequence; but, when avarice and ambition ſolicit, reaſon, philoſophy, and propriety, ſcarcely find a hearing. National calamities can alone remedy this, and many other abuſes which will inſinuate themſelves, and abound, till the evil which they occaſion becomes too heavy to be longer borne; when it will become its own remedy.

Among other arguments for travel in general, and early travel in particular, it has been urged, that it is abſolutely neceſſary, in order to be delivered from local prejudice in favour of our country. Prejudices in favour of our country are, indeed, eaſily removed by ſpending our early days in another. But is there no danger leſt theſe innocent and uſeful prejudices ſhould be changed for others equally unreaſonable, and really pernicious? Is it not likely, that prejudices in favour of our country being removed, prejudices againſt it may find admiſſion? This has often happened. And, however a modern philoſopher may inveigh againſt that honeſt preference which an Engliſhman gives to his nation, it is a natural attachment, and attended with effects greatly beneficial. This preference is not an ill-grounded prejudice, but is fully juſtified by real obſervation and by fair compariſon. Corrupted as we are, we have not yet kept pace in corruption with ſome of our admired neighbours. And we may add, that the corruption at preſent prevailing among us, if it does not originate, is greatly increaſed by our too frequent intercourſe with France and Italy.

Thoſe who begin their travels ſhould go out as philoſophers, when they are capable of conducting themſelves, both in the ſearch of knowledge and their moral behaviour. Travel undertaken in this manner, and after a valuable ſtore of learning, and a knowledge of our native country, have been acquired, is one of the beſt methods of accompliſhing the human mind. It crowns and completes all its other improvements. A few months occaſionally ſpent in France, or Italy, or Holland, or Swiſſerland, at or between the age of thirty or forty, will enrich the underſtanding of a man of ſenſe with valuable treaſure. He will then ſearch for gold, and find it in abundance; while, at a boyiſh age, he would have been fully employed, and ſufficiently ſatisfied, in procuring droſs or tinſel, inſtead of bullion.

But ſince, to reform the world, as the poet ſays, is a vaſt deſign, and the deſign commonly proves abortive, a writer muſt be contented with giving ſuch admonitions as may permit it to proceed in its own way with the leaſt inconvenience. As, therefore, mere boys will certainly continue to be ſent on their travels, notwithſtanding all that reaſon can advance againſt it, it remains that ſuch directions be given as may at leaſt prevent them from incurring evil, if they cannot obtain advantage. Much of the ſucceſs certainly depends on the choice of the tutor or travelling companion. He ſhould be a grave reſpectable man of a mature age. A very young man, or a man of levity, however great his merit, learning, or ingenuity, will not be proper; becauſe he will not have that natural authority, and that perſonal dignity, which command attention and obedience. A grave and good man will watch over the morals and the religion of his pupil; both which, according to the preſent modes of conducting travel, are commonly ſhaken from the baſis, and levelled with the duſt, before the end of the peregrination. In their place ſucceed univerſal ſcepticiſm and unbounded libertiniſm. But a tutor of character and principle will reſolve to bring his pupil home, if it be poſſible, not

worſe in his moral character than he was on his departure. It is a known fact, that they who, at too early an age, ſpend much time on the continent, ſeldom retain that religion in which their good forefathers lived and died. They commonly become the diſciples of the faſhionable philoſophers, and are led aſtray by the falſe lights of falſe wit, or loſt amidſt the clouds of metaphyſics. So many, indeed, are the dangers attending foreign travel, that they whoſe ſituation and circumſtances will not permit them to engage in it, need not repine. Our own country abounds with objects ſufficient to excite, and amply to repay, the labour of inquiry. And to prove that foreign travel is not abſolutely neceſſary to give the full improvement to the human mind, we may recollect many eminent perſons who have been richly adorned with every accompliſhment of the gentleman, and furniſhed with all the lights of the man of ſenſe and extenſive knowledge, though they never left their native ſhore.

We ſhall now conclude, by drawing the attention of our readers to the long-agitated queſtion, "Whether public or private education be the moſt advantageous for the riſing generation?"—And we think, that no one will heſitate to decide in favour of our public ſchools, when to what has been already ſuggeſted in the preceding pages, is added the following incontrovertible remark of Dr. Barrow, in his Eſſay on Education, publiſhed in 1803. "There is a further advantage reſulting from a *ſcholaſtic* education, of more value to the future man, than will at firſt ſight be eaſily ſuppoſed; the power, by which, whatever can be done, can be done at once; by which intellectual wealth can be immediately produced in current coin; that ſelf-poſſeſſion, by which he can at all times determine and perform what the occaſion requires; that promptitude of thought and action, ſo eſſentially neceſſary to eminence in any public profeſſion; that ready and ſpontaneous eloquence, which is no leſs uſeful in buſineſs, than pleaſing in converſation; that command over his inclinations and paſſions, which enables him to convert to his own purpoſes the paſſions and inclinations of others; that confidence in himſelf and his own ſtrength, which guards him againſt ſurpriſe, and leads him to meet difficulty or danger without diſmay; theſe advantages, with all their various branches and dependencies, are, not indeed univerſally and excluſively, but the moſt early, the moſt frequently, and the moſt effectually, obtained from the diſcipline, the ſtudies, and the amuſements, of a large and well-regulated public ſchool. It is the obſervation of Bacon, that 'Reading makes a full man, converſation makes a ready man, and writing makes an exact man.' But unleſs the foundation of theſe various excellencies be laid in the uſual ſeaſon of inſtruction, a ſuperſtructure is ſeldom afterwards erected of much beauty or utility." For a more ample diſcuſſion of this queſtion, and for a complete view of the opinions of all the moſt eminent writers on the inſtruction of youth, we beg leave to recommend to all parents and ſcholars, an attentive peruſal of the Liberal Education of Dr. Viceſimus Knox, from which valuable work this treatiſe has been principally ſelected.

On FEMALE EDUCATION.

Many prejudices are entertained againſt the character of a learned lady; and perhaps, if all ladies were profoundly educated, ſome inconveniencies might ariſe from it; but it does not appear that a woman will be rendered leſs acceptable in the world, or worſe qualified to perform any part of her duty in it, by having employed the time from ſix to ſixteen, in the cultivation of her mind. Time enough will remain, after a few hours every day ſpent in reading, for the improvement of perſonal accompliſhments. The ladies, and their inſtructors, want no directions in matters of external ornament, the end of which is to pleaſe on intuition. However ſelf-ſufficient the men have been in their claims of ſuperiority, they have uſually allowed the ladies the poſſeſſion of a delicate taſte in the improvement and perception of all kinds of beauty.

The literary education of women ought indiſputably to be varied according to their fortunes and their expectations. Much refinement, and a taſte for books, will injure her, whoſe time, from prudential motives, muſt be entirely engroſſed by economy. To theſe, arithmetic and book-keeping would often be moſt uſeful, and tend to preſerve the eſtates of families. Wives are often the beſt ſtewards, not only in commercial, but in genteel life. Few women are indeed exempted from all attention to domeſtic cares. But the unmarried, and thoſe who enjoy opulence, find many intervals which they devote to ſome ſpecies of reading. And there is no doubt, but that the reading would be ſelected with more judgment, and would afford more pleaſure and advantage, if the taſte were formed by what may be termed a claſſical education; we mean, that they ſhould be well and early acquainted with the French and the Engliſh claſſics. As ſoon as young ladies can read with fluency, let them begin to learn Lowth's or Aſhe's Grammar, and to read at the ſame time ſome eaſy and elegant author, with a view to exemplify the rules. They ſhould learn a part in grammar every morning, and then proceed to read a leſſon, juſt in the manner obſerved in claſſical ſchools in learning Latin. After a year ſpent in this method, if the ſucceſs is adequate to the time, they ſhould advance to French, and ſtudy that language exactly in the ſame mode. In the French grammar, it will not be neceſſary to go through thoſe particulars which are common to the grammars of all languages, and which have been learned in ſtudying Engliſh. Several years ought to be ſpent in this elementary proceſs; and when the ſcholar is perfectly acquainted with orthography and grammar, ſhe may then proceed to the cultivation of taſte. Milton, Addiſon, and Pope, muſt be the ſtanding models in Engliſh; Boileau, Fenelon, Fontenelle, and Vertot, in French; and theſe ſhould be attended to for a conſiderable time. Many inconveniencies ariſe from engaging young minds in the peruſal of too many books at a time. After theſe authors have been read with attention, and with a critical obſervation of their beauties, the ſcholar may be permitted to ſelect any of the approved writers of France and England, for her further improvement. She will now be able to ſelect with ſome judgment, and will have laid a foundation which will bear a good ſuperſtructure. Her mind, if ſhe has been ſucceſsful in this courſe, will have imbibed an elegance which will naturally diffuſe itſelf over her converſation, addreſs, and behaviour. It is well known, that internal beauty contributes much to perfect external grace. It will alſo be favourable to virtue, and will operate greatly in reſtraining the fair ſex from any conduct groſsly indelicate and obviouſly improper. Much of the profligacy of female manners has proceeded from a levity occaſioned by the want of a proper education. She who has no taſte for well-written books, will often be at a loſs how to ſpend her time; and the conſequences of ſuch a ſtate are too frequent not to be known, and too fatal not to be avoided.

Whenever a young lady in opulent circumſtances appears to poſſeſs a genius, and an inclination for learned purſuits, ſhe ought, if her ſituation and connections permit, to be early inſtructed in the elements of Latin and Greek. Her mind is certainly as capable of improvement, as that of the other ſex. The inſtances which might be brought to prove this, are all too well known to need citation. And the method to be purſued muſt be exactly the ſame as that which is uſed in the private tuition of boys, when judiciouſly conducted. And though we might diſapprove, for the moſt part, of private tuition for boys, yet it might be recommended for girls, with little exception. All ſenſible people agree in thinking, that large ſeminaries of young ladies, though managed with all the vigilance and caution which human abilities can exert,

are

are in danger of great corruption. Vanity and vice are too often introduced by ſome among a large number, and the contagion ſpreads with irreſiſtible violence. Who can be ſo proper an inſtructor and guardian, as a tender and a ſenſible mother? Where can virgin innocence and delicacy be better protected, than under a parent's roof, and in a father's and a mother's boſom? Certainly no where; provided the parents are ſenſible and virtuous, and the houſe free from improper or dangerous connections. But where the parents are much engaged in pleaſure or in buſineſs; where they are ignorant or vicious; where a family is expoſed to the viſits or conſtant company of libertine young perſons; there it is certainly expedient to place a daughter under the care of ſome of thoſe judicious matrons who preſide over the ſeminaries of learning adapted to the education of young ladies. It too often happens, however, that young females are ſent from their parent's eye to theſe ſeminaries, principally with a view to form connections, or to acquire external graces. Let the heart of a feeling father determine, whether it is not cruel to endanger the morals of his offspring from motives of intereſt or vanity. But it muſt be remembered, that only thoſe parents can incur this cenſure, who keep their daughters at ſchool after a certain age. Women, from fourteen years old, are commonly flattered by the men. Therefore, perceiving that they are regarded only as qualified to pleaſe, they begin to adorn themſelves; and in that to place all their hopes. It would be better to make them ſenſible, that they are much more eſteemed for a decent, modeſt, and diſcreet behaviour.

One of the ſtrongeſt arguments in favour of the literary education of women, is, that it enables them to ſuperintend the domeſtic education of their own children in the earlier periods. We are told, in the very elegant dialogue on the cauſes of the decline of eloquence, that it was the glory of the ancient Roman matrons to devote themſelves to economy, and the care of their children's education. As ſoon as a ſon was born, he was not brought up in the cottage of ſome hireling nurſe, but in the lap and the boſom of his mother, whoſe principal merit it was to take care of the houſe, and to devote herſelf to the ſervice of the children. But when the Romans had loſt the virtues, together with the liberties, of the ancient republic, theſe generous cares, with every other rational and laudable attention, gave way to the faſhionable diſſipations of thoſe degenerate days. The children were then conſigned to the care of ſome paltry female, in conjunction with two or three other domeſtics, equally unqualified for the important office of tuition. From the idle tales and groſs manners of this low and illiterate tribe, the ſoft and ductile mind was ſuffered to receive its earlieſt and deepeſt impreſſions. The parents themſelves, alſo, far from training their young families in the principles of virtue and knowledge, were the firſt to lead them, by their own encouragement and example, into the moſt luxurious indulgences, and moſt unprincipled licentiouſneſs of manners. A paſſion for races, theatrical entertainments, and gladiatorial ſhows, the favourite occupations of that frivolous age, was ſown even in their very womb: and when once the ſeeds of theſe contemptible and unmanly pleaſures had early taken root in the heart, they neceſſarily over-ran and deſtroyed every affection of nobler growth. Whether this picture of degenerate Rome bears any reſemblance to thoſe of more modern days, is left to the reader's conſideration. But be this as it may, it ſhould certainly be made a principal object of female education, to reſtrain young ladies, on coming into life, from an expenſive profuſion of dreſs, and from a baneful propenſity to the pleaſures of gay life. To dreſs, to appear gay, and to be ſeen in public places, will undoubtedly attract the attention of the men; but not of thoſe, with whom a connection for life would be eligible. Deſirous as thoſe might be of an honourable alliance with an elegant and graceful woman; yet, when they diſcover a want of economy, and a proneneſs to extravagance, they will have reaſon to dread the ſame conduct in affairs of greater moment; which, in a married life, would be productive of evils truly alarming and extenſive. Prudential conſiderations thus deter many from offering their hands, where their hearts are inclined, becauſe they are apprehenſive of bringing on themſelves a train of expences, which their fortunes could not ſupport. They would likewiſe ſuſpect, that the love of domeſtic retirement would not be found in thoſe ladies, who have been accuſtomed to a life of gaiety and pleaſure.

There appears too much truth in the remark of Mrs. Hannah More, in her Treatiſe on Female Education, publiſhed in 1799, "that in all poliſhed countries, an *entire devotedneſs* to the fine arts has been one grand ſource of the corruption of women." The whole time of a young lady is often conſumed either in the acquiſition or in the diſplay of what are termed *accompliſhments*; and ſhe ſeems to regard the end of exiſtence as being to ſhine rather than to be uſeful. If, ſays this author, the life of a young lady formerly too much reſembled the life of a confectioner, it now too much reſembles that of an actreſs. This is a fatal extreme for female domeſtic virtue, and little calculated for happineſs in the female circles. On the contrary, the profeſſion of ladies, to which the bent of their inſtruction ſhould be turned, is that of daughters, wives, mothers, and miſtreſſes of families. They ſhould be therefore trained with a view to theſe ſeveral conditions, and be furniſhed with a ſtock of ideas, and principles, and qualifications, ready to be applied and appropriated, as occaſion may demand, to each of theſe reſpective ſituations: for though the arts which merely embelliſh life muſt claim admiration; yet when a man of ſenſe comes to marry, it is a companion whom he wants, and not an artiſt. It is not merely a creature who can paint, and play, and dreſs, and dance; it is a being who can comfort and counſel him; one who can reaſon, and reflect, and feel, and judge, and diſcourſe, and diſcriminate; one who can aſſiſt him in his affairs, lighten his cares, ſooth his ſorrows, ſtrengthen his principles, and educate his children. This ſhould be the view of parents in the education of their daughters; and, perhaps, if this were more generally done, and daughters were only allowed to attend day-ſchools for the purpoſe of acquiring accompliſhments, they would not be ſo frequently educated above their ſtation in life; and the mind of a reputable merchant's child, or clergyman's daughter, would not be filled with notions of pride, caught by aſſociating with the daughters of the great and the faſhionable.

With regard to amiable manners in a young lady, much depends on the delicacy of her converſation, propriety of behaviour, modeſty, and tender ſenſibilities of feeling; all which engaging qualities are to be acquired and modified by the rules of female education. Propriety is to a woman what the great Roman critic ſays action is to an orator: it is the firſt, the ſecond, the third, requiſite. A woman may be knowing, active, witty, and amuſing; but without *propriety* ſhe cannot be amiable. Propriety is the centre in which all the lines of duty and of agreeableneſs meet. It is to character what proportion is to figure, and grace to attitude. It does not depend on any one perfection; but it is the reſult of general excellence. It ſhews itſelf by a regular, orderly, undeviating, courſe; and never ſtarts from its ſober orbit into any ſplendid eccentricities; for it would be aſhamed of ſuch praiſe as it might extort by any aberrations from its proper path. It renounces all commendation but what is characteriſtic; and becomes the criterion of true taſte, right principle, and genuine feeling, in a woman, whether ſhe would be leſs touched with all the flattery of romantic and exaggerated panegyric, than with that beautiful picture of correct and elegant propriety, which Milton draws of our firſt mother, when he delineates

> "Thoſe thouſand *decencies* which daily flow
> From all her words and actions."

Theſe

These amiable decencies are seen in the propriety of conversation.—To place a just remark, hazarded by the diffident, in the most advantageous point of view; to call the attention of the inattentive to the observation of one, who, though of much worth, is perhaps of little note; are requisites for conversation, less brilliant, but far more valuable, than the power of exciting bursts of laughter by the brightest wit, or of extorting admiration by the most poignant sallies. For wit is, of all the qualities of the female mind, that which requires the severest castigation; yet the temperate exercise of this fascinating quality throws an additional lustre round the character of an amiable woman; for to manage with discreet modesty a dangerous talent, confers a higher praise than can be claimed by those in whom the absence of the talent takes away the temptation to misemploy it. But to women, wit is a peculiarly perilous possession, which nothing short of the sober-mindedness of Christianity can keep in order. Intemperate wit craves admiration as its natural aliment; it lives on flattery as its daily bread. The professed wit is a hungry beggar that subsists on the extorted alms of perpetual panegyric; and, like the vulture in the Grecian fable, its appetite increases by indulgence. Simple truth and sober approbation become tasteless and insipid to the palate, daily vitiated by the delicious poignancies of exaggerated commendation. Women of the brightest faculties should not only bear those faculties meekly, but consider it as no derogation, cheerfully to fulfil those humbler duties which make up the business of common life, always taking into the account the higher responsibility attached to higher gifts. While women of lower attainments should exert to the utmost such abilities as Providence has assigned them; and while they should not deride excellencies which are above their reach, they should not despond at an inferiority which did not depend on themselves; nor, because God has denied them ten talents, should they forget that they are equally responsible for the one he *has* allotted them, but set about devoting that one with humble diligence to the service of society, and the glory of the Giver.

On sensibility, and the feelings of the mind, much has been said and written; but notwithstanding all the fine theories to which this topic has given birth, it will be found that very exquisite sensibility contributes so little to happiness, and may yet be made to contribute so much to usefulness, that it may, perhaps, be considered as bestowed for an exercise to the possessor's own virtue, and as a keen instrument with which to work for the good of others. Women of this cast of mind are less careful to avoid the charge of unbounded extremes, than to escape at all events the imputation of insensibility. They are little alarmed at the danger of exceeding, though terrified at the suspicion of coming short, of what they take to be the extreme point of feeling. They will even resolve to prove the warmth of their sensibility, though at the expence of their judgment, and sometimes also of their justice. Even when they earnestly desire to be and to do right, they are apt to employ the wrong instrument to accomplish the right end. They employ the passions to do the work of the judgment; forgetting, or not knowing, that the passions were not given us to be used in the search and discovery of truth, which is the office of a cooler and more discriminating faculty; but that they were given to animate us to warmer zeal in the pursuit and practice of truth, when the judgment shall have pointed out what is truth. Through this natural warmth, which they have been justly told is so pleasing, but which, perhaps, they have not been told will be continually exposing them to peril and to suffering, their joys and sorrows are excessive. Of this extreme irritability, the ill-educated learn to boast as if it were an indication of superiority of soul, instead of labouring to restrain it as the excess of a temper which ceases to be interesting when it is no longer under the control of the governing faculty. It is misfortune enough to be born more liable to suffer and to sin, from this conformation of mind; it is too much to allow its unrestrained indulgence; it is still worse to be proud of so misleading a quality.

Flippancy, impetuosity, resentment, and violence of spirit, grow out of this disposition, which will be rather promoted than corrected, by the system of education, which labours to ornament the person, rather than the mind; and in which system, emotions are too early and too much excited, and tastes and feelings are considered as too exclusively making up the whole of the female character; in which the judgment is little exercised, the reasoning powers are seldom brought into action, and self-knowledge and self-denial scarcely included. This propensity of mind, if unchecked, lays its possessors open to unjust prepossessions, and exposes them to all the danger of unfounded attachments. In early youth, not only love, but friendship, at first sight, grows out of an ill-directed sensibility; and in afterlife, women, under the powerful influence of this temper, conscious that they have much to be borne with, are too readily inclined to select for their confidential connections, flexible and flattering companions, who will indulge, and perhaps admire, their faults, rather than firm and honest friends, who will reprove and would assist in curing them. We may adopt it as a general maxim, that an obliging, weak, yielding, complaisant friend, full of small attentions, with little religion, little judgment, and much natural acquiescence and civility, is a most dangerous, though generally a too much desired, confidante: she sooths the indolence, and gratifies the vanity, of her friend, by reconciling her to her own faults, while she neither keeps the understanding nor the virtues of that friend in exercise. These obsequious qualities are the *soft green*, on which the soul loves to repose itself. But it is not a refreshing or a wholesome repose: we should not select, for the sake of present ease, a soothing flatterer, who will lull us into a pleasing oblivion of our failings; but a friend, who, valuing our soul's health above our immediate comfort, will rouse us from torpid indulgence to animation, vigilance, and virtue.

To EDU'CE, *v. a.* [*educo*, Lat.] To bring out; to extract; to produce from a state of occultation.—This matter must have lain eternally confined to its beds of earth, were there not this agent to *educe* it thence. *Woodward.*

Th' eternal art *educing* good from ill,
Grafts on this passion our best principle. *Pope.*

EDUC'TION, *s.* The act of bringing any thing into view.

EDUL'CORANTS, *s.* [from *edulco*, Lat. to make sweet.] Medicines which absorb the vicious humours of the body, sweeten the fluids, and deprive them of their acrimony.

To EDUL'CORATE, *v. a.* [from *dulcis*, Lat.] To sweeten.

EDULCORA'TION, *s.* The act of sweetening. In chemistry, it imports the same thing as dulcification; namely, the rendering things more mild: but chemists use the terms very differently. Dulcification consists in the obtunding of acids by combination with ardent spirit. Edulcoration consists in carrying off superfluous acid, or other saline matter, by one or more washings with water. Metallic calces, and other insoluble precipitates, are usually edulcorated previous to drying them.

EDU'LIA, in heathen mythology, the goddess who was supposed to give nourishment to infants.

ED'WARD, [eab, Sax. blessedness; and *aerd*, Teut. nature.] A man's name.

ED'WARD, a fort of the American States, in Nova-Scotia, in the town of Windsor, in Hampshire county. It is situated on Avon river, which is navigable thus far for vessels of 400 tons; those of sixty tons can go two miles higher.

ED'WARD, prince of Wales, surnamed, from the colour of his armour, the *Black Prince*; one of the most truly heroical characters of his age. He was the eldest son of Edward III. and Philippa of Hainault, born in 1330. For his noble exploits, see the article ENGLAND.

ED'WARDS (George), a celebrated ornithologiſt, born in 1693, at Weſt Ham in Eſſex. Being deſigned for commercial life, he was placed with a tradeſman in London, who happened to be a man of education. This circumſtance, with that of his chamber's being made the repoſitory of the library of a deceaſed phyſician, gave the youth a turn to literature and ſcientific inquiry, which detached him from the purſuit of gain. He paſſed ſome years in travelling, with no fixed purpoſe, but that of indulging his curioſity with the various objects of nature and art. On his return he cloſely applied to the ſtudy of natural hiſtory, and practiſed the drawing and colouring from nature of ſuch animals as fell under his inſpection; in which performances he ſtrictly attended to correctneſs of imitation. His birds were admired by the curious; and by his exertions in this branch he obtained a decent ſubſiſtence and a large acquaintance. In 1733, through the recommendation of ſir Hans Sloane, he obtained the place of librarian to the college of phyſicians. In 1743, he publiſhed the firſt volume of his Hiſtory of Birds, in quarto, with fifty-two coloured plates from original drawings, and full deſcriptions in French and Engliſh. Of this ſplendid work ſucceſſive volumes appeared in 1747, 1750, and 1751. The author diſplayed the characteriſtic piety of his diſpoſition, though in a manner ſomewhat ſingular, by a dedication of the concluding volume "To God," drawn up and ſubſcribed in the cuſtomary mode of thoſe formularies. As ſupplementary to this work, he publiſhed, in three ſucceſſive parts, 1758, 1760, and 1763, Gleanings of Natural Hiſtory, conſiſting of coloured plates of birds, fiſhes, inſects, and plants. The whole of his labours compriſes upwards of ſix hundred ſubjects in natural hiſtory, firſt delineated and deſcribed by himſelf. For this valuable work he juſtly obtained a high reputation, and was particularly eſteemed by the illuſtrious Linnæus. For his Hiſtory of Birds he was honoured by the Royal Society, in 1750, with ſir Godfrey Copley's medal; and in 1757 he was choſen a member of that body, whoſe memoirs he enriched with various occaſional papers on ſubjects of natural hiſtory. In 1769, he withdrew from his office at the college of phyſicians, and purchaſed a ſmall houſe at Plaiſtow in Eſſex. He had previouſly diſpoſed of his large collection of drawings to lord Bute. He publiſhed, in 1770, an octavo volume of Eſſays, chiefly collected from the prefaces and introductions to his books. He added ſome inſtructions for drawing and painting in water-colours, and for etching. His patience was tried in his latter years with the ſtone, and with a cancer which deprived him of the ſight of one eye; but he bore all his ſufferings with the greateſt fortitude and reſignation, and died at the age of eighty, in July 1773.

ED'WARDS (Jonathan), an Anglo-American divine, of conſiderable talents, born at Windſor, in Connecticut, in 1703. He was entered a ſtudent at Yale college in 1716, where he took his degree of bachelor of arts before he was ſeventeen years of age. He diſtinguiſhed himſelf by the diligence of his application to the uſual courſe of collegiate ſtudies, and made conſiderable progreſs in his acquaintance with the ſciences, and particularly natural philoſophy, which he cultivated through life with pleaſure, and that degree of diſcernment which he eminently poſſeſſed. In 1722, at the requeſt of ſeveral miniſters in New England who were entruſted to act on behalf of the Engliſh preſbyterians at New York, he went to that city, and preached there with great acceptability. Soon after this he received invitations from ſeveral churches to officiate among them, with a view to his ſettlement as their miniſter; but being choſen tutor of Yale college in 1724, he ſedulouſly devoted himſelf to the duties of that office for above two years. In 1726, his maternal grandfather, the Rev. Mr. Stoddard, miniſter of a congregation at Northampton, being from his great age under the neceſſity of calling in the aid of a colleague, Mr. Edwards was induced to reſign his tutorſhip and accept of that ſituation, where he was ordained to the paſtoral office in the following year. In this connection he continued reſpected, beloved, and happy, for many years, until, in 1744, a ſudden revolution took place in the diſpoſition of the people towards him, which terminated in his formal diſmiſſion from his miniſterial charge. In 1751 he accepted of an invitation to become Indian miſſionary at the town of Stockbridge, in the province of Maſſachuſets bay, where he diſcharged the duties of that office for ſix years, to the ſatisfaction of the inhabitants, both Engliſh and Indians, and was honourably ſupported by the commiſſioners of the ſociety in London for propagating the goſpel in foreign parts, who placed great confidence in his judgment and wiſdom in all matters relative to that inſtitution. In this quiet retreat he enjoyed more time to devote to the proſecution of his ſtudies, than during the preceding years of his life, and he diligently improved it in preparing different treatiſes for publication, and in digeſting materials for numerous other theological works, which he intended to complete if he met with the neceſſary encouragement. In 1757, on a vacancy taking place in the preſidency of the college of New Jerſey, the truſtees elected Mr. Edwards to that honourable ſtation. He had, however, ſcarcely entered upon his new office, when the ſmall pox, which he had hitherto eſcaped, became prevalent in the Jerſeys, and he fell a victim to the diſeaſe in March 1758, in the fifty-fifth year of his age. In his religious principles he was a rigid Calviniſt, and proved himſelf one of the ableſt defenders of ſome of the peculiarities of the Genevan ſchool. Beſides a vaſt number of manuſcripts, which he left behind him, on almoſt all ſubjects in divinity, and in ſcripture criticiſm, he was the author of a variety of ſingle ſermons, publiſhed during his life-time, and of a collection of Sermons on various important Subjects, 8vo. publiſhed after his death in 1765. He alſo publiſhed a great number of tracts on religious controverſy.

ED'WARDS, (John), a learned and pious divine of the church of England, ſon of the Rev. Thomas Edwards, born at Hertford, in 1637. After receiving his grammatical education at Merchant-tailor's ſchool in London, he was ſent, in 1653, to the univerſity of Cambridge, where he was entered at St. John's college. Soon after his admiſſion, he was choſen ſcholar of the houſe, and quickly recommended himſelf to notice by the manner in which he performed his exerciſes both in his tutor's chamber and in the college-hall. Towards the cloſe of his under-graduateſhip, he was appointed one of the moderators for the year. When he was middle bachelor he was choſen fellow of his college; and, during the time of his ſenior bachelorſhip, was again appointed moderator in the ſchools, where his performances were ſo able as to be long ſpoken of with great commendation. In 1664, he undertook the duty of Trinity church, in Cambridge; and, from the excellence of his pulpit-compoſitions, was frequently attended by many members of the univerſity of conſiderable ſtanding and rank. In 1665, when the plague raged at Cambridge, he removed from the college into the town, that he might devote himſelf entirely to the edification and comfort of his pariſhioners in the time of that calamity. In 1668 he was choſen one of the lecturers of Bury St. Edmund's in Suffolk, whither he removed, and diſcharged the duties of the office with great reputation and acceptability for twelve months, when he reſigned it, and returned to his college. Here, however, he met with ſome circumſtances of diſguſt, which determined him to reſign his fellowſhip, and remove to Trinity hall, where he entered himſelf as a fellow-commoner, and performed the regular exerciſes in the civil law. Not being willing, however, to remain unemployed in his clerical profeſſion, he accepted of an invitation to become miniſter of the pariſh of St. Sepulchre, in Cambridge, where his ſermons attracted the ſame reſpectable audience as had formerly attended him in Trinity church. In 1676, he was preſented to the living of St. Peter's in Colcheſter; and, during three years that he continued there, was highly

highly acceptable to his parifhioners. In 1699, he was admitted to the degree of doctor in divinity. He continued in a courfe of diligent ftudy till near his death, which took place in 1716, when he was in the feventy-ninth year of his age. That Dr. Edwards was a man of extenfive learning cannot be denied; and that he was diftinguifhed by ardent piety, and an exemplary moral conduct, there is not the leaft reafon to difpute. He, however, rendered himfelf obnoxious by the zeal which on all occafions he difplayed for the calviniftic doctrine; a zeal which he certainly carried to the excefs of bigotry, by contending for the abfurd notion of the old puritans, that there is a clofe connection between arminianifm and popery. His works, which are written much in the fcholaftic manner, will be chiefly acceptable to readers of the calviniftic fchool. They conlift of a great number of tracts in religious controverfy: alfo, Twelve Sermons, preached on fpecial Occafions and Subjects, 8vo. 1698; A Survey of the different Difpenfations of Religion, from the Beginning of the World to the Confummation of all Things, in two volumes, 1699; The Preacher, in three parts; *Theologia Reformata*, or the Subftance and Body of the Chriftian Religion, in two volumes, folio; to which was added a third volume folio, ten years after the author's death.

ED'WARDS (Thomas), a learned divine of the church of England, born at Coventry in 1729. His grammatical education he received, partly at the free grammar-fchool in his native city, but principally under the tuition of his own father, who was a clergyman there; and he early fhowed an uncommon eagernefs for acquiring knowledge. In 1747, he was entered at Clare-hall, in the univerfity of Cambridge, where he took his degree of bachelor of arts in 1750, and of mafter of arts in 1754. He was, likewife, chofen a fellow of his college. Before Mr. Edwards had completed the twenty-fixth year of his age, he afforded a ftriking proof of the diligence of his application to the ftudy of the learned languages, and the acquifition of facred literature, by publifhing A new Engliih Tranflation of the Pfalms from the original Hebrew, reduced to Metre by the late Bifhop Hare, with Notes, critical and explanatory, Illuftrations of many of the Paffages drawn from the Claffics, &c. 8vo. In 1758, he was appointed, by the corporation of Coventry, mafter of the free grammar-fchool, and prefented to the rectory of St. John the Baptift, in that city. The next work which Mr. Edwards fent into the world was in 1759; it is intitled The Doctrine of irrefiftible Grace proved to have no Foundation in the Writings of the New Teftament. This work reflects great honour on his abilities as a fcripture critic, on his liberality, and on his candour, and is of conliderable importance in the controverfy between the Calviniits and the Arminians. In 1762, he publifhed *Prolegomena in Libros Veteris Teftamenti poeticos, &c. fubjicitur metricæ Lowthianæ Confutatio, &c.* 8vo. In 1766, Mr. Edwards was admitted to the degree of doctor in divinity; and in the following year publifhed two differtations: the firft, On the Abfurdity and Injuftice of religious Bigotry and Perfecution; the fecond, On the principal Qualifications, &c. neceffary for the right and accurate Interpretation of the New Teftament, 8vo. Thefe differtations are entitled to conliderable praife, on account of the enlarged and liberal fentiments which they inculcate, and the ufeful aflillance which they afford to theological ftudents in attaining a critical knowledge of the Chriftian fcriptures. In 1770, Dr. Edwards was prefented by the crown to the valuable vicarage of Nuneaton in Warwickfhire, whither he retired in 1779, after having refigned his fchool and rectory at Coventry, and where he refided during the remainder of his life. In the year laft mentioned he publifhed his laft work, intitled *Selecta quædam Theocriti Idyllia recenfuit, variorum Notas adjecit, fuafque Animadverfiones, partim Latine, partim Anglice, fcriptas immifcuit Thomas Edwards, S.T.P.* 8vo. This work reflects honour on the extent and accuracy of the author's claffical literature, and will be found of great ufe to young ftudents, for whofe benefit it was chiefly defigned. He died at Nuneaton, in 1785, in the fifty-fixth year of his age.

ED'WARDS (Thomas), a critic and poet, born in 1699, fon of a gentleman in the profeffion of the law in London. After receiving a claffical education, he was entered of Lincoln's-inn, and was called to the bar, though a hefitation in his fpeech prevented him from ever engaging much in profeffional practice. It appears too that his favourite ftudies were of another kind, and the belles-lettres occupied more of his attention than books of law. Shakefpeare, in particular, was the object of his ftudy; and the appearance of Warburton's edition of that dramatift firft induced him to become an author. He publifhed, in 1744, A Letter to the Author of a late Epiftolary Dedication, addreffed to Mr. Warburton. This was followed, in 1747, by A Supplement to Mr. Warburton's Edition of Shakefpeare, a work which paffed through feveral editions, and became famous under its fubfequent title of The Canons of Criticifm. As a poet, Mr. Edwards chiefly diftinguifhed himfelf by his attempts to revive the fonnet, then a fpecies of compofition little ufed in Engliih poetry, to which, indeed, it feems but indifferently adapted. He compofed fifty of thefe pieces, of which feveral were printed in Dodfley's and Pearch's collections of poems. Their general character is ferious, moral, and unaffected; correct in their formation, but cold and fomewhat ftiff. They are more creditable to the juftnefs of his fentiments than to the powers of his imagination. He was likewife a fkilful critic in the Engliih language; and the feventh edition of his Canons of Criticifm, publifhed in 1765, befides his fifty fonnets, contains An Account of the Trial of the letter Y, alias Y, in which are difcuffed the principles of Engliih orthography. A poftlhumous tract on the doctrine of predeftination, finifhes the lift of his performances. Mr. Edwards paffed his life in literary leifure, and maintained a friendly intercourfe with many of the moft refpectable characters of his time. He died, unmarried, in 1757.

ED'WARDS (Bryan), a Weft-India merchant, and a writer of conliderable eminence. A little before his death, he drew up the following biograghical fketch of his own life, which he committed to the care of fir William Young, bart. with directions to have it prefixed to his Hiftory of the Weft Indies.

"I was born the 21ft of May 1743, in the decayed town of Weftbury, in the county of Wilts. My father inherited a fmall paternal eftate in the neighbourhood, of about 100l., per annum; which proving but a fcanty maintenance for a large family, he undertook, without any knowledge of the bufinefs, as I have been informed, to deal in corn and malt, but with very little fuccefs. He died in 1756, leaving my excellent mother, and fix children, in diftreffed circumftances. Luckily for my mother, fhe had two opulent brothers in the Weft Indies, one of them a wife and worthy man, of a liberal mind, and princely fortune. This was Zachary Bayly, of the ifland of Jamaica, who, on the death of my father, took my mother and her family under his protection, and, as I was the eldeft fon, directed that I fhould be well educated. I had been placed by my father at the fchool of a diffenting minifter in Briftol, whofe name was William Foot, of whom I remember enough to believe that he was both a learned and good man; but, by a ftrange abfurdity, he was forbidden to teach me Latin and Greek, and directed to confine my ftudies to writing, arithmetic, and the Engliih grammar. I fhould therefore have had little to do, but that the fchoolmafter had an excellent method of making the boys write letters to him on different fubjects, fuch as the beauty and dignity of truth, the obligation of a religious life, the benefits of a good education, the mifchief of idlenefs, &c. previoufly ftating to them the chief arguments to be urged; and inlifting on correctnefs in orthography and grammar. In this employment I had fometimes the good fortune to excel the other boys; and, when this happened, my mafter never failed to praife me very liberally before them all;

and he would frequently tranſmit my letters to my father and mother. This excited in my mind a ſpirit of emulation, and, I believe, gave me the firſt taſte for correct and elegant compoſition. I acquired, however, all this time, but very little learning; and, when my uncle (on my father's death) took me under his protection, his agent in Briſtol conſidered me as neglected by Mr. Foot, and immediately removed me to a French boarding-ſchool in the ſame city, where I ſoon obtained the French language; and, having acceſs to a circulating library, I acquired a paſſion for books, which has ſince become the ſolace of my life.

"In 1759, a younger and the only brother of my great and good uncle came to England, and, ſettling in London, took me to reſide with him, in a high and elegant ſtile of life. He was a repreſentative in parliament for Abingdon, and afterwards for his native town. Farther I cannot ſpeak of him ſo favourably as I could wiſh, for I remember that, at the period I allude to, his conduct towards me was ſuch as not to inſpire me with much reſpect: he perceived it, and ſoon after, in the latter end of the ſame year, ſent me to Jamaica. This proved a happy and fortunate change in my life, for I found my eldeſt uncle the reverſe, in every poſſible circumſtance, of his brother. To the moſt enlarged and enlightened mind he added the ſweeteſt temper, and the moſt generous diſpoſition. His tenderneſs towards me was exceſſive, and I regarded him with more than filial affection and veneration. Obſerving my paſſion for books, and thinking favourably of my capacity, he engaged a clergyman (my loved and ever to be lamented friend Iſaac Teale) to reſide in his family, chiefly to ſupply by his inſtructions my deficiency in the learned languages. Mr. Teale had been maſter of a free grammar-ſchool, and beſides being a moſt accompliſhed ſcholar, poſſeſſed an exquiſite taſte for poetry. I dare not ſay, however, that I made any great progreſs in the languages under his tuition; I acquired "ſmall Latin and leſs Greek;" even now, I find it difficult to read the Roman poets in their own language. The caſe was, that not having been grounded in the Latin grammar at an earlier period of life, I found the ſtudy of it inſupportably diſguſting, after I had acquired a taſte for the beauties of fine writing. Poetry was our chief amuſement; for my friend, as well as myſelf, preferred the charms of Dryden and Pope to the dull drudgery of poring over ſyntax and proſody. We preferred belles lettres. We laughed away many a happy hour over the plays of Moliere, and wrote verſes on local and temporary ſubjects, which we ſometimes publiſhed in the colonial newſpapers. Yet the Latin claſſics were not altogether neglected; my friend delighted to point out to me the beauties of Horace, and would frequently impoſe on me the taſk of tranſlating an ode into Engliſh verſe, which, with his aſſiſtance in conſtruing the words, I ſometimes accompliſhed.

"Having made myſelf known to the public by my writings, it is probable that after I am in the grave, ſome collector of anecdotes, or biographical compiler, may pretend to furniſh ſome particulars concerning my life and manners. It is not pleaſant to think that miſrepreſentation or malice may faſten on my memory; and I have therefore made it the amuſement of an idle hour, to compile a ſhort account of myſelf. My perſonal hiſtory, however, is of little importance to the world. It will furniſh no diverſified ſcenes of fortune, nor relate many circumſtances of myſelf, worth remembering. Yet I feel the fond ambition of an author, and am willing to hope, that thoſe who have read my book with approbation, will be glad to know ſomething farther concerning me;

For who, to dumb forgetfulneſs a prey, &c.

For the ſatisfaction then of ſuch kind readers (if ſuch there are) and the information of my poſterity, I have drawn up this paper, which I deſire my bookſeller to prefix to the next edition of my Hiſtory of the Weſt Indies.

B. E."

Thoſe who knew and were intimate with Mr. BRYAN EDWARDS, will recognize, in this ſhort account of himſelf, the energy of mind, the induſtry, and the truth, which characterized his converſations and his life; but all muſt allow, that much therein is omitted, which has uſual and proper place in biography, and which the editor might be preſumed, or be called upon, to ſupply. Some account might be required, of his literary eſſays and legiſlative acts, ſo efficient in the cauſe of humanity towards the negroes, whilſt a member of the aſſembly in Jamaica. Some account might be demanded, of this good and independent man, whilſt a member of the Britiſh parliament; and, eſpecially, in the poſthumous life of a literary man, ſome accurate detail of his literary purſuits and writings might be expected; of his Correſpondence—of his Eſſays—and of his conduct in the judicious compilation and elegant recital of the Travels of Mungo Park—and, eſpecially, of the origin and progreſs of his great work, the "Hiſtory of the Britiſh Colonies in the Weſt Indies," 3 vols. 4to. To theſe, and other points, the recollection of the reader is thus awakened. The editor preſumes no farther. He cannot venture to alter, or add to, the ſacred depoſit committed to his charge, but gives it to the public, as its author left, and *willed* it, to be given.

The above ſketch was haſtily drawn by its author, as an outline of a portrait intended to be filled up and finiſhed, had God permitted, and annexed with ſome intereſting prefatory matter to the third volume of his "Weſt Indies;" but ere the laſt ſheet was reviſed from the preſs, BRYAN EDWARDS was no more! He had long ſuffered from the diſorder which brought him to the grave, and ſeemed to foreſee the hour of diſſolution haſtening on. Rendered incapable by weakneſs and diſeaſe, of completing his prefatory diſcourſe, yet, with a fond anxiety for honeſt fame, he rouſed the embers of his genius,—to claim a fair reputation with poſterity for induſtry, integrity, and candid expoſition of the talents and acquirements which introduced him to public notice. The firmneſs of his mind, and the cheerfulneſs of his temper, which, throughout a long and checquered life, gave confidence to his friendſhips, and delight to his ſociety, forſook him not, even when he apprehended the laſt ſhort hour was before him. This he clearly ſhows, when turning from the awful conſideration of futurity, to look back upon his paſt life, himſelf brings the retroſpect to our view; and deſcribes the ſcene in ſo pure and lively colours, with no gloom from diſcontent, and no ſhade from remorſe, that we readily infer the nature of the light which ſo beamed on his laſt work, and to the laſt hour;—and pronounce its emanation to be from the pure conſcience of a benevolent and upright man! He died in the polygon-houſe (his own eſtate) at Southampton, in 1800, in the fifty-ſeventh year of his age. His much-eſteemed "Hiſtory of the Weſt Indies" has already undergone two editions; the copy-right of which he generouſly preſented to Mr. John Stockdale, in Piccadilly, as a reward for former civilities. He likewiſe kindly received the celebrious African traveller, Mr. Mungo Park, into his houſe at Southampton, aſſiſting him in arranging the materials, and in compiling, judiciouſly and elegantly, his intereſting Travels in the interior Diſtricts of Africa, in 1795, 1796, and 1797, 4to.

By the death of BRYAN EDWARDS, the proprietor of THIS ENCYCLOPÆDIA loſt an invaluable friend, and a moſt able aſſiſtant. He was the original projector of the work itſelf—furniſhed many intereſting articles for it—had undertaken to write the prefatory matter, with a ſyllabus of its various parts—its general objects—and particular utility.—To us, therefore, his loſs is truly irreparable, and never to be enough lamented!—He left a widow, ſince re-married; a ſecond ſon, Zachary Edwards, eſq. of Southampton; and one daughter. His eldeſt ſon Bryan Edwards died at Wincheſter, under the tuition of Dr. G. I. Huntingford, the preſent learned biſhop of Glouceſter.

ED'WAY, a river of South Wales, which runs into the Wye, four miles fouth-eaſt of Bealth, in the county of Radnor.

ED'WIN, [of ead, and pin, Sax. a happy conqueror.] A man's name; the name of two kings of England.

ED'WITH, a river of England, in the county of Monmouth, which joins the Uſk, at its mouth.

EECK'HOUT (Gerbrandt Vanden), a painter of great merit, born at Amſterdam in 1621. His father, a goldſmith by trade, meant him for the banking buſineſs; but his natural inclination was ſo decidedly bent to painting, that he was placed as a pupil under Rembrandt. He adopted the ſtyle of his maſter, and acquired great reputation in portraits, which he painted with admirable truth and expreſſion. His touch was bold and firm, his management of the chiaro-ſcuro excellent, and he ſurpaſſed Rembrandt in the care with which he finiſhed the extremities of his figures. Succeſsful as he was in this branch, he preferred being employed in hiſtory-painting, in which his compoſitions are rich and well diſpoſed, his diſtribution of light and ſhade admirable, and his expreſſion ſtrong and natural. His colouring, however, is accounted not equal to that of his maſter, though his backgrounds are clearer. He ſhared his maſter's defects of incorrectneſs in deſign, want of grace, and neglect of the coſtume. The ſlowneſs with which he worked kept him poor, notwithſtanding his excellence, till he obtained the patronage of a burgo-maſter, who gave him a penſion, and employed him on various ſcripture hiſtories, which were much admired. One of the beſt is Chriſt among the doctors, in the Duſſeldorp collection. Another, of the infant Jeſus in the arms of Simeon, is much eſteemed. This painter died at Amſterdam in 1674, at an age when he was ſtill capable of improvement.—ANTONY VANDEN EECKHOUT, born at Bruſſels in 1656, became eminent as a fruit and flower painter.

EED, a town of Norway: twenty-four miles north-north-weſt of Drontheim.

EEDT, a town of Germany, in the archduchy of Auſtria: fourteen miles eaſt-ſouth-eaſt of Ens.

To EEK, *v. a.* [ɛacan, ɛcan, ıcan, Sax. *eak*, Scott. *eek*, Erſe.] To make bigger by the addition of another piece. To ſupply any deficiency. See EKE.

Hence endleſs penance for our fault I pay;
But that redoubled crime, with vengeance new,
Thou biddeſt me to *eek*. *Spenſer.*

EEL, *ſ.* in ichthyology. See MURÆNA.

EEL-BACKED, *adj.* Applied to ſuch horſes as have black liſts along their backs.

EEL-FARES, *ſ.* A fry or brood of eels. 25 *Hen.* VIII.

EEL-POUT, *ſ.* A kind of young eel.

EEL-RIVER, a river of North America, with a large cove on the ſouth ſide of Chaleur bay, about three leagues from Maligaſh. The cove abounds with ſalmon, and great quantities of that fiſh is taken annually by the inhabitants ſettled on its bank.

EEL-RIVER-INDIANS, a tribe of Indians who inhabit the lands on Eel-River, a head branch of the Wabaſh. They were formerly hoſtile; but ceded ſome land at the mouth of the river to the United States, at the treaty of Greenville, in 1795; when that government paid them a ſum of money, and engaged to pay them in goods, to the value of 500 dollars annually for ever.

EEL-SKIN, *ſ.* The ſkin of an eel.—When he's drunk, you may thruſt your hand into him like an *eel-ſkin*, and ſtrip him inſide outwards. *Overbury.*

EEL-SPEAR, *ſ.* A forked inſtrument with three or four jagged teeth, uſed for catching eels; which they ſtrike into the mud at the bottom of the river, and if it ſtrike againſt any eels it never fails to bring them up.

EEL'WYCK, a town of Norway: twenty miles weſt of Romſdal.

EEM'BURG, or EMBURG, a town of Utrecht, on the Ems: five miles north-north-weſt of Amersfort.

EEMS, a river of Holland, which runs into the Zuyder ſea, below Emburg, in the ſtate of Utrecht.

E'EN, *adv.* Contracted from *even*. See EVEN.—Says the ſatyr, if you have a trick of blowing hot and cold out of the ſame mouth, I have *e'en* done with you. *L'Eſtrange.*

EER'SEL, a town of Brabant: ſix miles ſouth-weſt of Eyndhoven.

EF-BE, a ſafe and ſecure harbour, on the ſouth ſide of the iſland of Mixaol, one of the Moluccas. Lat. 2. 12. S. It has ſeveral ſmall picturesque iſlands on each ſide its entrance; the principal of which is called Crown Iſland, on account of its ſummit being crowned with a magnificent evergreen wood.

EFE'SC, a town of Aſiatic Turkey, in the province of Natolia: thirty-two miles ſouth-ſouth-eaſt of Smyrna.

EF'FABLE, *adj.* [*effabilis*, Lat.] Expreſſive; utterable.

To EFFA'CE, *v. a.* [*effacer*, Fr.] To deſtroy any thing painted, or carved. To leave no longer legible or viſible; to blot out; to ſtrike out.—Characters on duſt, the firſt breath of wind *effaces*. *Locke.*

Otway fail'd to poliſh or refine,
And fluent Shakeſpeare ſcarce *effac'd* a line. *Pope.*

To deſtroy; to wear away:

Nor our admiſſion ſhall your realm diſgrace,
Nor length of time our gratitude *efface*. *Dryden.*

EFFE'CT, *ſ.* [*effectus*, Lat.] That which is produced by an operating cauſe.—*Effect* is the ſubſtance produced, or ſimple idea introduced into any ſubject, by the exerting of power. *Locke.*—We ſee the pernicious *effects* of luxury in the ancient Romans, who immediately found themſelves poor as ſoon as this vice got footing among them. *Addiſon.*—Conſequence; event.—No man, in *effect*, doth accompany with others, but he learneth, ere he is aware, ſome geſture, or voice, or faſhion. *Bacon.*—To ſay of a celebrated piece that there are faults in it, is, in *effect*, to ſay that the author of it is a man. *Addiſon.*—Purpoſe; meaning; general intent.—They ſpake to her to that *effect*. 2 *Chron.*—Conſequence; intended ſucceſs; advantage.—Chriſt is become of no *effect* unto you. *Gal.* v. 4.—The inſtitution has hitherto proved without *effect*, and has neither extinguiſhed crimes, nor leſſened the numbers of criminals. *Temple.*—Completion; perfection:

Semblant art ſhall carve the fair *effect*,
And full achievement of thy great deſigns. *Prior.*

Reality; not mere appearance:

State and wealth, the buſineſs and the crowd,
Seems at this diſtance but a darker cloud;
And is to him, who rightly things eſteems,
No other in *effect* than what it ſeems. *Denham.*

[In the plural.] Goods; moveables.—The emperor knew that they could not convey away many of their *effects*. *Addiſon.*

To EFFE'CT, *v. a.* [*efficio*, Lat.] To bring to paſs; to attempt with ſucceſs; to achieve; to accompliſh as an agent:

Being conſul, I doubt not to *effect*
All that you wiſh. *Ben Johnſon.*

To produce as a cauſe.—The change made of that ſyrup into a purple colour, was *effected* by the vinegar. *Boyle.*

EFFECT'IBLE, *adj.* Performable; practicable; feaſible.—That a pot full of aſhes will ſtill contain as much water as it would without them, is not *effectible* upon the ſtricteſt experiment. *Brown.*

EFFEC'TION, *ſ.* in geometry, a conſtruction, a propoſition; a problem or praxis, drawn from ſome general propoſition.

EFFEC'TIVE, *adj.* Having the power to produce effects; efficacious; effectual: with *of*.—They are not *effective of* any thing, nor leave no work behind them. *Bacon.*—There is nothing in words, and ſtiles, but ſuitableneſs, that makes them acceptable and *effective*. *Glanville.*—Operative;

—Operative; active; having the quality of producing effects.—Nor do they ſpeak properly who ſay that time conſumeth all things; for time is not *effective*, nor are bodies deſtroyed by it. *Brown.*—Producing effects; efficient. —Whoſoever is an *effective* real cauſe of doing his neighbour wrong is criminal, by what inſtrument ſoever he does it. *Taylor.*—Having the power of operation; uſeful: as, *effective* men in an army.

EFFEC'TIVELY, *adv.* Powerfully; with real operation.—This *effectively* reſiſts the devil, and ſuffers us to receive no hurt from him. *Taylor.*

EFFECT'LESS, *adj.* Without effect; impotent; uſeleſs; unmeaning:

I'll chop off my hands;
In bootleſs prayer have they been held up,
And they have ſerv'd me to *effectleſs* uſe. *Shakeſpeare.*

EFFECT'OR, *ſ.* [Lat.] He that produces any effect; performer. Maker; Creator.—We commemorate the creation, and pay worſhip to that infinite Being who was the *effector* of it. *Derham.*

EFFEC'TRIX, *ſ.* A woman that effects. *Scott.*

EFFEC'TUAL, *adj.* [*effectuel*, Fr.] Productive of effects; powerful to a degree; adequate to the occaſion; operative; efficacious.—The communication of thy faith may become *effectual*, by the acknowledging of every good thing. *Philem.* 6.—Veracious; expreſſive of facts. *A ſenſe not in uſe:*

Reprove my allegation, if you can;
Or elſe conclude my words *effectual.* *Shakeſpeare.*

EFFEC'TUALNESS, *ſ.* The quality of being effectual. *Scott.*

EFFEC'TUALLY, *adv.* In a manner productive of the conſequence intended; efficaciouſly.—Sometimes the ſight of the altar, and decent preparations for devotion, may compoſe and recover the wandering mind more *effectually* than a ſermon. *South.*

To EFFEC'TUATE, *v. a.* [*effectuer*, Fr.] To bring to paſs; to fulfil.—He found means to acquaint himſelf with a nobleman, to whom diſcovering what he was, he found him a fit inſtrument to *effectuate* his deſire. *Sidney.*

EFFE'MINACY, *ſ.* Admiſſion of the qualities of a woman; ſoftneſs; unmanly delicacy; mean ſubmiſſion:

But foul *effeminacy* held me yok'd
Her bond ſlave: O indignity, O blot
To honour and religion! *Milton.*

Laſciviouſneſs; looſe pleaſure.—So long as idleneſs is quite ſhut out from our lives, all the ſins of wantonneſs, ſoftneſs, and *effeminacy*, are prevented.

EFFE'MINATE, *adj.* [*effeminatus*, Lat.] Having the qualities of a woman; womaniſh; ſoft to an unmanly degree; voluptuous; tender; luxurious: of perſons.—The king, by his voluptuous life and mean marriage, became *effeminate*, and leſs ſenſible of honour. *Bacon.*—Reſembling the practice of a woman; womaniſh: of things:

After the ſlaughter of ſo many peers,
Shall we at laſt conclude *effeminate* peace? *Shakeſpeare.*

Womanlike; ſoft without reproach. *A ſenſe not in uſe:*

As well we know your tenderneſs of heart,
And gentle, kind, *effeminate*, remorſe. *Shakeſpeare.*

To EFFE'MINATE, *v. a.* [*effemino*, Lat.] To make womaniſh; to weaken; to emaſculate; to unman.—When one is ſure it will not corrupt or *effeminate* children's minds, and make them fond of trifles, I think all things ſhould be contrived to their ſatisfaction. *Locke.*

To EFFE'MINATE. *v. n.* To grow womaniſh; to ſoften; to melt into weakneſs.—In a ſlothful peace both courage will *effeminate* and manners corrupt. *Pope.*

EFFE'MINATELY, *adv.* In an effeminate manner. By means of a woman:

What boots it at one gate to make defenſe,
And at another to let in the foe,
Effeminately vanquiſhed? *Milton.*

EFFEMINA'TION, *ſ.* The ſtate of one grown womaniſh; the ſtate of one emaſculated or unmanned.—Vices the hare figured; not only feneration, or uſury, from its fecundity and ſuperfetation, but degenerate *effemination. Bacon.*

EFFEN'DI, *ſ.* in the Turkiſh language, ſignifies *maſter:* and accordingly it is a title very extenſively applied; as, to the mufti and emirs, to the prieſts of moſques, to men of learning, and of the law. The grand chancellor of the empire is called *reis-effendi.*

EFFERA'TION, *ſ.* [from the Lat. *fera*, a wild beaſt.] The act of making wild. *Not uſed.*

To EFFERVE'SCE, *v. n.* [*efferveſco*, Lat.] To generate heat by inteſtine motion.—The compound ſpirit of nitre, put to oil of cloves, will *efferveſce* even to a flame. *Mead.*

EFFERVES'CENCE, *ſ.* [from *efferveo*, Lat.] The act of growing hot; production of heat by inteſtine motion.

In chemiſtry this term is appropriated to the commotion and increaſe of volume produced in fluids by ſome part of the maſs ſuddenly taking the elaſtic form, and eſcaping in numerous bubbles. Thus, when an acid is poured on chalk, the fixed air is diſengaged in the elaſtic ſtate with bubbles, vapour, and an hiſſing noiſe. Effervеſcences are more or leſs violent, according to circumſtances, and are uſually attended with a change of the temperature. If the capacity of the mixture or new combination for heat be diminiſhed by the change the bodies have undergone, in a greater degree than that of the elaſtic fluid is enlarged, the temperature will be increaſed: but if, on the contrary, the mixture retains its original, or acquire an increaſed capacity, the elaſtic fluid will carry off ſo much of the heat as to produce a greater or leſs degree of cold in the remainder. Chemiſtry affords many inſtances of both effects taking place.

EF'FERDING, a town of Germany, in the archduchy of Auſtria: ten miles weſt of Lintz, and 100 weſt of Vienna. Lat. 48. 14. N. lon. 31. 40. E. Ferro.

EFFE'TE, *adj.* [*effœtus*, Lat.] Barren; diſabled from generation. It is probable that females have in them the ſeeds of all the young they will afterwards bring forth, which, all ſpent and exhauſted, the animal becomes barren and *effete. Ray.*—Worn out with age.—All that can be allowed him now, is to refreſh his decrepit *effete* ſenſuality, with the hiſtory of his former life. *South.*

EFFICA'CIOUS, *adj.* [*efficax*, Lat.] Productive of effects; powerful to produce the conſequence intended:

A glowing drop with hollow'd ſteel
He takes, and, by one *efficacious* breath,
Dilates to cube or ſquare. *Philips.*

EFFICA'CIOUSLY, *adv.* Effectually; in ſuch a manner as to produce the conſequence deſired.—If we find that any other body ſtrikes *efficaciouſly* enough upon it, we cannot doubt but it will move that way in which the ſtriking body impels it. *Digby.*

EFFICA'CIOUSNESS, *ſ.* The quality of being efficacious.

EFFICA'CITY, *ſ.* Efficacy. *Not much uſed.*

EF'FICACY, *ſ.* [from *efficax*, Lat.] Power to produce effects; production of the conſequence intended.—*Efficacy* is a power of ſpeech which repreſents a thing, by preſenting to our minds the lively ideas or forms. *Peacham.* —The apoſtle tells us of the ſucceſs and *efficacy* of the goſpel upon the minds of men; and, for this reaſon, he calls it the power of God unto ſalvation. *Tillotſon.*

EFFI'CIENCE, or EFFICIENCY, *ſ.* [from *efficio*, Lat.] The act of producing effects; agency.—A pious will is the means to enlighten the underſtanding in the truth of Chriſtianity, upon the account of a natural *efficiency*: a will ſo diſpoſed, will engage the mind in a ſevere ſearch after truth. *South.*

EFFI'CIENT, *ſ.* [*efficio*, Lat.] The cauſe which makes effects to be what they are. See CAUSE AND EFFECT,

vol. iv. p. 2.—God, which moveth meer natural agents as an *efficient* only, doth otherwiſe move intellectual creatures, and eſpecially his holy angels. *Hooker.*—He that makes; the effector.—Obſervations of the order of nature carry the mind up to the admiration of the great *efficient* of the world. *Hale.*

EFFI'CIENT, *adj.* Cauſing effects; that makes the effect to be what it is.—Your anſwering in the final cauſe, makes me believe you are at a loſs for the *efficient*. *Collier.*

EFFIC'TION, *ſ.* [from the Lat. *ex*, out of, and *fingo*, to faſhion.] The act of faſhioning, the act of repreſenting. *Not uſed.*

To EFFI'GIATE, *v. a.* [*effigio*, Lat.] To form a ſemblance; to image.

EFFIGIA'TION, *ſ.* The act of imaging; or forming the ſemblance of things or perſons.

EFFI'GIES, or EF'FIGY, *ſ.* [*effigies*, Lat. effigy is from being *in effigy*.] Reſemblance; image in painting or ſculpture; repreſentation; idea.—We behold the ſpecies of eloquence in our minds, the *effigies* or actual image of which we ſeek in the organs of our hearing. *Dryden.*

Obſerve thoſe numerous wrongs in *effigy*,
The gods have ſav'd from the devouring ſea. *Garth.*

EF'FINGHAM, a village in the county of Surrey, three miles from Leatherhead, which gives the title of earl to the noble family of Howard. It was once, according to tradition, a large and populous place, in which were ſixteen churches. There are evident proofs of its having been much larger than at preſent; for wells, and cavities like cellars, are frequently found in the fields and woods in its vicinity; and in the church are ſome very ancient and curious ſtalls and monuments.

EF'FINGHAM, formerly Leavitſtown, a townſhip of the American States, in Strafford county, New Hampſhire, ſouth-eaſt of Oſſipee pond, on Oſſipee river, incorporated in 1766.

EF'FINGHAM, a county of the American States, in the lower diſtrict of Georgia, bounded by Savannah river on the north-eaſtward, which ſeparates it from South Carolina; by Ogechee river on the ſouth-weſtward, which divides it from Liberty county. It contained, by the cenſus, in 1796, 2424 inhabitants. Chief towns, Ebenezer and Elberton.

To EFFLA'GITATE, *v. a.* [*efflagitare*, Lat.] To deſire a thing earneſtly. *Bailey.*

EFFLAGITA'TION, *ſ.* [from the Lat. *ex*, out of, and *flagito*, to crave.] An earneſt deſire. *Not much uſed.*

EFFLA'TED, *adj.* Puffed up. *Chaucer.*

EFFLA'TION, *ſ.* [from the Lat. *ex*, out of, and *flo*, to blow.] The act of belching, the act of breaking wind. *Not much uſed.*

EFFLORES'CENCE, or EFFLORESCENCY, *ſ.* [*efflorеſco*, Lat.] Production of flowers. The time or ſeaſon in which plants put forth their bloſſoms.—Where there is leſs heat, there the ſpirit of the plant is digeſted, and ſevered from the groſſer juice in *efflorеſcence*. *Bacon.*—Excreſcencies in the form of flowers.—Two white ſparry incruſtations, with *efflorеſcencies* in form of ſhrubs, formed by the trickling of water. *Woodward.*—[In phyſic.] The breaking out of ſome humours in the ſkin, in diſtempers called exanthematous; as in the meaſles, &c. *Quincy.*—A wart beginneth in the cutis, and ſeemeth to be an *efflorеſcence* of the ſerum of the blood. *Wiſeman.*—[In chemiſtry.] The effect which takes place when ſolid or conſiſtent bodies gradually and ſpontaneouſly become converted into a powder. See the article CHEMISTRY, vol. iv. p. 229.

EFFLORES'CENT, *adj.* [*efflorеſco*, Lat.] Shooting out in form of flowers.—Yellow *efflorеſcent* ſparry incruſtations on ſtone. *Woodward.*

EFFLU'ENCE, *ſ.* [*effluo*, Lat.] That which iſſues from ſome other principle.—Bright *effluence* of bright eſſence increate. *Milton.*

From the bright *effluence* of his deed
They borrow that reflected light,
With which the laſting lamp they feed,
Whoſe beams diſpel the damps of envious night. *Prior.*

EFFLU'ENT, *adj.* [from *ex*, out of, and *fluo*, Lat. to flow.] Flowing from; running out. *Cole.*

EFFLU'I, a town of Norway: thirty-two miles north of Chriſtianſand.

EFFLU'VIA, or EFFLUVIUM, *ſ.* [from *effluo*, Lat.] Thoſe ſmall particles which are continually flying off from bodies; the ſubtilty of which appears from their being able, a long time together, to produce very ſenſible effects, without any ſenſible diminution of the body from whence they ariſe. *Quincy.*

If theſe *effluvia*, which do upward tend,
Becauſe leſs heavy than the air, aſcend;
Why do they ever from their height retreat,
And why return to ſeek their central ſeat? *Blackmore.*

EF'FLUX, *ſ.* [*efflux*us, Lat.] The act of flowing out.—Through the copious *efflux* of matter through the orifice of a deep ulcer, he was reduced to a ſkeleton. *Harvey.*—Effuſion; flow.—The firſt *efflux* of men's piety, after receiving of the faith, was the ſelling and conſecrating their poſſeſſions. *Hammond.*—That which flows from ſomething elſe; emanation:

Prime chearer, light!
Of all material beings, firſt and beſt!
Efflux divine! *Thomſon.*

The act of flowing is more properly *effluence*, and that which flows more properly *efflux*.

To EFFLU'X, *v. n.* [*effluo*, Lat.] To run out; to flow away.—Five thouſand and ſome odd centuries of years are *effluxed* ſince the creation. *Boyle.*

EFFLUX'ION, *ſ.* [*efflux*um, Lat.] The act of flowing out.—By *effluxion* and attraction, bodies tend towards the earth. *Brown.*—That which flows out; effluvium; emanation.—There are ſome light *effluxions* from ſpirit to ſpirit, when men are one with another; as from body to body. *Bacon.*

To EFFOR'CE, *v. a.* [*efforcer*, Fr.] To force; to break through by violence:

In all that room was nothing to be ſeen,
But huge great iron cheſts and coffers ſtrong,
All barr'd with double bonds, that none could ween
Them to *efforce* by violence or wrong. *Spenſer.*

To force; to raviſh; to violate by force:

Then 'gan her beauty ſhine as brighteſt ſky,
And burnt his beaſtly heart t' *efforce* her chaſtity. *Spenſer.*

To ſtrain; to exert with effort or vehemence:

The palmer lent his ear into the noiſe,
To wheet who called ſo importunely;
Again he heard a more *efforced* voice,
That bad him come in haſte. *Spenſer.*

To EFFO'RM, *v. a.* [*efformo*, Lat.] To make in any certain manner; to ſhape; to faſhion.—Merciful and gracious, thou gaveſt us being, raiſing us from nothing, and *efforming* us after thy own image. *Taylor.*

EFFORMA'TION, *ſ.* The act of faſhioning or giving form to.—Nature begins to ſet upon her work of *efformation*. *More.*

EF'FORT, *ſ.* [*effort*, Fr.] Struggle; ſtrain; vehement action; laborious endeavour:

Though the ſame ſun, with all diffuſive rays,
Bluſh in the roſe, and in the diamond blaze,
We prize the ſtronger *effort* of his pow'r,
And always ſet the gem above the flow'r. *Pope.*

EFFOS'SION, *ſ.* [*effodio*, Lat.] The act of digging up from the ground; deterration.—He ſet apart annual ſums for the recovery of manuſcripts, the *effoſſion* of coins, and the procuring of mummies. *Arbuthnot.*

EFFOY'ES,

EFFOY'ES, a town of France, in the department of the Aube: three leagues eaſt of Bar-ſur-Seine.

EFFRAC'TOR, *ſ.* [from *ex*, out of, and *frango*, Lat. to break.] One that breaks through; one that breaks into a houſe; a burglar. *Not uſed.*

EFFRÆNA'TION, *ſ.* [from *ex*, out of, and *fræna*, Lat. a bridle.] Ungovernableneſs. *Not uſed.*

EFFRAI'ABLE, *adj.* [*effroyable*, Fr.] Dreadful; frightful; terrible.—Peſtilential ſymptoms declare nothing a proportionate efficient of their *effraiable* nature but arſenical fumes. *Harvey.*

EFFRIN'GED, *adj.* [from *ex*, out of, and *frango*, Lat. to break.] Broken; ground to powder. *Not uſed.*

EFFRON'TERY, *ſ.* [*effronterie*, Fr.] Impudence; ſhameleſſneſs; contempt of reproach.—A bold man's *effrontery*, in company with women, muſt be owing to his low opinion of them, and his high one of himſelf. *Clariſſa.*

EFFRON'TES, *ſ.* in church-hiſtory, a ſect of heretics, in 1534, who ſcraped their forehead with a knife till it bled, and then poured oil into the wound. This ceremony ſerved them inſtead of baptiſm. They are likewiſe ſaid to have denied the divinity of the Holy Spirit.

To EFFUL'GE, *v. n.* [*effulgeo*, Lat.] To ſend forth luſtre or effulgence:

The topaz charms the ſight,
Like theſe *effulging* yellow ſtreams of light. *Savage.*

EFFUL'GENCE, *ſ.* [*effulgeo*, Lat.] Luſtre; brightneſs; clarity; ſplendour:

On thee
Impreſs'd, th' *effulgence* of his glory abides. *Milton.*

EFFUL'GENT, *adj.* [*effulgens*, Lat.] Shining; bright; luminous:

How ſoon th' *effulgent* emanations fly
Through the blue gulph of interpoſing ſky. *Blackmore.*

The downward ſun
Looks out *effulgent*, from amid' the flaſh
Of broken clouds. *Thomſon.*

EFFUMABI'LITY, *ſ.* [*fumus*, Lat.] The quality of flying away, or vapouring in fumes.—They ſeem to define mercury by volatility, or, if I may coin ſuch a word, *effumability*. *Boyle.*

To EFFU'ND, *v. a.* [from *ex*, out of, and *fundo*, Lat. to pour.] To pour out. *Scott.*

To EFFU'SE, *v. a.* [*effuſus*, Lat.] To pour out; to ſpill; to ſhed:

He fell, and, deadly pale,
Groan'd out his ſoul, with guſhing blood *effus'd*. *Milton.*

EFFU'SE, *ſ.* Waſte; effuſion:

The air hath got into my deadly wounds,
And much *effuſe* of blood doth make me faint. *Shakeſpeare.*

EFFU'SION, *ſ.* [*effuſio*, Lat.] The act of pouring out:

My heart hath melted at a lady's tears,
Being an ordinary inundation;
But this *effuſion* of ſuch manly drops,
This ſhow'r, blown up by tempeſt of the ſoul,
Startles mine eyes, and makes me more amaz'd. *Shakeſp.*

Waſte; the act of ſpilling or ſhedding.—When there was but as yet one only family in the world, no means of inſtruction, human or divine, could prevent *effuſion* of blood. *Hooker.*

Yet ſhall ſhe be reſtor'd, ſince public good
For private int'reſt ought not be withſtood,
To ſave th' *effuſion* of my people's blood. *Dryden.*

The act of pouring out words.—Endleſs and ſenſeleſs *effuſions* of indigeſted prayers, oftentimes diſgrace, in moſt inſufferable manner, the worthieſt part of Chriſtian duty towards God. *Hooker.*—Bounteous donation.—Such great force the goſpel of Chriſt had then upon men's ſouls, melting them into that liberal *effuſion* of all that they had. *Hammond.*—The thing poured out.—Purge me with the blood of my Redeemer, and I ſhall be clean; waſh me with that precious *effuſion*, and I ſhall be whiter than ſnow. *King Charles.*

EFFU'SIVE, *adj.* Pouring out; diſperſing:

The north-eaſt ſpends its rage; th' *effuſive* ſouth
Warms the wide air. *Thomſon.*

EFFUTI'TIOUS, *adj.* [from *ex*, out of, and *fundo*, Lat. to pour.] Laviſhly diſtributed; fooliſhly uttered. *Not uſed.*

EFLA'NI, a town of Aſiatic Turkey, in the province of Natolia: thirty-two miles eaſt-ſouth-eaſt of Amaſieh.

EFNANLU', a lake of Aſiatic Turkey, in the province of Natolia: thirty-ſix miles weſt of Boli.

E'FRIM, a town of Egypt: twenty-ſeven miles eaſt-ſouth-eaſt of Alexandria.

EFT, *ſ.* [ɐꝼeꝛa, Sax.] A newt; an evet; a ſmall kind of lizard that lives generally in the water. See LACERTA.—The crocodile of Egypt is the lizard of Italy, and the *eft* in our country. *Nicholas.*

EFT, *adv.* [ɐꝼꝛ, Sax.] Soon; quickly; ſpeedily; ſhortly. *Obſolete:*

Quite conſumed with flame,
The idol is of that eternal maid;
For ſo at leaſt I have preſerv'd the ſame,
With hands profane, from being *eft* betray'd. *Fairfax.*

Again.—*Eft* looking back would faine have runne away. *Spenſer.*—Afterwards:

Eft, when yeares
More rype as reaſon lent to choſe our peares,
Ourſelves in league of vowed love we knit. *Spenſer.*

Likewiſe.—Yet ſeem'd the ſoyle both fayre and frutefull *eft*. *Spenſer.*

EFT'SOONS, *adv.* [ɐꝼꝛ and ꝑoon, Sax.] Soon afterwards; in a ſhort time; again. An obſolete word; formed, as it ſeems, by the conjunction of two words of the ſame meaning.—The Germans deadly hated the Turks, whereof it was to be thought that new wars ſhould *eftſoons* enſue. *Knolles.*

Eftſoons, O ſweetheart kind, my love repay,
And all the year ſhall then be holiday. *Gay.*

E. G. [*exempli gratia.*] For the ſake of an inſtance or example.

E'GA, a river of Spain, which runs into the Ebro, about a league below Calahorra.

E'GA, or AEGA, a town of Portugal, in the province of Beira: ſeven miles ſouth-ſouth-weſt of Coimbra.

EGAK'LO, one of the ſmaller Kurule iſlands, in the North Pacific Ocean. Lat. 49. 5. N. lon. 172. 10. E. Ferro.

EG'BEL, a town of Hungary: eight miles weſt of Topaltzan.

EG'BERT, [of ece, eternal, and beoꝛht, Sax. flouriſhing, *q. d.* always flouriſhing; but Verſtegan derives it from eꝛht, equity, and beꝛht, propenſe, *q. d.* greatly inclined to equity.] A man's name; the name of the firſt monarch of England. See ENGLAND.

EGE'DE (Hans or John), ſuperintendant of the Daniſh miſſion to Greenland, born in January 1686, and in 1707 became preacher at Bogen in Nordland. Soon after, he formed a reſolution of converting the Greenlanders to the Chriſtian religion; for which purpoſe he went to Greenland in 1721, where he firſt eſtabliſhed the Daniſh miſſion, and where he reſided continually for fifteen years, employed with great zeal in endeavouring to accompliſh his pious undertaking. He died on the 5th of November 1758, at Stubekioping, in the Daniſh iſland of Falſter. Egede left behind him a natural hiſtory of Greenland, which appeared firſt in Daniſh, in 1729, 4to. A new edition, improved by the obſervations of his ſon Paul, was publiſhed at Copenhagen, with plates, in 1741. A Dutch tranſlation appeared at Delft in Holland, in 1746, 4to. and a French, by Roches de Parthenay, at Geneva, in 1763, 8vo. with a map and ten plates.

EGE'DE (Paul), ſon of the former, miſſionary and biſhop of Greenland, born in 1708. From his twelfth year, that is 1721, he was one of his father's moſt active aſſiſtants; and Denmark was much indebted to him for the ſucceſs of its Greenlandic colony. A deſire to promote the welfare and happineſs of the Greenlanders was the moſt ardent wiſh of his heart, as appears by his laſt publication, entitled *Efferretninger om Gronland, ud dragne af en Journal holden fra 1721 til 1788*; Kiopen. 1789, large 8vo. with plates. This journal, which the author began in his twelfth year, and continued to his eightieth, contains a great many curious facts reſpecting the Greenlanders, and the ſuperſtitious notions they entertain in regard to a kind of pretended conjurors whom they call *Angekok*. As it is carried down to a late period, it may ſerve to ſupply the deficiencies in what his father and Krantz wrote on the ſtate of Greenland, and the manners and cuſtoms of its inhabitants. He died on the 3d of June, 1789.

E'GEK, a town of Hungary: eight miles eaſt-ſouth-eaſt of Levens.

To EGE'LIDATE, *v. a.* [*egelidare*, Lat.] To thaw; alſo to make cold, or congeal. *Bailey.*

E'GELN, a town of Germany, in the circle of Lower Saxony, and duchy of Magdeburg: ſixteen miles ſouth-weſt of Magdeburg.

E'GENBURG, or EGGENBURG, a town of Germany, in the archduchy of Auſtria: twelve miles ſouth-weſt of Znaym, and thirty-ſix north-weſt of Vienna. Lat. 48. 37. N. lon. 33. 30. E. Ferro.

E'GER, *ſ.* See EAGER. An impetuous or irregular flood or tide.—From the peculiar diſpoſition of the earth at the bottom, wherein quick excitations are made, may ariſe thoſe *egers* and flows in ſome eſtuaries and rivers; as is obſervable about Trent and Humber in England. *Brown.*—An early tulip.

E'GERI, a lake of Swiſſerland: eight miles ſouth-eaſt of Zug.

E'GERI, or AEGERI, one of the grand communities, which, with the town of Zug, forms the canton of Zug. In this diſtrict, on a mountain, called *Mongarten*, a famous battle was fought in 1315, between the Auſtrians and the Swiſs, when the latter, with a far inferior number of troops, gained a complete victory.

EGE'RIA, a nymph of Aricia in Italy, where Diana was particularly worſhipped. She was courted by Numa Pompilius; and, according to Ovid, became his wife. This prince frequently viſited her; and that he might introduce his laws and new regulations into the ſtate, he ſolemnly declared before the Roman people, that they were previouſly ſanctified and approved by the nymph Egeria. Ovid ſays, that Egeria was ſo diſconſolate at the death of Numa, that ſhe melted into tears, and was changed into a fountain by Diana. She is reckoned by many as a goddeſs who preſided over the pregnancy of women; and ſome maintain that ſhe is the ſame as Lucina.

To EGER'MINATE, *v. a.* [*egerminare*, Lat.] To bud or ſpring out. *Bailey.*

EGERMINA'TION, *ſ.* [from *ex*, out of, and *germino*, Lat. to ſprout.] The act of budding; the act of ſprouting forth.

E'GERO, a ſmall iſland, near the coaſt of Norway, in the North Sea: twenty-four miles ſouth of Stavanger.

E'GERTON (Thomas), viſcount Brackley, lord-high chancellor of England, ſon of ſir Richard Egerton, born in Cheſhire about 1540. He was educated at Brazennoſe college, Oxford, whence he removed to Lincoln's-inn, and purſued the ſtudy of law. He ſoon acquired profeſſional reputation, and in 1581, was appointed ſolicitor-general. In 1584, he roſe to the office of attorney-general, and was knighted. The maſterſhip of the rolls was conferred upon him in 1593; and in 1596, from the queen's ſpecial favour, he received the ſeals, with the title of lord keeper. He was at the ſame time ſworn of the privy-council. Few perſons have enjoyed their advancement with more general approbation than this eminent lawyer, who may be conſidered as one of the worthieſt of queen Elizabeth's reign, when great places were uſually beſtowed upon approved merit and abilities. On the acceſſion of James, Egerton was continued in his office, and created baron of Elleſmere. He was ſoon after created lord-high-chancellor, which poſt he occupied above twelve years, with great dignity and reputation. He preſided as lord ſteward at the trials of lords Cobham and Grey de Wilton. In 1610, he was elected chancellor of the univerſity of Oxford, when he zealouſly occupied himſelf in checking the progreſs of popiſh and calviniſtical opinions in that ſeminary, and in ſupporting the doctrine and diſcipline of the church of England, to which he was ſincerely devoted. He diſtinguiſhed the merit of Williams, afterwards the celebrated archbiſhop of York, made him his chaplain, and brought him into the king's notice. He was alſo a friend and favourer of the great ſir Francis Bacon, with whom he lived ſeveral years in habits of intimacy. In 1615, when his health had begun to decline, he underwent a profeſſional attack from lord chief-juſtice Coke, relative to an interference of the court of chancery in a matter of common law, which that great lawyer judged illegal. The caſe was heard before the king, aſſiſted by ſeveral eminent lawyers, who decided in favour of the chancellor. He was ſoon after appointed high-ſteward at the trial of the earl and counteſs of Somerſet for the death of ſir Thomas Overbury; and, after the earl's conviction, he ſteadily refuſed to affix the great ſeal to the pardon which the king's weakneſs granted him. His age and infirmities at length cauſed him earneſtly to requeſt his diſmiſſion from his office of chancellor. The king, who appears greatly to have eſteemed him, complied with ſome reluctance, and as a mark of his approbation, raiſed him, in 1616, to the dignity of viſcount Brackley. He further intended to honour him with an earldom and a penſion, and ſent his ſucceſſor Bacon, with the earl of Buckingham, to acquaint him with this deſign; but the aged ſtateſman, then on his death-bed, replied by ſaying that theſe things were now only vanities to him. He expired at York-houſe, in the Strand, March 15, 1617, in his ſeventy-ſeventh year. The propoſed earldom of Bridgewater was conferred upon his ſon. Chancellor Elleſmere (the name by which he is generally known) was of a highly venerable preſence, and in all reſpects worthily filled the great ſtation which he occupied. His diſpoſition was open and ſincere, his adminiſtration honeſt and upright. His private character was virtuous and honourable. There was printed during his life-time, his Speech in the Exchequer Chamber, in Robert Calvine's cauſe, commonly called the caſe of the Poſtnati. After his death appeared his Privileges and Prerogatives of the High Court of Chancery; and his Obſervations concerning the Office of Lord Chancellor. There were likewiſe publiſhed, from ſome papers ſaid to be written in his own hand, Lord Chancellor Egerton's Obſervations on the Lord Coke's Reports; but it is doubted whether theſe are his. He left to his chaplain Williams four manuſcript collections, relating to, 1, The Prerogative Royal; 2, The Privileges of Parliament; 3, Proceedings in Chancery; 4, The Power of the Star-chamber; which are ſuppoſed to have been the ſource of that prelate's legal and political knowledge.

To EGE'ST, *v. a.* [*egero*, Lat.] To throw out food at the natural vents.—Divers creatures ſleep all the winter; as the bear, the hedge-hog, the bat, and the bee: theſe all wax fat when they ſleep, and *egeſt* not. *Bacon.*

EGES'TION, *ſ.* [*egeſtus*, Lat.] The act of throwing out the digeſted food at the natural vents.—The animal ſoul or ſpirits manage as well their ſpontaneous actions as the natural or involuntary exertions of digeſtion, *egeſtion*, and circulation. *Hale.*

EGESTUO'SITY, *ſ.* Extreme poverty. *Scott.*

EGES'TUOUS, *adj.* [*egeſtuoſus*, Lat.] Very poor.

EGG, *ſ.* [ægʒ, Sax. *eugh*, Erſe.] That which is laid by

by feathered and ſome other animals, from which their young is produced.—*Eggs* are perhaps the higheſt, moſt nouriſhing and exalted, of animal food, and moſt indigeſtible. *Arbuthnot.*—The ſpawn or ſperm of other creatures:

Ev'ry inſect of each different kind,
In its own *egg*, chear'd by the ſolar rays,
Organs involv'd and latent life diſplays. *Blackmore.*

Any thing faſhioned in the ſhape of an egg.—There was taken a great glaſs-bubble with a long neck, ſuch as chemiſts are wont to call a philoſophical *egg*. *Boyle.*

The animal phyſiology of the egg, with the proceſs of incubation, offers an enquiry of the moſt intereſting kind to thoſe who delight in the curious operations of nature: and for which ſee COMPARATIVE ANATOMY, vol. i. p. 663.—An early inveſtigation of the powers of the parent bird in producing its young firſt taught the Egyptians (that once learned and ſcientific people) the method of hatching chickens by artificial means. This has, for many centuries, conſtituted a regular trade in Cairo and its vicinity. Its practice, ſays Mr. Browne, in his recent Travels in Egypt, appears to have proceeded from the experience that, at a certain ſeaſon, the eggs foſtered only by the hens are commonly unprolific: of thoſe hatched in the ovens, on the contrary, not quite one-third is loſt. The ovens wherein theſe eggs are hatched, are conſtructed in the moſt ſimple manner, conſiſting only of a low arched apartment of clay. Two rows of ſhelves are formed, and the eggs are placed on them ſo as not to touch each other. They are ſlightly moved five or ſix times in twenty-four hours; and the whole time they are in the oven does not exceed twenty-two days, when the chickens eaſily free themſelves from the ſhells. All poſſible care is taken to diffuſe the heat equably throughout; and there is but one ſmall aperture, large enough to admit a man ſtooping. During the firſt eight days the heat is rendered great; and, during the laſt eight, is gradually diminiſhed, till at length, when the young brood is ready to come forth, it is reduced to the ſtate of the natural atmoſphere. At the end of the firſt eight days, it is known which eggs will not be productive. Thoſe who have eggs to be hatched, bring them to the maſter of the oven, and contract to pay ſo much a hundred; and when the chickens appear, he receives his money on delivering them. The eggs which have not ſucceeded are required to be produced; and the ovens are conſidered in the light of public property. It has been calculated that 92,640,000 chickens are by this means annually brought into life in Egypt.

M. Reaumur, contemplating this practice of the Egyptians, was led, by a number of experiments, to reduce the art of hatching eggs to fixed principles. He found, by experience, that the heat neceſſary for this purpoſe is nearly the ſame with that marked 32 on his thermometer, or that marked 96 on Fahrenheit's. This degree of heat is nearly that of the ſkin of the hen, and, what is remarkable, of the ſkin of all other domeſtic fowls, and probably of all other kinds of birds. The degree of heat which brings about the developement of the cygnet, the goſling, and the turkey-pout, is the ſame as that which fits for hatching the canary, and in all probability, the ſmalleſt humming-bird: the difference is only in the time during which this heat ought to be communicated to the eggs of different birds; it will bring the canary-bird to perfection in eleven or twelve days, while the turkey will require twenty-ſeven or twenty-eight. After many experiments, M. Reaumur found, that ſtoves heated by means of a baker's oven, ſucceeded better than thoſe made hot by layers of dung: and the furnaces of glaſs-houſes and thoſe of the melters of metals, by means of pipes to convey heat into a room, might, no doubt, be made to anſwer the ſame purpoſe. As to the form of the ſtoves, no great nicety is required. A chamber over an oven will do very well. Nothing more is neceſſary than to aſcertain the degree of heat; which may be done by melting a piece of butter of the ſize of a walnut, with half as much tallow, and putting it into a phial. This will ſerve to indicate the heat with ſufficient exactneſs: for when it is too great, this mixture will become as liquid as oil; and when the heat is too ſmall, it will remain fixed in a lump: but it will flow like a thick ſyrup, upon inclining the bottle, if the ſtove be of the proper temperature. Great attention therefore ſhould be given to keep the heat always at this degree, by letting in freſh air if it be too great, or ſhutting the ſtove if it be too ſmall: and that all the eggs in the ſtove may equally ſhare the irregularities of the heat, it will be neceſſary to ſhift them from the ſides to the centre; and thus to imitate the hens, who are frequently ſeen to make uſe of their bills, to puſh to the outer parts thoſe eggs that were neareſt to the middle of their neſts, and to bring into the middle ſuch as lay neareſt the ſides. For the purpoſe of hatching eggs, M. Reaumur has invented a ſort of boxes without bottoms lined with fur. Theſe, which he calls *artificial parents*, not only ſhelter the chickens from the injuries of the air, but afford a kindly warmth, ſo that they preſently take the benefit of their ſhelter as readily as they would have done under the wings of a hen. After hatching, it is neceſſary to keep the chickens, for ſome time, in a room artfully heated and furniſhed with theſe boxes; but afterwards they may be expoſed to the air in the court-yard, in which it may not be amiſs to place one of theſe artificial parents to ſhelter them, if there ſhould be occaſion for it. As to the manner of feeding the young brood, they are generally a whole day after being hatched, before they take any food at all; and then a few crumbs of bread may be given them for a day or two, after which they will begin to pick up inſects and graſs for themſelves. But to ſave the trouble of attending them, cocks may be taught to watch them in the ſame manner as hens do; and to lead them about, in ſearch of their food, juſt the ſame as if hatched under a hen.

With regard to the preſervation of eggs, it is obſerved that the egg is always quite full when it is firſt laid by the hen; but from that time it gradually becomes leſs and leſs ſo, to its decay: and, however compact and cloſe its ſhell may appear, it is nevertheleſs perforated with a multitude of ſmall holes, though too minute for the diſcernment of our eyes, the effect of which is a daily decreaſe of matter within the egg, from the time of its being laid; and the perſpiration is much quicker in hot weather than in cold. To preſerve the egg freſh, there needs no more than to ſtop its tranſpiration, the method of doing which is, by ſtopping up thoſe pores with matter which is not ſoluble in watery fluids: and on this principle it is, that all kinds of varniſh, prepared with ſpirit of wine, will preſerve eggs freſh for a long time, if they are carefully rubbed all over the ſhell: tallow, or mutton fat, is alſo good for this purpoſe; for ſuch as are rubbed over with this, will keep as long as thoſe coated over with varniſh.

A method of preſerving eggs has been lately offered to the public, by Mr. William Jayne, of Sheffield, in Yorkſhire, under the ſanction of letters patent, dated February 8, 1791, which deſcribes the invention as follows: Take one buſhel of quicklime, thirty-two ounces of ſalt, eight ounces of cream of tartar, and mix the whole together, with as much water as will reduce the compoſition to that conſiſtence which will cauſe an egg, put into it, to ſwim with its top juſt above the liquid; then put, and keep, the eggs therein, whereby they may be preſerved ſound and ſweet for the ſpace of two years at the leaſt.

To EGG, *v. a.* [*eggia*, to incite, Iſlandic; eggian, Sax.] To incite; to inſtigate; to provoke to action: for this, *edge* is ſometimes ignorantly uſed.—Study becomes pleaſant to him who is purſuing his genius, and whoſe ardour of inclination *eggs* him forwards, and carrieth him through every obſtacle. *Derham.*

EGG, one of the weſtern iſlands of Scotland, about ten miles in circumference: four miles ſouth of the iſland of Sky.

EGG, a town of Norway: forty-eight miles eaſt-north-eaſt of Drontheim.

EGG, a town of the American States, in Glouceſter county, New Jerſey, on Great Egg Harbour; famous for the exportation of pine and cedar.

EGG-BIRD, *ſ.* A bird of the Pacific Ocean.—Under the low trees ſat infinite numbers of a new ſpecies of tern or *egg-bird*. *Cook and King's Voyage.*

EGG HARBOUR (Great), a bay of the American States, in the ſtate of Jerſey, on the eaſt coaſt. Lat. 39. 20. N. lon. 74. 30. W. Greenwich.

EGG HARBOUR (Little), a bay of the American States, in the ſtate of Jerſey, on the eaſt coaſt. Lat. 39. 32. N. lon. 74. 23. W. Greenwich.

EGG HARBOUR RIVER *(Great and Little)*. Great Egg Harbour riſes between Glouceſter and Cumberland counties, in New Jerſey. After running eaſt-ſouth-eaſt a few miles, it becomes the diviſional line between Cape May and Glouceſter counties, and falls into the bay of its own name. The inlet from the Atlantic Ocean lies in lat. 39. 22. The river abounds with rock-fiſh, perch, oyſters, &c. which find a ready market at Philadelphia. This river is navigable twenty miles for veſſels of 200 tons. Little Egg Harbour inlet, lies about ſeventeen miles north-eaſt of Great Egg Harbour inlet. It receives Mulicus river, which riſes in Glouceſter and Burlington counties, and forms part of the diviſional line a few miles from the bay. It is navigable twenty miles for veſſels of ſixty tons. The townſhip of Little Egg Harbour, in Burlington county, conſiſts of about 23,000 acres; and the compact part of the townſhip is called *Clam Town*, where there is a meeting-houſe for friends, and about a dozen houſes. It has a ſmall trade to the Weſt Indies. During the American war, captains Ferguſon and Collins burnt a number of privateers and other veſſels in Little Egg Harbour, and deſtroyed the place.

EGG ISLAND, a ſmall iſland of the American States, on the north-eaſt ſide of Delaware-bay, in Cumberland county.

EGG PLANT, *ſ.* in botany. See SOLANUM.

EG'GE, a river of Germany, which runs into the Danube, between Dillingen and Hochſtet.

EG'GENBERG, a town of Germany, in the duchy of Stiria: three miles weſt-north-weſt of Graz.

EGGENFEL'DEN, a town of Germany, in Lower Bavaria: twelve miles ſouth-ſouth-eaſt of Dingelfingen.

EG'GERON, a town of Egypt; ſeven miles ſouth of Atfieh.

EG'HAM, a pleaſant town in the county of Surrey, ſeated on the Thames, eighteen miles from London, on the great weſtern road. Here is a neat alms-houſe, founded in 1706, by Mr. Henry Strode, merchant, of London, for ſix men and ſix women, who muſt be ſixty years of age, and have been pariſhioners of Egham twenty years, without having received any parochial relief. The center of this building is a houſe for a ſchool-maſter, amply endowed, for the education of twenty poor boys of Egham. Sir John Denham, father of the poet of the ſame name, and baron of the exchequer in the reigns of James and Charles I. alſo founded an alms-houſe here, for ſix men and ſix women. Here is an annual fair, commencing May 29, which continues three days. Cooper's Hill, the ſubject of a poem by Denham, is ſituated near this town, on the right of the road from London.

EGIL'SHA, one of the Orkney iſlands, about ſix miles in circumference, a little to the eaſt of Ronſa.

EGIN'HART. See ÆGINHARD.

EGIS'THUS, king of Argos, the ſon of Thyeſtes by his daughter Pelopea. Thyeſtes, being at variance with his brother Atreus, was told by the oracle, that his wrongs could be revenged only by a ſon born of himſelf and his daughter. To avoid ſuch an inceſt, Pelopea had been conſecrated to the ſervice of Minerva by her father, who ſome time after met her in a wood, and raviſhed her, without knowing who ſhe was. Pelopea kept the ſword of her raviſher, and finding it to be her father's, expoſed the child ſhe had brought forth. The child was preſerved, and when grown up, preſented with the ſword of his mother's raviſher. Pelopea, ſoon after this melancholy adventure, had married her uncle Atreus, who received into his houſe her natural ſon. As Thyeſtes had debauched the firſt wife of Atreus, Atreus ſent Egiſthus to put him to death; but Thyeſtes, knowing the aſſaſſin's ſword, diſcovered he was his own ſon, and, fully to revenge his wrongs, ſent him back to murder Atreus. After this murder Thyeſtes aſcended the throne, and baniſhed Agamemnon and Menelaus, the ſons, or as others ſay, the grandſons of Atreus. Theſe children were taken care of by Œneus, king of Ætolia. By their marriage with the daughters of Tyndarus, king of Sparta, they were impowered to recover the kingdom of Argos, in which Agamemnon ſucceeded, while Menelaus reigned in his father-in-law's place. Egiſthus had been reconciled to the ſons of Atreus; and when they went to the Trojan war, he was left guardian of Agamemnon's kingdoms, and of his wife Clytemneſtra. Egiſthus fell in love with Clytemneſtra, and lived with her. On Agamemnon's return, theſe two adulterers murdered him, and, by a public marriage, ſtrengthened themſelves on the throne of Argos. Oreſtes, Agamemnon's ſon, would have ſhared his father's fate, had not his ſiſter Electra privately ſent him to his uncle Strophius, king of Phocis, where he contracted the moſt intimate friendſhip with his couſin Pylades. Some time after, Oreſtes came to Mycenæ, the reſidence of Egiſthus, and reſolved to puniſh the murderers of his father, in conjunction with Electra, who lived in diſguiſe in the tyrant's family. To effect this more effectually, Electra publicly declared that her brother Oreſtes was dead; upon which Egiſthus and Clytemneſtra went to the temple of Apollo, to return thanks to the god for his death. Oreſtes, who had ſecretly concealed himſelf in the temple, attacked them, and put them both to death, after a reign of ſeven years. They were buried without the city walls. *Ovid. de Rem. Am.* 161. *Ælian. Æſchyl. Homer.*—Pompey uſed to call Julius Cæſar Egiſthus, on account of his adultery with his wife Mutia, whom he repudiated after ſhe had born him three children.

EGIST'MENT, *ſ.* a law term. The agiſtment, the compoſition for feeding cattle in the king's foreſt; cattle fed at a certain rate. *Scott.*

E'GLAH, [Heb. an heifer.] The name of a woman.

E'GLAIM, [Heb. drops of the ſea.] A city of Moab. *Iſaiah*, xv. 8.

E'GLANTINE, *ſ.* [*eſglantier*, Fr.] A ſpecies of roſe; ſweet-briar. See ROSA.

O'er-canopied with luſcious woodbine,
With ſweet muſk-roſes, and with *eglantine*. *Shakeſpeare.*

E'GLANTINE (P. F. N. Fabre d'), a dramatic writer, and inventor of the new French calendar, born at Chalons in Champaigne. He was early educated by his parents, in polite literature and natural philoſophy. From his youth he felt an invincible inclination to court the muſes, which he evinced in his juvenile publication, intitled *Les Etrennes du Parnaſſe*. He wrote a comedy in three acts, in verſe, called *Le Collateral, ou l'Amour et l'Intérêt*, which was repreſented at the *Théâtre de Monſieur*, but was not ſucceſsful. The revolution did not immediately confer on Fabre either wealth or diſtinction; he continued his literary labours, and produced another comedy called *Philinte*, which was alſo in verſe, and in five acts. This piece, the principal character of which is taken from Moliere, and intended as a continuation of the Miſanthrope, is much praiſed. La Harpe commends it as a judicious and ſpirited work. The plot is ſerious, and where the author has deviated from his model, he has

has done it with genius and judgment. His next production was a comedy in verſe, in two acts, called *Le Convaleſcent de Qualité, ou l'Ariſtocrate*, in which, as may be expected from the title, all the faults of the old French government, and all the prejudices and foibles reſulting from the pride of birth, are virulently attacked. At the ſame time he produced another in five acts, called *L'Intrigue epiſtolaire*, which was much applauded, and had conſiderable ſucceſs.

But the dramatic muſe, however aſſiduouſly or ſucceſſfully cultivated, was not able, in the tumult of revolution, to ſecure to her votary either fame or profit. Fabre had other qualities which promiſed to facilitate his progreſs in the paths of wealth and political renown. The ſpirit of intrigue which he diſplayed on the theatre, was his own characteriſtic in life. He was ſupple, inſinuating, cunning, and laborious; he echoed the ſentiments, and flattered the paſſions, of his ſuperiors, careful in avoiding offence, and careful to obtain the eſteem of all. With theſe requiſites he commenced flatterer of the duke of Orleans, and attached himſelf perſonally to Danton. Danton introduced him to madame Roland's cabinet parties, and recommended him to conduct, jointly with Camille Deſmoulins and Robert, a poſted paper called *Compte rendu au Peuple Souverain*. This publication was commenced and carried on for a ſhort time, but the parties having received the ſum propoſed, it was diſcontinued. Danton then made him one of his ſecretaries; in which ſituation he is ſuppoſed to have acquired great riches previous to and during the maſſacres of the priſoners. He was alſo one of the council-general of the commune, and among the firſt who divided with Danton, and joined Robeſpierre's party againſt Roland. He now lived in the Rue du Théâtre Français in a ſtile of elegance and luxury, and acknowledged himſelf to be worth twelve thouſand livres (525l.) a-year. As he poſſeſſed no viſible means of attaining ſuch a fortune, it was juſtly attributed to his having ſhared in the plunder of the murdered captives, or, perhaps, of the jewel-office.

Having diſtinguiſhed himſelf at the Jacobin club as a republican, and by his exertions againſt la Fayette, he was, by Danton's influence, elected member of the convention for Paris. During ten months he was not conſpicuous. He voted with the reſt of his party on the trial of the king, and recommended death in four-and-twenty-hours. He was marked as a conſtant opponent of Roland; but does not appear to have aſſiſted actively in the expulſion of the Briſſotines. He was a member of the committee of public ſafety, and of the committee of public inſtruction. At the beginning of the war with England, he moved that an addreſs to the Britiſh nation, againſt their government, ſhould be publiſhed; and that the perſons and property of Engliſhmen reſiding in France, and ſubmitting to the laws, ſhould be defended and protected: but, in the ſame year, he propoſed the meaſure of arreſting all the Engliſh, and other ſubjects of the king of England, then in the republic. Ambitious to be eſteemed a good economiſt and financier, he preſented to the convention a plan for ſupplying the army with neceſſaries, and preventing frauds: it ſeems well adapted to a revolutionary government, but totally inapplicable to a regular ſyſtem. He alſo made a report on the diſcredit of aſſignats; but it ſurpaſſed his talents to prevent that calamity.

He was an active member of the club of Cordeliers, and ſhewed himſelf worthy of their eſteem by joining earneſtly in all their labours for the extirpation of religion. One principal effort towards this was the formation of a new calendar, of which d'Eglantine was the author, and which took place from the 22d of September, 1793. The obvious aim of this invention was, by a new diviſion of the year, by the abolition of weeks, by the alteration of months, and by giving new names to the days; to obliterate every trace of Sundays, ſaints' days, holidays, and Chriſtian feſtivals. See the article CALENDAR, vol. iii. p. 615.

It has been aſſerted that Fabre materially aſſiſted Robeſpierre in the compoſition of his ſpeeches and writings; the ſame is ſaid of Camille Deſmoulins; but theſe accounts ſhould be received with caution. They are improbable, becauſe the ſtile of Deſmoulins was extremely careleſs; and d'Eglantine required a judicious friend to reform his own diction: the works of Robeſpierre are ſuperior in wit, ſentiment, and language, to the writings of his ſuppoſed inſtructors. The ſtile in which Fabre lived, and the open profligacy with which he ſold his patronage, may, perhaps, have given riſe to this report; but it was a part of Robeſpierre's prudence not to prevent peculation in his inferior agents, that he might, at pleaſure, ſacrifice them to his revenge or convenience. Fabre was, however, expoſed to denunciations; Boileau accuſed him in the convention of having propoſed the reſtoration of royalty; but the charge was evaded by the influence of his party. His ſtile of living pointed him out to the malice of his brother cordelier Hebert, who attacked him in his journal, called *Le Père Duchesne*, as an enriched patriot. This offence brought Hebert to the ſcaffold; but Fabre did not long triumph over his fallen adverſary: ſoon after the execution of Hebert, he was himſelf arreſted, together with Chabot and ſeveral others, and confined, firſt in the Luxemburg, afterwards in the Conciergerie. In priſon he behaved with the moſt effeminate weakneſs; his health was impaired, and he gave way to unmanly lamentations. Pride prevented his making the loſs of life the apparent topic of his regret; he therefore affected concern about a comedy in five acts, which had been ſeized and ſent to the committee of public ſafety, and of which he was apprehenſive that Billaud de Varennes would aſſume the credit. At his trial he exhibited the ſame deſpondency; not even the heroiſm of Danton could animate him. In the cart he evinced the ſame feebleneſs of character, and died under the guillotine, on the 5th of April 1794.

E'GLE, or ÆGLE, *ſ.* in botany, a new genus in Dr. Roxburgh's Deſcription of the Plants of the Coaſt of Coromandel, ii. 2. 143. *Correa in Act. Soc. Lin.* v. 222. The generic characters are—Trunk pretty erect; bark aſh-coloured; branches thin and irregular; thorns axillary, in pairs, ſingle, very ſharp and ſtrong; but ſometimes wanting. Leaves three'd; leaflets oblong, or broad-lanced, attenuated to a blunt point, crenulated, differing much in ſize, but the exterior one always the largeſt. Panicles as in FERONIA, but the flowers are much larger, and white, and ſuppoſed to be all hermaphrodite. Calyx and corolla, as in Feronia, (monophyllous, campanulate, quinque-partite, *Koenig.*) Filaments about forty, (thirty-two to thirty-ſix, *Koenig.*) Antheræ linear, erect, (acute, *Koenig.*) Piſtillum, as in Feronia. Berry conſiderably larger than in Feronia; ſmoother; ſhell much harder, from ten to fifteen celled, (twelve to ſixteen, *Koenig,*) the cells contain, beſides the ſeeds, a large quantity of an exceedingly tenacious tranſparent gluten, which, on drying, becomes very hard, but continues tranſparent; when freſh, it may be drawn out into threads of one or two yards in length, and ſo fine as to be ſcarcely perceptible to the naked eye. Seeds from ſix to ten in each cell, oblong, a little compreſſed, woolly, of a light-grey colour.

The only ſpecies is egle marmelos, the maredoo of the Telingas. This appears to be the *crateva marmelos* of Linnæus; and it is obſervable, that when this eminent botaniſt made it a crateva, he expreſſed much doubt of the fact, and predicted that it might, when better known, prove to be a diſtinct genus. It grows to a large tree; is a native of the mountainous parts of the coaſt of Coromandel, but met with ſometimes in the low lands; flowers during the hot ſeaſon. It is an aromatic tree; and, from the rind of the fruit, the Dutch on the iſland

of Ceylon prepare a perfume. The wood is of a light chocolate colour, much variegated with darker coloured veins; it is hard, durable, and used for a variety of purposes. The fruit, delicious to the taste and exquisitely fragrant, is not only nutritious, but possesses a laxative and aperient quality, confirmed by experience, which renders it particularly serviceable in habitual costiveness. The mucus of the seed makes a very good cement for several purposes.

E'GLETONS, a town of France, in the department of the Correze, and chief place of a canton, in the district of Tulle: five leagues north-east of Tulle.

EGLIN'GEN, a lordship of Germany, in the circle of Swabia, joining the county of Oettingen, and duchy of Neuburg, with a town of the same name, purchased by the prince of Tour-Taxis, for 200,000 florins. It pays twenty florins for a Roman month, and is taxed at five rixdollars thirty-six kruitzers. The town is six miles north of Dillingen, and six south of Norlingen.

EGLISAU', a town and bailiwic of Switzerland, in the canton of Zurich, on the Thur: fifteen miles north of Zurich.

EGLI'SE-NEUVE, a town of France, in the department of the Puy-de-Dome, and chief place of a canton, in the district of Besse: eight miles south of Besse.

EG'LOFF, or MEGLOFF, a lordship and principality of Germany, in the circle of Swabia, which pays sixteen florins for a Roman month, and is taxed at twenty-six rixdollars to the chamber of Wetzlar: the town of Egloff is four miles west of Isni.

To EGLO'MERATE, *v. n.* [from *e*, Lat. out of, and *glomero*, to gather into a round mass.] To unwind itself. *Not much used.*

E'GLON, [Heb. round.] A city of Palestine, in the tribe of Judah, situated in the low parts of that province. *Josh.* xv. 39.

EG'MONT, a town of Holland, on the sea coast: three miles south-west of Alcmaer.

EG'MONT BAY, a bay on the south-west of the island of St. John, in the Gulf of St. Lawrence. Lat. 46. 30. N. lon. 64. 0. W. Greenwich.

EG'MONT ISLAND, an island in the South Pacific Ocean, six miles long, and four broad, the land low and full of trees; discovered by captain Carteret. The Spaniards called it Santa Cruz. Lat. 19. 20. N. lon. 138. 30. W. Greenwich.

EGNA'ZIO (Batista), a learned Italian, whose true name was *Giambatista Cipelli*, born at Venice of poor parents about 1478. He received a literary education under Benedetto Brognolo and Francesco Bragadino; and at the persuasion of the latter, opened a private school of belles-lettres at Venice, when only eighteen years of age. His rising reputation and success excited the jealousy of Marcantonio Sabellico, public professor in the same city, who began to use all means of discrediting his rival. Egnazio retaliated by a severe censure of the labours of Sabellico on various ancient authors, which he published in 1502, under the title of *Racemationes*. He afterwards undertook to write new annotations upon the authors commented on by Sabellico; and, still further to vex him, opened a public school in the vicinity of his. It is to the honour of both these learned adversaries, that Sabellico on his death-bed, in 1506, sent for Egnazio, asked him pardon for the enmity with which he had treated him, and committed to his care his ten manuscript books of Examples, in order for their publication; and that Egnazio not only complied with this request, but pronounced his funeral eulogy. The Venetian republic mean time had conferred upon him the right of citizenship, with the title of notary; and as he had early embraced the ecclesiastical state, he was presented with the benefice of Gelarino, in the diocese of Trevigi. In 1511 he was appointed parish priest of St. Basso, and prior of the hospital of St. Mark in Venice. In 1515 he accompanied to Milan, four procurators of St. Mark, sent to compliment king Francis I. to whose honour Egnazio composed a panegyric, for which he was rewarded with a gold medal. On the death of Regio, public professor of eloquence at Venice, in 1520, he was elected, against several competitors, to the vacant chair, and was allowed to hold his school in the hospital of which he was prior. Such was the concourse from various parts to hear him, that he had sometimes more than five hundred daily auditors. He was also frequently consulted upon important affairs by the senators, who had a great opinion of his wisdom. He died in 1553, at the age of seventy-five, bequeathing his property and library to three noble Venetian families. Egnazio was an author in various walks. He composed Orations on several occasions; Epistles; the Panegyric above-mentioned; a treatise *De Romanis principibus vel Cæsaribus*, containing the lives of Roman emperors, from Julius Cæsar to Constantine Palæologus, and from Charlemagne to Maximilian I. a treatise On the Origin of the Turks; and a work in nine books, *De Exemplis Virorum illustrium*. But he principally employed himself in correcting and commenting upon the works of the ancients, in the editing of which he was of great use to the elder Aldus. His *Racemationes* have been inserted in Grutcr's *Lampas*.

EGN'BERG, a town of Germany, in the archduchy of Austria: eight miles north-east of Gmunden.

E'GOIST, *s.* [from *ego*, Lat.] A peculiar kind of Cartesian.—Hitherto Des Cartes was uncertain of every thing but his own existence, and the existence of the operations and ideas of his own mind. Some of his disciples, it is said, remained at this stage of his system, and got the name of *egoists*. *Reid.*

EGO'ITY, *s.* [*ego*, Lat.] The being or essence of I, or myself.

EGORBE'USK, a town of Russia, in the government of Riazan: twenty-eight miles north of Riazan.

EGOREVS'KOI, a town of Russia: forty miles north-east of Kologrin.

E'GOTISM, *s.* [from *ego*, Lat.] The fault committed in writing, by the frequent repetition of the word *ego*, or *I*; too frequent mention of a man's self in writing or conversation.—The most violent *egotism* which I have met with, in the course of my reading, is that of cardinal Wolsey's; *ego & rex meus*, I and my king. *Spectator.*

E'GOTIST, *s.* [from *ego*, Lat.] One that is always repeating the word *ego*, *I*; a talker of himself.—A tribe of *egotists*, for whom I have always had a mortal aversion, are the authors of memoirs, who are never mentioned in any works but their own. *Spectator.*

To E'GOTIZE, *v. n.* [from *ego*, Lat.] To talk much of one's self.

E'GRA, or CHEBBE, a town of Bohemia, in the circle of Saatz, formerly imperial, and in possession of towns and villages; it yet preserves some valuable privileges, and contains a college and three convents. Near it are some medicinal springs, exported in bottles sealed with the arms of the town. It was taken by the French in 1742, but retaken by the Austrians in 1743. The district to which it belongs at one time made part of the duchy of Bavaria, from which it was sold to the king of Bohemia: seventeen miles south-west of Elnbogen, and seventy-six west of Prague. Lat. 49. 59. N. lon. 39. 9. E. Ferro.

E'GRA, or EGER, a river which rises in the marggraviate of Culmbach, and runs into the Elbe near Leitmeritz in Bohemia.

EGRE'GIOUS, *adj.* [*egregius*, Lat.] Eminent; remarkable; extraordinary.—He might be able to adorn this present age, and furnish history with the records of *egregious* exploits both of art and valour. *Moore.*

One to empire born;
Egregious prince; whose manly childhood shew'd
His mingled parents, and portended joy. *Philips.*

Eminently bad; remarkably vicious. *This is the usual sense.*—We may be bold to conclude, that these last times, for insolence,

J. Pass sculp.t

The Egle Marmelos; the Empis livida; and three Species of Enchelis.

London. Published as the Act directs. Aug.t 1.st 1804. by J. Wilkes.

infolence, pride, and *egregious* contempt of all good order, are the worſt. *Hooker.*

And hence th' *egregious* wizzard ſhall foredoom
The fate of Louis and the fall of Rome. *Pope.*

EGRE'GIOUSLY, *adv.* Eminently; ſhamefully.—He diſcovered that, beſides the extravagance of every article, he had been *egregiouſly* cheated. *Arbuthnot.*

EGREGOR'SIS, *ſ.* [from εγεγορεω, Gr. to watch.] An uneaſy watchfulneſs; a morbid want of ſleep.

E'GREMONT, an ancient town in the county of Cumberland, ſituate on the banks of a ſmall river that falls into the ſea, near the promontory of St. Bees. It was formerly a borough, and ſent a member to parliament in the reign of Edward I. but never after; for, the burghers becoming unwilling to pay the burgeſſes their wages, they, to free themſelves from the burden, petitioned the king that they might be exempted from that charge. Here are the ruins of a caſtle finely ſituated, with juſt as much of it preſerved as is convenient for the earl of Egremont to hold a court in. Egremont is well watered. Its market, which is on Saturdays, is plentifully ſupplied with barley and oats. It has a fair on the 19th of September. Its diſtance from London is 299 miles. It gives the title of earl to the family of Wyndham.

This place bears the ſtrongeſt features of antiquity, ſeveral of the houſes being piazzaed in front. The remains of the caſtle is ſituated on a remarkable eminence; and bears ſingular marks of ſtrength. One cannot enter a place where ſuch veſtiges of ancient magnificence are ſeen, and where every object ſtrikes the eye with proofs of former pomp and power, and of preſent deſertion, decay, and deſolation, without various ſenſations of feeling and reflection. A contemplative viſitor is apt to exclaim, How fluctuating are the affairs of man! how changeable are all ſublunary things! theſe towers ſubmit to the ravages of time, and this once impregnable fortreſs yields itſelf to every aſſailant. How are thy honours waſted, and thy pride brought low! thy military powers are no more, and thy magnificence ſinks in the duſt! the ſhouts of victory are no longer re-echoed from thy walls, the voice of feſtivity hath forſaken thee! authority and rule are rent from thy hands, and thy conquering banners are delivered up to the deſtroying hand of time, who yields them to the darkneſs of oblivion! thy towers are no longer the abode of ſtrength, nor thy chambers of ſecurity! where the haughty hero trod, returning with the ſpoils of war, and the honours of victory, amidſt the acclamations of his troops, the lazy aſs now ſtands in his mid-day dream, ſhadowing his drowſy eye with heavy ear! tribulation takes the ſeat of hoſpitality; and, where the jocund gueſt laughed over the ſparkling bowl, adders hiſs, and owls ſing the ſtrains of melancholy to the midnight moonſhine, that ſleeps upon thy mouldering battlements!

E'GREMONT, a townſhip of the American States, in Berkſhire county, Maſſachuſetts, incorporated in 1760: fifteen miles ſouth-weſt of Stockbridge, and 145 weſt of Boſton.

E'GRESS, *ſ.* [*egreſſus*, Lat.] The power or act of going out of any place; departure:

Gates of burning adamant,
Barr'd over us, prohibit all *egreſs*. *Milton.*

EGRES'SION, *ſ.* [*egreſſio*, Lat.] The act of going out.—The vaſt number of troops is expreſſed in the ſwarms; the tumultuous manner of iſſuing out of their ſhips, and the perpetual *egreſſion*, which ſeemed without end, are imaged in the bees pouring out. *Pope.*

E'GRET, *ſ.* A water-fowl of the heron kind. See ARDEA.

E'GREVILLE, a town of France, in the department of the Seine and Marne, and chief place of a canton, in the diſtrict of Nemours: three leagues ſouth-eaſt of Nemours.

E'GRIOT, *ſ.* [*aigret*, Fr. perhaps from *aigre*, ſour.] A ſpecies of cherry.—The cœur-cherry, which inclineth more to white, is ſweeter than the red; but the *egriot* is more ſour. *Bacon.*

EGRISEL'LES, a town of France, in the department of the Yonne, and chief place of a canton, in the diſtrict of Sens: ſeven miles ſouth of Sens.

E'GRITUDE, *ſ.* [from *æger*, Lat. ſick.] Sickneſs. *Not much uſed.*

EGUIL'LES, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the diſtrict of Aix: two leagues north-weſt of Aix.

EGUIMU'HA, or ELGIMUHA, a town of Africa, in the empire of Morocco, at the foot of mount Atlas, near which is an iron mine.

E'GUISHEM, a town of France, in the department of the Upper Rhine, and chief place of a canton, in the diſtrict of Colmar: three miles ſouth-weſt of Colmar.

E'GULA, *ſ.* A ſort of ſulphur uſed in working woollen cloth, which makes it ſoft and white.

EGUREN'DE, a town of France, in the department of the Correze, and chief place of a canton, in the diſtrict of Uſſel: four leagues north-eaſt of Uſſel.

To EGUR'GITATE, *v. a.* [*egurgitare*, Lat.] To empty or diſgorge.

E'GUZON, a town of France, in the department of the Indre, and chief place of a canton, in the diſtrict of Argenton: three leagues ſouth of Argenton.

E'GYPT, a country of Africa, celebrated in all ages as the firſt ſeat of the ſciences, and the fountain from whence originally flowed every ſpecies of valuable learning. Its hiſtory becomes doubly intereſting to the Chriſtian and Engliſh reader, not only from its intimate connection with numerous paſſages of the holy ſcriptures, but likewiſe on account of the recent events which have occurred in that diſtant region. For theſe reaſons we ſhall be, perhaps, more circumſtantial in our details of this article, than the circumſcribed limits of our plan will generally allow.

Egypt is bounded on the north by the Mediterranean, on the eaſt by the Red Sea and the iſthmus of Suez, on the ſouth by mountains, which ſeparate it from Nubia, and on the weſt by the deſerts of Lybia. Its length from north to ſouth is about 500 miles, its breadth, including the greater and leſſer Oaſis, about 250. Egypt is now divided into Upper and Lower, the former extending in a long and narrow valley from Syene to Grand Cairo. Two ridges of mountains form the outlines of Upper Egypt, running along each ſide of the Nile till, reaching Cairo, the weſtern ridge takes its courſe towards Alexandria, the other towards the Red Sea. Beyond theſe mountains, on each ſide, are deſerts; between them lies a long plain, whoſe greateſt breadth is not more than nine leagues. Down this valley rolls the Nile. Lower Egypt includes all the country between Cairo and the Mediterranean on the north and ſouth; and Lybia and the iſthmus of Suez to the eaſt and weſt; bounded by ſandy deſerts, it contains ſlips of land fertile and well cultivated on the borders of the river and canals, and in the center, that tract or iſland which is called *Delta*, formed by the branches of the Nile.

Ancient geographers divided Egypt into three parts, Upper, Middle, and Lower. The Upper Egypt was called by the Greeks *Thebais*, now *Said*, or *Al Said*, which extends from Syene to Manfalout; Middle Egypt, called by the Greeks *Heptanomis*, now *Voſtani*; and Lower Egypt, the beſt part of which was is *Delta*, now called *Bahira*, or *Rif*.

Among the famous cities that formerly embelliſhed Upper Egypt, we may enumerate, on the weſtern ſide of the river, Lycopolis, or the city of the Wolves; Hypſele, now called Aboutig; Aphroditopolis, or the city of Venus; Ptolemais; Abydus, celebrated for the magnificent palace of Memnon; Little Dioſpolis, or the city of Jupiter; Tentyra; Latopolis; Great Apollinopolis, and Elephantine: and on the oppoſite ſide of the river ſtood

Antæopolis; Paſſalus; Panopolis; Chemoboſcia; Cæne, or Neapolis; Apollinopolis, or the village of Apollo; and the celebrated Thebes; which vied with the moſt illuſtrious cities in the univerſe for its extent, wealth, and population. Previous to its deſtruction by Cambyſes, its extent is ſaid to have been no leſs than fifty-two miles and a half: ſo great was its wealth, that, after it had been plundered by the Perſians, three hundred talents of gold, and two thouſand three hundred of ſilver, were found among the remains of the pillage; and its population has been deſcribed with peculiar animation by Homer, who informs us, that from each of its hundred gates iſſued two hundred warriors with their horſes and chariots. Some authors have, indeed, ſuppoſed that by the gates here ſpoken of are to be underſtood either the temples of the city, or the palaces of certain powerful princes, but as this ſuppoſition is avowedly founded upon the aſſertions of modern travellers reſpecting the *ruins* of Thebes, we beg leave to obſerve, that Mr. Browne found ſufficient veſtiges, in 1792, to eſtabliſh a contrary belief. "From the roof of the great temple at Akſor," ſays he, "may be ſeen an inſulated maſs, toward the ſouth, which has apparently been a gate; and ſome other imperfect remains may be diſcovered with a teleſcope, in the directions weſt and north, under the ſame circumſtances; ſo that from the ſituation of theſe ruins, preciſely oppoſed to each other at the three cardinal points, it ſeems extremely probable that they were three of the gates belonging to the ancient city." Among the auguſt remains of this celebrated city, are ſome temples and palaces, which have triumphed over the corroding hand of time, and ſtill exhibit to the amazed ſpectator a profuſion of majeſtic columns, exquiſite ſtatues, and brilliant paintings. We cannot give a livelier idea of the ſtrong effects of their appearance upon a contemplative mind, than is expreſſed in the words of M. Sonnini, who viſited the ſpot in the ſummer of 1778: "It would be impoſſible," ſays this traveller, "to deſcribe the ſenſations I experienced at the ſight of objects ſo truly grand and majeſtic. It was not ſimply admiration, but an exſtacy which ſuſpended the uſe of my faculties: I remained a long time motionleſs with rapture, and was more than once inclined to proſtrate myſelf in veneration before monuments the erection of which ſeemed to ſurpaſs the genius and the powers of man. Coloſſal and other gigantic ſtatues, obeliſks, avenues formed by rows of ſphinxes which are ſtill viſible, porticoes of a prodigious elevation, immenſe colonnades, the pillars of which are ſome twenty and ſome thirty feet in circumference; paintings which ſtill retain an incomparable brilliancy; granite and marble laviſhed in the ſtructures; ſtones of aſtoniſhing dimenſions forming the magnificent roofs; and thouſands of proſtrate columns which literally ſtrew the ground, combine to ſtrike the beholder with equal admiration and amazement."

Middle Egypt was called *Heptanomis* on account of the ſeven nomes or prefectures into which it was divided. This part of Egypt was alſo celebrated for the magnificence of its cities, of which the moſt remarkable were Memphis, Acanthus, Heracleopolis, Arſinoe, and Antinopolis.—Memphis, ſuppoſed to have been founded by Menes the firſt Egyptian monarch, was for ſeveral ages the metropolis of the whole kingdom. This part of Egypt contains the principal of its curioſities, viz. the obeliſks, the pyramids, the labyrinth, the lake of Moeris, &c.

Lower Egypt contains not only the Delta, but alſo Mareotis and Alexandria to the weſt, and Caſiotis and Auguſtamnica toward the eaſt. Several places have been mentioned by the ancients as being ſituate in the Mareotic nome, but we find nothing relating to them worthy of notice. The famous city of Alexandria, which was formerly reckoned next to Rome for the grandeur of its buildings and richneſs of its materials, is ſituate between the lake Marea and the Canopic branch of the Nile. For a more particular deſcription of this and the other ancient cities of Egypt, ſee under their reſpective titles in this Encyclopædia.

At a ſmall diſtance from Alexandria was the iſland of Pharos, and the famous light-houſe or tower of the ſame name. The iſland Antirrhodes has been alſo mentioned by the ancients as lying at a ſhort diſtance from the ſhore, but this has been totally deſtroyed by the ſea. About three miles diſtant was the city of Nicopolis, greatly embelliſhed by Auguſtus after the defeat of Antony; and at the diſtance of one hundred and twenty ſtadia was Canopus, reputed infamous on account of the lewd diverſions which the Alexandrians there indulged in. On the narrow tract of land, between the ſea and the canal that runs from Alexandria to Canopus, were Zephyrium, the Leſſer Tapoſiris, and Thonis; and to the ſouth of Canopus ſtood Shadia, Anthylla, Momemphis, Andropolis, and Latona. The Delta is encompaſſed by the arms of the Nile, lying between the Canopic branch to the weſt, and the Peluſian to the eaſt. It is ſaid to have contained ſeveral famous cities, of which we enumerate Sais, once the metropolis of Lower Egypt, and celebrated for a magnificent temple of Minerva; Butus, famous for the oracle of Latona; Leontopolis, where particular adoration was paid to the lion; and Tanis, formerly honoured by the reſidence of the Pharaohs. Theſe are the chief cities in the Delta, which, together with the province of Al Feyyûm, may be regarded as the moſt fertile and beſt cultivated part of Egypt. It is now ſaid to contain 360 villages, and yields a variety of fruit in ſo great an abundance, that when a ſcarcity is experienced in other parts of the kingdom, the Delta is crowned with an exuberant produce. The other cities of Lower Egypt are Bubaſtus, which formerly contained a ſplendid temple of Diana; Babylon, ſaid by Joſephus to have been built on the ſite of the ancient Latopolis; Peluſium, called by Hirtius the key of Egypt, becauſe whoever was maſter of this city had a free paſſage into Egypt; and Heliopolis, or the city of the ſun, where a magnificent temple was erected to the great luminary of heaven, and where particular worſhip was paid to a bull under the name of Menevis.

ORIGINAL HISTORY.

No part of ancient hiſtory ſeems more abſtruſe than that of the firſt Egyptian monarchs. According to the account of its own hiſtorians, gods and demi-gods governed it ſucceſſively, through a ſeries of twenty thouſand years. But the abſurdity of ſuch an aſſertion is ſufficiently obvious. To theſe gods and heroes ſucceeded mortals as ſovereigns of Egypt, of whom Manetho has left us thirty dynaſties or principalities, which, if allowed to be ſucceſſive, make up a ſeries of time of more than five thouſand three hundred years, to the reign of Alexander the Great; but this is evidently erroneous: beſides, Eratoſthenes, the hiſtorian of Cyrene, has written a catalogue of thirty-eight kings of Thebes, all different from thoſe of Manetho. Much labour has been uſed by the literati in attempting to clear up theſe difficulties; but it is generally ſuppoſed that the kings of theſe dynaſties did not reign ſucceſſively, but many of them at the ſame time, and in different parts of Egypt.

Pharaoh, in ſcripture hiſtory, is the common name of the early kings of Egypt. Joſephus ſays, that all the kings of Egypt, from Minæus, the founder of Memphis, who lived ſeveral ages before Abraham, have always had the name or Pharaoh, down to the times of Solomon, for more than 3300 years. He adds, that in the Egyptian language, the word *Pharaoh* ſignifies *king*; and that thoſe princes did not aſſume this name but when they aſcended the throne, at which time they quitted alſo their former name. Hence, ſays Joſephus, Herodotus names none of the kings of Egypt after Minæus, the builder of Memphis, though he had 330 kings for his ſucceſſors, becauſe they had all the name of Pharaoh; but becauſe this name did not paſs

to women alſo, he names an Egyptian queen, Nicaule, who ſucceeded them. Laſtly, I find, adds Joſephus, from the ancient records of our nation, that from the age of Solomon no king of Egypt had any longer the name of Pharaoh. But Joſephus is not very accurate in this paſſage. True it is, Herodotus ſays, that Mines, or Minæus, was the firſt king of Egypt, and founder of Memphis; that there were 330 kings after him in Egypt; that after them there was a queen called Nicotris, and not Nicaule, as Joſephus writes it; but it is not true that theſe kings had no other name but Pharaoh. Herodotus ſays expreſsly, that in the books of the Egyptian prieſts were read the names and the catalogue of 330 kings; that in this number of 330 there were eighteen Ethiopians, and a woman that was a foreigner, called Nicotris, and that all the others were Egyptians. Theſe princes, therefore, had every one his proper name mentioned in the catalogue of the Egyptian kings, and which, in the order of this treatiſe we ſhall follow. So likewiſe we ſee in the fragments of Manetho, that every king of Egypt had a name peculiar to him; and we find the name *Pharaoh* only in ſcripture.

What Joſephus adds concerning queen Nicaule, or Nicotris, whom he pretends to be the ſame as the queen of Sheba, of whom mention is made in ſcripture, 1 Kings, x. 1, 2, &c. is entirely fabulous; and as to what he ſays, that ſince the time of Solomon the kings of Egypt have no longer had the name of Pharaoh, is manifeſtly falſe, ſince we ſtill find this name in the ſecond book of Kings, under Hezekiah, 2 Kings, xviii. 21; under Joſiah, xxiii. 29, 30, 33, &c. where this name is joined to Necho, which was the proper name of this prince; under Jehoiakim, xxiii. 35; and in the prophets Iſaiah, Jeremiah, and Ezekiel, who are much later than Solomon. It is very probable that the Egyptians gave the name of Pharaoh to their kings as long as the Egyptian language was in common uſe, and as long as their kings were of their own nation: but after the conqueſt of Egypt by Alexander the Great, and that the Grecians introduced their language with their government, the name of Pharaoh was known no longer among them, being ſupplied by that of *Ptolemy*, a title applied to the Greek monarchs who reigned over Egypt, as *Pharaoh* had before been to its native kings.

The firſt prince known to us by the name of Pharaoh was he in whoſe time Abraham went down to Egypt, when Sarah, who paſſed only for Abraham's ſiſter, was by the command of Pharaoh brought to his palace in order to become his wife. But the Lord ſmote Pharaoh and his family with great infirmities, and gave him to know that ſhe was Abraham's wife; whereupon Pharaoh ſent for Abraham, reſtored him his wife, and at the ſame time gave orders that he ſhould be conducted out of Egypt, with every thing that belonged to him. The ſecond Pharaoh ſpoken of in the ſcriptures is he that reigned when Joſeph arrived there. This prince, or his ſucceſſor, had the myſterious dream of the fat and lean kine, and the ſeven full and barren ears of corn, which Joſeph explained ſo well to his ſatisfaction, that he made him governor of his houſe and of all Egypt, reſerving only to himſelf the name of a king. This is the ſame Pharaoh that ſent for and entertained the patriarch Jacob and his family in Egypt, and gave them the land of Goſhen for their habitation. The third Pharaoh known in holy writ is he that perſecuted the Iſraelites. Moſes tells us that he was a new king, and had no knowledge of Joſeph, Exod. i. 8. This prince, obſerving that the Iſraelites were become very numerous and powerful, reſolved to depreſs them by hardſhip and labour; and ſet cruel and pitileſs taſkmaſters over them. But the more he oppreſſed them, the faſter they multiplied; inſomuch that he gave orders to the Egyptian midwives, who aſſiſted the Hebrew women in their labour, to put all the male children to death, and to ſave alive the females only. But this command was not executed. The midwives feared the Lord, and preſerved alive not only the female children, but the males alſo. Pharaoh, ſeeing this edict did not ſucceed, publiſhed a decree, Exod. i. 22. that all the male children born of Hebrew women ſhould be thrown into the Nile, and that only the females ſhould be ſpared. This order was rigorouſly executed; yet, by the providence of God, Moſes was preſerved, and even brought up in Pharaoh's own court, by his own daughter, who by chance had found the child as he was expoſed upon the Nile.

Moſes being grown up, and having killed an Egyptian who had abuſed an Hebrew, was obliged to fly from Egypt to avoid the death that Pharaoh had threatened to inflict upon him. Several years after, when about eighty years old, he returned again by an order from God, and performed the mighty miracles before Pharaoh. There is great probability that this Pharaoh, before whom Moſes appeared, and in whoſe ſight he ſmote Egypt with ſo many plagues, was a different perſon from him who would have laid hands on him after he had ſlain the Egyptian. This ſame Pharaoh having at laſt been compelled to ſend away the Hebrews, and to ſuffer them to go out of Egypt, purſued them at the head of his army with his chariots, and was drowned in the Red Sea, wherein he had raſhly entered in the eagerneſs of his purſuit. Hiſtorians pretend to give us the name of this Pharaoh; ſome, as Appion, call him Amoſis or Amaſis; Euſebius calls him Chenchris; Uſher calls him Amenophis; but we muſt not look for accuracy among vague conjectures.

The fifth Pharaoh known to us in the Bible, is he that gave protection to Hadad ſon of the king of Edom, who gave him to wife the ſiſter of his own queen, enriched him with lands, and brought up his ſon Genubah in his own court. Hadad returned to Idumea after the death of David. The ſixth Pharaoh is he that gave his daughter in marriage to Solomon king of the Hebrews, 1 Kings, iii. 1. and, having taken Gezer, he ſet it on fire, drove the Canaanites out of it, and gave it for a preſent to Solomon, in lieu of a dowry for his daughter, whom he had married to this prince, 1 Kings, ix. 16. The ſeventh is Shiſhak, who entertained Jeroboam in his dominions, a rebellious ſubject of Solomon, and offered him a refuge in oppoſition to the king his maſter. The ſame Shiſhak declared war againſt Rehoboam the ſon and ſucceſſor of Solomon, beſieged and took Jeruſalem, carried away all the king's treaſures, and thoſe of the houſe of God, and particularly the golden bucklers that Solomon had made. The eighth is that Pharaoh with whom Hezekiah made a league againſt Sennacherib king of Aſſyria, in the year of the world 3290. This Pharaoh is probably the ſame whom Herodotus names Sethon, prieſt of Vulcan, who came to meet Sennacherib before Peluſium, and to whoſe aſſiſtance Vulcan ſent an army of rats, which gnawed the bow-ſtrings and the thongs of the bucklers of Sennacherib's ſoldiers. The ninth is Pharaoh Necho, or Nechus ſon of Pſammiticus, who made war with Joſiah, and ſubdued him. Herodotus alſo mentions this prince. The tenth is Pharaoh Hophra, who entered into an alliance with Zedekiah king of Judah, and attempted to come to his aſſiſtance againſt Nebuchadnezzar king of Chaldea. It was againſt this Pharaoh that Ezekiel pronounced ſeveral of his prophecies. See *Ezek.* xxix. xxx. xxxi. xxxii. He is called Apries in Herodotus. He is alſo mentioned in Habakkuk, ii. 15. See alſo *Iſaiah*, xix. xx. and *Jeremiah*, xlvi. 16. We ſhall now give the ancient hiſtory of the Egyptian kings, from the records afforded us by profane authors.

Menes is generally acknowledged as the firſt king who ſwayed the Egyptian ſceptre. In his time the greateſt part of the country was a moraſs, till he diverted the courſe of the Nile, and founded the city of Memphis within the ancient bed of that river. He was the firſt who inſtructed the Egyptians in theology; introduced domeſtic luxury; and inſtituted magnificent feaſts.

Herodotus informs us, that the Egyptians had a catalogue

logue of three hundred and thirty monarchs, extending from Menes to Moeris, and that nothing worthy notice was recorded of any of them, except an Ethiopian woman named Nitocris: but Diodorus affirms, that the family of Menes ſucceſſively filled the throne for the ſpace of fourteen hundred years. As, therefore, we find ſo vaſt a chaſm in the accounts of both hiſtorians, we ſhall venture to fill it up, in part, with ſome tranſactions which evidently belong to that remote period. During the reign of Timaus king of Egypt, the government was ſubverted, and the country ſubdued, by a multitude of perſons from the eaſt, who poured forth like a torrent, and behaved in the moſt inhuman manner, extirpating the princes, burning the cities, demoliſhing the temples, and carrying the women and children into captivity. After ſatiating their cruelty by theſe atrocities, they elected a king from among themſelves, who choſe Memphis for the place of his reſidence; and, by placing garriſons in various parts, contrived to keep the upper and lower regions in ſubjection. He alſo fortified the eaſtern parts, to ſecure him from an invaſion of the Aſſyrians, who were at that time a powerful people. He rebuilt a city, in the Saitic nome, which was ſeated on the eaſtern bank of the river Bubaſtis, and, having ſurrounded it with a ſtrong wall, he placed a garriſon of twenty-four thouſand ſoldiers therein. On the deceaſe of Salatis, the throne was ſucceſſively occupied by Beon, Aphacnas, Apophis, Janias, and Aſſis, who, like their predeceſſor, endeavoured to deſtroy the whole nation of the Egyptians. Theſe invaders were called *Hyeſos*, or Shepherd kings, and are ſaid by Manetho to have held all Lower Egypt in ſubjection for the ſpace of two hundred and fifty-nine years, at the expiration of which they were obliged, by Amoſis king of Upper Egypt, to abandon their uſurped poſſeſſions.

According to the account of Diodorus, Buſiris in proceſs of time obtained the diadem, and was ſucceeded by eight princes of his line; the laſt of whom, called Buſiris the Second, founded the city of Thebes, and made it the capital of his kingdom. Oſymandyas occupies the next place; but it is equally uncertain whom he ſucceeded, or at what time he obtained the regal dignity. He is ſaid to have chaſtiſed the Bactrians for a revolt, with an army of four hundred thouſand foot and twenty thouſand cavalry: and his monument far exceeded the moſt ſplendid of thoſe which graced the royal city. It conſiſted of ſpacious courts, ſhrines, porticoes, temples, a library, and other buildings. The firſt court was 200 feet in extent and forty-five feet high. Next to this was a ſquare portico 400 feet long on each ſide, and ſupported by figures of animals of an extraordinary ſize: the ceiling was deſigned to repreſent the ſplendid canopy of heaven, being painted of an azure blue, and ſprinkled with a profuſion of ſtars. Beyond this portico was the ſecond court, ſimilar in extent and conſtruction to the firſt, but enriched with a variety of exquiſite ſculptures, three of which were deſigned to repreſent the royal founder, with his mother and daughter; and a fourth was erected in honour of his mother only, whoſe head was decorated with three crowns, in token of her illuſtrious birth, marriage, and progeny. This court led to a ſecond portico, the walls of which were covered with numerous ſculptures and paintings, repreſenting the king fighting at the head of his army, accompanied by a lion; the captives deprived of their hands as a puniſhment for their cowardice; the royal ſacrifices and triumph; and two gigantic ſtatues, each twenty-ſeven cubits high. From hence three paſſages led into a great hall ſupported by columns, and decorated with ſeveral repreſentations of parties engaged in law, and the diſcuſſion of cauſes before the aſſembly of judges. Next was a gallery in which were apartments ſtored with the moſt delicious refreſhments. Here was a ſtatue of the king, moſt curiouſly wrought and painted, in the act of preſenting to the gods the annual produce of the Egyptian mines, amounting to 3,200,000 minæ, or £6,000,000 of pounds ſterling. Not far from hence was a magnificent library with this appropriate inſcription: "The office for the diſeaſes of the mind:" and beyond the library was a ſumptuous edifice containing twenty couches, and the ſtatues of Jupiter, Juno, and the king. This was ſurrounded by ſeven pavilions ornamented with pictures of the ſacred animals; and from hence was the aſcent to the mauſoleum of Oſymandyas, which diſcovered an extraordinary magnificence, being encompaſſed with a circle of gold, one cubit broad, and 365 cubits in circumference; and this ring being divided by the days of the year, ſhewed the riſing, ſetting, and aſpects, of the ſtars, according to the Egyptian aſtrology.

Uchoreus, the laſt deſcendant of Oſymandyas who reigned in Egypt, is ſaid to have enlarged the city of Memphis; to have ſecured it from invaſion by mounds and trenches; and to have adorned it with ſeveral public buildings. He tranſlated the royal ſeat from Thebes to that city, and has been therefore regarded by ſeveral authors as its original founder.

Having followed Diodorus thus far in his account, we ſhall next relate what Herodotus has left upon record concerning Nitocris. This woman ſucceeded her brother, (an Ethiopian, who was murdered by the Egyptians, though they afterwards conferred the crown upon her,) and meditating revenge for his untimely fate, put many of her ſubjects to death privately, and afterwards contrived a ſubterraneous building, whither ſhe deluded the chief objects of her vengeance to a feaſt, and, in the midſt of their mirth, overwhelmed them with deſtruction, by turning the river upon them through a ſecret paſſage. She then eluded the rage of the populace by taking refuge in a place well fortified. Her perſon is ſaid to have been extremely beautiful, but her diſpoſition revengeful and cruel. Some authors ſuppoſe her to have erected the third great pyramid. After twelve generations, we find the throne of Egypt filled by Moeris, who dug the celebrated lake which bears his name, built a ſumptuous portico on the north ſide of Vulcan's temple at Memphis, and erected ſome other ſtructures.

Seſoſtris, the celebrated king of Egypt, being deſigned by his father for a great warrior, was in his early youth attended by all the male Egyptians of his own age, who, together with the prince, were inured to a hard and laborious life, that they might be able to ſuſtain the toils of war without repining. When he was more advanced in years, he was ſent, with his companions, againſt the Arabians, who had never been conquered. In this expedition he acquired a conſiderable ſhare of military knowledge; ſurmounted all the dangers and perils of a howling deſert; patiently endured the hardſhips attached to a dry and ſteril country; and finally compelled the enemy to bow to his reſiſtleſs arms. He was next ſent by his father to try his fortune weſtward, and he ſubdued the greateſt part of the African continent with the ſame facility that attended his enterprizes in Arabia. About this time his father died, leaving him the undiſputed ſucceſſion of the government. Seſoſtris immediately formed the deſign of conquering the world; but, previous to his quitting the kingdom, he provided for his domeſtic ſecurity by a generous and obliging behaviour towards his ſubjects at large, and by magnificent donations and remiſſions of puniſhments among his ſoldiers. He alſo divided the kingdom into thirty-ſix nomes or provinces, and beſtowed them on perſons of the moſt approved fidelity. Having taken theſe precautions, he levied forces equal to his great deſigns, and headed them with officers of known courage, who were chiefly ſelected from the companions of his youth; this army conſiſted of ſix hundred thouſand foot, twenty-four thouſand horſe, and twenty-ſeven thouſand armed chariots. Conſcious, however, that this amazing force was not adequate to his vaſt intentions, he broke through the ancient ſuperſtition of the Egyptians, and fitted out a fleet of 400 ſail, which was commiſſioned to vanquiſh the iſles and cities lying on the coaſts of the Red Sea; while the king himſelf,

ſelf, heading his land forces, obliged the nations of Ethiopia to pay him an annual tribute of ebony, gold, and ivory; and afterwards overran and pillaged all Aſia, and ſome part of Europe. He is even ſaid to have extended his victories beyond the Ganges, and to have advanced as far as the ocean. The Scythians were obliged to ſubmit to his authority. The ancient kingdom of Colchis was partly colonized by his followers; and his empire extended from the Ganges to the Danube. It was his cuſtom to erect pillars in every country he ſubdued, with an inſcription to this effect: "Seſoſtris, king of kings, and lord of lords, vanquiſhed this country by the power of his arms:" and theſe pillars were alſo marked with hieroglyphical figures, expreſſive of the courage or puſillanimity of the conquered nations.

Finding a ſcarcity of proviſions in Thrace, whither he had advanced in the progreſs of his conqueſts, he returned to Egypt laden with the ſpoils of various ſubjugated nations, and followed by a ſurpriſing multitude of captives. He now rewarded his officers and ſoldiers with a truly royal munificence, in proportion to their rank and merit; reſolving that thoſe who had been his companions in the toils of war, ſhould be enabled to paſs the remainder of their days in the full enjoyment of peace and plenty. While he thus provided for the future repoſe of his brave followers, he rendered his power highly advantageous to his ſubjects, by enriching their country with uſeful works and magnificent edifices. An hundred temples, raiſed as monuments of gratitude to the tutelar gods of all the cities, were the firſt and moſt celebrated teſtimonies of his ſignal ſucceſs; and, in the courſe of this univerſal undertaking, no Egyptian was employed, as appeared from an inſcription upon each temple to this effect: "No native laboured hereon." But he was particularly ſtudious of embelliſhing the temple of Vulcan at Memphis, in acknowledgment of that god's imaginary deliverance of himſelf and his family from fire, contrived by his own brother, at the period of his return from the wars.

To ſecure Egypt from the inroads of its neighbours, the Syrians and Arabians, he fortified all the eaſtern ſide with a wall that extended from Peluſium to Heliopolis, a diſtance of 187 miles and a half. He alſo raiſed a great number of lofty mounts, to which he removed ſuch towns as had formerly been injured by the inundations of the Nile; and cut on both ſides of the river ſeveral canals, which not only advanced the trade and proſperity of the kingdom, by affording an eaſy communication between the diſtant cities; but alſo rendered the country inacceſſible to the cavalry of its enemies, which in former times had haraſſed it by frequent predatory incurſions. But with reſpect to the kings and chiefs of the conquered nations, who waited upon him to preſent their tribute, his behaviour was groſsly inſolent; for he is ſaid to have cauſed theſe princes, four a-breaſt, to be harneſſed to his car inſtead of horſes, that they might draw him to the temple. A conduct ſo unworthy fails not to tarniſh all his warlike actions, and draws a cloud over the luſtre of his private virtues. Having loſt his ſight in his old age, this celebrated hero of antiquity laid violent hands on himſelf, and left the throne to his ſon Pheron.

This monarch, by ſome called Pheron, and by others Seſoſtris the Second, ſeems to have performed nothing to dignify his memory. Herodotus relates, that in an extraordinary inundation of the Nile, he capriciouſly took offence, and inſolently threw a javelin into the waters, as if he intended to chaſtiſe them for their encroachment upon his dominions; he was, however, immediately afflicted with a violent pain in his eyes, and ſoon after had the misfortune to be involved in total darkneſs. Several ages after this event, the government devolved to Ammoſis, whoſe reign was one continued ſcene of cruelty, violence, and oppreſſion. Many of his ſubjects were dragged to execution without cauſe; others were ſtripped of their poſſeſſions upon no other motive than his imperious will; and toward all he behaved with the moſt intolerable arrogance; till at length he was driven from the throne by the united exertions of the people, aſſiſted by Actiſanes, king of Ethiopia. Actiſanes united Egypt and Ethiopia under his government, bore his proſperity with prudence and moderation, and behaved in the moſt affectionate manner towards his new ſubjects. Having cauſed a general ſearch to be made after the Egyptian robbers, he commanded their noſes to be cut off, and then baniſhed them to the remoteſt part of the deſert, between Syria and Egypt, where he built them a town, which, from the mutilation of its inhabitants, was diſtinguiſhed by the name of Rhinocolura.

On the deceaſe of Actiſanes, the throne was left at the diſpoſal of the Egyptians, and they elected Mendes for their king. His actions, however, were, in all probability, unworthy notice, as he is merely celebrated in hiſtory for building a ſepulchral labyrinth. After Mendes, enſued an interregnum for five generations, at the end of which a Memphite, of ignoble extraction, was exalted to the throne. The prieſts characterized him as a magician, and pretended that he could aſſume whatever form he pleaſed. His Egyptian name was Cetes, which the Greeks rendered Proteus. During his reign, Paris and Helen were driven by contrary winds on the coaſts of Egypt, in their paſſage to Troy; but when the Egyptian monarch underſtood the perfidious breach of hoſpitality the young Trojan had committed, he commanded him to quit his dominions within three days; at the ſame time detaining Helen and her huſband's treaſures, till they might be reſtored to the injured owner.

Rhampſinitus, the ſon and ſucceſſor of Proteus, was of ſo avaricious a diſpoſition, that Diodorus aſſerts, his conduct during his whole reign, was rather that of a mean-ſpirited ſteward than of a wealthy king. The ſame author informs us, that he was never at any expence either for the honour of the gods or the welfare of his people, but that his whole delight was in the augmentation of his private fortune, which, at his deceaſe, amounted to no leſs than 400,000 talents. He is, however, ſaid to have been a ſtrict obſerver of that good order which had hitherto ſubſiſted throughout the kingdom, from its firſt foundation. This king was ſucceeded by ſeven others, all of ignoble character, except Nilus, who is celebrated for the great number of canals he dug in the country, and for his endeavours to render the advantages of the Nile as general as poſſible, for which reaſon the river that had been formerly called Egyptus, was now firſt called by his name.

Cheops is branded in the page of Egyptian hiſtory for his tyranny and impiety. He began his reign with ſhutting up the temples, and forbidding all public ſacrifices; he then boldly ſubverted the laws, invaded the liberties of his people, and reduced them to a ſtate of the moſt abject ſlavery; numbers of them were ſent to work in the Arabian quarries, and others burdened with the labour of raiſing the largeſt of the pyramids. By this and other works of oſtentation, the king was reduced ſo low, that he expoſed his daughter to proſtitution for the ſake of gain. She complied with his injunctions, and is ſaid to have required each of her gallants to contribute a ſtone towards a ſmall pyramid which ſhe built, after her father's example, to perpetuate her memory. This tyrannical prince, having reigned fifty years, was ſucceeded by his brother Cephrenes, whoſe actions were ſtrictly conſonant with thoſe of his predeceſſor. He alſo erected a pyramid, but its dimenſions were conſiderably ſmaller than thoſe of the other. He reigned fifty-ſix years, and left orders that his remains ſhould be depoſited in his pyramid; but neither this king nor Cheops obtained their wiſh in this reſpect, as their friends, dreading the rage of the populace, buried them in ſilence and obſcurity.

Egypt having thus groaned under the ſway of tyrannical power for the ſpace of one hundred and ſix years, was next governed by Mycerinus, the ſon of Cheops, who, being

ing of a merciful diſpoſition, and abhorring the impiety of his deceaſed relatives, opened the temples, reſtored the ſacrifices, encouraged his people to follow their reſpective avocations with avidity, and cheerfully redreſſed the injured, to the beſt of his ability. This conduct might naturally have been ſuppoſed to have drawn down bleſſings upon his perſon and family; but, on the contrary, his lovely daughter was torn from his arms by death, and the oracle at Butus pronounced that his own life ſhould continue but ſix years more. In conſequence of this prediction the king ſent to remonſtrate with the oracle, alleging that his father and uncle, who were monſters of impiety, had been bleſſed with length of days; while he, who had reverenced the gods, and acted with juſtice and humanity towards his ſubjects, was requited with ſo ſevere a ſentence. To this expoſtulation the oracle replied, that Cheops and Cephrenes were acquainted with the decree of fate which had doomed the Egyptians to one hundred and fifty years of ſevere miſery, and had acted conformably thereto; but, as the preſent reign had interrupted the courſe of the deſtined affliction, it muſt therefore be ſuddenly terminated. Mycerinus, finding his doom irrevocable, reſolved to make the moſt of his allotted time, and ordering a ſplendid illumination to be prepared every night, ſo that he devoted the whole of his time to feaſting and revelry, thenceforward making no diſtinction between day and night. He is alſo ſaid to have erected a pyramid, which, from the baſis to the middle, was of Ethiopian ſtone, inſcribed on the northern front with the name of the royal founder.

Though we are unable to fix with accuracy the time of his ſucceſſion, we ſhall procced to notice Gnephactus, a king renowned for his temperance, and for the execration he denounced againſt Menes, who firſt introduced exceſs and luxury among the Egyptians. This execration reſulted from the ſalutary repoſe which Gnephactus enjoyed, after a day of fatigue and ſlender diet, in the midſt of a barren deſert; and, by conſent of the prieſts, it was engraved upon a pillar in the temple of Thebes.

Bocchoris, the ſon of this abſtemious prince, was ſurnamed the Wiſe, on account of his great prudence and knowledge; though his perſonal appearance is ſaid to have been ignoble. He is called the fourth Egyptian lawgiver; and his excellent deciſions were retained for ſeveral ages after his death. The luſtre of his qualities was, however, tarniſhed by his inordinate love of money; and he drew a general odium upon himſelf, by letting in a wild bull to the ſacred animal called Mnevis, though the latter obtained a complete victory over his antagoniſt. Previous to this event, Bocchoris was highly venerated by his ſubjects, but at laſt he was taken captive by Sabbaco the Ethiopian, and burnt to death.

Aſychis, whom ſome authors ſuppoſe to have been the ſame with Bocchoris, is ſaid to have built the eaſtern portico to the temple of Vulcan with peculiar magnificence; to have erected a pyramid of brick, on which appeared a vaunting inſcription; and to have enacted a law, whereby a man might borrow money on the dead body of his father. The throne was now filled by a blind man named Anyſis, who, on the invaſion of his kingdom by Sabbaco, fled for ſhelter to the fens. Sabbaco, who is ſaid to have condemned the unhappy Bocchoris to the devouring flames, no ſooner found himſelf eſtabliſhed in his new dignity, than he laid aſide his cruelty, and became a pattern of clemency and benevolence. He was excited to the invaſion of Egypt by a dream, which aſſured him that he ſhould hold that country for the ſpace of fifty years. During his continuance in Egypt, he exhibited the brighteſt proofs of wiſdom and piety, and ſtudied to render his power ſerviceable to all his ſubjects. At length, however, he had a viſion in his ſleep, wherein the tutelar god of Thebes informed him that he could no longer retain the Egyptian diadem with happineſs and ſecurity, unleſs he maſſacred the prieſts as he paſſed through them with his guards. In conſequence of this viſion he ſent for the prieſts, and reſigning the crown, which he had now held for the promiſed term of fifty years, he returned into Ethiopia. On this Anyſis came forth from his hiding-place, and re-aſſumed the reins of government, having formed an iſland during his long abſence, compoſed of earth and ſand, in the midſt of the Nile, for his habitation.

Sethon king of Egypt, and prieſt of Vulcan, injuriouſly diveſted the military order of their lands and ancient privileges; in conſequence of which they thought themſelves abſolved from their allegiance, and determined not to bear arms under his command. In this ſtate of affairs, Egypt was threatened with an invaſion by Sennacherib king of Aſſyria. Sethon, perceiving his danger, had now recourſe to the men whom he had treated with ſuch injuſtice; but, finding them obſtinate in their determination, he repaired to his god, and in the deepeſt diſtreſs implored aſſiſtance. Whilſt he was in the temple he fell into a deep ſleep, during which he imagined Vulcan ſtood before him, exhorting him to march againſt the enemy, promiſing to crown his efforts with a complete victory. Animated by this dream, he aſſembled a body of tradeſmen, labourers, and artificers, and boldly commenced his march towards Peluſium. The night after his arrival, an infinite multitude of field rats entered the enemy's camp, and gnawed the quivers, ſhield-ſtraps, and bow-ſtrings, to pieces; in conſequence of which Sethon purſued them with great ſlaughter, and, in memory of the miraculous event, erected a ſtatue of ſtone in the temple of Vulcan, holding a rat in one hand, and bearing an inſcription to this effect: "Whoever beholdeth me, let him learn to reverence the gods." Such is the account given by Herodotus; but we are inclined to ſuppoſe, with M. Rollin, that this ſtory is merely an alteration of that which is narrated in the ſeventeenth chapter of the Second Book of Kings. We there read that Sennacherib king of the Aſſyrians, having vanquiſhed all the neighbouring nations, deſigned to beſiege Hezekiah in Jeruſalem. The Jewiſh miniſters, alarmed for their own ſafety, ſent (in oppoſition to the advice of their prince and the prophet Iſaiah) to the Egyptians and Ethiopians for aſſiſtance. Theſe armies united and marched immediately to their relief; but were overthrown in a pitched battle by the Aſſyrians, who purſued them into Egypt, and plundered the country. At his return from thence, on the very night preceding his intended aſſault of the holy city, he loſt one hundred four-ſcore and five thouſand men, by the immediate judgment of God, placed in the hands of the deſtroying angel. This was the real fact; but, as it was no ways honourable to the natives of Egypt, they endeavoured to turn it to their advantage by corrupting the circumſtances, and weaving it into the tale recited by Herodotus.

After the death of Sethon, Egypt was divided into twelve kingdoms, and as many nobles ſeized on the government of the ſtate. Theſe kings entered into the ſtricteſt aſſociation for the public welfare, and built the famous labyrinth, in order to perpetuate their names to the lateſt ages. Their government was for a conſiderable time attended with peace, and their regulations were productive of ſatisfaction and harmony; till at length, being all aſſembled in the temple of Vulcan, Pſammetichus preſented his libation in his helmet, the high-prieſt having neglected to provide him with a golden bowl. This occurrence, though purely accidental, was obſerved by the other kings as an inauſpicious augury reſpecting their future fortunes, as they immediately recollected that an oracle had affirmed, the man who ſhould offer his libation to Vulcan in a brazen cup, ſhould be king of all Egypt. They thought it therefore prudent to ſecure themſelves from his attempts, and unanimouſly agreed to baniſh him into the fenny parts of the country. Pſammetichus withdrew in purſuance of his ſentence, but ſent to the oracle of Latona, to enquire by what means he might hope for redreſs. The oracle affirmed, in anſwer, that

that brazen men would ſuddenly ariſe from the ſea and avenge the ſeverity of his treatment. This declaration was regarded as an abſurdity; but, not long after, ſome Grecians, Carians, and Ionians, landed in braſs-armour, which Pſammetichus conceiving to be the accompliſhment of the myſterious prediction, immediately engaged the ſtrangers by large promiſes to ſtay with him, and uniting them with ſuch Egyptians as eſpouſed his cauſe, he obtained a deciſive victory over the eleven kings, and ſeized on the whole kingdom for himſelf. Thus was the duodecemvirate diſſolved, after it had continued fifteen years.

Pſammetichus, thus poſſeſſed of the throne without a rival, in the year before Chriſt 670, is ſaid to have reigned with as much policy, wiſdom, and magnificence, as any of his predeceſſors. He rewarded his allies to the full extent of his promiſe. He alſo gave them certain lands on each ſide of the Nile, and honoured them with the tuition of ſeveral young Egyptians who were deſirous of learning the Greek language. Herodotus informs us, that he built the ſouthern portico to the temple of Vulcan, and raiſed a magnificent edifice for the reception of the god Apis. The partiality expreſſed by this monarch towards the foreigners who placed him on the throne, was ſo obnoxious to the Egyptians, that two hundred thouſand of them quitted his ſervice at once, and removed, in ſpite of every remonſtrance, to the territories of Ethiopia. Pſammetichus, however, contrived to repair this loſs by opening his ports to all ſtrangers, in oppoſition to the reſerved maxims of his predeceſſors, and by entering into an advantageous alliance with the Athenians and other Greek nations. After a reign of fifty-four years he died, and was buried in the temple of Minerva, at Sais. He is celebrated for the ſiege he laid to Azotus in Syria, which held out againſt the whole power of Egypt for twenty-nine years; and he is ſaid to have been the firſt king who ſent perſons to diſcover the ſprings of the Nile. It was this prince alſo, who, being anxious to prove whether the Egyptians were in reality the moſt ancient nation upon earth, cauſed two children born of poor parents to be brought up in a hovel, under the care of a ſhepherd, who was to nouriſh them with goats milk, and to ſeclude them carefully from every other human being, that they might never have an opportunity of hearing an articulate ſound. At the end of two years, as the ſhepherd was one day entering the hut to feed theſe children, they both extended their little hands towards him, crying out at the ſame time *beckos*, *beckos*. They were immediately taken to court, that the king might hear them ſpeak; and after much enquiry it was found that the Phrygians called bread by the name of *beckos*. The Egyptians were therefore obliged to reſign the honour of antiquity, or rather of priority, to the Phrygians.

On the deceaſe of Pſammetichus, before Chriſt 616, the ſceptre devolved to his ſon Nechus, the Pharaoh-Necho of the ſcriptures, a prince of an enterprizing genius. In the commencement of his reign, he attempted to cut a canal that might unite the Red Sea with the Nile; but, after much expence and labour, he was warned by an oracle to deſiſt. He accordingly gave up his deſign; built a fleet of galleys in the northern ſea, and another in the ſtraits of the Arabian gulf; and ſent out ſome of the moſt expert Phœnician mariners, upon a diſcovery of the African coaſts. He was not only great at ſea, but formidable alſo by land. The ſcripture expreſsly ſays, that he went out againſt the king of Aſſyria. In this expedition he was oppoſed by Joſiah, who was mortally wounded in the valley of Megiddo. The conqueror then proceeded to the banks of the Euphrates, ſubdued the city of Carchemiſh, and, at the expiration of three months, returned towards Egypt. Hearing that Jehoahaz had raiſed himſelf to the throne in Jeruſalem, he ordered him to appear before him at Riblah in Syria, where he loaded him with chains, and ſent him priſoner into Egypt. He then viſited Jeruſalem; made Eliakim king over Judah, changing his name to Jehoiakim, and impoſing on him a tribute of one talent of gold and a hundred talents of ſilver. Thus he became maſter of Judea and Syria; and, in commemoration of his good fortune, he conſecrated to Apollo the garments which he had worn in his moſt ſplendid engagements. His enjoyment of theſe new acquiſitions was, however, but of ſhort duration; for, in a few years, he was defeated and ſtripped of all his poſſeſſions in Syria and Judea by Nebuchadnezzar king of Babylon, who undertook to drive the Egyptians from Carchemiſh, and recover the Syrian and Phœnician provinces. After this period, the actions of Nechus gradually dwindled into obſcurity, nor did he again attempt to quit the boundaries of his own kingdom. He died in the ſixteenth year of his reign, and left the kingdom to his ſon.

Pſammis, who began to reign in the year before Chriſt 600, held the regal dignity only ſix years; and hiſtory contains nothing reſpecting him worthy of mention, except that he made an expedition into Ethiopia. During this reign a ſplendid embaſſy was ſent by the Eleans to know whether the moſt ſage Egyptians could diſcover any defect in the Olympic games. The king accordingly called an aſſembly of the moſt judicious men in his dominions, who, having heard all that could be ſaid in favour of the inſtitution and its regulations, aſked the Eleans whether ſtrangers and citizens were both admitted to contend at their games; and, on the Eleans replying that they were open to any one, the Egyptians pronounced their conduct erroneous, ſince it was natural they ſhould favour their fellow-citizens more than foreigners.

Apries the ſon of Pſammis, and the Pharaoh Hophra of holy writ, entered into a league with Zedekiah king of Judah, againſt the king of Babylon. About two years after this tranſaction, which marked his acceſſion, he led an army to the relief of Jeruſalem, then cloſely beſieged by Nebuchadnezzar; but, finding that the Babylonian reſolved to give him battle, he retreated haſtily to his own country, and abandoned the Jews to the fury of their enemy. To puniſh this breach of faith, Ezekiel predicted that the Egyptians ſhould be confounded and deſolate for forty years, and that they ſhould gradually degenerate till they ſhould have no power to elect a monarch of their own. The ſcripture ſpeaks of Apries in very degrading terms, and finally threatens him with a violent death, which was his fate. The fulfilment of theſe prophecies are ſatisfactorily recorded, even by profane hiſtorians, who inform us that Apries, in conſequence of expoſing the Egyptians to a dreadful defeat, by ſending them to the relief of Andican king of Lybia, cauſed an univerſal defection among his ſubjects; that, in the hope of appeaſing the diſturbance by the mediation of his ſuppoſed friend Amaſis, he furniſhed the rebels with a valiant leader, whom they accordingly ſaluted king of Egypt; and that Apries, being vanquiſhed in a pitched battle near Memphis, was taken captive by the uſurper, who for ſome time treated him with great reſpect; but at length delivered him into the hands of the people, who ſtrangled him, and laid his body among his deceaſed anceſtors, in the temple of Minerva.

During theſe inteſtine commotions, Egypt was invaded by Nebuchadnezzar, who miſerably haraſſed the country, and led great numbers of its inhabitants into captivity. At length, however, he came to an accommodation with Amaſis, and quitted the kingdom with an immenſe booty, which had been promiſed him by the God of Iſrael in theſe words: "Nebuchadnezzar king of Babylon, cauſed his army to ſerve a great ſervice againſt Tyrus, yet had he no wages, nor his army for Tyrus. Therefore, thus ſaith the Lord God, I will give the land of Egypt unto Nebuchadnezzar king of Babylon, and it ſhall be the wages for his army."

Amaſis began to reign in the year 569 before Chriſt; and is generally believed to have been of plebeian extraction, upon which account he met with no reſpect from

from his ſubjects in the beginning of his reign. He, however, thought it prudent to ſubdue their temper by an artful mode of conduct, and to conciliate their affections by gentleneſs and reaſon. He cauſed a golden ciſtern, in which he uſed to waſh his feet, to be melted down and caſt into a ſtatue, which, by his expreſs order, was expoſed to public adoration. The people haſtened in crowds to perform their devotions before the new god, when the king informed them of the vile uſes to which it had once been applied, though it was now become an object of their worſhip. The application of this remark had the deſired ſucceſs, and the king was from that time treated with veneration. He attended cloſely to buſineſs during the morning, and devoted the reſt of the day to mirth and conviviality: but, as he ſometimes carried his gaiety beyond due bounds, his friends aſſured him that he would render himſelf contemptible by the unſuitableneſs of his conduct: to which he anſwered, that the mind of man required relaxation to preſerve its energy; and that it was as impoſſible to be always ſerious, as for a bow to continue always bent, without loſing its vigour. He built a magnificent portico to the temple of Minerva at Sais; founded the great temple of Iſis at Memphis; enriched the other celebrated temples with a profuſion of gifts and ornaments; and removed an edifice, conſiſting only of one ſtone, from Elephantina to Sais: two thouſand men were employed during the ſpace of three years in tranſporting this extraordinary edifice, which meaſured twenty-one cubits in front, fourteen in depth, and eight in height: the interior dimenſions were eighteen cubits, twelve, and five. So great was his fame for munificence and humanity, that when the Delphians endeavoured to raiſe a contribution towards the rebuilding of their temple, which had been deſtroyed by fire, he voluntarily gave them a thouſand talents of alum. He made an alliance with the Cyrenians, and married Ladice, the daughter of Critobolus. After the conſummation of his nuptials, he ſent a gilded ſtatue of Minerva and his own portrait to the city of Cyrene; to the city of Lindus he preſented two ſtone ſtatues of the ſame goddeſs; and to Samos he ſent two wooden images of himſelf, which were ſeen ſtanding ſeveral ages afterwards behind the gates of the great temple of Juno. To theſe particulars we may add, that he was the firſt prince who conquered Cyprus, and extorted a tribute from its inhabitants.

Hitherto we have ſpoken of Amaſis as a great and happy monarch, but we are now obliged to confeſs that his reign, however glorious in ſome particulars, was mixed with ignominy, and that his latter days were darkened by one of the moſt dreadful ſtorms that ever threatened the ſafety of Egypt. Xenophon aſſures us that Egypt was ſubdued by Cyrus; which muſt have been during this long reign. Herodotus aſſerts, that Amaſis and Cræſus were leagued together againſt Cyrus; and it is well known that Nebuchadnezzar almoſt ruined the whole kingdom; though no mention is made of this deſtruction by profane authors, who have either copied from the ancient records of Egypt, or depended upon the oral traditions of the Egyptian prieſts, men who would naturally exert themſelves to hide from every ſcrutinizing eye the foul diſhonour of their nation. Amaſis, having by ſome means exaſperated Cambyſes the Perſian, was threatened with an invaſion by that prince immediately after the death of Cyrus. At the ſame time Phanes of Halicarnaſſus, commander of the Grecian auxiliaries in the pay of Amaſis, quitted Egypt in diſguſt, and embarked for Perſia. Amaſis was juſtly alarmed at the gathering cloud, and was perfectly ſenſible how great a loſs he muſt ſuſtain in the defection of a man who, as a valiant captain, a judicious counſellor, and a perſon thoroughly acquainted with all his affairs, might ſtrengthen the hands of Cambyſes, and facilitate the deſtruction of Egypt. He therefore ſent a ſwift-ſailing galley to purſue the fugitive, who was overtaken at Lycia; but, having intoxicated his guard, he rendered abortive all the ſchemes of Amaſis, and proceeded without moleſtation to the court of Cambyſes. About the ſame period Amaſis, as if finally deſtined to accumulated misfortunes, renounced the friendſhip and alliance which had long ſubſiſted between himſelf and Polycrates, the tyrant of Samos. In conſequence of this prepoſterous behaviour, Polycrates offered to aſſiſt Cambyſes with a fleet of ſhips, in his purpoſed invaſion. Previous, however, to the commencement of the impending ſtorm, Amaſis paid the debt of nature, in the forty-fourth year of his reign; and left a diſtracted kingdom to his ſon.

Pſammenitus had ſcarcely aſſumed the enſigns of the regal office, when Cambyſes appeared on the frontiers with a powerful army, in the year before Chriſt 525. A body of forces was levied with all poſſible expedition, to elude the preſſing danger; but the Perſian laying ſiege to Peluſium, made himſelf maſter of that important city, without the leaſt oppoſition from the Egyptian garriſon. Immediately after the ſurrender, Pſammenitus advanced to ſtop the progreſs of his foe. Previous to the engagement, the Greeks who ſerved under Pſammenitus, anxious to expreſs their indignation againſt their faithleſs countryman, Phanes, brought his children into the camp, killed them before their father's face, and drank their blood in preſence of the two armies. This barbarity rouſed the Perſian ſoldiers to vengeance, and they immediately commenced their revenge with ſuch fury as ſoon put the Egyptian forces to flight, and covered the field with their dead bodies. Thoſe who eſcaped the ſlaughter fled to Memphis, where they tore a Perſian herald to pieces, and carried his limbs in triumph through the city. They were, however, ſoon beſieged by their inveterate foes, and compelled to ſurrender at diſcretion: when their enormities were retaliated by the public execution of the prime nobility, among whom was the ſon of Pſammenitus. The Egyptian monarch himſelf was taken captive, but Cambyſes reſtored him to his liberty, and would probably have entruſted him with the adminiſtration of affairs; but this forbearance made no impreſſion on his vindictive ſpirit, which thirſted for revenge on the conqueror; he was therefore condemned to drink bull's blood, and expired after a diſmal reign of ſix months, and a ſhort captivity. Cambyſes having thus brought Egypt under his ſubjection proceeded to Sais, the burying-place of the Egyptian kings; and having cauſed the dead body of Amaſis to be taken from the ſepulchre, he expoſed it to a thouſand indignities, and finally ordered it to be reduced to aſhes. He afterwards pillaged and burnt the Theban temples; killed the god Apis with his own hand; and ordered the prieſts to be ſeverely whipped. Theſe ſeverities made ſo ſtrong an impreſſion upon the minds of the wretched Egyptians, that they ever afterwards regarded the Perſians with the moſt irreconcileable averſion. In the reign of Darius Hyſtaſpis, they broke out into an open revolt, and remained in a ſtate of rebellion againſt the Perſians, till the ſecond year of Xerxes, when they were reduced to greater ſubjection than before, under Achæmenes, who was appointed their governor.

Their ſufferings, however, ſeem rather to have irritated than broken their ſpirits; as we find them revolting again, in the fifth year of Artaxerxes Longimanus, before Chriſt 450. As this period they perſuaded Inarus king of Lybia, to fill their vacant throne, and implored aſſiſtance from the Athenians, who embraced with ardour this opportunity of driving the Perſians from Egypt. Theſe auxiliaries attacking the Perſian fleet, took and deſtroyed fifty ſail of their ſhips; and then ſailed up the Nile, haſtened to join the Egyptian and Lybian forces, under the banner of Inarus. Having effected a junction, they ventured to attack the Perſian general, though his army conſiſted of three hundred thouſand effective men; and their attempt was crowned with ſuch ſucceſs, that a third part of the enemy were ſlain, together with the general himſelf, and the reſt fled to Memphis, where they

took refuge in the beſt fortified part of the city, called the White Wall. The Egyptians, elated with ſucceſs, ſuppoſed that they had completely delivered themſelves and their poſterity from the ſeverity of their oppreſſors: but, at the end of three years, during which they had blocked up the Perſians in the White Wall, they were defeated by Artabazus governor of Silicia, and Megabyzus governor of Syria. Inarus was wounded in the engagement, but he retreated with his Athenian allies, and the remnant of the Egyptian army to the city of Byblus, in the iſland of Proſopitis, where he ſuſtained a ſiege of eighteen months duration. The majority of the Egyptians laid down their arms, and acknowledged the ſovereignty of Artaxerxes; but Amyrtæus retreated with a body of men to the fens, where he enjoyed his government for ſeveral years without moleſtation, as the nature of the place ſecured him againſt all the attempts of the Perſians. Inarus and his adherents, in the mean time, were fully occupied in defending themſelves againſt the attacks of the enemy: but, at length, the latter having recourſe to ſtratagem, drained that branch of the Nile which contained the Athenian fleet, and thus effected a paſſage to the iſland. Inarus and the Egyptians now ſurrendered themſelves, on condition of being ſecured in their lives; but the Athenians ſet their veſſels on fire, and reſolved to ſell their lives at the deareſt rate: the Perſians, however, thought fit to offer ſuch terms as were accepted. At this juncture, a fleet of fifty Athenian ſhips appeared in the river, on behalf of the beſieged; but they were immediately deſtroyed by the Perſians, and with their deſtruction ended the war between Inarus king of Egypt, and Artaxerxes of Perſia, under whoſe government the Egyptians long remained quiet, and made no farther exertions for the recovery of their liberty during his reign. Sartamus was now left as governor of Egypt, and Inarus was carried to Suſa; where, in violation of the Perſian general's promiſe, he was condemned to the ignominious death of the croſs. Amyrtæus, the Saite, ſtill remained in poſſeſſion of the marſhy country; and in the fifteenth year of Artaxerxes, was joined by an Athenian fleet of ſixty ſail, but nothing worthy of notice was effected towards the extirpation of the Perſians.

In the tenth year of Darius Nothus, the diſcontent of the Egyptians again burſt through the barriers of reſtraint, and they revolted a third time. Amyrtæus being appriſed of their deſigns, was inſpired with the moſt enthuſiaſtic ardour in behalf of his diſtreſſed countrymen; and ruſhing from his ſequeſtered abode, put himſelf at the head of the Egyptians, and performed ſuch prodigies of valour, as effectually drove the Perſians beyond the frontiers, and left him monarch of the whole kingdom. Elated with ſucceſs, Amyrtæus reſolved to carry his arms into Phœnicia; that, in confederacy with the Arabians, he might drive the Perſians from thence alſo. This expedition, however, proved unfortunate to the Egyptian, who was engaged by Darius in perſon, and overthrown. Pauſiris the ſon of Amyrtæus, was now elected to the throne of Egypt, with the conſent of the Perſians; by which means the Egyptians, though probably tributary, experienced ſome alleviation of their misfortunes, under a governor of their own nation. Subſequent to this reign was that of Pſammetichus, a barbarous and ungrateful prince, who, hearing that Tamus, a Memphite by birth, had quitted the Perſian ſervice, and ſailed for Egypt, with his family and effects, fell upon him as an enemy, and cauſed him to be inhumanly murdered with all his followers, that his treaſures might be conveyed into the royal coffers. Nephereus, who next ſucceeded to the throne, ſent a ſquadron of an hundred galleys to aſſiſt the Lacedæmonians in their war againſt the Perſians, and ſupplied them with 600,000 buſhels of corn for the ſubſiſtence of their army; but the veſſels which carried this valuable preſent, were taken by the Perſian fleet at Rhodes, and never reached the place of their deſtination.

Acoris, the ſucceſſor of Nephereus, in the year before Chriſt 398, entered into a treaty againſt the Perſians, with the Tyrians, Barceans, Arabians, and the king of Cyprus. About the ſame time Gaus, the only ſurvivor of the family of Tamus, who, like his father, had been promoted to the rank of admiral in Perſia, quitted the ſervice, and, carrying with him a great part of the fleet and army, formed an alliance with the Egyptians and Lacedæmonians. But ſoon afterwards Gaus was aſſaſſinated by ſome of his followers; and other incidents conſpired to ſet aſide the deſigns which began to alarm the Perſian power. Thirty years after the acceſſion of Amyrtæus to the throne of Egypt, and the expulſion of the Perſians, Artaxerxes Mnemon threatened the Egyptians with a cruel war. Great preparations were accordingly made, and Acoris engaged a number of mercenaries under the command of Chabrias the Athenian; but, previous to the commencement of hoſtilities, Acoris died and left the kingdom to his ſon. Pſammuthis enjoyed the regal dignity but one year; and his actions ſeem to have been unimportant, as they are paſſed over in ſilence by hiſtorians. Nepherotes his ſucceſſor, reigned but four months. He is called the laſt of the Mendeſian race.

The ſceptre now devolved to Nectanebis, who, in the ſecond year of his reign, was invaded by the Perſian fleet and army. Owing, however, to the king's precautions, and the mutual jealouſies that ſubſiſted between the Perſian commanders, the attempt of the enemy was rendered abortive; and they were finally obliged to retreat, by the inundation of the Nile. Five years after this event, Ageſilaus king of Sparta, viſited Egypt in character of an ambaſſador, to requeſt ſuccours for the Lacedæmonians, who were ſeverely diſtreſſed by the Thebans: and, in ſeven years after this embaſſy, Nectanebis died. Tachos, the ſucceeding prince, collected all his forces, in order to fruſtrate the plans of his ambitious enemies, who had not relinquiſhed their hope of reducing Egypt. To ſtrengthen himſelf the more, he applied for ſuccour to the Lacedæmonians, who ſent him a conſiderable number of troops under the command of Ageſilaus; but Tachos conceiving an averſion to that able commander, violated his promiſe of appointing him generaliſſimo of the forces, and ſlighted thoſe counſels which might have preſerved Egypt from deſtruction. Having joined his mercenaries and Egyptians together, he marched imprudently towards Phœnicia, deſigning to attack the Perſians in that quarter; but, during his abſence, the Egyptians ſhook off their allegiance, and placed his kinſman Nectanebis on the throne. Ageſilaus eſpouſed the cauſe of the new monarch, and thus completed the ruin of Tachos; who fled through Arabia, and took refuge under the Perſian government.

Nectanebis had ſcarcely obtained the crown, when a Mendeſian came forth with one hundred thouſand men to wreſt the ſceptre from his hands. This rebellion increaſing daily in ſtrength, became at length ſo formidable, that the king ſhut himſelf up in one of his towers, till the beſiegers were defeated by Ageſilaus, who took the Mendeſian priſoner, and eſtabliſhed Nectanebis in the full poſſeſſion of his dominions. In the twelfth year of this reign, the Perſians made great preparations for the reduction of Egypt; but the Sidonians and Phœnicians entering into a confederacy with Nectanebis, formed a ſtrong barrier to his kingdom; ſo that it was impoſſible that the enemy ſhould approach without marching through Phœnicia. Upon this account, the Egyptian prince detached a body of Greek mercenaries to join the allies; who, being encouraged with the ſupply, expelled the Perſians from their territories, and were immediately after joined by the Cypriots, in their ſtruggle for complete liberty. Darius Ochus, appriſed of theſe circumſtances, reſolved to put himſelf at the head of his forces, and to inflict a ſevere chaſtiſement upon the unruly Egyptians; a deſign which was approved and forwarded by Mentor the Rhodian, who was perfectly acquainted with the con-

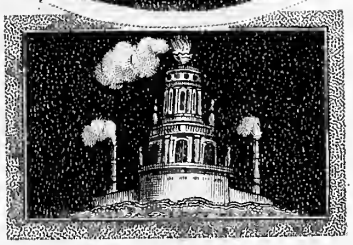
cerns of Egypt. Nectanebis, in the mean time, aſſembled an army of one hundred thouſand men, conſiſting of forty thouſand mercenaries, and the reſt Egyptians; but they did not altogether amount to a third part of the Perſian troops. With ſome of them he guarded the paſſes through which the enemy muſt approach, and the others were appointed to garriſon the frontier towns. Darius, on the other hand, detached three bodies from his army. The firſt, commanded by Lachares the Theban, ſat down before Peluſium; the ſecond, under the command of Nicoſtratus the Argive, ſailed up the Nile in a ſquadron of the Perſian fleet, and, landing at a convenient place, formed a ſtrong encampment in the heart of the country; and the third remained under the command of Mentor, in expectation of a favourable opportunity for their incurſion.—The whole kingdom being now alarmed at the poſition of Nicoſtratus, all the neighbouring garriſons undertook to force him from his entrenchments; but, after a long and obſtinate combat, the Egyptians were utterly overthrown and diſperſed. Upon the news of this defeat, Nectanebis abandoned the paſſes and marched haſtily to the capital, which he ſuppoſed Nicoſtratus would aſſault with his victorious fleet and army. This removal completed his ruin; for the Greek garriſon at Peluſium immediately ſurrendered to Lachares, upon condition that they and their effects ſhould be conveyed in ſafety to Greece: and Mentor the Rhodian, entering the country, affirmed publicly that Darius would receive with clemency all who ſubmitted, but take the moſt ample vengeance on thoſe who preſumed any longer to oppoſe him. The Egyptians, and Egyptian Greeks, immediately ſtrove which ſhould make the moſt ready ſubmiſſion; and Nectanebis, thus driven to deſpair, fled with his treaſures into Ethiopia, from whence he never attempted to return. From this time, before Chriſt 350, Egypt continued to be a province of Perſia, till that monarchy was ſubverted by Alexander the Great, who was in conſequence received by the Egyptians as their deliverer from the Perſian tyranny.

From the FOUNDATION of the MONARCHY of PTOLEMY SOTER to the REDUCTION of EGYPT by the ROMANS.

In the diviſion of the Macedonian empire, upon the death of Alexander the Great, Ptolemy Lagus was inveſted with the government of Egypt, Lybia, and part of Arabia; provinces which he retained during his life, and tranſmitted, with other acquiſitions, as an hereditary kingdom to his deſcendants. Hiſtorians differ materially in their aſſertions reſpecting the extraction of this prince; ſome affirming that he was a native of Eordea, a ſmall place in the province of Mygdonia, and that he was called Lagides, or the ſon of Lagus, though he was commonly believed to be an illegitimate ſon of king Philip; others ſuppoſing him to have been of the royal family of Macedon, not by the father, but his mother Arſinoe, who was nearly related to Philip; and others aſſuring us that he was of a mean deſcent, and that he ſerved in the Macedonian army as a common ſoldier, till his gallant behaviour induced Alexander to honour him with a chief command. Ptolemy himſelf ſeems to have preferred the name of Lagides to any other appellation, as he tranſmitted it to all his deſcendants; and Epiphanius tells us, that he inſtituted a military order in honour of his father, calling it from his name Lageion. But whatever was his real extraction, it is certain that he was equally beloved by Alexander and the army; and all the ancients have given him a moſt excellent character. He choſe the city of Alexandria for the place of his reſidence, and granted many privileges to all perſons who ſettled there, whether Greeks, Jews, or Egyptians; in conſequence of which it became one of the moſt wealthy and populous cities of the eaſt. Hence it is called by the ancients the ſecond metropolis of the world, the city of cities, the queen of the eaſt, a ſecond Rome, &c.

Though Ptolemy exerciſed the regal authority from the time of his appointment to the government, before Chriſt 304, he did not aſſume the title of king, till he found himſelf firmly ſettled in his new dignity, after the unſucceſsful attempts of Antigonus and Demetrius, which were relinquiſhed nineteen years after the death of Alexander. From this time he reigned twenty years, agreeable to Ptolemy's canon, and theſe with the nineteen aſcribed by that writer to Philip and Alexander Ægus, make up the thirty-nine years, which other authors ſuppoſe Ptolemy Lagus or Soter to have reigned alone. The name of *Soter* was firſt given to Ptolemy Lagus by the Rhodians on the following occaſion: Antigonus having projected the ſeizure of the iſland of Cyprus, which was then held by Ptolemy, demanded a ſquadron of ſhips from the Rhodians for the accompliſhment of his purpoſe; but as thoſe iſlanders were ſenſible of the great advantage which reſulted from their trade with Egypt, they refuſed to enter into any meaſures that appeared inimical to the intereſt of Ptolemy. Antigonus, in revenge, ſent his ſon Demetrius with a powerful fleet and army to reduce their iſland; but Ptolemy afforded ſuch ſuccours to the beſieged during the ſpace of a whole year, that Demetrius was obliged to conclude a peace upon honourable terms; and the Rhodians, in teſtimony of gratitude, conſecrated a grove to Ptolemy, and decreed that he ſhould be honoured with the name of *Soter* or Saviour, in commemoration of their happy deliverance. In the fortieth year of his reign he placed Ptolemy Philadelphus on the throne, declaring him his partner and ſucceſſor to the kingdom after his death. In this year, which was the firſt of the hundred and twenty-fourth olympiad, was finiſhed the famous tower in the iſland of Pharos; and the image of Serapis was brought to Alexandria, after Ptolemy had for three ſucceſſive years requeſted it of the king of Pontus without effect. Ptolemy Soter poſſeſſing a conſiderable ſhare of erudition, as appears from his hiſtory of Alexander, which was greatly eſteemed by the ancients, founded in that city an academy, or ſociety of learned men, who devoted their time to the ſtudy of philoſophy, and all other ſciences. For the uſe of theſe perſons, he made a collection of choice books, which gradually increaſed under his ſucceſſors to the fineſt library in the world. See ALEXANDRIA, vol. i. p. 273.

Toward the cloſe of the ſecond year of Philadelphus, before Chriſt 284, his father Ptolemy Soter expired, in the eighty-fourth year of his age, and the forty-firſt of his reign. He was revered as the beſt prince of his race, and left behind him an illuſtrious example of prudence, juſtice, and clemency, which none of his ſucceſſors were able to imitate. He retained the ſame unaffected eaſe and ſimplicity of manners in his royal dignity, as he had ſhown while in a private ſtation. He did not think himſelf degraded by converſing with the meaneſt of his ſubjects: the objects of oppreſſion had at all times a free acceſs to his perſon; and the injured party might ſafely look up to him for redreſs and protection. When he gave a public entertainment, he thought it no diſparagement to borrow plate of his friends, having no more of his own than was requiſite for his common uſe; and, when his courtiers obſerved that a monarch ſhould be better provided, he anſwered, that the magnificence of a king conſiſted in enriching others rather than himſelf. He had four wives, viz. Artonis, Thais, Eurydice, and Berenice. By the third of theſe he had Ptolemy Ceraunus, or the Thunderer, who, being the eldeſt of the male iſſue, was conſidered as the rightful heir to the crown; but Bereniee, whoſe wit and beauty had gained an aſcendancy over her royal conſort, prevailed upon him to exclude Ceraunus from the ſucceſſion, and to ſettle it upon her children; in conſequence of which, he reſolved to ſhare the throne in his life-time with her ſon Philadelphus, to prevent the wars that might otherwiſe ariſe between the brothers after his deceaſe. He had by Berenice four children, viz. Philadelphus, Argæus, Philoteria, and Arſi-



PTOLEMY SOTER.

noe. He had alſo iſſue by his other wives, Lenticus, Lagus, Irene, Ptolemais, and Lyſandra.

Ceraunus finding himſelf diſappointed in the regal ſucceſſion, quitted Egypt, and fled to the court of Seleucus Nicanor, where he was received in the moſt affectionate manner, and entertained with unbounded hoſpitality: yet the ungrateful wretch conſpired againſt his benefactor, and treacherouſly murdered him. He then ſeized the kingdom of Macedon, which Seleucus had recently wreſted from Lyſimachus; but, as he could not expect to enjoy theſe dominions in peace while the queen and children of Lyſimachus were alive, he formed the horrid reſolution of putting them to death, in order to free himſelf from any apprehenſions on their account. Arſinoe, the widow of Lyſimachus, though half-ſiſter to the uſurper, was well acquainted with his cruel temper; and had therefore abſconded with her children, on the death of Seleucus. Ceraunus, however, reſolved that ſo fine a woman ſhould not eſcape him; and therefore feigning a paſſion for Arſinoe, he offered to eſpouſe her, and to adopt her two children as his own. This propoſal was at firſt rejected, through dread of ſome unhappy conſequence; but Ceraunus, to obviate all ſuſpicion, repaired to a temple which the Macedonians held in the higheſt veneration, and there proteſted before the ſtatues of the gods and the friends of Arſinoe, that he entertained no thought inimical to the welfare of his ſiſter and her children. But no ſooner had the traitor attained his ends, than he threw off the maſk; cauſed the young princes to be aſſaſſinated in the very boſom of their diſtracted mother; and, ſtripping her of all her poſſeſſions, baniſhed her into Samothrace, with only two women to attend her. Such diabolical conduct might be naturally ſuppoſed to incur a dreadful retribution; and we accordingly find that this monſter of cruelty was taken priſoner the next year by the Gauls, and literally torn to pieces. After the death of Ceraunus, Arſinoe quitted the place of her baniſhment, and haſtened to the court of her brother Philadelphus, who, being ſtruck with her charms, exalted her to the participation of his throne, after he had divorced another woman of the ſame name, whom he had eſpouſed on his acceſſion to the crown, but whoſe jealouſy prompted her to ſome treaſonable deſigns. On the diſcovery of the plot, all the other conſpirators were executed; and the queen was confined for life to a province of Upper Egypt, bordering upon Ethiopia.

Pyrrhus king of Epirus, having been defeated in Italy by the Romans, and driven diſgracefully into his own country, Ptolemy Philadelphus was anxious to form an alliance with the conquerors, whoſe name began to be highly celebrated among foreign nations; and he accordingly ſent ambaſſadors to Rome for that purpoſe. This being the firſt time that any Egyptian had viſited Rome, the ſenate was greatly delighted to ſee foreigners come from ſuch a diſtance to ſolicit the friendſhip of their republic. They immediately diſpatched four ambaſſadors to Egypt, who met with a reception at Ptolemy's court ſuitable to their rank, and worthy the magnificence of an Egyptian monarch. At a ſplendid entertainment given by the king, each of them was preſented with a crown of gold, which they reſpectively accepted; but the very next morning they placed them on the ſtatues of Ptolemy, which were erected in the city. This contempt of wealth eſtabliſhed the reputation of the Romans in Egypt, but the king would not ſuffer them to depart without other tokens of his royal favour towards their republic and themſelves; however, they ſhowed the ſame diſintereſtedneſs on their return; for they depoſited all their preſents in the public treaſury, before they gave an account of their embaſſy to the ſenate.

Ptolemy who had for a long time enjoyed the ſweets of domeſtic tranquillity was, in the year before Chriſt 265, unexpectedly alarmed by the revolt of Magas, who had been regarded as one of the king's moſt faithful friends. This man was the ſon of Berenice, by a Macedonian officer, previous to her marriage with Ptolemy Soter, and in conſequence of her aſcendency over the mind of her royal conſort, ſhe had obtained for this ſon the government of Lybia and Cyrene. Magas having ſtrengthened himſelf in theſe provinces by long poſſeſſion, and an advantageous marriage with a princeſs of Syria, began to give vent to his ambition, and actually formed the deſign of driving his brother from the throne. With this intent, he marched at the head of a numerous army towards the capital, and obtained poſſeſſion of Paretonion in his way thither, but upon intelligence that the Marmarides had revolted from him, he abandoned his enterprize and returned home. The king, who was then with a great body of troops on the frontiers, had a favourable opportunity of cutting off the rebels, by falling upon their rear; but he was prevented from embracing it by a ſimilar revolt among the Gauls, whom he had taken into his ſervice, and who had now reſolved to ſeize the throne for themſelves. To obviate this danger, he haſtened back into Egypt, and ſhut up the conſpirators ſo effectually in an iſland of the Nile, that moſt of them periſhed either by famine or the ſword. Magas, after quelling the troubles which demanded his attendance at home, renewed his deſigns upon Egypt, and prevailed on Antiochus Soter, his father-in-law, to invade the country on one ſide, while he ſhould make an incurſion on the other. Theſe meaſures were however fruſtrated; for Ptolemy, who received private intelligence of all his motions, ſent a powerful force into the maritime provinces of Syria, which committed ſuch devaſtations as obliged Antiochus to relinquiſh his engagement, and Magas thought it moſt adviſable to withdraw his pretenſions. Ptolemy now began to turn his thoughts to the advancement of his people's proſperity; and to this end he reſolved to draw to Egypt all the trade of the eaſt, which the Tyrians had till this time carried on by ſea to Elath, and from thence by the way of Rhinocorura to Tyre. To effect this important deſign, Ptolemy built a city on the weſtern ſide of the Red Sea, from whence he ſent out his fleets to all the countries whither the Tyrians reſorted with their merchandize from Elath; but finding that the Red Sea was extremely dangerous, on account of its numerous ſhelves and rocks, he transferred the trade to the city of Myas-Hormos, near the frontiers of Ethiopia. To this place all the commodities of the different nations were conveyed by ſea, and from thence carried on camels to Coptus on the Nile, where they were again ſhipped for Alexandria; and diſpoſed of from that city all over the weſt, in exchange for the goods that were afterwards exported to the eaſt. Alexandria thus became the chief mart of all the trade that ſubſiſted between the eaſtern and weſtern countries, and continued to be the greateſt emporium of the world for upwards of one thouſand ſeven hundred years, till the paſſage was found out by the Cape of Good Hope. But as the road from Coptus to the Red Sea lay acroſs the deſerts, where travellers were equally diſtreſſed for lodging and water, the king cauſed a canal to be opened along the great road, which was filled by the waters of the Nile, and bordered with houſes at ſuitable diſtances, where paſſengers might find repoſe and neceſſary refreſhments. Ptolemy alſo provided for the ſecurity of his trading ſubjects, by fitting out two powerful fleets, one of which he kept in the Red Sea, and the other in the Mediterranean. With theſe fleets he rode triumphant on the ſeas, and kept moſt of the maritime provinces of Aſia Minor in ſubjection.

Magas, king of Cyrene and Lybia, expreſſed a deſire, in the latter part of his reign, of compoſing all differences with Ptolemy; and, in order to effect a complete reconciliation, he propoſed a marriage between his brother's eldeſt ſon and his own daughter, promiſing to give the latter all his dominions by way of dowry. This propoſal was accepted at the court of Egypt, and peace was concluded upon theſe terms; but Magas dying before the celebration of the nuptials, his wife Apamea uſed her utmoſt

utmoſt efforts to break off the match; her attempts were, however, unſucceſsful, and only ſerved to kindle the flames of war between Ptolemy and her brother Antiochus Theus, king of Syria. Notwithſtanding the inquietudes occaſioned by this war, Ptolemy did not relinquiſh his ſearch for books wherewith to enrich his library, and for paintings and drawings, of which he was a great admirer. Aratus, the Sicyonian, being employed to collect pictures from Greece, conciliated the king's favour, by this ſervice, to ſuch a degree, that Ptolemy regarded him as one of his deareſt friends; and preſented him with an hundred and fifty talents for the reſtoration of peace and liberty to his native city.

This celebrated prince died in the ſixty-third year of his age, and the fortieth of his reign. He left behind him two ſons and a daughter, whom he had by his firſt wife, the daughter of Lyſimachus. Ptolemy Euergetes, his eldeſt ſon, ſucceeded to the throne; Lyſimachus (ſo named from his grandfather by the mother's ſide) was put to death for engaging in a rebellion; and Berenice was married to the king of Syria. With reſpect to the character of Ptolemy Philadelphus, we cannot propoſe it as a perfect model of royal imitation; as his numerous good qualities were in ſome meaſure counterbalanced by his faults. The commencement of his reign was diſhonoured by a deſpicable reſentment againſt a man of uncommon merit, whoſe only offence conſiſted in having given ſuch advice as was ſtrictly conſonant with the laws of juſtice and ſound policy. He cauſed two of his brothers to be put to death from mere motives of jealouſy. He was greatly addicted to effeminate pleaſures; and paid ſo little attention to military diſcipline, that the army was utterly unfit for action at the time of his death. Yet, on the other hand, he was a zealous patron of literature, an induſtrious collector of books, and the man to whom we owe the Greek tranſlation of the ſcriptures, commonly called the Septuagint. Though this prince was extremely fond of ſcientific ſtudies, he did not ſuffer them to engroſs his whole time or attention, but applied himſelf with unremitting induſtry to the welfare of the ſtate, and to ſuch purſuits as ſeemed moſt likely to enſure the wealth and felicity of his ſubjects. By this laudable conduct he enticed ſuch multitudes of foreigners to ſettle in his dominions, that he is ſaid to have poſſeſſed thirty-three thouſand three hundred and thirty-nine populous cities. Conſcious that the real power of a monarch conſiſts in the number and riches of his people, he purſued his meaſures with firmneſs, and yielded to no diſcouragement of difficulty or trouble. Notwithſtanding the great expence he muſt have been at in maintaining two great fleets, an army of two hundred thouſand foot, forty thouſand horſe, two thouſand chariots of war, and three hundred elephants, the Alexandrian armory containing three hundred thouſand ſuits of armour, engines, implements, &c. and the Alexandrian library, muſeum, &c. he left in his treaſury ſeven hundred and fifty thouſand Egyptian talents. Athenæus therefore juſtly calls him the moſt wealthy prince of the age; and Appian obſerves, that "as he was the moſt magnificent of kings in the diſtribution of his money, ſo he was the moſt ſkilful and induſtrious in raiſing it."

Ptolemy Euergetes, his eldeſt ſon, had no ſooner obtained the crown, before Chriſt 246, than he engaged in a war with the king of Syria; from whoſe dominions he brought two thouſand five hundred pictures and ſtatues, among which were many of the idols formerly carried from Egypt by Cambyſes. Theſe were reſtored to their ancient temples by the king, who was on that occaſion honoured by his ſubjects with the appellation of *Euergetes*, or the Beneficent. In this expedition he is ſaid to have made himſelf maſter of all the countries that lie between Mount Taurus and the confines of India. On his return he paſſed through Jeruſalem, and made a ſolemn acknowledgment for his conqueſt over Syria, by offering many ſacrifices to the God of Iſrael. It is highly probable that he had ſeen the prophecies of Daniel, and that he concluded from thence who was the real author of his ſignal victories. Subſequent to the concluſion of peace, he ſeems to have devoted the greateſt part of his time to the cultivation of the ſciences, and the improvement of the Alexandrian library. He diſpatched perſons of eminence into foreign countries to purchaſe valuable books at any price, and invited Eratoſthenes the Cyrenian, from Athens, to take charge of the library.

The tribute of the Jews having been withheld for a conſiderable time from Ptolemy, by the covetous diſpoſition of Onias, the high prieſt, a meſſenger was diſpatched from Alexandria to demand the arrears, and to inform the citizens of Jeruſalem, that if they continued to delay the remittance, a body of troops would be ſent into Judea, to drive out the inhabitants, and to divide the country among themſelves. This meſſage was no ſooner made public at Jeruſalem, than the whole city was in the utmoſt conſternation, as not knowing how to divert the effects of the king's anger. At that time Joſeph, the nephew of Onias, was in high repute for his prudence, and the ſanctity of his manners: he was therefore ſummoned to the city, and choſen as ambaſſador to the court of Ptolemy. Joſeph ſoon furniſhed himſelf with a ſuitable equipage; commenced his journey to the Egyptian capital, and in his way met with ſome of the chief nobility of Cœlo-Syria and Paleſtine, who deſigned to offer terms for farming the revenues of thoſe provinces. On their arrival at Alexandria, they were informed that Ptolemy had made an excurſion to Memphis; Joſeph accordingly ſet out for that city, but had the good fortune to meet the king upon the road. He was immediately honoured with a ſeat in the royal chariot; when he made ſo handſome an apology for the neglect of his aged uncle Onias, that Ptolemy was not only appeaſed, but allotted Joſeph an apartment in the palace, and honoured him with ſeveral proofs of his eſteem.

On the day when the revenues of the provinces were ſet up in order to be let to the higheſt bidder, before Chriſt 234, the Syrians and Phœnicians, who had been Joſeph's fellow-travellers, offered no more than eight thouſand talents for Cœlo-Syria, Phœnice, Judea, and Samaria; but, as they had plainly diſcovered by their converſation on the road, that theſe provinces were worth more than double the ſum which they meant to offer, Joſeph upbraided them with depreciating the king's revenues, and offered ſixteen thouſand talents, beſides the forfeitures, which he promiſed to return into the royal treaſury, though they had always been regarded as the property of the farmers, Ptolemy liſtened with aſtoniſhment; but aſked Joſeph what ſecurity he could give for the fulfilment of his agreement. He anſwered he would give the ſecurity of ſuch perſons as were unexceptionable; and on being commanded to mention them, he named the king and queen, affirming, that they would be bound to each other for the faithful performance of his undertaking. This well-timed pleaſantry ſerved to confirm the king in his opinion of Joſeph; and he therefore entruſted him with the charge of all the afore-mentioned revenues, without any other ſecurity than his own word. Joſeph thus appointed receiver-general, borrowed five hundred talents at Alexandria to pay his uncle's arrears, and having received a ſuitable guard for the execution of his office, he quitted the court, in order to act in his new capacity. On his arrival at Aſkelon he was inſulted by the populace, who refuſed to pay him the accuſtomed duties. He, however, ſoon appeaſed the tumult, with the aſſiſtance of his guards; and cauſing twenty of the ringleaders to be executed, he ſent their forfeited eſtates to the king. By a ſimilar conduct at Scythopolis, where he met with the ſame treatment, he ſo effectually terrified the other cities, that they all paid the king's dues without heſitation. His prudent conduct, and the punctuality of his payments, procured him ſuch favour at court, that he was continued in his office, by three ſucceſſive

ceſſive monarchs, for the ſpace of two-and-twenty years; at the expiration of which time the provinces were annexed to the crown of Syria by Antiochus the Great.

Ptolemy having at length concluded a peace with Syria, applied himſelf to the extenſion of his dominions ſouthward; and proved ſo ſucceſsful in his attempts, that he became maſter of all the coaſts of the Red ſea, both on the Arabian and Ethiopian ſhores, down to the ſtraits through which that ſea diſembogues itſelf into the ſouthern ocean. Theſe acquiſitions were made with little trouble; and the king returned to Alexandria with an immenſe treaſure, which he generouſly divided amongſt his gallant followers. Upon his return, he received an embaſſy from the Achæans, and promiſed them his aſſiſtance againſt the Etolians and Lacedemonians; but they having, in the mean time, requeſted ſuccours from the king of Macedon, Ptolemy renounced his firſt intention, and reſolved to humble both the Achæans and their new ally, by ſending a ſtrong reinforcement to Cleomenes king of Sparta. His expectations were, however, ſoon fruſtrated, as Cleomenes was totally defeated at the famous battle of Selaſia, and finally obliged to take refuge in Egypt. Ptolemy, though much chagrined, received the vanquiſhed prince with every mark of kindneſs and reſpect, allowed him a yearly penſion of twenty-four talents, and aſſured him that he would uſe his utmoſt exertions to replace him on the throne; but this promiſe was annulled by the death of Ptolemy, which happened in the twenty-ſeventh year of his age. This prince, with reſpect to his encouragement of literature and the arts, ſeems to have trodden in the ſteps of his predeceſſor, as he applied himſelf with the utmoſt care to the augmentation of the public library, and the remuneration of ſuch perſons as were eminent for their abilities. He is ſaid to have poſſeſſed a conſiderable ſhare of erudition, and to have written, in his younger days, ſome hiſtorical commentaries that were in high repute.

Ptolemy Philopator, ſon of Euergetes and Berenice, ſucceeded his father in the government, before Chriſt 217, and proved a moſt debauched prince. Juſtin affirms that he committed the crime of parricide to obtain the crown, and that he was therefore ironically called Philopator, or lover of his father; but this aſſertion ſeems ill-founded. He was named Tryphon, from the effeminacy of his diverſions; and Gallus, becauſe he uſed to walk through the ſtreets on the bacchanal ſolemnities with a wreath of ivy on his head, like the galli, or prieſts of Cybele. In the very commencement of his reign, he cauſed his brother Magas to be put to death, at the inſtigation of Soſibius his prime miniſter; and this act of barbarity was ſoon followed by others of a ſimilar nature. Cleomenes, whom we have mentioned as having obtained a ſecure aſylum after his defeat with Euergetes, was, for ſome time, entruſted with the moſt ſecret counſels of Soſibius; but in conſequence of his oppoſition to the murder of Magas, his advice was ſoon neglected, and both the king and his courtiers abandoned themſelves ſo entirely to licentiouſneſs and debauchery, that the kingdom fell into a kind of anarchy; and the Spartan prince began to lead a very melancholy life. In the mean time he received intelligence that Antigonus, king of Macedon, was dead; that the Achæans were engaged in hoſtilities with the Etolians; and that the Lacedæmonians had joined the latter againſt the Achæans and Macedonians. He therefore reminded Philopator that he had promiſed to aſſiſt him with a powerful fleet; and earneſtly petitioned for leave to depart with his followers, as he could not poſſibly expect a more favourable opportunity for the recovery of his dominions. This requeſt was, however, of no effect; for Ptolemy was too deeply immerſed in vice and luxury to attend to ſuch concerns; and Soſibius, knowing the great ſagacity and enterpriſing ſpirit of the Spartan, deemed it adviſable to detain him in Egypt, leſt he ſhould invade the kingdom at a future day, and take an ample revenge for the illiberal treatment he had lately received. It was even judged impolitic to allow him his liberty at Alexandria; wherefore the unfortunate Cleomenes was ſeized and kept in confinement till his deſpair ſuggeſted the reſolution of eſcaping from priſon, with his friends and domeſties, in order to excite the Alexandrians to a revolt. This attempt was, however, rendered abortive, and the prince and his followers voluntarily periſhed by each other, to avoid the ignominy of a public puniſhment. The dead body of Cleomenes was flayed and hung upon a croſs, by command of Philopator; who alſo extended his inhuman revenge to the mother, children, and attendants, of the deceaſed.

Ptolemy, by concluding a diſhonourable peace with Antiochus king of Syria, occaſioned ſo general a diſcontent among the Egyptians, as finally broke out into an open rebellion; but the royal party ſeems to have obtained a victory, though hiſtorians are ſilent with reſpect to the particulars of the event. About this time, before Chriſt 208, the king, who had received an affront from the Jews, publiſhed an edict, excluding all perſons from the palace, who did not ſacrifice to the Egyptian deities; in conſequence of which every individual of the Jewiſh nation muſt either violate the law of his Creator, or reſign all pretenſions to the royal protection, in what caſe ſoever he might need it. And by another decree, the Jews were ſtripped of all thoſe valuable rights and privileges, which had induced them to quit their native country and ſettle in Egypt; for it ſhould be obſerved, that by favour of Alexander the Great and Ptolemy Soter, they enjoyed the ſame privileges at Alexandria as the Macedonians, and were enrolled among the firſt rank of inhabitants. Philopator, however, degraded them to the third rank, and ordered that at the time of this enrolment the mark of an ivy leaf ſhould be impreſſed on their faces with a hot iron; that this mark ſhould be univerſally regarded as a badge of ſlavery; and that every perſon, who preſumed to oppoſe the execution of the decree, ſhould be put to death. But that he might not appear an enemy to the whole nation, he made an exception in favour of thoſe who ſhould ſacrifice to his idols, promiſing all ſuch the enjoyment of their former rank and privileges. This ſpecious offer was however of ſmall effect, ſince only three hundred individuals out of the many thouſands of the Jews who reſided in Alexandria, debaſed themſelves by a complianee with the king's command: the others preferred the ignominious badge, or purchaſing a dear exemption, with all their property. Thoſe who continued ſtedfaſt in allegiance to their God, expreſſed their abhorrence of their apoſtate brethren, by excluding them from all manner of communication. This being conſidered as a contempt of the king's authority, it ſo much enraged Ptolemy, that he reſolved on the extirpation of all the Jews, beginning with thoſe who reſided in Egypt, and then proceeding with equal ſeverity againſt the inhabitants of Judea and Jeruſalem. Purſuant to this ſanguinary deſign, he cauſed all the Jews who dwelt in Egypt to be brought in chains to his capital, and there to be ſhut up in the hippodrome, that he might amuſe himſelf with the view of their deſtruction. He next commanded the maſter of the elephants to prepare five hundred of thoſe animals for the execution of that perſecuted people; and appointed the enſuing morning for the tragical cataſtrophe of their misfortunes. Theſe orders were accordingly obeyed, and the people aſſembled in crowds to witneſs the cruel maſſacre; but the king having ſat till a late hour with his debauched companions, was unable to attend the dreadful exhibition, and the priſoners conſequently obtained a ſhort reſpite. Next morning Ptolemy was awakened, by his own command, for the ſame purpoſe; but being much inebriated, he threatened the perſon who ſpoke to him with the effects of his reſentment, and the execution was delayed till the third day. In the mean time the captive Jews preſented their prayers to

Almighty God for their deliverance, and obtained it: for on the third day, when Ptolemy had taken his ſeat, and the elephants were let looſe upon the trembling priſoners, thoſe powerful animals, inſtead of aſſailing the captive Jews, turned the whole of their rage upon the ſpectators, ſoldiers, and aſſiſtants, and deſtroyed great numbers of them; which, together with ſome ſingular appearances in the air, ſo terrified Philopator, that he immediately gave orders for the liberation of the captives; publicly acknowledged the power of their God, and ſtrove to deprecate his wrath by reinſtating the Jews in their former privileges, beſtowing upon them many favours, and loading them with preſents at their departure.

In the ninth year of this reign, two ambaſſadors arrived at Alexandria to propoſe a renewal of the ancient friendſhip and alliance that had ſubſiſted between the Romans and Egyptians. Shortly after this embaſſy, Ptolemy had an opportunity of obliging the Romans, by reſcuing one of their moſt illuſtrious officers from captivity, and by honouring him with his favour and protection. Arſinoe, the queen, who had for ſeveral years been barren, was at length delivered of a ſon, ſurnamed *Epiphanes*, or the Illuſtrious. His birth occaſioned great rejoicings in the kingdom; and many of the Syrian and Phœnician nobles went to Alexandria to congratulate Ptolemy on the occaſion: but the king, purſuing his cuſtomary diverſions, devoted his time to drinking, gaming, and intemperance. Arſinoe, ſhocked at his infamous conduct, reproached him with ſuch ſeverity, that orders were given to Soſibius for her aſſaſſination. Soon after the death of this princeſs, Ptolemy fixed his affections upon Agathoclea, a woman of mean extraction; and was ſo abſolutely governed by her, by Œnanthes her mother, and Agathocles her brother, that his power was literally veſted in their hands, and all the civil and military offices were filled with their creatures and favourites. The murder of Arſinoe incenſed the populace ſo violently againſt Soſibius, that Ptolemy was obliged to diſmiſs him, and to raiſe to the office of prime-miniſter a young man of quality named Tlepolemus, who had ſignalized himſelf in the army, and was at that time the king's treaſurer.

Ptolemy, having exhauſted a robuſt conſtitution by intemperance and debauchery, died in the thirty-ſeventh year of his age, and the ſeventeenth of his reign. He was one of the moſt wicked princes that ever governed a kingdom. He began his career with the murder of an innocent brother, and terminated it with the aſſaſſination of an affectionate wife. His whole time was devoted to the gratification of his ruling paſſions, ſome of which were of the moſt deteſtable nature: his ſubjects groaned beneath the oppreſſion of his abandoned courtiers; and the ſtate of his affairs was in the utmoſt confuſion. He is, however, celebrated for his liberality towards the Rhodians, who were involved in the deepeſt diſtreſs by an earthquake; for his encouragement of learning; and for his erection of a magnificent temple in honour of Homer, whoſe ſtatue was placed in the center of the edifice, and ſurrounded with the repreſentations of the ſeveral cities that claimed the honour of his birth. As the only perſons preſent at the death of the king were Agathocles, his ſiſter, and their creatures, they concealed the news as long as poſſible, and in the mean time appropriated to their own uſe all the money, jewels, and other valuables, found in the palace; they alſo formed a project for uſurping the regency during the minority of the young prince, and vainly ſuppoſed that the death of Tlepolemus, the new miniſter, would eſtabliſh their deſign. When, therefore, they thought proper to publiſh the king's death, they aſſembled a council of thoſe Alexandrians who were of the Macedonian race; informing them that Philopator had, with his departing breath, recommended his young ſucceſſor to the care of Agathocles; and exhorted them to take vengeance on Tlepolemus, who had formed the ambitious deſign of aſcending the throne. Agathocles, who ſpoke to this purport in the aſſembly, imagined this weak artifice would have exaſperated the people againſt Tlepolemus; but his malicious contrivance was ſo ill diſguiſed, that he drew upon his own head the deſtruction which he had planned for the miniſter. The people of Alexandria, recollecting the numerous crimes and oppreſſions of Agathocles and his party, roſe in a general tumult, and having placed the young king on the throne in the hippodrome, brought before him Agathocles, Agathoclea, and their mother Œnanthes, and cauſed them to be put to death; after which their bodies were dragged through the ſtreets, and torn in pieces by the multitude.

Ptolemy Epiphanes, the ſon and ſucceſſor of Philopator, was but five years old at the time of his father's death, before Chriſt 204. During his minority Antiochus the Great, and Philip of Macedon, ſubdued the provinces of Cœlo-Syria and Paleſtine; but were ſoon obliged to relinquiſh them to Ariſtomenes, the prime-miniſter of Egypt. In the third year of his reign three deputies were ſent to Alexandria to notify the victory which the Romans had gained over Hannibal, and the treaty of peace concluded between Rome and Carthage; (ſee CARTHAGE,) to thank Epiphanes for his faithful attachment to the republic, at a time when the neighbouring nations had renounced her alliance through cowardice; and to intreat him alſo to continue his amity with the Romans, in caſe Philip ſhould compel them to carry the war into Macedon. The Egyptian nobles, who were guardians to the prince, encouraged by this embaſſy, thought it adviſable to place their young king and his dominions under the protection of the Roman ſenate; which they accordingly did, by ſending a deputation to Rome for that purpoſe. The ſenate, in compliance with their requeſt, empowered M. Lepidus to take upon him the guardianſhip, which, after a ſhort ſtay at Alexandria, he conferred upon Ariſtomenes, an experienced miniſter, and perfectly acquainted with the affairs of Egypt. He accordingly accepted the honourable charge, and acquitted himſelf in it with prudence and fidelity. In the commencement of his adminiſtration he perſuaded Ptolemy to offer the moſt unequivocal proofs of friendſhip to the Romans; and prudently renewed the ancient alliance between the kingdom of Egypt and the republic of Achaia.

Ptolemy Epiphanes, having arrived at the age of fourteen, was ſolemnly crowned and inveſted with full authority, in the year before Chriſt 195. But no ſooner had he aſſumed the reins of government, than he became the prey of flatterers and paraſites, who ſoon obliterated from his mind the judicious counſels of his tutor, and rendered the latter part of his reign tyrannical and infamous. Ariſtomenes did not indeed tamely ſubmit to this contamination of his royal pupil's diſpoſition, but frequently preſumed to give him advice, and beſought him to adopt a mode of life that might prove more advantageous to his ſubjects and honourable to himſelf. Epiphanes was ſo highly offended at this liberty, that he paſſed a ſentence of death upon his affectionate cenſor; and abandoned himſelf ſo entirely to every ſpecies of intemperance, that the Egyptians began to ſhrink from his tyrannic power, and formed a conſpiracy for the purpoſe of driving him from the throne. At this perilous criſis he raiſed Polycrates, a man of abilities and experience, to the office of prime-miniſter, and by his prudence obliged the leaders of the rebellion to ſubmit upon certain conditions; but, after promiſing them life and liberty, he treated them in the moſt cruel manner, and cauſed them all to be put to death. This treachery involved him in freſh difficulties, but he was again extricated by the policy of his faithful miniſter. He maintained a ſtrict friendſhip with the Romans during the whole of his reign; and offered them a thouſand pounds weight of gold, and twenty thouſand of ſilver, to proſecute the war againſt his father-in-law Antiochus, king of Syria. He hated Antiochus on account of the diſturbances he had occaſioned in Egypt, and his queen was ſhocked at the cruelty of her parent, who ſeems to have

have married her to Ptolemy with no other view than that of deſtroying the Egyptian monarch, and thereby obtaining an eaſy conqueſt of his dominions. But the virtuous queen, inviolably attached to her duty, joined with Ptolemy againſt Antiochus, and preferred the ties of nuptial love to thoſe of conſanguinity.

Ptolemy was anxious to conciliate the friendſhip of the Achæan republic. Towards the end of his reign he ſent ambaſſadors to them, inviting the confederacy to join with him in an offenſive and defenſive league, promiſing them a ſupply of ſhips, money, ſhields, &c. This offer was accepted, and ambaſſadors were appointed to renew the alliance; but while they were preparing to depart, news arrived of Ptolemy's death. This diſſipated prince, having cruſhed the rebellion in Egypt, reſolved to quit his kingdom in order to carry on a vigorous war againſt Seleucus, king of Syria: but as his finances were exhauſted, one of his chief officers aſked him by what means he deſigned to raiſe money for the expedition. The king anſwered, that his friends were his treaſure; in conſequence of which the nobles inferred that he intended to pillage them of their fortunes and eſtates; and, to prevent ſuch an evil, they contrived to put a period to his life by poiſon, in the twenty-ninth year of his age, and twenty-fourth of his reign. While he acted under the care of Ariſtomenes, and ſubmitted to his directions, he was regarded as an excellent and munificent prince; but after the murder of that able man, he ſunk into the moſt abject ſtate of wickedneſs, and tarniſhed the honour of his youth by folly, tyranny, and debauchery. He left two ſons, Philometor and Phyſcon, both under age, and one daughter named Cleopatra.

Ptolemy Philometor, when ſix years old, ſucceeded his father, before Chriſt 180, under the guardianſhip of the queen-mother, who governed the Egyptians for the ſpace of eight years. Upon her death the regency was tranſferred to Lannæus, a nobleman of diſtinction, and to Eulæus, who was charged with the young king's education. Theſe perſons, in the very beginning of their adminiſtration, demanded the provinces of Cœlo-Syria and Paleſtine from Antiochus Epiphanes, who at that time occupied the throne of Syria. This demand was peremptorily rejected, and a war enſued; in the courſe of which Philometor either ſurrendered himſelf voluntarily to Antiochus, or was taken priſoner. The Alexandrians, ſuppoſing their ſovereign irrecoverably loſt, raiſed his younger brother to the throne, who for ſome time bore the name of Ptolemy Evergetes the Second, but was afterwards diſtinguiſhed by the appellation of *Phyſcon*, or Great-bellied, in conſequence of the extreme obeſity which reſulted from his gluttony and luxury. On his acceſſion, Cineas and Cumanus were nominated to ſerve him in the capacity of prime-miniſters, and were charged with the important taſk of reſtoring the kingdom to its former wealth and ſplendor. But, on the return of Antiochus Epiphanes into Egypt, Phyſcon was driven from his ſtation, and Philometor was reſtored to his throne and dignity. Antiochus, however, deſigned to kindle a war between the brothers, in order that when their ſtrength was exhauſted he might ſeize on their dominions; and to this end he retained Peluſium in his hands, that he might be enabled to enter the country when he pleaſed. But Philometor, ſuſpecting his deſign, effected an accommodation with his brother, who embraced a propoſal of reigning jointly, and of uniting their arms againſt the treacherous Antiochus. In conſequence of this agreement, the king of Syria invaded Egypt with a great army; but he was compelled to relinquiſh his project, and quit the country.

The royal brothers, being delivered from the apprehenſions of a foreign enemy, began, as is uſual, to quarrel with each other, and their diviſions ſoon roſe to ſuch a height, that Phyſcon dethroned Philometor, and compelled him to quit the kingdom. He embarked for Italy, and landed at Brunduſium; whence he travelled to Rome on foot, meanly clothed and ill attended, a mode of conduct well adapted to raiſe the compaſſion of the Roman ſenate. Demetrius ſon of Seleucus Philopator, late king of Syria, who was then as hoſtage at Rome, hearing of the arrival of Ptolemy, and of the deplorable condition in which he was about to appear in the metropolis of the world, cauſed a magnificent equipage to be prepared, and went with it himſelf to meet him. Finding him on foot and covered with duſt, he embraced him in the moſt affectionate manner, placed a crown upon his head, and entreated him to make uſe of the carriage which he brought: but Ptolemy refuſed the offer of the Syrian, and would not even permit him to accompany him during the remainder of his journey. Demetrius therefore withdrew, and Philometor entered Rome in his humble attire, and took up his lodging in the private houſe of an Alexandrian painter. The ſenate, on his arrival, ſent for him, and apologized for the omiſſion of thoſe ceremonies which were uſual upon ſuch an occaſion, aſſuring him that it was not from want of reſpect, but merely becauſe his viſit had been kept ſo private that they had no intelligence of it till after his arrival. He was then requeſted to quit the habit in which he came, to accept of more ſuitable accommodations, and to fix a day for an audience of the ſenate.

Philometor, at the appointed time, preſented himſelf before the conſcript fathers, B. C. 162; and pleaded his cauſe ſo powerfully, that the juſtice of his complaint was obvious to every auditor, and a decree was paſſed for his reſtoration. Two deputies were ordered to attend him to Alexandria, and on their arrival in Egypt they ſucceeded in negociating an accommodation between the brothers; by virtue of which Phyſcon was acknowledged king of Lybia and Cyrene, and Philometor was reſtored to the government of Egypt and the iſland of Cyprus. This treaty of mutual agreement, though ſolemnly ratified by the cuſtomary ſacrifices, was ſoon violated by Phyſcon, who, being diſſatisfied with his diviſion of territory, ſent ambaſſadors to Rome, requeſting that the iſland of Cyprus might be aſſigned to him. Finding his embaſſy unſucceſsful, he went to Rome in perſon, in order to preſs his ſolicitation; but Menithyllus of Alabanda maintained the oppoſite cauſe with great ability. He repreſented to the ſenate, that Phyſcon had already received much more than he could reaſonably have expected from his injured brother; that he had been protected from the fury of the populace, who ſuſpected him of parricide; and that he had himſelf acceded to the recent diviſion of territory in the preſence of the gods; but that his unbounded ambition had ſlighted the moſt ſacred bonds, and led him to contemn the ſolemn decree of the conſcript fathers. Theſe aſſertions were ſubſtantiated by the ambaſſadors, who had been ſent from Rome to negociate the accommodation; and Phyſcon had nothing to anſwer, but that he was compelled, by the urgency of his affairs, to ſubmit to the propoſal of his elder brother, though highly prejudicial to his intereſt. He inſiſted upon the inequality of the diviſion, appealed to the equity of the ſenate for a favourable deciſion, and craftily ſuggeſted that Philometor, by retaining his preſent large dominions, might ſoon become a formidable enemy. This ſuggeſtion proved effectual in behalf of the royal ſupplicant: for thoſe refined politicians, who would have continued firm on the ſide of juſtice, though aſſailed by all the energy of zeal and the enchanting powers of oratory, no ſooner recollected it was for their own advantage that the ſtrength of Egypt ſhould be divided, than they adjudged the iſland of Cyprus to the younger brother, as an addition to his ſhare, in direct oppoſition to a treaty which had been ſo lately concluded by their own ambaſſadors. Two commiſſioners were therefore ſent with Phyſcon to put him in poſſeſſion of Cyprus; but they were commanded to uſe lenient methods, and to perſuade Philometer, if poſſible, voluntarily to give up the iſland to his brother. Phyſcon, arriving

riving in Greece, on his way to Cyprus, raifed a great number of mercenaries, with a defign to enlarge his territories by force; but, on the remonftrance of the ambaffadors, he difmiffed his forces and returned to Lybia, while one of the deputies proceeded to Alexandria.

The defign of the ambaffadors was to bring the two brothers to an interview on the frontiers of their dominions, and there to effect an amicable compromife agreeably to the orders of the fenate; but Torquatus, on his arrival at Alexandria, found Philometor much averfe to the requeft of the fenate. He did not, indeed, abfolutely refufe to fubmit to its decifion, but, confenting to fomethings, and objecting againft others, lengthened the difcuffion without coming to any determination. Phyfcon, receiving no intelligence, became impatient, and fent Merula, the other ambaffador, alfo to the Alexandrian court, hoping that both the deputies would prevail on Ptolemy to comply with the expreffs orders of the fenate. Philometor, however, ftill obferved the fame conduct, treating the ambaffadors with great kindnefs, and entertaining them in the moft fumptuous manner for forty days fucceffively, without giving them a decifive anfwer; and, when he found they would no longer be put off, he plainly told them that he would accede to no other treaty than that which had already been ratified between himfelf and Phyfcon.

The Cyreneans, in the mean time, conceived fo ftrong an averfion againft Phyfcon, that they determined to keep him out of their country by force of arms. Phyfcon immediately haftened to Cyrene with all his forces, but was overthrown by the iflanders. Being thus involved in great difficulties, he fent two ambaffadors to Rome to renew his complaints againft his brother; in confequence of which the fenate declared in his favour, and expreffed their refentment againft Philometor, by renouncing his alliance, and commanding his ambaffadors to leave the city. Phyfcon having in the mean time fubdued his rebellious fubjects, eftabliffied himfelf in Cyrene; but his vicious conduct foon eftranged the minds of the Cyreneans to fuch a degree, that feveral conf irators vowed his deftruction, and falling upon him one night as he returned from the palace, wounded him in feveral places, and left him for dead. This outrage was immediately attributed to Philometor, and Phyfcon repaired with all poffible fpeed to Rome to lay his grievances before the fenate, and to fhew them the fcars of his wounds. Though Philometor was well known to be a generous and humane prince, and moft unlikely to have countenanced affaffination, yet the confeript fathers encouraged the accufation, and carried their prejudices to fuch a height, that they actually refufed to hear Philometor's ambaffadors in refutation of the charge. At the fame time they appointed five commiffioners to conduct Phyfcon into Cyprus, and to put him in poffeffion of that ifland, enjoining all their allies in thofe parts to fupply him with forces for that purpofe. Phyfcon, thus encouraged by the Romans, affembled a numerous army, and effected his landing in Cyprus, B. C. 157; but, being there engaged by Philometor in perfon, his forces were defeated, and he was obliged to fhelter himfelf in the city of Lapitho, where he was befieged and taken prifoner. Philometor, on this occafion, gave a high proof of his generofity. Inftead of treating his turbulent brother with that feverity which his actions deferved, he indulged him with free forgivenefs, reftored to him Lybia and Cyrene, affigned him fome other territories in lieu of Cyprus, and promifed him his daughter in marriage. This unexampled clemency put an end to the war; and the Romans could no longer oppofe a prince whofe goodnefs of difpofition had gained him the affection of all the neighbouring nations.

Philometor, on his return to Alexandria, entrufted the government of Cyprus to a man of the name of Archias, before Chrift 145, who perfidioufly agreed, after the king's departure, to deliver up the ifland to Demetrius king of Syria. His treachery was, however, difcovered, and Archias, to avoid a public punifhment, became his own executioner. Ptolemy, in the mean time, determined to revenge himfelf upon Demetrius, and accordingly joined the kings of Pergamus and Cappadocia in fetting up Alexander Balas as a pretender to his crown. This defign was attended with fuccefs, and Alexander was not only placed on the throne of Syria, but received the daughter of Philometor in marriage: yet, notwithftanding thefe favours, the new monarch entered into a plot againft his benefactor, and Ptolemy, who confequently became his greateft enemy, marched againft him and defeated his army near Antioch, but was mortally wounded in this engagement, and died on the fifth day after his victory. This prince was of an amiable difpofition, and is highly commended for his clemency and good-nature. He aflumed the name of Philometor, to teftify his gratitude to his mother for her prudent adminiftration during his minority. He permitted the Jews to build a temple in Egypt; and he is faid to have received from Ariftobolus, an Alexandrian Jew, a commentary on the Pentateuch.

Cleopatra queen of Egypt, on the deceafe of her royal confort, before Chrift 145, endeavoured to fecure the fucceffion for her fon, being fupported in that defign by fome of the principal lords; but others declaring for Phyfcon, fent ambaffadors to invite him to Alexandria. The queen immediately took the moft prudent meafures for her fafety, and engaged a numerous army to efponfe her caufe. But, previoufly to the commencement of hoftilities, a compromife was effected between the parties by the Roman ambaffador, who propofed that Phyfcon fhould marry Cleopatra, and reign jointly with her during his life; but at the fame time declare her fon by Philometor next heir to the crown. Thefe terms were embraced; but Phyfcon had no fooner obtained the kingdom by his marriage, than he murdered the young prince in his mother's arms. This monarch, as we have already obferved, was commonly called Phyfcon, on account of his corpulency; but the name which he aflumed was Evergetes, or the Benefactor: this was changed by his fubjects into Kakergetes, or the Evil Doer; for he was the moft cruel, wicked, and defpicable, of the Ptolemies who fwayed the Egyptian fcep're. He was no fooner eftabliffied in the kingdom, than he caufed all perfons to be put to death who had lamented the fate of the young prince; and exercifed the moft wanton cruelties upon the Jews for no other reafon than their adherence to Cleopatra. In the fecond year of his reign his queen brought him a fon, whom he called Memphitis, from fome particular ceremonies which he was performing at the time of the child's birth in the city of Memphis. On his return to Alexandria, he baniffied all thofe who had been brought up with Philometor, and, without the leaft provocation, gave permiffion to the foreigners who compofed his guard, to plunder and maffacre the inhabitants at their pleafure; in confequence of which the ftreets were deluged with the blood of the innocent citizens; and thofe who efcaped the flaughter fled into other countries, leaving their native land in a manner defolate. After this unparalleled barbarity, Phyfcon invited ftrangers to re-people the place, giving them the habitations of the wretched fugitives, and admitting them to all the rights and privileges of the former citizens. As there were among thofe who had emigrated on this occafion many philofophers, phyficians, and maffers of the liberal arts and fciences, literature, was by their means, revived in Greece, Afia Minor, the iflands of the Archipelago, and in other places where they formed their new fettlements. The fanguinary wars which had been carried on for a conffderable number of years among the fucceffors of Alexander, had almoft annihilated learning in thofe parts; but the unfortunate Alexandrians, by erecting fchools, and undertaking the tuition of youth for a fmall falary, revived the feveral branches of learning, which would certainly have been

loft,

loſt, but for the protection and encouragement given to learned men by the Ptolemies of Egypt.

While foreigners were flocking from all parts to Alexandria, in purſuance of Phyſcon's invitation, B. C. 136, Scipio Africanus the younger, Spurius Mummius, and L. Metullus, landed at that port; having been ſent in quality of ambaſſadors to viſit the countries that were ſubject to, or in alliance with, their republic. They were commiſſioned to notice the ſtate of affairs in each kingdom, to compoſe ſuch differences as might exiſt between the ſovereigns, and to uſe their utmoſt endeavours in every place for the eſtabliſhment of peace and amity. Scipio, having filled the world with the fame of his exploits, was received with loud acclamations by the populace, and the king himſelf went out to meet the ambaſſadors; but his appearance inſpired them with equal contempt and averſion. He, however, affected to ſhew them the utmoſt reſpect, and entertained them, during their ſtay, with the moſt coſtly and delicious viands; but they, preferring the vigour of the conſtitution to the gratification of the palate, refuſed to partake of any nouriſhment but ſuch as was merely requiſite for the ſupport of nature. After viewing the royal palace, the treaſury, and whatever was worthy of notice in Alexandria, they ſailed up the Nile to Memphis, and other parts of Egypt; concluding, from their obſervations on the numerous cities, the great population, the fertile ſoil, &c. that nothing was wanted but a prince of abilities and application, to render Egypt one of the moſt powerful ſtates in the world. Shortly after the departure of the ambaſſadors, Phyſcon began to exerciſe the ſame tyrannical cruelties upon the new inhabitants of his metropolis, which had compelled the ancient citizens to ſeek an aſylum in a foreign country; and ſcarcely a week paſſed without ſeveral of the wealthy Alexandrians being murdered upon ſome frivolous accuſation. We have already obſerved that this monſter of wickedneſs married Cleopatra, his ſiſter and brother's widow, and ſlew her ſon in her arms on the very day of his nuptials: but now falling in love with his niece, who was alſo named Cleopatra, he firſt violated her chaſtity, and then married her; having divorced her ill-fated mother for the gratification of his carnal deſires. Theſe, and many other exceſſes of a ſimilar nature, rendered him ſo contemptible among his people, that they only waited an opportunity of taking up arms for revenging their injuries upon the mercileſs tyrant who occaſioned them. That Phyſcon retained poſſeſſion of the throne under ſo general an odium, was chiefly owing to the management of his prime-miniſter Hierax, who conciliated the eſteem of the ſoldiers by his punctual payments, and exerted himſelf to balance, as much as poſſible, the abominable conduct of his maſter: but, when Hierax was removed from his office, the Alexandrians began to complain openly of their oppreſſions, and to throw out menaces againſt their brutal monarch; Phyſcon, however, in order to incapacitate them for ſuch retribution, reſolved on a general maſſacre of the young men, in whom the ſtrength of the place conſiſted; and accordingly ordered the gymnaſium, or place of public exerciſes, to be ſet on fire when they were aſſembled, ſo that they either periſhed in the flames, or were ſlaughtered by the mercenary guards whom the king had placed at all the avenues. This diabolical action exaſperated the people to ſuch a degree, that they ran in a tumultuous manner to the palace, which they reduced to aſhes; but Phyſcon retired undiſcovered with his wife and ſon to the iſland of Cyprus. The Alexandrians were no ſooner informed of his cowardly flight, than they placed his divorced queen on the throne, and expreſſed their abhorrence of his cruelty by pulling down and deſtroying all the ſtatues which had been erected to him in Alexandria. Phyſcon, ſuppoſing this to have been done at the inſtigation of his repudiated conſort, reſolved to revenge himſelf upon the harmleſs Memphitis, whom he now conſidered only as the child of Cleopatra; and accordingly ordered his throat to be cut in his own preſence, and his mangled limbs to be put in a box, with the head entire, to ſhew to whom they belonged. Having thus ſhed the blood of his own ſon, who was amiable equally on account of his perſonal and mental accompliſhments, he ſent the box to Alexandria, charging the meſſenger to preſent it at court on the queen's birth-day. His inhuman orders were obeyed, and the public rejoicings were conſequently changed into a general mourning: but the exhibition of ſo dreadful a ſpectacle ſerved only to inflame the minds of the populace, who reſolved to prevent the tyrant from re-aſcending the throne.

Cleopatra, B. C. 129, having raiſed an army, gave the command of it to Marſyas; and Phyſcon ſent Hegelochus with a numerous body of mercenaries againſt the Alexandrians. The two armies met on the frontiers of Egypt, and a ſanguinary battle enſued, which terminated in the defeat of the Egyptians and the captivity of their general, who was ſent in chains to Phyſcon. It was expected that this unhappy priſoner would have been doomed to the moſt exquiſite torments; but the tyrant, to the aſtoniſhment of all, indulged him with a free pardon, and gave him his liberty; a generoſity which reſulted entirely from the policy of Phyſcon, who, finding that his cruelties had tended to exaſperate the people, reſolved to regain their affection by ſome public acts of lenity. The queen, greatly diſtreſſed by the loſs of her forces, ſent to implore aſſiſtance from her ſon-in-law Demetrius, promiſing to reward his exertions with the Egyptian diadem. The Syrian readily embraced her propoſal, and marching into Egypt at the head of a numerous army, laid ſiege to Peluſium; but, in conſequence of a revolt among his native ſubjects, he was obliged to return with all poſſible expedition into Syria. Cleopatra, thus diſappointed in her hopes, and too weak to reſiſt the conquering arms of Phyſcon, ſecured all her valuable effects, and ſet ſail for Ptolemais, where ſhe found an aſylum in the court of her daughter. The tyrant now returned to Alexandria and re-aſſumed the government, which he held without farther diſturbance till the ſixty-ſeventh year of his age, and the twenty-ninth of his reign, when his death put a period to his oppreſſive and iniquitous conduct. It ſeems ſcarcely credible that a prince of ſo vile and barbarous a diſpoſition ſhould have taken any pleaſure in the arts and ſciences, or have deſerved the character of a patron of literature. Yet ſeveral authors of reſpectability aſſure us that he acquired the appellation of the *philologiſt*, from his extenſive knowledge, and the facility with which he converſed on all literary ſubjects; that he enriched the Alexandrian library, at a great expence, with many valuable books; and that he obtained a conſiderable ſhare of reputation by ſome hiſtorical writings. He left three ſons, Apion, Lathurus, and Alexander. To Apion, whom he had by a concubine, he bequeathed the kingdom of Cyrene; and that of Egypt he left to his widow, in conjunction with one of her ſons whom ſhe ſhould chooſe. The ſucceſſion belonged, by right of inheritance, to Lathurus, the eldeſt of his legitimate children; but the queen preferred Alexander, who ſhe ſuppoſed moſt likely to leave the management of affairs in her own hands. This unjuſt partiality was, however, oppoſed by the Alexandrians, who obliged her to ſend for Lathurus from the iſland of Cyprus, whither he had been baniſhed in his father's life-time. The prince arrived accordingly, and was ſolemnly inaugurated; but Cleopatra ſtill retained the deſire of abſolute authority, and politically eſtabliſhed her younger ſon in the kingdom of Cyprus, that he might be in a condition to afford her important aſſiſtance in caſe of any miſunderſtanding with the reigning prince.

Lathurus began to reign in the year before Chriſt 107; but had not long enjoyed the regal dignity before his mother found means to occaſion a revolt among the Alexan-

drians, by accuſing him of the moſt heinous and unnatural crimes, in revenge for ſome meaſures he had entered into againſt her will. Her malicious fictions obtained ſuch credit with the misjudging populace, that they roſe in a general tumult againſt their ſovereign, and would certainly have torn him in pieces if he had not fortunately embarked in a veſſel, which carried him out of the reach of the impending danger. Cleopatra now ſent for Alexander from Cyprus; and, having cauſed him to be proclaimed king of Egypt, obliged Lathurus to be content with the former territory of his younger brother. Soon after this revolution, the inhabitants of Ptolemais were driven to the utmoſt extremities by Alexander Jannæus king of the Jews; in conſequence of which they ſent to Lathurus for aſſiſtance. But the meſſengers were ſcarcely gone, when they recollected that the alliance of Ptolemy might prove as prejudicial to their intereſts as the enmity of Alexander; for it was highly probable that Cleopatra would, upon their receiving the king of Cyprus, march againſt them with an irreſiſtible body of forces. Upon this conſideration they reſolved to rely on their own exertions; and they took the earlieſt opportunity of acquainting Lathurus with their determination: but he, having increaſed his army to the number of thirty thouſand men, and provided veſſels for their accommodation, ſailed to Phœnice, and encamped at a ſmall diſtance from the city of Ptolemais. Finding the citizens obſtinate in refuſing to admit his meſſengers, or to enter into any conference, he was greatly perplexed, not knowing what mode of conduct to adopt. But while he was meditating on the ſingularity of his ſituation, meſſengers arrived in his camp from the Gazæans, and from Zoilus prince of Dora, deſiring his aſſiſtance againſt the Jews, who were ſo divided by Jannæus, that one part of their army inveſted Ptolemais, while the other ravaged the territories of Zoilus and Gaza. Ptolemy embraced this opportunity of employing his troops, and accordingly marched to the relief of thoſe who had importuned him. His ſuccour was ſo powerful and opportune, that Jannæus deemed it adviſable to raiſe the ſiege of Ptolemais, and led back his army to watch the motions of Lathurus. Conſcious of his inability to vanquiſh ſo formidable an enemy, he affected to court his friendſhip, and promiſed to give him four hundred talents of ſilver, on condition that he would deliver Zoilus and his territories into his hands. Lathurus accepted the propoſal; but, diſcovering the treachery of Alexander, who was treating privately with Cleopatra, he ſuddenly renounced his intentions, and reſolved to take the moſt ample revenge on his pretended ally. With this view he divided his army into two bodies, one of which he commiſſioned to beſiege Ptolemais, and the other he led in perſon againſt Alexander. In the commencement of this expedition he ſubdued Aſochis, a city of Galilee, and carried from thence ten thouſand priſoners, with an immenſe treaſure. He alſo inveſted Sephoris, but was compelled to raiſe the ſiege, upon intelligence that Jannæus was advancing at the head of fifty thouſand men. The hoſtile armies met at Aſophos, near the river Jordan, and engaged with the utmoſt fury. Victory was for ſome time doubtful, as eight thouſand of Alexander's men, who carried brazen bucklers, performed prodigies of valour, and diſputed every inch of ground with undaunted firmneſs: but the Jews were at length defeated, after having loſt thirty thouſand men in the combat, excluſive of priſoners. A moſt inhuman conduct is attributed to Lathurus upon this occaſion; for, having taken up his quarters, after the engagement, in the neighbouring villages, he cauſed all the female and infant inhabitants to be murdered, and their mutilated limbs to be put into boiling caldrons, as if he deſigned to make a repaſt for his army. This refinement in cruelty was intended to ſtrike terror into the Jews, by repreſenting their enemies as cannibals.

While Lathurus and his followers were employed in ravaging the country, Cleopatra, B. C. 103, received intelligence of their motions, and reſolved to put a ſtop to their future progreſs. She therefore raiſed a powerful army, under the command of Chelcias and Ananias, two Jews; and, having ſecretly embarked with her troops, ſet ſail for Phœnice, where ſhe landed, to the aſtoniſhment of Lathurus, who haſtily raiſed the ſiege of Ptolemais, and retired into Cœlo-Syria. Cleopatra ſent one diviſion of her army to attack the fugitive, and with the other ſhe marched to Ptolemais, expecting to meet with an agreeable reception from the citizens: her expectations were, however, fruſtrated; for they obſtinately refuſed to open their gates. She therefore reſolved to obtain admiſſion by force, and commanded the fortreſs to be inveſted. Lathurus, in the mean time, contrived to elude the purſuit of his enemies, and marched with all his forces into Egypt, which he expected to find ſlenderly guarded in the abſence of his mother. But the troops which Cleopatra had left in that kingdom, defended their charge with the utmoſt valour, till a reinforcement arrived from Phœnice. Lathurus was therefore compelled to return to Paleſtine, and he took up his winter quarters at Gaza. The ſiege of Ptolemais in the mean time was carried on with ſuch vigour and reſolution, that the inhabitants were obliged to ſubmit to Cleopatra: when an alliance was formed between the queen and Alexander Jannæus. The victorious army ſailed back into Egypt; and Lathurus, finding that all his attempts in Paleſtine were rendered abortive, returned to his own territory of Cyprus.

During theſe tranſactions Ptolemy Alexander, the younger brother, ſuffered all the reſtraints of ſlavery under the ſpecious appearance of ſovereign authority; but, at length, being wearied with the indignities he received from his ambitious mother, and diſguſted at the unnatural malice with which ſhe perſecuted Lathurus, he departed privately from Alexandria, chooſing rather to live in obſcurity with ſafety, than to ſhare the throne with a woman of ſo baſe a diſpoſition. His flight embarraſſed the queen, who was well appriſed that the Alexandrians would never permit her to reign without one of her ſons; and ſhe, therefore, uſed all poſſible artifices to allure him back to court. Not long after his return ſhe formed a conſpiracy againſt his life; but Alexander, diſcovering her treachery, prevented his own deſtruction by turning it upon the life of the projector. She was certainly a vicious character, and might be thought to have deſerved this tragical retribution of her actions, if it had come from any hand than that of her own ſon. As ſoon as it was rumoured in the city, B. C. 89, that Ptolemy had cauſed his mother to be aſſaſſinated, the enormity of the crime ſtirred up all his ſubjects againſt him; they inſiſted upon the impropriety of ſubmitting to the government of a parricide, and drove him ignominiouſly from his dominions, which they now conferred upon his brother Lathurus. Alexander for ſome time led a wandering life in the iſland of Cos; but, having got together ſome ſhips, he, next year, attempted to return into Egypt. Being, however, fruſtrated in this deſign, he fled to Myra in Lycia; and from thence ſteered his courſe towards the iſland of Cyprus, where he hoped to obtain his brother's vacant throne; but Chœreas, one of Lathurus's admirals, obſtructed his landing, diſperſed his fleet, and killed him in the engagement, after he had borne the title of king for the ſpace of nineteen years. He left a ſon alſo named Alexander, of whom we ſhall have occaſion to ſpeak hereafter.

Ptolemy Lathurus, being thus freed from two formidable competitors, began to regulate the government, and to remedy thoſe numerous abuſes which had militated againſt the felicity of the people; yet his regulations were ſo far from giving ſatisfaction, that the Thebans refuſed to ſubmit to them, and even attempted to ſhake off their allegiance. The king immediately led an army againſt

againſt the rebels, defeated them in a pitched battle, and cloſely inveſted their city, which reſiſted all his exertions with the moſt ſurpriſing obſtinacy for the ſpace of three years; but was finally reduced and given up to the rapacity of the ſoldiers.

In the year before Chriſt 78, Lucullus being ſent from Rome by Sylla to procure ſhips, in order to block up the ports of Piræus and Munychia, landed at Alexandria, and was received with ſuch honours as were only paid to the kings of Egypt. Upon the firſt intimation of his arrival the royal fleet ſailed out to meet him; and, upon his entrance into the city, the king honoured him with the moſt diſtinguiſhing marks of eſteem, allotted him an apartment in his own palace, and ordered his miniſters to give the Roman attendants four times the allowance that was uſually given to other ambaſſadors. Lucullus, however, obſerved the moſt rigid temperance amidſt the ſplendour and profuſion of the court; and refuſed a pecuniary preſent which Lathurus preſſed him to accept. He even declined viſiting the other famous cities of Egypt, which were the admiration of all the world; alleging that it would ill become him to take a tour of pleaſure, while his general was expoſing his life to the moſt imminent danger in behalf of his country. When he urged his requeſt of maritime aſſiſtance, Ptolemy pretended that he was threatened with a civil war in his own dominions, and could not, therefore, part with any of his ſhips; he, however, preſented him with his likeneſs cut in an emerald of great value, and diſmiſſed him with every token of veneration. Soon after this Lathurus died, having reigned, from the death of his father, thirty-ſix years; eleven jointly with his mother in Egypt, eighteen in Cyprus, and ſeven alone in Alexandria after the death of Cleopatra.

Upon the deceaſe of this prince, the ſceptre devolved on his only legitimate offspring Cleopatra. To obviate many obſcurities which occur in the Egyptian hiſtory, it is proper to remark, that as the males of the royal family had the general name of Ptolemy, ſo the females had that of Cleopatra, though they had likewiſe proper names to diſtinguiſh them from each other. Sylla, who at that time was perpetual dictator at Rome, ſent Alexander, the nephew of Lathurus, to aſſume the reins of government, as the next heir of the male line. On his arrival in Egypt, he was perſuaded to eſpouſe the princeſs, who had been placed on the throne ſix months before that period. The nuptials were accordingly ſolemnized with great pomp and magnificence; but Cleopatra, becoming an object of averſion to her conſort, either on account of her perſon, or her ſhare in the regal dignity, was cruelly aſſaſſinated nineteen days after the marriage. After this barbarous tranſaction, Alexander reigned fifteen years; during which time he rendered himſelf ſo obnoxious to his ſubjects by his tyrannical conduct, that they took up arms, and would have ſacrificed him to their reſentment, if he had not ſecured his ſafety by a precipitate retreat. He fled firſt to Pompey, who was then carrying on the war againſt Mithridates king of Pontus, and offered him a large ſum of money, in hopes of perſuading him to eſpouſe his cauſe; but, finding his deſign impracticable, he took refuge in the city of Tyre, whither he had ſent great part of his treaſures, and there died, as is ſuppoſed, with grief. By his laſt will he made over all his rights to the Romans, declaring them heirs to his wealth and dominions. This will, which was expreſsly intended to ſow the ſeeds of diſcord among the Roman ſenators and the people of Egypt, occaſioned ſome warm debates in the ſenate, but it was at length conſidered invalid, as far as related to the kingdom: and the fathers contented themſelves with ſending to Tyre for the effects which the deceaſed prince had bequeathed to the republic.

The Egyptians, after having driven Alexander into baniſhment, beſtowed the crown upon Ptolemy Auletes, the natural ſon of Lathurus, who, knowing he had but a doubtful title to the throne, purchaſed an alliance with the Romans at the price of ſix thouſand talents, fifty-eight years before Chriſt. Though the royal yearly revenues amounted to twice this ſum, yet Auletes could not raiſe it immediately without burdening his people with very heavy taxes. This occaſioned a general diſcontent; and the refuſal of the king to a popular requeſt reſpecting the iſle of Cyprus, exaſperated the populace to ſuch a degree, that they revolted from their allegiance; and, ſurrounding the palace, threatened the life of their ſovereign; but Auletes, on the firſt intimation of his danger, withdrew privately from Alexandria, croſſed Egypt, and embarked for Rhodes, with an intention of obtaining aſſiſtance from the Roman ſenate. Finding, on his arrival, that Cato was in the iſland, the Egyptian monarch went to viſit him: but, finding that Cato neither vouchſafed to riſe at his entrance, nor ſaluted him otherwiſe than as an ordinary perſon, he was much ſurprifed at a mode of conduct which appeared ſo incongruous with the Roman's ſimple dreſs and equipage: his amazement was, however, ſoon converted into admiration, when, having explained the ſituation of his affairs, Cato blamed him for leaving the richeſt country in the world, to expoſe himſelf to the indignities which he muſt endure among the proud and avaricious grandees of Rome; aſſured him, that the wealth of Egypt would be inſufficient to ſatisfy the rapacity of the leading men: and finally exhorted him to return, and ſtrive to regain the affections of his ſubjects by a more equitable conduct; adding, that he would cheerfully accompany him thither, and uſe his utmoſt exertions to effect a happy reconciliation. Auletes now perceived the impropriety of his flight, and entertained thoughts of embracing Cato's propoſal; but, on the advice of his companions, he relinquiſhed that deſign, and purſued his journey. The Egyptians, in the mean time, not knowing what courſe he had taken, and either believing or affecting to believe that he had periſhed, placed the diadem on the head of his daughter Berenice, and ſent an embaſſy into Syria, to Antiochus Aſiaticus, who, by his mother Selene, was the next male heir of the family, inviting him to marry the princeſs that he might reign jointly with her; but he being dead, the Alexandrian nobles enjoined the ambaſſadors to make a ſimilar propoſal to his brother Seleucus, who readily complied with their deſire. His conduct in Egypt ſoon rendered him contemptible in the eyes of his ſubjects, and Berenice was ſo violently exaſperated by his unbounded avarice, that ſhe laid aſide all conſiderations of duty, and cauſed him to be ſtrangled, after which ſhe beſtowed her hand upon Archelaus high-prieſt of Comana, who pretended to be the ſon of Mithridates the Great, though he was in reality only the ſon of that monarch's chief general.

Auletes, on his arrival at Rome, B. C. 57, found that Cæſar, on whom his principal hopes were founded, was making war in Gaul. He was, however, kindly received by Pompey, his other patron, who accommodated him with an apartment in his houſe, and omitted nothing that lay in his power to ſerve him; yet, notwithſtanding the protection of ſo powerful a man, the king was obliged to go, like a private citizen, from houſe to houſe, in order to obtain the ſuffrages of the ſenators. Having at laſt procured a ſtrong party, he was admitted to lay his complaints before the ſenate, which he did in the moſt artful manner, exaggerating the ill-treatment he had received from his rebellious ſubjects, and reminding the Romans of his alliance with their republic, by which they were bound to ſupport him againſt foreign and domeſtic enemies. To oppoſe theſe proceedings, and to juſtify the revolt of the Egyptians, a ſolemn embaſſy, conſiſting of one hundred citizens of diſtinction, was ſent from Alexandria; but Ptolemy found means to deſtroy moſt of them either by poiſon or the ſword, and ſtruck ſuch terror into the minds of the ſurvivors, that they were equally incapable of executing their commiſſion, or of demanding juſtice for the aſſaſſi-

nation

nation of their colleagues. The rumour of ſo audacious a contempt of the laws, rouſed the indignation of the public, and gave a general alarm. Marcus Favonius the ſtoic, boldly accuſed Auletes before the conſcript fathers; expatiated on the miſconduct of ſome intereſted ſenators who had ſuffered themſelves to be corrupted with money; and inſiſted that Dio, a celebrated philoſopher, who was the chief of the embaſſy, ſhould appear before the ſenate, in order to teſtify, upon oath, the murder of his companions. This demand was too reaſonable to admit a refuſal, and Dio was therefore ſummoned to come forward; but Pompey, Lentulus, and the other leading men, whoſe favour had been purchaſed by Ptolemy, declared ſo openly for the perfidious prince, that Dio was fearful of attending the ſummons; and Auletes, unwilling to give him time to recollect his accuſtomed firmneſs, cauſed him to fall by the dagger of a hired aſſaſſin. Ptolemy Auletes, now thinking himſelf ſecure in the protection of Pompey, had the audacity to avow this infamous action. A proſecution was, however, commenced againſt Aſcitius the murderer, who was proved to have ſtabbed Dio with his own hand: yet Aſcitius was acquitted in ſpite of the moſt incontrovertible evidence. An action was then brought againſt the venial judges by the adverſe party; but this was alſo ſet aſide by the artifices of Pompey's faction: and a decree was carried in the ſenate for Ptolemy's reſtoration by force of arms. All the great men were ambitious of re-conducting a monarch who had laviſhed ſuch immenſe ſums upon his protectors; and, after ſome debates, the commiſſion was obtained by Lentulus Spinther, the proconſul, who had been appointed governor of Cilicia. But about this time a ſtatue, erected on the hill of Alba, was thrown down by a thunder ſtorm; in conſequence of which the Sibylline books were opened to diſcover the meaning of the prognoſtic. C. Cato, an enterpriſing young man, who was one of the tribunes, ſeized this opportunity of confounding the intrigues of Ptolemy's party. He read, or pretended to read, in the Sibylline prophecies, the following words: "If a king of Egypt ſhall apply to you for ſuccour, aſſiſt him, but not with an army; if you adopt violent meaſures, you muſt expect great misfortunes." This prediction, though evidently forged, was reported to the people by the keepers of the Sibylline books, and produced its deſired effect ſo forcibly, that the recent decree of the ſenate was immediately revoked.

Various expedients were now propoſed in order to facilitate the king's return without violating the injunction of the pretended oracle; but, as the diverſity of opinion in the ſenate rendered every ſcheme abortive, Ptolemy determined, in purſuance of Pompey's advice, to recur to Gabinius, who commanded as proconſul in Syria. Gabinius was a perſon of the moſt infamous character, and would readily undertake any thing for money. He had already ruined the province of Syria by his unparallelled oppreſſions; and had engaged, for a large reward, to aſſiſt Mithridates in the recovery of his crown. Ptolemy came up with him as he was advancing towards the frontiers of Parthia, and delivered into his hands letters from Pompey, their common friend, whereby he was deſired to reſtore the baniſhed prince, upon ſuch terms as might prove agreeable to both parties. Gabinius was well aware that he ſhould tranſgreſs an expreſs law of the republic by acceding to this propoſal without orders from the ſenate; but on the receipt of five thouſand talents, and the aſſurance that he ſhould be rewarded with five thouſand more on Ptolemy's reſtoration to the throne, he laid aſide all dread of the conſequence, abandoned the cauſe of Mithridates, and marched without heſitation towards Egypt. On his approach, he detached Marc. Antony, who was extremely zealous in Ptolemy's behalf, to ſeize the paſſes with a body of cavalry, and open the way for the reſt of the army. The young Roman acquitted himſelf of this commiſſion with admirable addreſs, and, through the friendly offices of Hircanus prince of Judea, and Antipater the father of Herod, obtained poſſeſſion of the important city of Peluſium. Auletes on entering the place, propoſed a general maſſacre of the Egyptian inhabitants; but Antony, who juſtly ſuppoſed that ſo barbarous an action would fix an eternal ſtigma on the Roman name, and either prevent or retard the deſired reſtoration, prevented the king from executing his deſign.

On the firſt intelligence of Antony's ſucceſs, Gabinius advanced into the heart of the country, where he was met and engaged by Archelaus at the head of a conſiderable army. Victory, however, decided in favour of the proconſul, the Egyptian troops were cut in pieces, and Archelaus himſelf was taken priſoner. Gabinius might now have terminated the war without further effuſion of blood, but his avarice tempted him to prolong it; and he therefore firſt gave Archelaus his liberty, upon his paying a conſiderable ranſom; and then, pretending that his priſoner had eſcaped, he extorted freſh ſums from Ptolemy for the proſecution of the war. Archelaus, on recovering his liberty, exerted himſelf in the moſt heroic manner for the preſervation of his dominions; but his panic-ſtruck army, having turned its back in ſeveral encounters, he was obliged to ſuſtain a ſiege in Alexandria, till, being reduced to the utmoſt extremity, he marched out to hazard another battle, which put an end to his reign and life. Marc. Antony, who had been the particular friend of this valiant prince, commanded his dead body to be carefully embalmed, and cauſed it to be interred with the utmoſt magnificence. The entire reduction of Egypt ſoon followed this event, and Auletes was in conſequence reſettled on his throne: Gabinius left ſome of his Roman forces to overawe the Alexandrians; and Berenice was ſacrificed to the reſentment of her inhuman father. Moſt of the wealthy citizens were alſo put to death by the command of the king, who had occaſion for the confiſcation of their eſtates, to make up the reward he had promiſed to Gabinius; and every ſpecies of violence was daily practiſed with impunity. C. Rabirius Poſthumus, who had lent Auletes the greateſt part of the money he had borrowed at Rome, now preſſed the king to perform his engagements, but Ptolemy gave him to underſtand that he diſpaired of ſatisfying his claim, unleſs he would accept the office of receiver-general, by which he might pay himſelf as he collected the revenues. Rabirius embraced the offer, ſuppoſing that he muſt otherwiſe loſe his debt; but the ungrateful prince ſoon ordered the unfortunate creditor to be cloſely confined, though he was one of Cæſar's particular friends, and though Pompey was in ſome degree reſponſible for the debt, as the money had been advanced at his requeſt, and the obligation was executed in his preſence. Rabirius, having found means to obtain his liberty, quitted Egypt with all poſſible expedition, to elude the more dangerous deſigns of Auletes; but, to complete his misfortunes, a formal proſecution was commenced againſt him, on his return to Rome, for having aided Ptolemy in corrupting the ſenate; for having diſhonoured the quality of a Roman knight by accepting an employment in Egypt; and for having ſhared in the treaſures which Gabinius acquired in his late illegal expedition. The eloquent oration which Cicero delivered in his defence on this occaſion, is an eternal monument of Ptolemy's perfidy and ingratitude.

Auletes died in the peaceable poſſeſſion of his kingdom, about four years after his re-eſtabliſhment, and thirty after he had firſt aſſumed the government, leaving behind him two ſons and two daughters. He bequeathed his crown to his eldeſt ſon and daughter, Ptolemy and Cleopatra, commanding them to be joined in the bonds of marriage, according to the cuſtom of their family, and to govern with equal authority. And becauſe they were both under age he recommended them in the moſt ſolemn manner to the protection of the Romans, who in compliance with his deſire appointed Pompey the young prince's guardian. The name of *Auletus* had been given

to their father, becauſe he prided himſelf on his ſkill in playing on the flute, and debaſed himſelf ſo far as to contend for the prize in the public games. He was alſo called *Dionyſius Neos*, or the new Bacchus, from the great pleaſure which he took in imitating the effeminacies of the Bacchanals, dancing in a female habit, and in the ſame meaſures that they uſed during the ſolemnities of their god. Strabo aſſerts, that he ſurpaſſed all his predeceſſors in the effeminacy of his manners, and was no leſs contemptible on that account, than his grandfather Phyſcon was infamous for wickedneſs.

As Ptolemy the ſucceſſor of Auletes, who ſucceeded to the throne in the year before Chriſt 48, was a minor under Pothinus an eunuch and Achillas the commander in chief of the army, theſe miniſters, with a ſelf-intereſted view, deprived Cleopatra of her ſhare in the regal authority, and compelled her to quit the kingdom. This princeſs, who was the famous Cleopatra that had afterwards a conſiderable ſhare in occaſioning the civil wars of Rome, and whoſe high ſpirit could never bear an inſult, retired immediately into Syria, and having raiſed a powerful army, prepared to aſſert her right by force of arms. Ptolemy, receiving intelligence of her return at the head of her troops, aſſembled all his forces, and marched out againſt her. Both armies encamped between mount Caſius and Peluſium, each obſervant of the other's motions, but neither inclined to venture an engagement. Such was the ſituation of affairs, when Pompey, having loſt the battle of Pharſalia, arrived off Peluſium, expecting to find a ſecure aſylum in Egypt from the further perſecution of his enemies. He therefore ſent to inform the king of his arrival, and to ſolicit permiſſion to enter his kingdom. To this meſſage Ptolemy, who was but thirteen years of age, returned no anſwer; but the two miniſters, Achillas and Pothinus, conſulted with Theodotus a rhetorician, and ſome others, on the nature of Pompey's requeſt. Some voted for his reception, alleging that it would be an everlaſting reproach to the Egyptian nation if they ſhould refuſe to ſuccour a man in his diſtreſs, who had been the conſtant protector of Auletes, and was the acknowledged guardian of the preſent king. Others were for deſiring him to depart in queſt of ſome other aſylum; but Theodotus diſplayed all his eloquence to ſhew that it was moſt adviſable to murder him. This diabolical advice was readily embraced, and put in execution; as ſtated under the article Rome. Cæſar being informed, in the mean time, that his adverſary had ſteered his courſe towards Egypt, purſued him thither, and arrived at Alexandria juſt as the news of the perfidious aſſaſſination was brought to that city. Theodotus is ſaid to have preſented him with the head and ring of his deceaſed rival; but he melted into tears at the ſight, and ordered the head to be interred in a proper place with the accuſtomed ſolemnities. Cæſar, on his firſt landing, appears to have been in imminent danger from the lower claſs of Alexandrians, who were all in confuſion on account of Pompey's death. He, however, obtained admiſſion into the royal palace, where he ſhut himſelf up, with part of his men, till the tumult was appeaſed. He then ventured to appear in public; and, having conciliated the eſteem of the populace by his affable behaviour, he viſited the curioſities of that ſtately metropolis, and aſſiſted at the public harrangues of the young rhetoricians and orators; but, that he might not devote his whole time to diverſion, while detained by contrary winds, he began to ſolicit the payment of the money that was due to him from Auletes, and to take cognizance of the miſunderſtanding between the prince and his ſiſter Cleopatra. For this purpoſe he ſummoned a general aſſembly; and, cauſing the will of Auletes to be publicly read, he decreed, as guardian and arbitrator, that Ptolemy and Cleopatra ſhould reign jointly in Egypt, according to their father's expreſs deſire: and that Ptolemy the younger ſon, and Arſinoe the younger daughter, ſhould jointly exerciſe the regal authority in Cyprus, which had for ſome time been in the poſſeſſion of the Romans. The Alexandrians were all ſatisfied with this decree except Pothinus, who, dreading the reſentment of Cleopatra, inſpired the people with new jealouſies, and ſolicited Achillas, by private letters, to advance with his army from Peluſium to drive Cæſar from the metropolis. Achillas embraced the propoſal; and, approaching Alexandria with twenty thouſand regular troops, put all things into confuſion. Cæſar, being in no condition to hazard an engagement, reſolved to keep within the walls of the city, and poſted his men ſo advantageouſly in the ſtreets and avenues of the quarter where he reſided, that he found no difficulty in repelling the attacks of his enemies. Achillas, being thus foiled by the dictator's precautions, changed his meaſures, and went to attack the port, with the hope of ſecuring the fleet, that he might ſhut up the Romans by ſea, and cut off the poſſibility of their receiving ſuccours on that ſide; but Cæſar, repulſing him there, cauſed the Egyptian veſſels to be ſet on fire, and at the ſame time placed a ſtrong garriſon in the tower of Pharos, by which means he ſecured his communication with the ſea. Some of the burning ſhips happening to drive towards the ſhore, communicated their flames among the neighbouring houſes, whence the conflagration extended to the Bruchion, and conſumed the noble library, which had been the work of many kings, and contained four hundred thouſand manuſcripts.

Cæſar now wrote for ſpeedy ſuccours to Domitius Calvinus, his lieutenant in Aſia; and in the mean time fortified the quarter of the city which he poſſeſſed with walls, towers, and other works, including within them the royal palace, a theatre, which he uſed as a citadel, and a paſſage to the harbour. Ptolemy, who was ſtill detained by Cæſar, received intelligence of all that paſſed, through his chief miniſter Pothinus; but at length the correſpondence was diſcovered, and Pothinus was doomed to ſuffer death for his treaſon. This execution alarmed Ganymede, an eunuch who was charged with the education of Arſinoe, and who had been privy to the inſidious practices of Pothinus; he therefore conveyed the young princeſs ſecretly to the Egyptian army, who were overjoyed at her arrival, and immediately proclaimed her queen; and Ganymede, having cauſed Achillas to be put to death upon a falſe accuſation, obtained the command of the army, and aſſumed the adminiſtration of all other affairs. He contrived many artful ſtratagems to diſtreſs Cæſar during the courſe of the war; and by ſtopping up the communications between the reſervoirs in Cæſar's quarters, and thoſe in the reſt of the city, he contrived to turn the ſea-water into the former, and by that means ſpoiled all the freſh water that was kept in them. This produced the utmoſt diſtreſs among the Romans, until the dictator obviated the inconvenience, by cauſing wells to be ſunk till ſprings of freſh water were diſcovered. Cæſar having now intelligence that a legion ſent by Calvinus was detained on the neighbouring coaſts of Libya by contrary winds, he advanced with his whole fleet to convoy it ſafely to Alexandria. Ganymede inſtantly aſſembled all his naval force, with a deſign to intercept him on his return; but he was repulſed, and would have loſt the whole of his fleet, if Cæſar had not been compelled by the approach of night to retire with his auxiliaries into the harbour. To repair this misfortune Ganymede drew together all the ſhips that were in the private arſenals, and in the mouth of the Nile, with which he again attacked the Romans, but without ſucceſs. Cæſar, anxious to improve his victory, attempted to ſeize the iſle of Pharos, and the mole called the Heptaſtadium, by which it was joined to the continent; but, after he had effected a landing, he was repulſed, with the loſs of more than eight hundred men, and was himſelf expoſed to the moſt imminent danger in his retreat; for his veſſel being ready to ſink, he threw himſelf into the ſea, and with great difficulty ſwam to the next ſhip.

The Egyptians, finding that the Roman troops retained an unſhaken intrepidity in the midſt of dangers and difficulties, and that ill-ſucceſs only tended to inflame their military ardour, ſent a deputation to Cæſar, demanding their king, and aſſuring him that a compliance with their deſire would put a ſpeedy termination to the war. Cæſar readily granted their requeſt, and admoniſhed the young prince to inſpire his ſubjects with ſentiments of peace and equity; to redreſs the evils which had already reſulted from the war; and to prove himſelf worthy of the confidence that was now repoſed in him. Ptolemy petitioned, with tears in his eyes, that he might continue with the dictator, affirming that he would rather enjoy his company as a private citizen, than ſway the ſceptre without him. But he was no ſooner at the head of his army, than he renewed hoſtilities with more vigour than ever; he alſo attempted to intercept Cæſar's proviſions, but the engagement which this deſign brought on near Canopus, terminated in his defeat, and added new luſtre to the achievements of his enemy. About this time alſo, Mithridates of Pergamus, and Antipater the Idumean, marched into Egypt at the head of a conſiderable army, in compliance with Cæſar's requeſt, and upon arriving before Peluſium, they carried that city by ſtorm. On their route from thence to Alexandria they found all the paſſes in the country of Onion ſeized by the Jews, who conſtituted the greateſt part of the inhabitants. This difficulty threatened them with the deſtruction of their plan; but at length Antipater engaged the Jews to eſpouſe Cæſar's cauſe, and prevailed on them to furniſh the army with proviſions. On their approaching the Delta, Ptolemy detached a body of troops to diſpute the paſſage of the Nile, and a ſanguinary engagement enſued. Mithridates's wing was ſoon broken and diſordered, but Antipater, by affording him a ſpeedy ſuccour, checked the enemy's ſucceſs, drove them with incredible fury from the field of battle, and took poſſeſſion of their camp. Ptolemy then advanced with all his forces to overpower the victorious generals; but Cæſar having ſecretly fallen upon his rear, rendered his ſcheme abortive. Moſt of the Egyptian ſoldiers were cut in pieces, and Ptolemy, in attempting to eſcape, was drowned in the Nile. Cæſar returned to Alexandria, and finding no oppoſition to his will, beſtowed the crown of Egypt on Cleopatra, obliging her, through motives of policy, to marry her younger brother Ptolemy, who was then but eleven years of age. The paſſion he had conceived for Cleopatra was in reality the cauſe of his undertaking ſo dangerous a war, and the ſame paſſion detained him much longer in Egypt than his affairs required, but the ſucceſs which now attended Pharnaces, king of the Cimmerian-Boſphorus, and ſon of Mithridates, in the recovery of his father's dominions, awakened Cæſar from the lethargy into which he was drawn by Cleopatra's blandiſhments, and called him forth again to conqueſt and ambition.

Cleopatra now enjoyed the throne of Egypt without the leaſt diſturbance, having an unlimited authority during the minority of her brother; but the young prince no ſooner aſſumed his ſhare of the government than ſhe cauſed him to be poiſoned, and reigned from that time without a partner. Soon after this unnatural action, Cæſar being aſſaſſinated at Rome, and the famous triumvirate formed between Antony, Lepidus, and Octavius, afterwards ſurnamed Auguſtus Cæſar, the queen declared for the triumvirs, and ſent four legions to Albienus, the conſul Dolabella's lieutenant. Theſe forces were taken by Caſſius, who had earneſtly ſolicited Cleopatra to aſſiſt him againſt the triumvirs; but finding her obſtinate in refuſal, he marched towards the frontiers of Egypt with a deſign to invade her kingdom. The enterprize was, however, relinquiſhed; and Cleopatra, being freed from her apprehenſions, ſailed with a numerous fleet to join Octavius and Antony; but illneſs compelled her to return to Egypt, after ſeveral of he ſhips had been wrecked in a ſtorm.

Antony having paſſed over into Aſia, after the famous battle of Philippi, to ſettle all concerns for the intereſt of the conqueror, received intelligence that Cleopatra had aſſiſted Caſſius againſt Dolabella. He immediately ſummoned the queen to appear before him at Tarſus in Cilicia. Cleopatra, who had already proved the effect of her charms on Cæſar, inſtantly conceived the deſign of enſnaring Antony, and promiſed herſelf the moſt ample ſucceſs, upon the recollection that Cæſar had acknowledged her irreſiſtible at a time when ſhe was very young and unacquainted with the world, whereas Antony would be equally dazzled with the brilliancy of her wit, and the incomparable beauties of her perſon. She accordingly provided herſelf with rich preſents, immenſe ſums of money, ſumptuous habits, and ſplendid ornaments, and, in compliance with Antony's requeſt, ſet ſail for Cilicia. As ſoon as the news of her arrival was publiſhed in Tarſus, the citizens crowded out of the gates to meet her; and Antony, who was diſtributing juſtice in the forum, ſaw his tribunal ſuddenly deſerted, no one remaining with him but his lictors and domeſtics; nor was it ſurprizing that the populace ſhould flock to behold ſo unuſual a ſpectacle. Her royal galley flamed with gold, the ſails were of the fineſt purple, and the oars inlaid with ſilver; beneath a pavilion of cloth of gold appeared the Egyptian queen, robed like Venus, and ſurrounded by the moſt beautiful youths and virgins of her court, deſtined to repreſent the Nereids and the Graces; the hills and dales re-echoed with the ſound of hautboys, flutes, and other muſical inſtruments, with which the oars kept time, and rendered the ſcene more delightful; while the great quantity of perfumes that were burning on the deck, diffuſed their fragrance on each ſide of the river, and impregnated the air with the moſt balſamic odours. Cleopatra had no ſooner landed, than Antony ſent her a complimentary meſſage, and invited her to ſupper; but ſhe returned for anſwer, that according to the rules of decorum, he ſhould firſt viſit her, and that ſhe ſhould expect him in the tents which were erecting for her accommodation on the banks of the river. Antony complied with her deſire, and was entertained with inexpreſſible magnificence. Next day he returned the compliment, and commanded that no expence ſhould be ſpared; but notwithſtanding his utmoſt efforts, he acknowledged the inferiority of his banquet to that of Cleopatra. The queen's expectations were fully juſtified by the event; for Antony found ſuch irreſiſtible charms in her manners and converſation, that inſtead of arraigning her as an offender, he bowed in homage before the ſhrine of her beauty, and readily granted all her requeſts, however repugnant to the laws of juſtice, religion, or humanity: for it was about this time that Antony cauſed Cleopatra's ſiſter Arſinoe to be put to death, who had taken refuge in the temple of Diana, at Melitus.

Conſcious of her faſcinating powers, and anxious to bind the Roman by the ſtrongeſt ties to her perſon and intereſt, the fair Egyptian entertained him every day, during her reſidence at Tarſus, with the moſt ſumptuous banquets, which were ſerved up and diſpoſed with ſuch peculiar elegance, that ſhe ſeemed to ſtudy to excel her own inventions. Antony expreſſing ſome ſurprize at the profuſion of gold cups enriched with jewels that appeared on every ſide, ſhe told him, that if he admired ſuch trifles they were at his ſervice, and might be carried to his houſe. The next day the banquet was more ſuperb, and Antony was requeſted to bring all his officers of rank and diſtinction with him; he accepted the invitation, and Cleopatra preſented them with all the gold and ſilver plate that had been uſed in the courſe of the entertainment. In one of theſe feaſts happened the incident which Pliny relates of Cleopatra's profuſeneſs. Having laid a conſiderable wager that ſhe could expend more than fifty thouſand pounds upon one repaſt, ſhe cauſed one of the pearls that ſhe wore in her ears, which was valued at the above-mentioned ſum, to be diſſolved in an acid, and then ſwallowed it She was preparing to melt the other in

in a ſimilar manner, when Plancus, who was preſent, diverted her from the deſign. When Antony was obliged to quit Tarſus, Cleopatra accompanied him as far as Tyre, from whence ſhe returned into Egypt; but the triumvir, unable to endure her abſence, entruſted his affairs to two of his lieutenants, and haſtened to Alexandria, where he devoted the enſuing winter to all ſorts of voluptuouſneſs. Cleopatra's whole ſtudy was to divert him, and all her winning arts were exerted to retain him at her court. Yet after noticing the ſupineneſs theſe indulgencies had brought upon him, ſhe admoniſhed him to reaſſume the hero, and direct his thoughts to the reduction of cities and kingdoms.

Upon intelligence that Labienus had obtained ſome great advantages in Syria, at the head of the Parthian army, B. C. 39, Antony took leave of this beauteous queen early in the ſpring; but having changed his intentions with reſpect to the Parthians, he ſailed into Italy with two hundred ſhips, againſt Octavius: a reconciliation was, however, ſoon effected; and an allianee with his ſiſter Octavia, ſeemed to promiſe the happieſt conſequenees. It was generally ſuppoſed that the extraordinary merit of his new wife would effectually detach Antony from his recent ill-placed affection; but, after ſpending the winter at Athens, he haſtened back to Alexandria, where he again indulged without reſtraint in every ſpeeies of luxury and diſſipation. On his removing into Syria, to reſiſt the arms of the Parthians, he left Cleopatra in Egypt; but before he ſet out on his expedition, he ſent for her into Syria, in direct oppoſition to ſound policy, and the adviee of his friends. On her arrival ſhe perſuaded him to ſueh flagrant acts of cruelty and injuſtice, as rendered him odious to the whole nation. The delay whieh he made with her before he commeneed his mareh againſt the Parthians, was productive of many misfortunes; and his imprudenee in returning in the depth of winter, merely for the gratification of luſt, was attended with the loſs of ſixty thouſand ſoldiers, who either periſhed from the ſeverity of the ſeaſon, or the incredible hardſhips they had ſuffered on their march. On his return to Syria he retired to the caſtle of Leuceeome, between Sidon and Berytus, and there paſſed his time in revelling with the queen of Egypt, without expreſſing the leaſt eoneern for the wife of his boſom, or for the loſs of his troops. As, however, he deemed it neceſſary to pacify the ſoldiery, who juſtly eomplained of their aeeumulated ſufferings, he ordered ſome clothes and money to be diſtributed among them in Cleopatra's name, and then returned to Alexandria with the faſeinating idol of his affections.

The kings of Parthia and Media having quarrelled, in the mean time, reſpecting the diviſion of the booty which they had taken from the Romans, the latter ſent ambaſſadors to Antony, offering to join him againſt the Parthian with all his forces. At the ſame time intelligenee arrived that the Parthians had revolted againſt their ſovereign, and were in the utmoſt confuſion; in conſequenee of this, Antony haſtened into Syria to embraee the opportunity of revenging himſelf upon a formidable enemy. But Cleopatra, hearing that his wife Octavia was eome as far as Athens, in her way to meet Antony, and fearing that the virtue and wiſdom of that juſtly-eelebrated woman might reeal the triumvir to a ſenſe of duty and honour, ſhe employed various arts to make herſelf look pale and dejected, and then wrote to her credulous lover, that his abſenee had materially affected her health, and that ſhe muſt inevitably die if he refuſed to return. Antony needed no other allurements: he haſtened to the arms of his miſtreſs, and was ſo deeply affected by her tears, blandiſhments, reproaches, and vows of everlaſting love, that he conſented to relinquiſh his projected expedition, and to command Octavia to proeeed no farther, but to remain at Athens.

Early in the enſuing ſpring Antony ſet out for Syria, with an intention to march from thence into Parthia. Before he commeneed his journey, he beſtowed Cyrene, Cyprus, Cœlo-Syria, Itruria, and Phœnice, with great part of Crete and Cilieia, upon Cleopatra. But this not ſatisfying her ambition, ſhe earneſtly ſolicited him to put to death Herod king of Judea, and Malchus king of Arabia-Petræa, that their dominions might alſo be transferred to her. This wicked requeſt proved unſueceſsful; but Antony, to pacify her, conſented to give her that part of Malchus's kingdom which bordered on Egypt; and out of Herod's, the territory of Jericho, with the balſam gardens. The queen, having obtained theſe important grants, aeeompanied her lover as far as the Euphrates, and returning by way of Apamea and Damaſcus, came to Jeruſalem, where ſhe was ſumptuouſly entertained by Herod. During her ſtay in that city, ſhe was ſaid to feign an affection for the king, and acted ſo unbecoming the eharacter of her ſex, that Herod formed a deſign to aſſaſſinate her; but being diſſuaded from ſo wicked and inhoſpitable a meaſure, he eontinued to entertain her with all poſſible reſpect, and attended her in perſon to the frontiers of her kingdom.

Antony, who, in defiance of the moſt ſolemn oaths and promiſes, had taken Artabazus, king of Armenia, priſoner, and redueed his country, now haſtened back to Egypt, B. C. 33, and entered Alexandria in a triumphal ear, preceded by the trophies of his victory, and by the moſt illuſtrious eaptives. Cleopatra waited to receive him in the forum, being ſeated on a golden throne, ſurrounded by the ehief lords of her court. The unfortunate Artabazus was brought before her in chains, and with him the other priſoners of diſtinction; but on being commanded to kneel before her, they peremptorily refuſed their complianee. Antony now ſummoned a general aſſembly of the Alexandrians to meet in the gymnaſium, and there made a publie oration, in which he proclaimed Ceſario, the ſon of Cleopatra, begot by Julius Cæſar, king of Egypt and Cyprus, in conjunction with his mother. Antony had alſo three children by Cleopatra, named Alexander, Cleopatra, and Ptolemy. To Alexander he gave Armenia, Media, Parthia, and the other eaſtern eountries from the Euphrates to India, *when they ſhould be ſubdued*; to Cleopatra, the twin ſiſter of Alexander, he promiſed Lybia and Cyrene; and to Ptolemy, whom he ſurnamed Philadelphus, he preſented Phœnice, Syria, Cilieia, and all the countries of Aſia Minor from the Euphrates to the Helleſpont; eonferring on eaeh of the ehildren the title of kings. To eomplete the abſurdity of his conduct, he obliged his queen to take the name of Iſis, himſelf aſſuming that of Oſiris, and from that time they both appeared in publie in the dreſs that was deemed peeuliar to thoſe Egyptian deities. Yet after all this, Antony's mind was rent with jealouſy and ſuſpicion, that Cleopatra, notwithſtanding her pretended affection, had a deſign upon his life, and therefore he would not partake of any diſh at her banquets till it had been taſted by ſome other perſon. The queen, in order to obviate his fears, and at the ſame time to prove how ineffectual all his preeautions would be if ſhe really meditated his deſtruction, eauſed the flowers to be dipped in poiſon which compoſed the garlands that were to be worn by Antony and herſelf at the next feaſt. When the triumvir was in the height of feſtivity, Cleopatra propoſed drinking the flowers of their garlands, and Antony admiring the frolie, threw ſome of them into his wine, and was on the point of ſwallowing them, when the queen ſeizing him by the arm, told him the flowers were poiſoned, and that ſhe herſelf, againſt whom he had been ſo guarded, had prepared the poiſon. She then commanded a condemned eriminal to be brought in, and eauſed him to drink the wine in Antony's cup, which immediately terminated his life.

In eomplianee with the adviee of ſome of his partiſans, Antony declared war againſt his former colleague, who

was now employed in ſtirring up the Romans againſt him; and at the ſame time ſent a divorce to Octavia, whom he ordered to be driven forcibly from his houſe at Rome. His preparations for the war were ſo far advanced, that an immediate attack upon his adverſary would in all probability have been attended with ſucceſs, as Octavius was not then in a condition to withſtand his forces either by ſea or land; but in this, as in every other affair of importance, he was immerſed in misfortune through his ill-fated paſſion; for, inſtead of leading his ſoldiers to the field while they might reaſonably have expected the victory, he continued to revel in the arms of Cleopatra, as if in the moſt peaceable times. Whenever he appeared in public ſhe was with him; even in the adminiſtration of juſtice in the forum ſhe was ſeated by his ſide; he always addreſſed her with the title of queen and ſovereign; and frequently followed her on foot among the eunuchs, while ſhe was drawn through the city in a ſtately chariot. In ſhort, ſhe had gained ſo entire an aſcendancy over him, that ſhe entertained the hope of becoming queen of Rome.

In the year before Chriſt 31, Octavius, having prepared a powerful fleet and army, declared war againſt the queen of Egypt; and as ſoon as the ſeaſon would permit, the two armies prepared for engagement, and the fleets put to ſea. After ſeveral encounters, Antony was perſuaded by Cleopatra to put the whole to the iſſue of a ſea fight, though Canidius remonſtrated on the impolicy of ſuch a riſk. This memorable battle was fought at the mouth of the Ambracian gulf, near the city of Actium, in ſight of both armies. The victory, being diſputed with great vigour and reſolution, was for ſome time doubtful; but the timidity of Cleopatra induced her to draw off the whole Egyptian ſquadron, conſiſting of ſixty large veſſels, in the middle of the engagement; and her ill-fated lover immediately followed her, to the aſtoniſhment of all the ſpectators. Next day Octavius detached a ſquadron of his beſt ſhips in purſuit of the fugitives, but they ſoon returned to the fleet without executing their commiſſion, and Cleopatra and Antony arrived ſafely at Tænarus in Laconia. Octavius cauſed the war to be declared only againſt Cleopatra, to avoid offending Antony's friends, who were very numerous and powerful at Rome. Cleopatra now left Antony, and returned to Alexandria; but fearing leſt the knowledge of her misfortunes ſhould excite her ſubjects to a revolt, ſhe entered the harbour with emblematical ornaments on her ſhips, as if ſhe had obtained a ſignal victory; and when by this artifice ſhe had obtained admiſſion into her metropolis, ſhe iſſued orders for the execution of all thoſe perſons who were averſe to her meaſures.

From Tænarus Antony ſailed to Lybia, where he had left Pinarius Scarpus, with a conſiderable body of troops, to defend the Egyptian frontier on that ſide; but on his landing, he had the mortification to find that Scarpus, and all the forces under his command, had revolted to Octavius. The only reſolution therefore he could now take, was to follow Cleopatra to Alexandria: where he found her engaged in a very extraordinary undertaking. To avoid falling into the hands of Octavius, who, ſhe was well aware, would follow her into Egypt, ſhe commanded all her ſhips in the Mediterranean to be carried to the Red Sea, over an iſthmus of ſeventy miles, for the purpoſe of tranſporting herſelf and all her treaſures beyond the enemy's reach. But the Arabians who inhabited that coaſt having burnt all the veſſels, ſhe was obliged to relinquiſh her deſign. The extremity to which ſhe was thus reduced, effected a total change in her projects; and ſhe inſtantly formed the baſe reſolution of ſacrificing Antony to his inveterate foe, whom ſhe now regarded as her conqueror. She accordingly prevailed on her deluded lover to ſend propoſals of peace to Octavius, and joined her deputies in the ſame embaſſy, but gave them private inſtructions to treat ſeparately for herſelf. Octavius refuſed to admit Antony's ambaſſadors to his preſence, but Cleopatra's were diſmiſſed with a favourable anſwer.

Antony, on his return from Lybia, was ſo deeply overwhelmed with diſtreſs by the treachery of Searpus, that he was with difficulty prevented from ruſhing into the arms of death; and, on his landing, retired to a country-houſe on the banks of the Nile, in order to ſequeſter himſelf from Cleopatra, and all his former companions. But as nothing could eraſe from his heart the recollection of his beloved miſtreſs, he ſoon quitted his retreat, and returned to Alexandria, from whence he again ſent deputies to demand his life of Octavius, upon the ſhameful condition of reſiding at Athens in the capacity of a private perſon; provided Cleopatra and her children might retain the government of Egypt. This deputation proving equally unſucceſsful with the former, Antony ſeemed determined on extinguiſhing the recollection of his paſt troubles, and the apprehenſion of his approaching deſtiny, by immoderate luxury and voluptuouſneſs: Cleopatra and he regaled each other alternately, and ſtrove to exceed each ſucceſſive entertainment in ſplendor and magnificence.

Octavius being anxious to get the queen of Egypt within his power, that he might adorn his triumph with her perſon, and diſcharge his debts with her immenſe treaſures, ſent her ſeveral aſſurances of protection on condition that ſhe would kill Antony, whom he ſtiled the author of all her misfortunes: Cleopatra peremptorily refuſed to embrue her hands in the blood of Antony, but at the ſame time conſented to deliver his perſon, and the kingdom of Egypt, into the enemy's hand. In conſequence of this promiſe the city of Peluſium was betrayed to Octavius, while Antony was gone to lay ſiege to Peritonium, the key of Egypt on the weſtern ſide. Antony, fruſtrated in his deſigns, and defeated with the loſs of his whole fleet, haſtened to Alexandria to defend the metropolis from the fury of Octavius. On his arrival he found Cleopatra employed in removing her jewels and moſt valuable effects to a monument which ſhe was ſaid to have formerly built near the temple of Iſis. Upon being queſtioned reſpecting this removal of her treaſures, together with a great quantity of aromatic wood, flax, perfumes, &c. ſhe anſwered, that if the town ſhould be taken, ſhe would there raiſe a funeral pile and conſume herſelf with her riches in the flames, to diſappoint the enemy of his expectations. This, however, was a mere ſtratagem to conceal her perfidy from Antony, and to obtain further aſſurances of favour from Octavius. The enemy in the mean time encamped in the hippodrome, hoping ſoon to be maſter of the city, by means of the private intelligence which he held with Cleopatra. Antony, who was ſtill ignorant of the queen's intrigues, made a vigorous ſally, and threw the beſiegers into great diſorder; but this was the laſt effort of his expiring valour; for, inſtead of improving his advantage, or providing for his perſonal ſafety, he preſented himſelf in his armour before Cleopatra, and, amidſt the acclamations of the Alexandrians, proſtrated himſelf before her throne, recommending to her favour one of his ſoldiers who had diſtinguiſhed himſelf on that occaſion in a very eminent manner. The queen immediately ſent for the ſoldier, and, in the preſence of the whole people, preſented him with a ſuit of armour and helmet of pure gold, with which he deſerted the ſame night to Octavius. Early the next morning Antony reſolved to attack the invader by ſea and land. He accordingly drew up his land army upon ſome eminences within the city, and from thence kept the galleys in view, which were ſailing out of the port to attack the enemy's fleet. He waited in ſilence the reſult of the expected engagement; but the ſignal was no ſooner given, than Cleopatra's admiral ſtruck his flag and ſurrendered his whole force, in compliance with the orders of his royal miſtreſs.

This treaſon convinced Antony of the ſincerity of thoſe friends

friends who had warned him of Cleopatra's perfidy, and opened his eyes to the true extent of his misfortune. Frantic with rage and despair, he challenged Octavius to decide their quarrel by single combat; but the young Roman, smiling at the proposal, replied, that if Antony was weary of his life, there were means enough in Alexandria to give him relief. Upon the receipt of this contemptuous message, Antony hastened to the palace, in order to sacrifice Cleopatra to his just resentment; but she eluded his fury by a timely flight, and, having shut herself up in the above-mentioned monument, with three attendants, caused it to be published that she had killed herself to avoid the horrors of captivity. This artifice hastened on the catastrophe of Antony's calamities; for he no sooner heard that the queen was dead, than all his former affections rushed into his heart; his transports of rage were converted to those of grief; and he formed the desperate resolution of following her example. He accordingly retired to his apartment with a faithful slave, who had engaged to kill him when the extremity of his affairs should require that mournful office, and, reminding him of his promise, commanded him to run him through the body; but the affectionate Eros, unable to murder his unfortunate master, stabbed himself to the heart, and sunk lifeless at his feet. Antony immediately fell upon his sword, and gave himself the wound of which he afterwards died. At that moment one of the queen's officers came to contradict the account of her death, and found him weltering in his blood. Antony, hearing that Cleopatra was alive, suffered his wound to be dressed, and caused himself to be carried to the monument. The queen would not permit the gates to be opened for his admission, lest she should be surprised by the enemy; but, having ordered her servants to fasten him to some ropes which hung from the top of the monument, she drew him up, with the assistance of her two women. Never was there a more affecting scene! Antony, bathed in his blood, struggling with death, stretching out his feeble arms, and turning his dying eyes to Cleopatra, as if conjuring her to receive his latest breath, was dragged up in the air; while the object of his dearest affection pulled the cords with trembling hands and distorted features, for the poor satisfaction of seeing him die in her arms. When she had, with much difficulty, drawn him up, she laid him upon a bed; tore her garments to stop the bleeding of his wounds; bedewed his face with a profusion of tears; called him by the most endearing epithets; and cut off his hair, acccording to the superstition of the Pagans, who believed this to be a relief to all those who died a violent death. Antony, seeing the queen's affliction, endeavoured to comfort her by observing that his defeat was honourable, since it was no disgrace for one Roman to be vanquished by another; and that his death was rendered felicitous by her kind attentions: he advised her to save her life and kingdom, provided she could do it with honour, and warned her to trust none of the conqueror's friends, except Proculeius. The exertion which attended these words was too powerful for his strength, and he closed his eyes in death at the moment that Proculeius arrived from the enemy's camp, B. C. 30.

Octavius, who had received intelligence of all that passed, and had shed some tears at the sight of the sword with which Antony had wounded himself, commissioned Proculeius to get the queen into his hands: but she refused to surrender herself, unless he would promise, in his master's name, that her children should enjoy the kingdom. He, being unable to accede to these terms, reported the ill success of his conference to Octavius, who immediately sent Cornelius Gallus, a man of great learning and eloquence, to persuade her to confide in his clemency; Gallus accordingly went to the gate of the monument, and, speaking to her through the crevices, engaged her attention while Proculeius scaled the wall, and entered, with two officers, at the place where Antony had been taken in. When Cleopatra saw him appear, she drew a dagger with an intent to stab herself, but Proculeius running swiftly to her, forced the weapon from her hand, and shook her robes lest she should have concealed any poison in them; he then assured her, in general terms, that she might safely rely on Octavius's honour; and immediately dispatched a messenger to inform him that the queen of Egypt was his prisoner. The victorious Roman, overjoyed at this important news, now approached the city of Alexandria, and, finding the gates open, went with Arius, a native of the place, who had been his preceptor, to the gymnasium, where he ascended a tribunal, and made an eloquent harangue to the citizens, in which he told them that he freely pardoned, and would protect them. Cleopatra, having in the mean time obtained permission to bury Antony, caused the body of her unfortunate lover to be embalmed in the most costly manner, and deposited in the burying-place of the kings of Egypt.

Octavius deemed it improper to intrude upon Cleopatra's privacy during the first days of her mourning; but, when the violence of her grief had subsided, he was introduced, by her own permission, into her chamber. He found her extended on a little bed, in a very simple and negligent manner; her hair dishevelled; her visage haggard; her eyes swoln by excessive weeping; and her bosom covered with wounds and bruises: yet, though so greatly disfigured, she did not despair of inspiring her youthful conqueror with the same sentiments as had formerly inflamed the hearts of Julius Cæsar and Marc Antony. With this design she threw herself at his feet, and exerted all her powers in depicting the situation of her affairs: but all her arts were employed to no purpose, for Octavius did not appear to be affected either with her person or conversation, but merely advised her to take courage, and to rest assured that his intentions were equitable. She was far from misconstruing this inauspicious coldness; yet she dissembled her concern, and put an inventory into his hands of all her moveables, jewels, and revenues. Seleucus, one of her treasurers, then present, accused her of concealing part of her most valuable effects; in return for which affront she flew towards him, and, seizing him by the hair, gave him several blows on the face. Then, turning towards Octavius, she demanded whether such treatment from a servant was not insupportable; and acknowledged that she had reserved some jewels for a present to his wife and sister, that through their intercession she might receive some alleviation of her misfortunes. Octavius, supposing from this discourse that his prisoner had relinquished all sorts of suicide, gave her free permission to dispose of the jewels in what manner she thought proper; and, having promised to treat her with more generosity than she expected, quitted the apartment.

Cleopatra, being now convinced that she was designed as an ornament to the victor's triumph, resolved to avoid the approaching infamy by a voluntary death, and devoted her thoughts entirely to the execution of that design. In hopes of deceiving the vigilant Epaphroditus, who never suffered her to go out of his sight, she obtained permission to pay her last respects to the memory of Antony: she bathed the tomb with her tears, covered it with flowers, and, with many expressions of grief, performed such ceremonies as were practised among the Egyptians on similar occasions. But Epaphroditus kept so close to her during the whole time, that she had no opportunity of attempting any thing on her own life. Upon her return she commanded a sumptuous entertainment to be made, and exhibited an uncommon degree of vivacity during the feast. In the height of her apparent mirth she rose from the table, and wrote a letter to Octavius, which she requested Epaphroditus to deliver with his own hand. Having, by this artifice, delivered herself from the observation of Cæsar's freedman, she retired, with two female attendants, to her chamber, where she dressed herself in her royal robes, lay down on her bed, and asked

for a baſket of figs, which one of her ſervants had brought her in the diſguiſe of a peaſant. Among the figs was concealed an aſp, (ſee the article COLUBER, vol. iv. p. 799,) which ſhe applied to her left arm, and, ſinking immediately into a lethargy, ſhe expired in the arms of her attendants. Octavius, on entering the queen's apartment, found her lying dead on a golden bed; one of her maids likewiſe dead at her feet, and the other expiring by her ſide. Octavius tried all poſſible means to recover his fair priſoner; but, finding his attempts fruitleſs, he granted her laſt petition, and cauſed her to be buried with the utmoſt pomp in the ſame tomb with Antony.

Thus died Cleopatra, in the year before Chriſt 30, in the thirty-ninth of her age, and the twenty-ſecond of her reign. She was a woman of extraordinary abilities, for ſhe is ſaid to have been a perfect miſtreſs of the Greek and Latin languages, and to have converſed fluently with Ethiopians, Troglodites, Jews, Arabians, Syrians, Medes, and Perſians, without the aſſiſtance of an interpreter. She retained, in the midſt of her voluptuouſneſs, a taſte for polite learning, and erected a magnificent library, which ſhe enriched with the two hundred thouſand volumes taken from Pergamus. She ſeems to have been capable of the moſt ardent attachments; but ambition was her ruling paſſion, and to this ſhe ſacrificed her virtue, her kingdom, and her life. In her ended the family of Ptolemy Lagus, the founder of the Egyptian monarchy, after it had retained the ſceptre two hundred and ninety-three years from the death of Alexander the Great.

FROM THE CONQUEST OF EGYPT BY THE ROMANS TO THE FALL OF THE EGYPTIAN CALIPHS.

After the death of Cleopatra, Egypt was reduced to the humble ſtate of a Roman province, and was, for ſeveral centuries, governed by prætors ſent from Rome. This luxuriant country, however, was highly favoured by its conquerors, who delegated to the people the privilege of ſubſiſting under their ancient laws, and of exerciſing uninterruptedly the functions of their religion. Even the gods Iſis and Serapis were naturalized at Rome; and, though their temples were demoliſhed in the year of Rome 701, by order of the ſenate, yet they were afterwards reſtored with ſtill greater ſolemnity and magnificence. Under the Roman government, the revenues of Egypt were eſtimated at three millions ſterling per annum, having been greatly improved by the care and economy of the prætors, who literally made that province the granary and ſtorehouſe of Rome. When Probus commanded in Egypt, he executed many conſiderable works, which greatly contributed to the ſplendour and benefit of the country. The navigation of the Nile, ſo important to the Roman commerce, was highly improved; and temples, bridges, porticoes, and palaces, were conſtructed by the hands of the ſoldiers, who acted by turns as architects, as engineers, and as huſbandmen; all tending to the augmentation of this rich domain. Under the Roman juriſdiction, likewiſe, the light of the goſpel, and the bleſſings of the Chriſtian religion, made their firſt entrance into Eypt. It was firſt embraced by the Therapeutæ, or Eſſenians of the lake Mareotis, a Jewiſh ſect, which had abated much of its reverence for the Moſaic ceremonies; but it was in the ſchool of Alexandria, that the Chriſtian theology appears to have aſſumed a regular and ſcientific form; and, when Adrian viſited Egypt, he found a church compoſed of converted Jews and of Greeks, ſufficiently important to attract the notice of that inquiſitive prince.

But, notwithſtanding the wiſdom and mildneſs of the Roman juriſprudence over every part of Egypt, yet this grand acceſſion to their dominions could not be governed without frequent inſurrections and rebellions of the people. About the year of Chriſt 296, five Mooriſh nations iſſued forth from their deſerts to invade the neighbouring provinces; they ſeized upon Egypt, and, being joined by the natives, aſſumed the reins of ſovereignty in Alexandria. Dioeletian, appriſed of theſe meaſures, loſt no time in puniſhing the inſurgents. He opened the campaign in Egypt by the ſiege of Alexandria, cut off the aqueducts which conveyed the waters of the Nile into every part of the city; and, rendering his camp impregnable to the ſallies of the beſieged multitude, he puſhed his attacks with caution and vigour. After a ſiege of eight months, Alexandria, waſted by the ſword and by fire, implored the elemency of the conqueror; but it experienced the full extent of his ſeverity. Many thouſands of the citizens periſhed in a promiſcuous ſlaughter, and there were few obnoxious perſons in Egypt who eſcaped a ſentence either of death, or of exile. The fate of Euſiris and of Coptos was ſtill more melancholy than that of Alexandria; thoſe famous cities, the former diſtinguiſhed by its vaſt antiquity, the latter enriched by the paſſage of the Indian trade, were utterly deſtroyed by the arms and by the ſevere order of Dioeletian. The character of the Egyptian nation, inſenſible to kindneſs, but extremely ſuſceptible to fear, could alone juſtify this exceſſive rigour. The ſeditions of Alexandria had often affected the tranquillity of Rome; and the province of Upper Egypt, inceſſantly relapſing into rebellion, had embraced the alliance of the ſavages of Ethiopia. Even the Blemmyes, ſcattered between the iſland of Meroe and the Red Sea, were ſubſidized by the Egyptians; and theſe ſavage barbarians, whom antiquity, ſhocked with the deformity of their figure, had almoſt excluded from the human race, preſumed to rank themſelves among the enemies of Rome. Such had been the unworthy allies of the Egyptians, who now ſuffered in turn from the unrelenting rigour of the Roman arms. But at the ſame time that Dioeleſian chaſtiſed the paſt crimes of the Egyptians and their allies, he provided for the future ſafety and happineſs of the country, by many wiſe regulations, which were confirmed, and enforced, under the ſucceeding reigns.

Egypt continued under the Roman yoke, not without occaſional ſtruggles for the recovery of its liberty, and ſtill more ſerious quarrels with the prætors and Greek Chriſtians, until the reign of the emperor Heraelius, when the Saracen forces, in the caliphate of Omar, bore down the kingdoms of the eaſt, conquered Paleſtine, and reduced Syria under the Mohammedan power. After ſetting out from Medina, to viſit the holy city of Jeruſalem, and review his victorious troops, A. D. 638, Omar directed his general Yezid to remain in Paleſtine, Abu Obadiah to march againſt Antioch and Aleppo, and Amrou, otherwiſe Amru Ebn Al As, to invade Egypt. The intrepid Amrou, at the head of only four thouſand Arabs, haſtened from his ſtation at Gaza, and continued his route by forced marches, until his tents were pitched on Egyptian ground. He aſſembled his forces before Peluſium, and took poſſeſſion of that key to Egypt, as it is uſually called, in only thirty days, which unlocked the entrance of the country as far as the ruins of Heliopolis, and the neighbourhood of Memphis, or the modern Cairo. In the age of Auguſtus, and even in that of Conſtantine, Memphis ranked among the greateſt and moſt populous of the Roman provincial cities. The banks of the Nile, in this place of the breadth of three thouſand feet, were united by two bridges of ſixty and of thirty boats, connected in the middle ſtream by the ſmall iſland of Rouda, which was covered with gardens and habitations. The eaſtern extremity of the bridge was terminated by the town of Babylon and the camp of a Roman legion, which protected the paſſage of the river and the ſecond capital of Egypt. This important fortreſs, which might fairly be deſcribed as a part of Memphis or Miſrah, was ſoon inveſted by the arms of the valiant Amrou: a reinforcement of four thouſand Saracens arrived in his camp; and the military engines, which battered the walls, may be imputed to the art and labour of his Syrian allies. Yet the ſiege was protracted to ſeven months; and the raſh

invaders

CLEOPATRA, QUEEN OF EGYPT.

London Published 1st the Act directs Jan.y 21.1806 by J.Wilkes.

invaders were encompaſſed and threatened by the approaching inundation of the Nile. Their laſt aſſault was therefore bold and ſucceſsful: they paſſed the ditch, which had been fortified with iron ſpikes, applied their ſcaling-ladders, entered the fortreſs with ſhouts, and drove the remnant of the Greeks to their boats and the iſle of Rouda. The ſpot was afterwards recommended to the conqueror by the eaſy communication with the gulf and the peninſula of Arabia: the remains of Memphis were deſerted; the tents of the Arabs were converted into permanent habitations: and the firſt moſque roſe up in the preſence of fourſcore companions of Mahomet. A new city aroſe in their camp on the eaſtward bank of the Nile; and the contiguous quarters of Babylon and Foſtat are confounded in their preſent decay by the appellation of old Miſrah or Cairo, of which they form an extenſive ſuburb. But the name of Cairo, the town of *victory*, more ſtrictly belongs to the modern capital.

The Arabs, however, after this glorious and profitable enterpriſe, muſt have finally retreated to the deſert, had they not found a powerful alliance in the heart of the country. The rapid conqueſt of Alexander had formerly been aſſiſted by the ſuperſtition and revolt of the natives: they abhorred their Perſian oppreſſors who had burnt the temples of Egypt and deſtroyed their gods. After a period of ten centuries, the ſame revolution was renewed by a ſimilar cauſe; and in the ſupport of an incomprehenſible creed, the zeal of the Coptic Chriſtians was equally ardent. The Saracens were therefore received as the deliverers of the Jacobite church; and a ſecret treaty was opened during the ſiege of Memphis between the victorious army and a people of ſlaves. A rich and noble Egyptian, named Al Mokawkas, had diſſembled his faith to obtain the adminiſtration of his province: but the abuſe of his truſt had expoſed him to the reſentment of Heraclius; his ſubmiſſion was only delayed by arrogance and fear; and his conſcience was prompted by intereſt to throw himſelf on the favour of the Saracens. In his firſt conference with Amrou, he heard without indignation the uſual option of the Koran, *the tribute, or the ſword.* "The Greeks, (replied Mokawkas,) are determined to abide the determination of the ſword; but with the Greeks I deſire no communion, either in this world or in the next, and I abjure for ever the Byzantine tyrant, his ſynod of Chalcedon, and his Melchite ſlaves. For myſelf and my brethren, we are reſolved to live and die in the profeſſion of the goſpel and unity of Chriſt. It is impoſſible for us to embrace the revelations of your prophet; but we are deſirous of peace, and cheerfully ſubmit to pay tribute and obedience to his temporal ſucceſſors." The tribute was aſcertained at two pieces of gold for the head of every Chriſtian; but old men, monks, women, and children of both ſexes under ſixteen years of age, were exempted from this perſonal aſſeſſment; the Copts above and below Memphis ſwore allegiance to the caliph, and promiſed an hoſpitable entertainment of three days to every Muſſulman who ſhould travel through their country. In the march, therefore, from Memphis to Alexandria, Amrou entruſted his ſafety to the zeal and gratitude of the Egyptians: the roads and bridges were diligently repaired; and in every ſtep of his progreſs, he could depend on a conſtant ſupply of proviſions and intelligence. The Greeks of Egypt, whoſe numbers could ſcarcely equal a tenth of the natives, were overwhelmed by the univerſal defection; they had ever been hated, they were no longer feared: the magiſtrate fled from his tribunal, the biſhop from his altar; and the diſtant garriſons were ſurpriſed or ſtarved by the ſurrounding multitudes. Had not the Nile afforded a ſafe and ready conveyance to the ſea, not an individual could have eſcaped, who by birth, or language, or office, or religion, was connected with the Greek name.

By this retreat of the Greeks from the provinces of Upper Egypt, a conſiderable force was collected in the iſland of Delta: the natural and artificial channels of the Nile afforded a ſucceſſion of ſtrong and defenſible poſts; and the road to Alexandria was laboriouſly cleared by the victory of the Saracens in two and twenty days of general or partial combat. In their annals of conqueſt, the ſiege of Alexandria is perhaps the moſt arduous and important enterpriſe. The firſt trading city in the world was abundantly repleniſhed with the means of ſubſiſtence and defence. Her numerous inhabitants fought for the deareſt of human rights, religion and property; and the enmity of the natives ſeemed to exclude them from the common benefit of peace and toleration. The ſea was continually open; and, if the emperor Heraclius had been awake to the public diſtreſs, freſh armies of Romans and barbarians might have been poured into the harbour to ſave the ſecond capital of the empire. A circumference of ten miles would have ſcattered the forces of the Greeks, and favoured the ſtratagems of an active enemy; but the two ſides of an oblong ſquare was covered by the ſea and the lake Maræotis, and each of the narrow ends expoſed a front of no more than ten furlongs. The efforts of the Arabs were not inadequate to the difficulty of the attempt and the value of the prize. From the throne of Medina, the eyes of the caliph Omar were fixed on the camp and city: his voice excited to arms the Arabian tribes and the veterans of Syria; and the merit of an holy war was recommended by the peculiar fame and fertility of Egypt. Anxious for the ruin or expulſion of their tyrants, the Egyptian natives devoted their labours to the ſervice of Amrou; ſome ſparks of martial ſpirit were perhaps rekindled by the example of their allies; and the ſanguine hopes of Mokawkas had fixed his ſepulchre in the church of St. John of Alexandria. Eutychius the patriarch obſerves, that the Saracens fought with the courage of lions; they repulſed the frequent and almoſt daily ſallies of the beſieged, and ſoon aſſaulted in their turn the walls and towers of the city. In every attack, the ſword, the banner of Amrou, glittered in the van of the Moſlems. On a memorable day, he was betrayed by his imprudent valour: his followers who had entered the citadel were driven back; and the general, with a friend and a ſlave, remained a priſoner in the hands of the Greek Chriſtians. When Amrou was conducted before the præfect, he remembered his dignity, but forgot his ſituation; a lofty demeanour, and reſolute language, revealed the lieutenant of the caliph, and the battle-axe of a ſoldier was already raiſed to ſtrike off the head of the audacious captive. His life was ſaved by the promptitude of his ſlave, who inſtantly gave his maſter a blow on the face, and commanded him, with an angry tone, to be ſilent in the preſence of his ſuperiors. The credulous Greek was by this artifice deceived; he liſtened to the offer of a treaty, and his priſoners were diſmiſſed in the hope of a more reſpectable embaſſy, till the joyful acclamations of the camp announced the return of their general, and inſulted the folly and weakneſs of their enemies. At length, after a ſiege of fourteen months, and the loſs of three and twenty thouſand men, the Saracens prevailed: the Greeks embarked their diſpirited and diminiſhed numbers, and the ſtandard of Mahomet was planted on the walls of Alexandria. "I have taken, (ſaid Amrou to the caliph,) the great city of the weſt. It is impoſſible for me to enumerate the variety of its riches and beauty; and I ſhall content myſelf with obſerving, that it contains four thouſand palaces, four thouſand baths, four hundred theatres or places of amuſement, twelve thouſand ſhops for the ſale of vegetable food, and forty thouſand tributary Jews. The town has been ſubdued by force of arms, without treaty or capitulation, and the Moſlems are impatient to ſeize the fruits of their victory." The caliph Omar rejected with firmneſs the idea of pillage, and directed Amrou to reſerve the wealth and revenue of Alexandria for the public ſervice: the inhabitants were numbered, a tribute was impoſed; and the people indulged in an obſcure exerciſe of their worſhip. The intelligence of this diſgraceful and calamitous

calamitous event afflicted the declining health of the emperor; and Heraclius died about ſeven weeks after the loſs of Alexandria. Under the minority of his grandſon, the clamours of the people compelled the court to undertake the recovery of Egypt. In the ſpace of four years, the harbour and fortifications of Alexandria were twice occupied by a fleet and army of Romans. They were twice expelled by the valour of Amrou, who was recalled by the domeſtic peril from the diſtant wars of Tripoli and Nubia. But the facility of the attempt, and the obſtinacy of the reſiſtance, provoked him to ſwear, "that if a third time he drove the infidels into the ſea, he would render Alexandria as acceſſible on all ſides as the houſe of a proſtitute." Faithful to his promiſe, he diſmantled ſeveral parts of the walls and towers, but the people was ſpared in the chaſtiſement of the city, and the moſque of *Mercy* was erected on the ſpot where the victorious general had ſtopped the fury of his troops.

It was now that the learned had to deplore the fate of the Alexandrian library, as it is deſcribed by the learned Abulpharagius. The ſpirit of Amrou was more curious and liberal than that of his brethren; and in his leiſure hours the Arabian chief was pleaſed with the converſation of John, the laſt diſciple of Ammonius, and who derived the ſurname of *Philoponus*, from his laborious ſtudies of grammar and philoſophy. Emboldened by this familiar intercourſe, Philoponus preſumed to ſolicit a gift, ineſtimable in his opinion, contemptible in that of the Barbarians; the royal library; which alone, among the ſpoils of Alexandria, had not been appropriated by the viſit and the ſeal of the conqueror. Amrou was inclined to gratify the wiſh of the grammarian, but his rigid integrity refuſed to alienate the minuteſt object without the conſent of the caliph; and the well-known anſwer of Omar was inſpired by the ignorance of a fanatic. "If theſe writings of the Greeks agree with the book of God, they are uſeleſs and need not be preſerved: if they diſagree, they are pernicious and ought to be deſtroyed." The ſentence was executed with blind obedience: the volumes of paper or parchment were diſtributed to the four thouſand baths of the city; and ſuch was their incredible multitude that ſix months were barely ſufficient for the conſumption of this precious fuel!

In the adminiſtration of Egypt, Amrou endeavoured to balance the demands of juſtice and of policy. In the management of the revenue he diſapproved the ſimple but oppreſſive mode of a capitation, and preferred with reaſon a proportion of taxes, deducted on every branch from the clear profits of agriculture and commerce. A third part of the tribute was appropriated to the annual repairs of the dykes and canals, ſo eſſential to the public welfare. Under his adminiſtration the fertility of Egypt ſupplied the dearth of Arabia; and a ſtring of camels, laden with corn and proviſions, covered almoſt without an interval the long road from Memphis to Medina. But the genius of Amrou ſoon renewed the maritime communication which had been attempted or achieved by the Pharaohs, the Ptolemies, or the Cæſars; and a canal, at leaſt eighty miles in length, was opened from the Nile to the Red Sea. This inland navigation, which would have joined the Mediterranean and the Indian Ocean, was ſoon diſcontinued as uſeleſs or dangerous: and the Saracen throne was removed from Medina to Damaſcus. Of this new conqueſt, the caliph Omar had but an imperfect knowledge from the voice of fame. He requeſted that his general would place before his eyes the realm of Pharaoh and the Amalekites; and the anſwer of Amrou exhibits, even in thoſe early days, a lively and not unfaithful picture of that ſingular country; "O commander of the faithful, Egypt is a compound of black earth and green plants, between a pulveriſed mountain and a red ſand. The diſtance from Syene to the ſea is a month's journey for an horſeman. Along the valley deſcends a river, on which the bleſſing of the Moſt High repoſes both in the evening and morning, and which riſes and falls with the revolutions of the ſun and moon. When the annual diſpenſation of Providence unlocks the ſprings and fountains that nouriſh the earth, the Nile rolls his ſwelling and ſounding waters through the realm of Egypt: the fields are overſpread by the ſalutary flood; and the villages communicate with each other in their painted barks. The retreat of the inundation depoſits a fertilizing mud for the reception of the various ſeeds: the crowds of huſbandmen who blacken the land may be compared to a ſwarm of induſtrious ants: and their native indolence is quickened by the laſh of the taſk-maſter, and the promiſe of the flowers and fruits of a plentiful increaſe. Their hope is ſeldom deceived; but the riches which they extract from the wheat, the barley, and the rice, the legumes, the fruit-trees, and the cattle, are unequally ſhared between thoſe who labour and thoſe who poſſeſs. According to the viciſſitudes of the ſeaſons, the face of the country is adorned with a *ſilver* wave, a verdant *emerald*, and the deep yellow of a *golden* harveſt. Thus the rich and fruitful province of Egypt was completely conquered, and the Roman government wholly ſuperſeded by the Arabs or Saracens, in the 19th year of the hegira, A. D. 640.

Upon the acceſſion of Othmar to the caliphate, after the aſſaſſination of Omar, Amrou was removed from his command in Egypt, in order to make way for Abdallah, foſter-brother to the new caliph. His birth and talents gave him an honourable rank among the Koreiſh; and, in a nation of cavalry, Abdallah was renowned as the boldeſt and moſt dextrous horſeman of Arabia. The conqueſt of Africa, from the Nile to the Atlantic Ocean, was now firſt projected by the caliph Othmar; who, A. D. 647, entruſted the conduct of the war to Abdallah. At the head of forty thouſand Moſlems, he advanced from Egypt into the unknown countries of the weſt. The ſands of Barca might be impervious to a Roman legion; but the Arabs, attended by their faithful camels, beheld without terror the familiar aſpect of the ſoil and climate; and, after a painful march, they pitched their tents before the walls of Tripoli. A reinforcement of Greeks was ſurpriſed and cut in pieces on the ſea-ſhore; but the fortifications of Tripoli reſiſted the firſt aſſaults; and the Saracens were tempted by the approach of the præfect Gregory to relinquiſh the labours of the ſiege for the perils and the hopes of a deciſive action. His ſtandard was followed by one hundred and twenty thouſand men; and he rejected with indignation the option of the Koran, or the tribute. During ſeveral days, the two armies were fiercely engaged from the dawn of light to the hour of noon, when their fatigue and the exceſſive heat compelled them mutually to ſeek ſhelter and refreſhment in their reſpective camps. The daughter of Gregory, a maid of incomparable beauty and ſpirit, is ſaid to have fought by her father's ſide: from her earlieſt youth ſhe was trained to mount on horſeback, to draw the bow, and to wield the ſcymetar; and the richneſs of her arms and apparel was conſpicuous in the foremoſt ranks of the battle. Her hand, with an hundred thouſand pieces of gold, was offered for the head of the Arabian general, and the youths of Africa were excited by the proſpect of the glorious prize. At the preſſing ſolicitation of his brethren, therefore, Abdallah withdrew from the field; but the Saracens were diſcouraged by the retreat of their leader, and the repetition of theſe equal or unſucceſsful conflicts.

A noble Arabian, Zobeir, who afterwards became the adverſary of Ali and the father of a caliph, had ſignalized his valour in Egypt, and was the firſt who planted a ſcaling-ladder againſt the walls of Babylon. In this war he had been detached from the ſtandard of Abdallah. On the news of the battle, Zobeir, with twelve companies, cut his way through the camp of the Greeks, and preſſed forwards, without taſting either food or repoſe, to partake of the dangers of his brethren. He caſt his eyes round the field: "Where, (ſaid he,) is our general?" "In his tent." "Is the tent a ſtation for the general of the

the Moſlems?" Abdallah repreſented with a bluſh the importance of his own life, and the temptation that was held forth by the Roman præfect. "Retort, (ſaid Zobeir,) on the infidels their ungenerous attempt. Proclaim through the ranks, that the head of Gregory ſhall be repaid with his captive daughter, and the equal ſum of one hundred thouſand pieces of gold." To the courage and diſcretion of Zobeir the general of the caliph entruſted the execution of his own ſtratagem, which inclined the long-diſputed balance in favour of the Saracens. Supplying by activity and artifice the deficiency of numbers, a part of their forces lay concealed in their tents, while the remainder prolonged an irregular ſkirmiſh with the enemy, till the ſun was high in the heavens. On both ſides they retired with fainting ſteps: their horſes were unbridled, their armour was laid aſide; and the hoſtile nations prepared, or ſeemed to prepare, for the refreſhment of the evening, and the encounter of the enſuing day. On a ſudden, the charge was ſounded; the Arabian camp poured forth a ſwarm of freſh and intrepid warriors; and the long line of the Greeks and Africans was ſurpriſed, aſſaulted, and overturned, by new ſquadrons of the Saracens. The præfect Gregory was ſlain by the hand of Zobeir: his daughter, who ſought revenge and death, was ſurrounded and made priſoner; and the fugitives involved in their diſaſter the town of Sufetula, to which they eſcaped from the ſabres and lances of the Arabs. After the attack and fall of this opulent city, the provincials and barbarians implored on all ſides the mercy of the conqueror. His vanity or his zeal might be flattered by offers of tribute or profeſſions of faith: but his loſſes, his fatigues, and the progreſs of an epidemical diſeaſe, prevented a ſolid eſtabliſhment; and the Saracens, after a campaign of fifteen months, returned to Egypt, with the captives and the wealth of their African expedition. The author of the death of Gregory was expected to have claimed the moſt precious reward of the victory: from his ſilence it might be preſumed that he had fallen in the battle, till the tears and exclamations of the præfect's daughter, at the ſight of Zobeir, revealed the valour and modeſty of that gallant ſoldier. The unfortunate virgin was offered, and almoſt rejected as a ſlave, by her father's murderer, who coolly declared that his ſword was conſecrated to the ſervice of religion; and that he laboured for a recompenſe far above the charms of mortal beauty, or the riches of this tranſitory life. A reward congenial to his temper, was the commiſſion of announcing to the caliph Othman the ſucceſs of his arms. The companions, the chiefs, and the people, were aſſembled in the moſque of Medina, to hear the intereſting narrative of Zobeir; and, as the orator forgot nothing except the merit of his own counſels and actions, the name of Abdallah was joined by the Arabians with the heroic names of Caled and Amrou.

The conqueſts of the Saracens were ſuſpended near twenty years by domeſtic broils, till their diſſentions were compoſed by the eſtabliſhment of the houſe of Ommiyah: and the caliph Moawiyah, who ſucceeded, was invited by the Africans themſelves. For the cauſes of theſe diſſentions, ſee the article ARABIA, vol. ii. p. 13, &c. The firſt general of Moawiyah acquired a juſt renown, ſubdued an important city, defeated an army of thirty thouſand Greeks, ſwept away fourſcore thouſand captives, and enriched with their ſpoils the adventurers from Syria and Egypt. But the title of conqueror of Africa is more juſtly due to his ſucceſſor Akbah. He marched at the head of ten thouſand of the braveſt Arabs; and the genuine force of the Moſlems was enlarged by the aid and converſion of many thouſand barbarians. The fearleſs Akbah plunged into the heart of the country, traverſed the wilderneſs in which his ſucceſſors erected the ſplendid capitals of Fez and Morocco, and at length penetrated to the verge of the Atlantic and the great deſert. The river Sus deſcends from the weſtern ſides of mount Atlas, fertilizes, like the Nile, the adjacent ſoil, and falls into the ſea at a moderate diſtance from the Canary, or Fortunate, iſlands. Its banks were inhabited by the laſt of the Moors, a race of ſavages, without laws, or diſcipline, or religion: they were aſtoniſhed by the ſtrange and irreſiſtible terrors of the oriental arms; and as they poſſeſſed neither gold or ſilver, the richeſt ſpoil was the beauty of the female captives, ſome of whom were afterwards ſold for a thouſand pieces of gold. The career, though not the zeal, of Akbah was checked by the proſpect of a boundleſs ocean. Yet this Mahometan Alexander was unable to preſerve his recent conqueſts. By the univerſal defection of the Greeks and Africans, he was recalled from the ſhores of the Atlantic, and the ſurrounding multitudes left him only the reſource of an honourable death. The prudence of Akbah had propoſed to found an Arabian colony in the heart of Africa; a citadel that might curb the levity of the barbarians, a place of refuge to ſecure, againſt the accidents of war, the wealth and the families of the Saracens. With this view, and under the modeſt title of the ſtation of a caravan, he planted this colony in the fiftieth year of the hegira. In its preſent decay, Cairoan ſtill holds the ſecond rank in the kingdom of Tunis, from which it is diſtant about fifty miles to the ſouth; its inland ſituation, twelve miles weſtward of the ſea, has protected the city from the Greek and Sicilian fleets. When the foreſt, or rather wilderneſs, was cleared, the veſtiges of a Roman town were diſcovered in a ſandy plain: the vegetable food of Cairoan is brought from afar; and the ſcarcity of ſprings conſtrains the inhabitants to collect in ciſterns and reſervoirs a precarious ſupply of rain-water. Theſe obſtacles were ſubdued by the induſtry of Akbah; he traced a circumference of three thouſand and ſix hundred paces, which he encompaſſed with a brick wall; in the ſpace of five years, the governor's palace was ſurrounded with a ſufficient number of private habitations; a ſpacious moſque was ſupported by five hundred columns of granite, porphyry, and Numidian marble; and Cairoan became the ſeat of learning as well as of empire. But theſe were the glories of a later age; the new colony was ſhaken by the ſucceſſive defeats of Akbah, and the weſtern expeditions were again interrupted by the civil diſcord of the Arabian monarchy. The ſon of the valiant Zobeir maintained a war of twelve years, and a ſiege of ſeven months againſt the houſe of Ommiyar, for the caliphate, (which ſee under ARABIA.)

The return of domeſtic peace allowed the caliph Abdalmalek to reſume the conqueſt of Africa, as an appendage to the government of Egypt; and the ſtandard was delivered to Haſſan, its governor, A. D. 692. The whole revenue of Egypt, with an army of forty thouſand men, was conſecrated to the important ſervice. In the viciſſitudes of war, the provinces had been alternately won and loſt by the Saracens. The veteran bands of Haſſan, under a boundleſs inſurrection, became inadequate to the defence of Africa: the conqueſts of an age were loſt in a ſingle day; and the Arabian chief, overwhelmed by the torrent, retired to the confines of Egypt, where he expected, for five years, the promiſed ſuccours of the caliph. The lot of combating this inſurrection devolved on the ſucceſſor of Haſſan; it was finally quelled by the activity of Muſa and his two ſons; but the number of the rebels may be preſumed from that of three hundred thouſand captives; ſixty thouſand of whom, the caliph's fifth, were ſold for the profit of the public treaſury. Thirty thouſand of the barbarian youth were immediately inliſted in the troops of Muſa, and deſtined to aſſiſt him in the conqueſt of Spain.

Egypt, for many centuries, continued thus under the uncontrolled dominion of the caliphs of Medina, Damaſcus, and Bagdad, conſtantly aſſiſting them in their conqueſt of Africa, or rather that portion of it which extends along the Mediterranean Sea; but which was not completed till the year 709 of our era. Under the caliphate of Mohammed ben Yezid, the Africans revolted,

and fell unexpectedly upon the Saracens, whom they defeated with great ſlaughter. Yezid died, and was ſucceeded by the caliph Hakim, who appointed Hantelé ben Seffran governor of Egypt, A. D. 741. This Arabian general, with the whole power of Egypt, added to the Saracen's troops, was ordered to march againſt the inſurgents, whom he defeated with great ſlaughter, and regained poſſeſſion of Cairoan, the Arabian capital of Africa, founded, as above-mentioned, by Akbal. The revolt ſoon after reviving, Hantelé again conquered the rebels, whoſe army was conducted by Abdel-wahhad. The uſual exaggeration of the Arabian authors, (againſt which the ſerious reader ſhould be conſtantly guarded,) computes the inſurgents ſlain at no leſs than 160,000! and Hantelé, in giving an account of his operations to the caliph Hakim, declared that a more ſanguinary battle had never been fought.

In the year 749, after conſiderable warfare and ſtruggle, (which ſee under ARABIA,) the ſceptre of the caliphs paſſed from the houſe of Ommiyah to the houſe of Al Abbas, thence called Abbaſſides; upon which Abdalrahman, the Saracen commander in Africa, and heir of Ommiyah, refuſed the tribute, aſſembled the people in the moſque of Cairoan, tore his robe, abjured the authority of the new Abbaſſide caliph, and procured himſelf to be proclaimed caliph in the weſt; but being ſlain by his brothers, a civil war aroſe, which was finally curbed by Dawud governor of Egypt, who conquered the Berbers or Arabs of the weſt, and once more reſtored tranquillity to Cairoan the capital. The family of Abdalrahman nevertheleſs continued to aſſume the dignity of caliphs, as deſcendants of the Ommiades; which title they carried with them into Spain, and exerciſed the regal authority in their palace at Cordova.

In conſequence of an attempt to aſſaſſinate the caliph Al Manſur, or Almanſor, in the palace of Damaſcus, the prince was induced to remove his court from that city to Bagdad; about which time, A. D. 800, began the dynaſty of the Agglabites in the perſon of Ibrahim ben el Aghleb, governor of Africa, who threw off the yoke of the caliphate, fortified himſelf in Cairoan, and was ſucceeded by his ſon Abul Abbas, in 811. Ziadat Ullah ſucceeded him, and ſubdued Sicily; but died A. D. 837, when Abu Akkal aſcended the African throne. The next prince, named after his great anceſtor Abul Abbas, began to reign in the year 840, and was humane, liberal, and a lover of juſtice. He reigned thirty-four years; and, having obtained from his brother Iſhak, in the moſque of Cairoan, a formal renunciation of all claim to the crown, left the ſucceſſion to his ſon. But on his death, Iſhak ſlew the young prince, and aſſumed the ſovereignty of Africa. In 877, he beſieged Syracuſe, which he plundered of immenſe treaſures, and put the inhabitants to the ſword. The Egyptians, ſtill faithful to the caliphs of Bagdad, were ordered by the deſcendants of the famous Harun al Raſhid, to invade Africa, and beſiege Tripoli; but on the approach of Iſhak with his negro army, the Egyptians retired, and were quickly driven back to their own country. Iſhak was a moſt cruel prince: he put to death, in one day, ſixteen of his own natural daughters by different concubines. His mother preſenting him with two beautiful females, he ſent her in return a platter covered with a napkin; on lifting it up, inſtead of jewels, which ſhe expected, ſhe beheld the heads of the two female ſlaves. He was ſucceeded by his ſon Abul Abbas Abdallah; but this prince was cruelly murdered by his brother Ziadet Ullah, who ſeized on the ſceptre of Cairoan. A revolt was the conſequence; upon which the timid Ullah abandoned his uſurped dominions, and fled for ſhelter to Egypt, then governed by Baſi al Nuchiſi, under Al Moktadi, or Moktadir, eighteenth caliph of the dynaſty of the Abaſſides. With Ziadat Ullah, who died in Egypt, A. D. 908, expired the dynaſty of the Agglabites, which had ruled Africa for an hundred and eight years.

The dynaſty of the Fatimites, or Iſmaëlians, now ſucceeded. Obeid Ullah, who had ſeized the authority, reſigned it ſoon after to his ſon Abul Caſſim. Though this new family was of Egyptian extraction, it pretended to deduce its origin from Fatima the daughter of Mahomet, through Iſmael the ſixth imam of the poſterity of Ali. Abul Caſſim, aſſuming the name of Mahadi, or *real ſucceſſor*, and cauſing himſelf to be proclaimed at Cairoan, A. D. 912, attacked Egypt with three armies, intending to add that rich province to his other African dominions. The caliph of Bagdad, however, had anticipated his deſign, which was fruſtrated by the defeat of the armies of Mahadi, though he took Alexandria. He built a city called after himſelf Mehedié, on the African ſhore, which he deſtined for the ſeat of his empire. He died in the year 933, and was ſucceeded by his ſon Achmed, who died while his capital Mehedié was beſieged by inſurgents. His ſon Iſmail defeated the rebels, aſſumed the ſovereignty, A. D. 945, and built Manſurich in Africa. Now ſucceeded Abu Tammin, ſurnamed Moaz, the ſon of Iſmail, A. D. 952. This prince determined on the conqueſt of Egypt; for which purpoſe he diſpatched Jaafan, or Jeuhar, a Greek general, in 968, at the head of a powerful army, to inveſt Memphis, or *Miſrah*; which inſtantly opened its gates. Encouraged by the inhabitants, Jeuhar reſolved to found a new capital for Moaz, and directed the building to be begun under the horoſcope or aſcendant of the planet Mars, called *kahir*, or conqueror, by the Arabs; and hence the city was named *Kahira*, or the *victorious*, now corrupted to Cairo. In the mean time Jeuhar reduced Egypt; and in 972, Moaz landed at Alexandria, from whence he advanced to Kahira, and was welcomed by the acclamations of his new ſubjects. To this city he removed all his treaſures, and even the bodies of his forefathers. The dynaſty of the Fatimites, thus tranſplanted into Egypt, ruled till the year 1171, of the hegira 566, when it was ſupplanted by Salah-el-din, the famous Saladin of the Chriſtian writers on the CROISADES: which ſee.

Moaz, after he had gained a firm footing in Egypt, and aſſumed the ſovereignty of Syria, reſigned the kingdom of Africa, on condition of homage, to Yuſſuf, or Joſeph ben Zeiri, of a family ſprung from Arabia Felix, and in whom commenced the African dynaſty of Zeirites. He was ſucceeded by Abul Caſſim Manſur, who erected a new palace in the city of Cairoan, which coſt eight hundred thouſand pieces of gold. His cruelty was manifeſted by the murder of his faithful miniſter Abdallah, and in the puniſhment of the rebel Abul Fahm, whoſe heart this prince is ſaid to have torn from his body and devoured. He died in his palace of Cairoan, where his ſon and ſucceſſor Abu Menad compelled the nobles to do homage. Jealous of the growing magnificence and power of this young prince, Moaz, now firſt caliph of Egypt and Syria, diſpatched his general Jeuhar to Abu Menad, with the dreſs and ſabre of Egypt, which he compelled him to wear, as a mark of the Egyptian ſovereignty over the African kingdom. Moaz died at the age of eighty-five, after a reign of twenty-one years as ſovereign of Africa, and of forty as caliph of Egypt and Syria. His body was interred in the magnificent moſque of Kahira, or Cairo, which he had erected, and in which he had depoſited the bones of his anceſtors.

Moaz was ſucceeded by his ſon Aziz, A. D. 975, who being only twenty-one years of age, deputed the conduct of the government to his late father's favourite general Jeuhar. Aziz married a Chriſtian woman; he had alſo a perſon of that religion for his ſecretary, and his treaſurer was a Jew; both the latter, however, were afterwards diſcarded and ſtripped of their wealth, in conſequence of the complaints of ſome of his courtiers. He carried on many wars, in which he was not always ſucceſsful; but he never appeared in perſon at the head of his armies. Jeuhar, the conqueror of Egypt, a ſecond Beliſarius, to whom Aziz had delegated the concerns of government, was, on account of his bad fortune in Syria, diſgraced and deprived

deprived of his riches, and died in poverty. After this, Aziz fuddenly died in the forty-third year of his age, having reigned twenty-one years and five months. He was fucceeded in the caliphate by his fon Hakim, or Alakem, A. D. 996, whom during his minority, he being then only eleven years of age, the dying father had committed to the care and fuperintendence of a miniſter of great experience and approved integrity. The firſt remarkable event of his reign was a dangerous inſurrection which broke out in his dominions, under the conduct of an obſcure water-carrier, though deſcended, or at leaſt pretending to be deſcended, from Heſham, of the houſe of Ommiyah. This perſon began his enterprize by crying aloud among the zealous Muſſulmans for a reformation of life and manners; and, by a more than ordinary oſtentation of ſanctity, he induced ſuch numbers of them to follow him, that he ſoon found himſelf at the head of a powerful army. He had made himſelf maſter of Upper Egypt, before Alakem had time to collect his troops. The conteſt was long obſtinate and doubtful; but the inſurgents were defeated, and their leader taken priſoner and put to death; upon which the revolt ceaſed, and tranquillity was reſtored. Alakem, at length, became inſane, and was murdered at the inſtigation of his own ſiſter, who, in order to avoid ſuſpicion, ſtabbed the aſſaſſins with her own hand. Daher, or Taher, his ſon, was only ſeven years of age when proclaimed caliph of Egypt and Syria, A. D. 1021; and his aunt, during his minority, took upon herſelf the regency of the two kingdoms. The obſcurity of his reign has furniſhed hiſtory with nothing more reſpecting him, than that he was a wiſe and prudent prince, and a lover of poetry. Taher was ſucceeded in the caliphate by his ſon Monſtanzer, called by ſome writers Abu Tamim Moſtanſir, a prince of extraordinary ſagacity and prudence, of great moderation, and who, by his mild and humane government, acquired the eſteem and affection of his ſubjects. The African monarchy having revolted from the ſovereignty of Monſtanzer, the Egyptians entered the province of Muggrib, by the town of Zenata, ſeized Tripoli, and inveſted the capital Cairoan; where they ſtopped the ſprings, turned the courſe of the river, and deſtroyed the magnificent palaces and delicious gardens of that city. During this reign, A. D. 1066, happened a moſt grievous famine throughout Egypt and Syria; inſomuch that cats, dogs, and horſes, were ſold for food at enormous prices; and thouſands of the inhabitants of Cairo periſhed. Amidſt the extreme miſery of the people, the caliph exhibited the moſt exemplary inſtances of generoſity towards his ſubjects. To ſupply their neceſſities, he not only diſpoſed of all the money, jewels, and other things of value, with which his predeceſſors had enriched the royal treaſury, but likewiſe ſold the coſtly furniture of his palaces and ſeraglios. A deſtructive peſtilence, which immediately followed the famine, tended to complete the miſery of the kingdom; and its calamities and deſolate condition encouraged Haſan to make an invaſion, at the head of a numerous army of Turks. After beſieging the caliph in his palace, the mercileſs invaders plundered Lower Egypt, and inflicted the moſt horrid cruelties on the inhabitants. Having no other reſource, Monſtanzer was reduced to the neceſſity of obtaining peace by giving up to the plunderers all the treaſures he could collect from his ſubjects. This evil was followed by the loſs of moſt of the Egyptian poſſeſſions in Syria. Towards the end of his reign, Monſtanzer committed the care and government of Egypt to a favourite miniſter, and retained little more than a nominal power. Having a taſte for poetry, he employed his time principally in reading and compoſing poetical works; and died in the ſixtieth year of his reign.

The grand-vizier eſpouſing the intereſts of Moſtali, the the younger ſon of the late caliph, againſt thoſe of his brother, had the addreſs to cauſe him to be proclaimed, A. D. 1094, and acknowledged by the court and army, as the lawful ſucceſſor to the caliphate. Nezar, the elder brother of Moſtali, fled with his friends to Alexandria, where he endeavoured to maintain his juſt title. The grand-vizier, however, ſoon compelled Nezar to ſurrender himſelf at diſcretion, whoſe life he not only ſpared, but alſo procured him the forgiveneſs and reconciliation of the caliph. But this clemency was of ſhort duration, and had little effect on the temper and diſpoſition of Nezar, who, being detected in a ſecond conſpiracy againſt the government, was thrown into irons, and condemned to be ſtarved to death in a dungeon. The moſt remarkable event during the life of this caliph, was the retaking the city of Jeruſalem from the Franks or cruſaders, and the immenſe plunder which Afdal, his general, brought from thence. Moſtali died in the eighth year of his reign.

His ſon and ſucceſſor, Amer, though at that time only five years of age, was proclaimed caliph, and inveſted with the authority, A. D. 1101. The tender age of Amer encouraged his uncle to attempt to dethrone him. With that intention he repaired to Alexandria, which was then commanded by a ſlave belonging to the grand-vizier, who, by means of promiſes and rewards, permitted him to be proclaimed caliph in that city. Afdal, who governed the kingdom during the minority of Amer, was no ſooner apprized of this revolt, than he marched an army to beſiege the caſtle of Alexandria, which he reduced, and compelled the traitors to ſurrender at diſcretion. The grand-vizier returned in triumph to Cairo, and continued to conduct the affairs of the kingdom with ſuch moderation and prudence, that he acquired the affection and eſteem of the Egyptians; and the caliph, by his means, and during his regency, enjoyed a peaceable and proſperous reign. Afdal, however, was very ill rewarded for the ſervices he rendered to Amer and to the ſtate; being afterwards diſgraced by the prince, and expoſed to the moſt ignominious treatment. Amer, we are told, was cruel, abandoned to debauchery, addicted to gaming, and deſtitute of all religion. In other reſpects, he is repreſented as having been poſſeſſed of the art of governing, fond of the ſciences, and a prince of no inconſiderable learning and abilities. He was, at length, aſſaſſinated by ſome mercenary wretches, whom the diſcontented grandees of the kingdom hired for that purpoſe. In this reign Tamim, and his ſon Yaiah, who ſucceeded to the African monarchy, beſieged Tunis. Yaiah being addicted to aſtrology, imagined a particular day would be fatal to him, and paſſed it in prayer. In the evening, happy that he had eſcaped the danger, he ordered a magnificent feaſt, and died as he ſat down to table. Ali his ſon ſucceeded him, received Tunis on ſubmiſſion, ſent a fleet and army againſt Sicily, and ſeverely puniſhed the robbers of the caravans.

The widow of Amer, whom he had left pregnant at his death, being delivered of a daughter, Hafed, the grandſon of Monſtanzer, was proclaimed and acknowledged lawful ſucceſſor to the caliphate, A. D. 1126. This prince was no ſooner ſeated on the throne, than he appointed Bahram to be his grand-vizier, a perſon of noble extraction, and of great merit and integrity. Under his government, the Chriſtians were much favoured, and advanced to lucrative places of the army and the ſtate; inſomuch that the jealouſy of the Muſſulmans was thereby excited, and a tumult enſued. Redvan, the rival of the grand-vizier, marched to the gates of the palace, at the head of a body of troops, who were armed with lances to which copies of the Koran were affixed. Upon this Bahram removed with the beſt of his Armenian ſoldiers into Upper Egypt; but finding his affairs deſperate, he retired into a monaſtery, where he ſoon after took the monkiſh habit. Redvan deſtroyed a great part of Cairo, and plundered the houſes and churches of the Chriſtians, whom he compelled to wear a particular garb, as a mark of reproach. Hafed, however, to heal the diſſenſions which prevailed, thought it neceſſary to deprive Redvan of his dignities and authority, to confine him to his own palace, and not

to ſuffer him for the future to interfere in the affairs of government. From that time he ruled without the aſſiſtanee of a vizier: and he eſtabliſhed an equilibrium between the Chriſtian and Mahometan religions, by employing able and upright men of both perſuaſions. But the conteſt which was begun under Hafed, by the aſpirers to the office of vizier, was, to the great detriment of the authority of the caliphs, continued during the reign of Dafer, or Dhafer, and his ſucceſſors, A. D. 1151, and may be conſidered as a principal cauſe of the revolution which was afterwards effected in Egypt. Dhafer was murdered by Abbas his vizier; who, in the morning after the murder, repaired to the palace of the caliph, and after many pretended enquiries reſpecting Dhafer, accuſed two of his brothers, and ſome other relations, as principals or accomplices in the murder, and commanded them to be put to death.

Fayez, or Alfayez, who ſucceeded his father, A. D. 1154, was ſtruck with horror and dread at the ſight of his uncles and relatives, whom the vizier had unjuſtly condemned to death. The clamour and diſcontent of the people, occaſioned by the perfidious conduct of Abbas, ſoon became univerſal throughout the kingdom; and the vizier and his ſon privately conveyed themſelves and their wealth into Syria, attended by a conſiderable body of troops. The ſiſter of the late caliph, however, applied to the Franks, or European cruſaders, who had juſt taken Aſcalon; and by means of preſents and promiſes engaged them to apprehend thoſe murderers. Accordingly a body of troops was ſent to intercept them, and a bloody engagement enſued, in which Abbas was ſlain, and his ſon taken priſoner. Naſir was conducted to Cairo, where he expiated, by his ſufferings, the crimes and vices of his father and himſelf. His right hand was cruſhed; the fleſh was torn off his bones with hot pincers; and in this condition he was fixed to a gibbet till he was dead, when his body was burnt to aſhes. Alfayez did not long ſurvive, but died in the eleventh year of his age.

Previous to this event, the African dynaſty of the Zeirites had ceaſed in the perſon of Haſſan ben Ali, the laſt prince of that houſe; and upon whoſe deceaſe the Marabut dynaſty was founded, A. D. 1060, called by ſome writers Al Moravids. Marabut implies a ſaint; and this dynaſty advanced to power from a pretended zeal for religion. It aroſe in Cairoan; and Yuſſuf the ſecond prince founded Moroeco, in the year 1069. He conquered part of Spain, and died in 1106. His ſon ſuceeeded to the African throne; but being unſucceſsful in war, this ſhortlived race was followed by the dynaſty of the Elmohads, or Unitarians, which originated in Mount Atlas. Tomrut, its founder, was followed by his celebrated diſciple Abdel-mumin, originally a doctor of theology, but who diſplayed ſuch talents in war, that Ali, above-mentioned, after meeting with many defeats, died of a broken heart. Abdel-mumin, now aſpiring to the univerſal ſovereignty of the Mohammedans in Africa, beſieged and took Oran and Fez, A. D. 1142. Taſfin, the ſon of Ali, hardly retained Morocco, which had been founded by his aneeſtor; and it was now taken by Abdel-mumin from Ithak his ſucceſſor, the laſt of the Marabut dynaſty. The ſucceſs and ambition of this prince led him alſo to endeavour to ſhake off the Egyptian yoke, and war would have been inevitable, had not death unexpectedly ſeized him, A. D. 1160.

We now approach the era of the decline and fall of the Fatimite dynaſty in Egypt. Al Aded, the laſt of thoſe caliphs, ſuceeeded Alfayez, A. D. 1161, at a time when the Frank, or European arms, threatened death and deſolation to the Mohammedan powers in Aſia and Africa. Egypt was rent with internal diſſentions, owing to the perſonal imbecility of the caliph Aded, and the intrigues and ambition of two favourite viziers, Shawur and Dargham. Al Aded withdrew from the buſy world, and committed the abſolute direction of the government to Shawur; but in a ſhort time, by the aid of party and cabal, Dargham found means to ſupplant Shawur, and aſſumed the reins of government, and the command of the army, without ſuffering his colleague to exerciſe the ſmalleſt authority. Finding no redreſs from the ſupine and inactive caliph, Shawur reſorted to the Turkiſh ſultan of Damaſcus, named Nur-el-din, or Noureddin, promiſing him one-third of the whole revenue of Egypt, provided he would furniſh an army to reinſtate him in the government of that country. Noureddin, who had long thirſted for the ſubjugation of Egypt, without heſitation complied with the requeſt. Shirakuk, called Syracon, or Shiracou, by the Chriſtian writers, and his nephew Salah-el-din, or Saladin, were ſent with a powerful army to reinſtate Shawur; but after ſuceeeding in the defeat of his opponent, the baſe and ungenerous Shiracon ſeized on the government of Noureddin, obtained an order from the weak and ſenſeleſs Aded for the deeapitation of Shawur, with the gift of the robe and firman of vizir for himſelf. For a while the Turk was eontent with the offiee he had gained at the expence of the blood of the unfortunate Shawur; but the fall of the Fatimites was the principal objeet in view, whieh was at length accompliſhed by a mere meſſage and a word. The caliphs had been degraded by their own weakneſs, and by the tyranny and oppreſſion of their viziers; their ſubjects bluſhed at the monſtrous frauds of the magiſtracy, and were ripe for revolt. Noureddin, therefore, aſſumed the ſupreme authority in the perſon of his general Shiraeou, and commanded the names of Abubeker, Omar, and Othman, of the Abbaſſide dynaſty, to be ſolemnly reſtored, and the caliph Moſthadi of Bagdad, to be acknowledged in the public prayers of the Egyptians, as the truc ſucceſſors of Mahomet, inſtead of the ſons of Ali. Thc laſt of his race, the caliph Aded, ſurvived this political treaſon only ten days, expiring in happy ignorance of his fate, on the 13th of September 1171; and in him terminated the dynaſty of thc Fatimites, and the caliphate of Egypt and Syria, after it had preſided over the Mohammedan provinces of Africa two hundred and ſeventy-one years.

The empire of the caliphs had been for a conſiderable time on the decline. After becoming the greateſt monarchs in the world, their mutual jealouſies, animoſities, and party views, ſplit them into three factions, which deſolated Arabia, and ſpilt more of its native blood, than was loſt in all the ſanguinary conteſts of the Holy War. In this viſible ſeparation of parties, they were to be diſtinguiſhed by the colour of their turbans and ſtandards: the *green* was conſecrated to the Fatimites; the Ommiades were diſtinguiſhed by the *white*; and the *black*, as moſt adverſe, was choſen by the Abbaſſides. From the Indus to the Euphrates, the whole country was convulſed by the quarrel of theſe factions; whieh had ſeated themſelves in Damaſeus, Egypt, Bagdad, Cairoan, Cordova, and Mehedie. In the tenth eentury, the three caliphs who reigned at Bagdad, Cairoan, and Cordova, excommunicated each other, and entered into a mutual vow of eternal diſcord; the effect of exceſſive luxury, luſt, and unbounded proſperity. In the eity of Bagdad, amidſt the riehes of the eaſt, the Abbaſſides ſoon diſdained the abſtinence and frugality of the firſt caliphs, and aſpired to emulate the magnificence of the Perſian kings. After his wars and buildings, Almanſor left behind him in gold and ſilver about thirty millions ſterling; and this treaſure was exhauſted in a few years by the vices or virtues of his children. His ſon Mahadi, in a ſingle pilgrimage to Mecca, expended ſix millions of dinars of gold. A pious and charitable motive may ſanctify the foundation of ciſterns and caravanſeras, which he diſtributed along a meaſured road of ſeven hundred miles; but his train of camels, laden with ice, could ſerve only to aſtoniſh the natives of Arabia, and to refreſh the fruits and liquors of the royal banquet. The courtiers would ſurely praiſe the liberality of his grandſon Almamon, who gave away four-fifths of the income of a province, a ſum of two millions four hundred thouſand gold dinars, before he

he drew his foot from the ſtirrup. At the nuptials of the ſame prince, a thouſand pearls of the largeſt ſize were ſhowered on the head of the bride, and a lottery of lands and houſes diſplayed the capricious bounty of fortune. The glories of the court were brightened, rather than impaired, even in the decline of the empire; and a Greek ambaſſador might admire or pity the magnificence of the feeble Moktader. "The caliph's whole army, (ſays the hiſtorian Abulfeda,) both horſe and foot, was under arms, which together made a body of one hundred and ſixty thouſand men. His ſtate-officers, the favourite ſlaves, ſtood near him in ſplendid apparel, their belts glittering with gold and gems. Near them were ſeven thouſand eunuchs, four thouſand of them white, the remainder black. The porters or door-keepers were in number ſeven hundred. Barges and boats, with the moſt ſuperb decorations, were ſeen ſwimming upon the Tigris. Nor was the palace itſelf leſs ſplendid, in which were hung up thirty-eight thouſand pieces of tapeſtry, twelve thouſand five hundred of which were of ſilk embroidered with gold. The carpets on the floor were twenty-two thouſand. An hundred lions were brought out, with a keeper to each lion. Among the other ſpectacles of rare and ſtupendous luxury, was a tree of gold and ſilver ſpreading into eighteen large branches, on which, and on the leſſer boughs, ſat a variety of birds made of the ſame precious metals, as well as the leaves of the tree. While the machinery affected ſpontaneous motions, the ſeveral birds warbled their natural harmony. Through this ſcene of magnificence, the Greek ambaſſador was led by the vizir to the foot of the caliph's throne." In the weſt, the Ommiades of Spain ſupported, with equal pomp, the title of caliph, or commander of the faithful. Three miles from Cordova, in honour of his favourite ſultana, the third and greateſt of the Abdalrahmans conſtructed the city, palace, and gardens, of Zehra. Twenty-five years, and above three millions ſterling, were employed by the founder: his liberal taſte invited the artiſts of Conſtantinople, the moſt ſkilful ſculptors and architects of the age; and the buildings were ſuſtained or adorned by twelve hundred columns of Spaniſh and African, of Greek and Italian, marble. The hall of audience was encruſted with gold and pearls, and a great baſon in the center, was ſurrounded with the curious and coſtly figures of birds and quadrupeds. In a lofty pavilion of the gardens, one of theſe baſons and fountains, ſo delightful in a ſultry climate, was repleniſhed not with water, but with the pureſt quickſilver. The ſeraglio of Abdalrahman, his wives, concubines, and black eunuchs, amounted to ſix thouſand three hundred perſons; and he was attended to the field by a guard of twelve thouſand horſe, whoſe belts and ſcymetars were ſtudded with gold. His royal city of Cordova contained ſix hundred moſques, nine hundred baths, and two hundred thouſand houſes: he gave laws to eighty cities of the firſt, to three hundred of the ſecond and third, order; and the fertile banks of the Guadalquiver were adorned with twelve thouſand villages and hamlets.

In a private condition, our deſires are perpetually repreſſed by poverty and ſubordination; but the lives and labours of millions are devoted to the ſervice of a deſpotic prince, whoſe laws are blindly obeyed, and whoſe wiſhes are inſtantly gratified. Our imagination is dazzled by the ſplendid picture; and whatever may be the cool dictates of reaſon, there are few among us who would obſtinately refuſe a trial of the comforts and the cares of royalty. It may, therefore, be of ſome uſe to borrow the experience of the ſame Abdalrahman, whoſe magnificence has perhaps excited our admiration and envy, and to tranſcribe an authentic memorial which was found in the cloſet of the deceaſed caliph. "I have now reigned above fifty years in victory or peace; beloved by my ſubjects, dreaded by my enemies, and reſpected by my allies. Riches and honours, power and pleaſure, have waited on my call, nor does any earthly bleſſing appear to have been wanting to my felicity. In this ſituation I have diligently numbered the days of pure and genuine happineſs which have fallen to my lot; *they amount to fourteen:* O man! place not thy confidence in this preſent world." The luxury of the caliphs, ſo uſeleſs to their private happineſs, relaxed the nerves, and terminated the progreſs of their arms. Under the laſt of the Ommiades, the Arabian empire extended two hundred days journey from eaſt to weſt, from the confines of Tartary and India to the ſhores of the Atlantic ocean. And if we retrench the ſleeve of the robe, as it is ſtyled by their writers, the long and narrow province of Africa, the ſolid and compact dominion from Fargana to Aden, from Tarſus to Surat, will ſpread on every ſide to the meaſure of four or five months journey of a caravan.

Temporal and ſpiritual conqueſt, in this vaſt acquiſition of territory, had been the ſole occupation of the firſt ſucceſſors of Mahomet; and after ſupplying themſelves with the neceſſaries of life, the whole revenue was ſcrupulouſly devoted to that ſalutary work. The Abbaſſides were impoveriſhed by the multitude of their wants and their contempt of economy. Inſtead of purſuing the great object of ambition, their leiſure, their affections, the powers of their mind, were diverted by pomp and pleaſure: the rewards of valour were embezzled by women and eunuchs, and the royal camp was encumbered by the luxury of the palace. A ſimilar temper was diffuſed among the ſubjects of the caliph. Their ſtern enthuſiaſm was ſoftened by time and proſperity: they ſought riches in the occupations of induſtry, fame in the purſuits of literature, and happineſs in the tranquillity of domeſtic life. War was no longer the paſſion of the Saracens; and the increaſe of pay, the repetition of donatives, were inſufficient to allure the poſterity of thoſe voluntary champions who had crowded to the ſtandard of Abubekir and Omar for the hopes of ſpoil and of paradiſe. This exuberance of effeminacy and refinement gradually made way for the revolutions that were to follow.

From the USURPATION of the SULTANS to the COMMENCEMENT of the NINETEENTH CENTURY.

Soon after the deceaſe of the caliph Al Aded, the views of Noureddin in acquiring the ſovereignty of Egypt, were fruſtrated by the ſudden death of Shiracou, and the ſuperior addreſs of his nephew Saladin. This celebrated hero was a native of the hilly country beyond the Tigris, occupied by the paſtoral tribes of the Curds; a people hardy, ſtrong, ſavage, impatient of the yoke, addicted to rapine, and tenacious of the government of their national chiefs. The reſemblance of name, ſituation, and manners, ſeem to identify them with the Carduchians of the Grecks; and they ſtill defend, againſt the Ottoman Porte, the antique freedom which they aſſerted againſt the ſucceſſors of Cyrus. Poverty and ambition prompted them to embrace the profeſſion of mercenary ſoldiers; and the ſervices of his father and uncle unſuſpectedly prepared the reign of the ſultan or ſoldan Saladin. His father Ayub, or Job, was a ſimple Curd, but of great prudence and foreſight; and from his name *Ayub*, was denominated the Aiubite dynaſty, which uſurped the throne of Egypt in the perſon of Saladin, A. D. 1174. So unconſcious was Noureddin of the impending ruin of his houſe, that he had conſtrained the reluctant youth to follow his uncle Shiracou into Egypt. On the death of Shiracou, the office of grand vizier was beſtowed on Saladin, as the youngeſt and leaſt dangerous of the emirs of Damaſcus; but, with the help of his father, whom he had invited to Cairo, his genius obtained the aſcendant over his equals, and attached the army to his perſon and intereſt. While Noureddin lived, theſe ambitious Curds were the moſt humble of his ſlaves; and the jealous murmurs of the divan were ſilenced by the prudent Ayub, who loudly proteſted that, at the command of Noureddin, he himſelf would lead his ſon in chains to the foot

of the throne. "Such language (he added in private to his ſon) was prudent and proper in an aſſembly of your rivals; but we are now above fear and obedience; and the threats of Noureddin ſhall not extort a tribute from us." Noureddin's death relieved them from the doubtful conflict; and his ſon, a minor of eleven years of age, was left to the care of the emirs of Damaſcus: meanwhile the new ſultan of Egypt was decorated with every title that could ſanctify his uſurpation in the eyes of the people. Nor was the aſpiring Saladin long content with the poſſeſſion of Egypt; he deſpoiled the Chriſtians of Jeruſalem, and the Atabeks of Damaſcus, Aleppo, and Diarbekir: Mecca and Medina ſoon acknowledged him for their temporal protector; his brother ſubdued the diſtant regions of Yemen, or Arabia Felix; and, at the hour of his death, his empire was ſpread from the African Tripoli to the Tigris, and from the Indian ocean to the mountains of Armenia. In the judgment of his character, the reproaches of treaſon and ingratitude ſtrike forcibly on our minds, impreſſed, as they are, with the principle and experience of law and loyalty. But his ambition may in ſome meaſure be excuſed by the revolutions of Aſia, which had eraſed every notion of legitimate ſucceſſion; and by his humane and generous behaviour to the collateral branches of the dethroned caliphs. In his virtues, and in thoſe of his patron, they admired the ſingular union of the hero and the ſaint; for both Noureddin and Saladin are ranked among the Mahometan ſaints; and the conſtant meditation of the Holy War appears to have ſhed a ſober colour over their lives and actions. The early youth of Saladin was addicted to wine and women; but his ambitious ſpirit ſoon renounced the temptations of pleaſure, for the graver follies of fame and dominion: the garment of Saladin was of coarſe woollen; and water was his only drink; ſo that, while he emulated the temperance, he ſurpaſſed the chaſtity, of his Arabian prophet; and thus held in ſovereign contempt the gilded trappings, luxury, and voluptuouſneſs, of the degenerate caliphs. Both in faith and practice he was a rigid Muſſulman; he ever deplored that the defence of religion had not allowed him to accompliſh the pilgrimage of Mecca; but, at the ſtated hours, five times each day, the ſultan devoutly prayed with his brethren: the involuntary omiſſion of faſting was ſcrupuloufly repaid; and his peruſal of the Koran on horſeback between the approaching armies, may be quoted as a proof, however oſtentatious, of piety and courage. The juſtice of his divan was acceſſible to the meaneſt ſuppliant in Egypt againſt himſelf and his miniſters; and it was only for a kingdom that Saladin would deviate from the rule of equity. While the deſcendants of Seljuk and Zenghi held his ſtirrup and ſmoothed his garments, he was affable and patient with the meaneſt of his ſervants. So boundleſs was his liberality, that he diſtributed twelve thouſand horſes at the ſiege of Acre; and, at the time of his death, no more than forty-ſeven drams of ſilver and one piece of gold coin were found in the treaſury; yet, in his reign, the tributes were diminiſhed, and the wealthy citizens enjoyed, without fear or danger, the fruits of their induſtry. Egypt, Syria, and Arabia, were adorned by the royal foundations of hoſpitals, colleges, and moſques; and Cairo was fortified with a wall and citadel: all his works were conſecrated to public uſe; nor did the ſultan indulge himſelf in a garden or palace of private luxury. In a fanatic age, himſelf a fanatic, the genuine virtues of Saladin commanded the eſteem of the Chriſtians: the emperor of Germany gloried in his friendſhip; the Greek emperor ſolicited his alliance; and the conqueſt of Jeruſalem diffuſed, and perhaps magnified, his fame both in the eaſt and weſt.

During its ſhort exiſtence, the kingdom of Jeruſalem was ſupported in the hands of the Franks, by the diſcord of the Turks and Saracens. The common appellation of *Franks*, was firſt applied by the Greeks and Arabians, to the Chriſtians of the Latin church; and afterwards to all the nations of Europe, who united in the Holy War, or croiſades; becauſe all of them profeſſed the doctrine of the Latins. The powers of Egypt, Syria, and Arabia, were now united by an hero, whom the chance of war had armed againſt the Franks. All without, now bore the moſt threatening aſpect; and all was feeble in the internal ſtate of Jeruſalem. After the two firſt Baldwins, the brother and couſin of Godfrey of Bouillon, the ſceptre devolved by female ſucceſſion to Meliſendâ, daughter of the ſecond Baldwin, and her huſband Fulk, count of Anjou, the father, by a former marriage, of our Engliſh Plantagenets. Their two ſons, Baldwin the Third, and Amaury, waged a ſtrenuous war againſt the infidels; but the ſon of Amaury, Baldwin the Fourth, was deprived, by the leproſy, of the faculties both of mind and body. His ſiſter Sybilla, the mother of Baldwin the Fifth, was his natural heireſs: after the ſuſpicious death of her child, ſhe crowned her ſecond huſband, Guy of Luſignan, a prince of a handſome perſon, but of baſe character. Such were the guardians of the holy city of Jeruſalem; but its fate was delayed twelve years by ſome ſupplies from Europe, by the valour of the military orders, and by the diſtant or domeſtic avocations of their great enemy. At length, on every ſide, the ſinking ſtate was encircled and preſſed by an hoſtile line; yet the truce was violated by the Franks, whoſe exiſtence it protected. A ſoldier of fortune, Reginald of Chatillon, had ſeized a fortreſs on the edge of the deſert, from whence he pillaged the caravans and threatened the cities of Mecca and Medina. Saladin rejoiced in the denial of juſtice; and at the head of fourſcore thouſand horſe and foot invaded the Holy Land. The choice of Tiberias for his firſt ſiege was ſuggeſted by the count of Tripoli, to whom it belonged; and the king of Jeruſalem was perſuaded to drain his garriſons, and to arm his people, for the relief of that important place. By the advice of the perfidious Raymond, the Chriſtians were betrayed into a camp deſtitute of water; he fled on the firſt onſet, with the curſes of both nations: Luſignan was overthrown, with the loſs of thirty thouſand men; and the wood of the true croſs, the moſt valuable of the relics, was left in the power of the infidels. The royal captive was conducted to the tent of Saladin; and, as he fainted with thirſt and terror, the generous victor preſented him with a cup of ſherbet cooled in ice, without ſuffering his companion, Reginald of Chatillon, to partake of this pledge of hoſpitality. On the refuſal of Reginald to turn Mahometan, Saladin ſtruck him on the head with his ſcymetar, and he was diſpatched by the guards. The trembling Luſignan was ſent to Damaſcus to an honourable and ſpeedy ranſom; but the victory was ſtained by the execution of two hundred and thirty knights of the hoſpital of St. John of Jeruſalem, the intrepid champions and martyrs of their faith. The kingdom was left without a head; and of the two grand maſters of the military orders, the one was ſlain, and the other was a priſoner. From all the cities, both of the ſea-coaſt and the inland country, the garriſons had been drawn away for this fatal field. Tyre and Tripoli alone could eſcape the rapid inroad of Saladin; and three months after the battle of Tiberias, he appeared in arms before the gates of Jeruſalem.

He might naturally expect, that the ſiege of a city ſo venerable, would rekindle the laſt ſparks of enthuſiaſm; and that, of ſixty thouſand Chriſtians, every man would be a ſoldier, and every ſoldier a candidate for martyrdom. But queen Sybilla trembled for herſelf and her captive huſband. Some feeble efforts were made for the defence of Jeruſalem; but in the ſpace of fourteen days, the victorious army drove back the ſallies of the beſieged, planted their engines, applied their ſcaling-ladders, took the city, A. D. 1187, October 2, and erected on the walls twelve banners of the prophet and the ſultan. It was in vain that the queen, the women, and the monks, implored the mercy of the conqueror; to their firſt ſuppliant deputation that mercy was ſternly denied: "He had

had ſworn to avenge the patience and long-ſuffering of the Moſlems; the hour of forgiveneſs was elapſed, and the moment was now arrived to expiate in blood, the innocent blood, which had been ſpilt by Godfrey and the firſt cruſaders." But a deſperate and ſucceſsful ſtruggle of the Franks admoniſhed the ſultan that his triumph was not yet ſecure; he liſtened with reverence to a ſolemn abjuration in the name of the common Father of mankind; and a ſentiment of human ſympathy mollified the rigour of fanaticiſm and conqueſt. He conſented to accept the city, and to ſpare the inhabitants. The Greek and oriental Chriſtians were permitted to live under his dominion; but it was ſtipulated, that in forty days all the Franks and Latins ſhould evacuate Jeruſalem, and be ſafely conducted to the ſea-ports of Syria and Egypt; that ten pieces of gold ſhould be paid for each man, five for each woman, and one for every child; and that thoſe who were unable to purchaſe their freedom, ſhould be detained in perpetual ſlavery. Of ſome writers it is a favourite theme to compare the humanity of Saladin with the maſſacre of the firſt cruſade. The difference would be merely perſonal; but we ſhould not forget that the Chriſtians had offered to capitulate, and that the Mahomedans of Jeruſalem ſuſtained the laſt extremities of an aſſault and ſtorm. Juſtice is, indeed, due to the fidelity with which Saladin fulfilled the conditions of the treaty; and he may be deſervedly praiſed for the glance of pity which he caſt on the miſery of the vanquiſhed. Inſtead of a rigorous exaction of his debt, he accepted a ſum of thirty thouſand byzants, for the ranſom of ſeven thouſand poor; two or three thouſand more were diſmiſſed by his gratuitous clemency; and the number of ſlaves was reduced to eleven or fourteen thouſand perſons. In his interview with the queen, his words, and even his tears, ſuggeſted the kindeſt conſolations; his liberal alms were diſtributed among thoſe who had been made orphans or widows by the fortune of war; and, while the knights of the hoſpital of St. John were in arms againſt him, he allowed their more pious brethren to continue, during the term of a year, the care and ſervice of the ſick. In theſe acts of mercy, the virtue of the ſultan of Egypt deſerves our admiration: he was above the neceſſity of diſſimulation; and his ſtern fanaticiſm would have prompted him to diſſemble, rather than to affect, this generous compaſſion for the enemies of the Koran. After Jeruſalem had been delivered from the preſence of the ſtrangers, the ſultan made his triumphant entry, his banners waving in the wind, and to the harmony of martial muſic. The great moſque of Omar, which had been converted into a church, was again conſecrated to God and to Mahomet; the walls and pavement were purified with roſe-water; and a pulpit, the labour of the deceaſed Noureddin, was erected in the ſanctuary. The golden croſs that glittered on the dome, was caſt down amidſt the ſhouts of the Moſlems. In four ivory cheſts the patriarch had collected the croſſes, the images, the vaſes, and the relics, of the holy place: they were ſeized by the conqueror, who was deſirous of preſenting the caliph with theſe trophies of popiſh idolatry. He was, perſuaded, however, to entruſt them to the patriarch and prince of Antioch; and they were redeemed by Richard of England, at the expence of fifty-two thouſand byzants of gold.

In this event, the world might have expected the final expulſion of the Franks from Syria; yet the croiſades were continued till above a century after the death of Saladin. In the career of victory, the ſultan of Egypt was firſt checked by the reſiſtance of Tyre; the troops and garriſons, which had capitulated, were imprudently conducted to the ſame port: their numbers were adequate to the defence of the place; and the arrival of Conrad of Montferrat inſpired the crowd with confidence and union. His father, a venerable pilgrim, had been made priſoner in the battle of Tiberias; but that diſaſter was unknown in Italy and Greece, when the ſon was urged by ambition and piety to viſit Jeruſalem, the inheritance of his royal nephew, the infant Baldwin. The view of the Mohammedan banners warned him from the hoſtile coaſt of Jaffa; and Conrad was unanimouſly hailed as the prince and champion of Tyre, which was already beſieged by the conqueror of Jeruſalem. The firmneſs of his zeal enabled him to brave the threats of the ſultan, and to declare, that ſhould his aged parent be expoſed before the walls, he himſelf would diſcharge the firſt arrow, and glory in his deſcent from a Chriſtian martyr. The Egyptian fleet was allowed to enter the harbour of Tyre; when the chain was ſuddenly drawn, and five galleys were either ſunk or taken: a thouſand of the ſultan's beſt troops were ſlain in a ſally; and Saladin, after burning his engines, made a diſgraceful retreat to Damaſcus. He was ſoon aſſailed by a more formidable tempeſt. The pathetic narratives, and even the pictures, that repreſented in lively colours the ſervitude and profanation of Jeruſalem, awakened the torpid ſenſibility of Europe: the emperor Frederic Barbaroſſa, and the kings of France and of England, aſſumed the Holy War; and the tardy magnitude of their armaments was anticipated by the maritime ſtates of the Mediterranean and the ocean. The ſkilful and provident Italians firſt embarked in the ſhips of Genoa, Piſa, and Venice. They were ſpeedily followed by the moſt eager pilgrims of France, Normandy, and the weſtern iſles. The powerful ſuccour of Flanders, Friſe, and Denmark, filled near a hundred veſſels; and theſe northern warriors were diſtinguiſhed in the field by a lofty ſtature and a ponderous battle-axe. Their increaſing multitudes could no longer be confined within the walls of Tyre, or remain obedient to the voice of Conrad. They pitied the misfortunes, and revered the dignity, of Luſignan, who was releaſed from priſon, perhaps, to divide the army of the Franks. He propoſed the recovery of Ptolemais, or Acre, thirty miles to the ſouth of Tyre; and the place was firſt inveſted by two thouſand horſe and thirty thouſand foot under his nominal command. This memorable ſiege laſted near two years, and conſumed, in a narrow ſpace, the forces of Europe and Aſia. Never did the flame of enthuſiaſm burn with fiercer and more deſtructive rage; nor could the true believers, who conſecrated their own martyrs, refuſe ſome applauſe to the miſtaken zeal and courage of their adverſaries. At the ſound of the brazen trumpet, the Moſlems of Egypt, Syria, Arabia, and the oriental provinces, aſſembled under the ſultan Saladin; his camp was pitched within a few miles of Acre; and he laboured, night and day, for the ſucceſs of his army, and the annoyance of the Franks. Nine battles were fought in the neighbourhood of Mount Carmel, with ſuch viciſſitude of fortune, that, in one attack, the ſultan forced his way into the city; that, in one ſally, the Chriſtians penetrated to the Egyptian tent. By the means of divers and pigeons, a regular correſpondence was maintained with the beſieged: and, as often as the ſea was left open, the exhauſted garriſon was withdrawn, and a freſh ſupply was poured into the place. The Latin camp was thinned by famine, the ſword, and the climate; but the tents of the dead were repleniſhed with new pilgrims, who exaggerated the ſtrength and ſpeed of their approaching countrymen. The vulgar was aſtoniſhed by the report, that the pope himſelf, with an innumerable cruſade, was advanced as far as Conſtantinople. The march of the emperor filled the eaſt with more ſerious alarms; the obſtacles which he encountered in Aſia, and, perhaps, in Greece, were raiſed by the policy of Saladin; his joy, on the death of Barbaroſſa, was meaſured by his eſteem; and the Chriſtians were rather diſmayed than encouraged at the ſight of the duke of Suabia, and his way-worn remnant of only five thouſand Germans. At length, in the ſpring of the ſecond year, the royal fleets of France and England majeſtically caſt anchor in the bay of Acre; and the ſiege was more vigorouſly proſecuted by the youthful emulation of the two kings, Phi-

lip

lip Auguſtus, and Richard Plantagenet. After every reſource had been tried, and every hope was exhauſted, the Saracen defenders of Acre ſubmitted to their fate; a capitulation was granted, but their lives and liberties were taxed at a ranſom of two hundred thouſand pieces of gold, the deliverance of one hundred nobles, and fifteen hundred inferior captives, and the reſtoration of the wood of the holy croſs. Some doubts in the agreement, and ſome delay in the execution, rekindled the fury of the Franks, and three thouſand Moſlems, almoſt in the ſultan's view, were beheaded by the command of our Engliſh Richard. By the conqueſt of Acre, the Latin powers acquired a ſtrong town and a convenient harbour; but the advantage was moſt dearly purchaſed. The hiſtorian of the ſultan of Egypt computes, from the report of the enemy, that their numbers, at different periods, amounted to five or ſix hundred thouſand; that more than one hundred thouſand Chriſtians were ſlain; that a far greater number was loſt by diſeaſe or ſhipwreck; and that only a ſmall portion of this mighty hoſt could return in ſafety to their native countries.

Philip Auguſtus, and Richard the Firſt, are the only kings of France and England, who have fought under the ſame banners; but the holy ſervice in which they were enliſted, was, as uſual, inceſſantly diſturbed by their national jealouſy; and the two factions, which they protected in Paleſtine, were more averſe to each other than to the common enemy. In the eyes of the Orientals, the French monarch was ſuperior in dignity and power; and in the emperor's abſence, the Latins revered him as their temporal chief. Yet his exploits were not adequate to his fame. Philip was brave, but the ſtateſman predominated in his character; he was ſoon weary of ſacrificing his health and intereſt on a barren coaſt; the ſurrender of Acre became the ſignal of his departure; nor could he juſtify this unpopular deſertion, by leaving the duke of Burgundy, with five hundred knights and ten thouſand foot for the ſervice of the Holy Land. The king of England, though inferior in dignity, ſurpaſſed his rival in wealth and military renown; and if heroiſm be confined to ferocious valour, Richard Plantagenet will ever ſtand high among the heroes of the age. The memory of Cœur de Lion, or the lion-hearted prince, was long dear and glorious to his Engliſh ſubjects; and, at the diſtance of ſixty years, it was celebrated in proverbial ſayings by the grandſons of the Egyptians and Saracens, againſt whom he had fought: his tremendous name was employed by the Syrian mothers to ſilence their infants; and, if an horſe ſuddenly ſtarted from the way, his rider was wont to exclaim, "Doſt thou think king Richard is in the buſh?" His cruelty to the Mahomedans was the effect of zeal; but we cannot believe that a ſoldier, ſo free and fearleſs in the uſe of his lance, would have deſcended to whet a dagger againſt his valiant brother Conrad of Montferrat, who was ſlain at Tyre by ſome ſecret aſſaſſins. After the ſurrender of Acre, and the departure of Philip, the king of England led the cruſaders to the recovery of the ſea-coaſt; and the cities of Cæſaria and Jaffa were quickly added to the kingdom of Luſignan. A march of one hundred miles from Acre to Aſcalon, was a great and perpetual battle of eleven days. In the diſorder of his troops, the ſultan of Egypt remained on the field with ſeventeen guards, without lowering his ſtandard, or ſuſpending the ſound of his brazen kettle-drum: he again rallied and renewed the charge; and his preachers, or heralds, called aloud on the Unitarians manfully to ſtand up againſt the Chriſtians. But the progreſs of Richard was irreſiſtible: and it was only by demoliſhing the walls and buildings of Aſcalon, that the ſultan could prevent him from occupying an important fortreſs on the confines of Egypt. During a ſevere winter, the armies ſlept; but, in the ſpring, the Franks advanced within a day's march of Jeruſalem, under the victorious ſtandard of the Engliſh king; and his active ſpirit intercepted a convoy, or caravan, of ſeven thouſand camels. Saladin had fixed his ſtation in the holy city; but the city was ſtruck with conſternation and diſcord: he faſted; he prayed; he preached; he offered to ſhare the dangers of the ſiege; but his ſoldiers, who remembered the fate of their companions at Acre, preſſed the ſultan with loyal or ſeditious clamours, to reſerve his perſon, and their courage, for the future defence of their religion and empire. The Moſlems were all at once delivered by the ſudden, or, as they deemed, the miraculous, retreat of the Chriſtians; and the laurels of Richard were blaſted by the prudence or envy of his companions. The hero, aſcending an hill, and veiling his face, exclaimed with an indignant voice, "Thoſe who are unwilling to reſcue, are unworthy to view, the ſepulchre of Chriſt!" After his return to Acre, on the news that Jaffa was ſurpriſed by the ſultan, he ſailed with ſome merchant veſſels, and leaped foremoſt on the beach; the caſtle was relieved by his preſence; and ſixty thouſand Saracens fled before his arms. The diſcovery of his weakneſs provoked them to return in the morning; and they found him careleſsly encamped before the gates with only ſeventeen knights and three hundred archers. Without counting their numbers, he ſuſtained their charge; and we learn from the evidence of his enemies, that the king of England, graſping his lance, rode furiouſly along their front, from the right to the left wing, without meeting an adverſary who dared to encounter his career.

During theſe hoſtilities, a languid and tedious negociation between the Franks and Moſlems was ſtarted, and continued, and broken, and again reſumed, and again broken. Some acts of royal courteſy, the gift of ice and fruit, the exchange of Norway hawks and Arabian horſes, ſoftened the aſperity of religious war: from the viciſſitude of ſucceſs, the monarchs might learn to ſuſpect that heaven was neutral in the quarrel; nor, after the ſtubborn trial of each other, could either hope for a deciſive victory. The health both of Richard and Saladin appeared to be in a declining ſtate; and they reſpectively ſuffered the evils of diſtant and domeſtic warfare: Plantagenet was impatient to puniſh a perfidious rival who had invaded Normandy in his abſence; and the ſultan of Egypt was ſubdued by the cries of the people, who was the victim, and of the ſoldiers, who were the inſtruments, of his martial zeal. The firſt demands of the king of England were the reſtitution of Jeruſalem, Paleſtine, and the true croſs; and he firmly declared, that himſelf and his brother pilgrims would end their lives in the pious labour, rather than return to Europe with ignominy and remorſe. But the conſcience of Saladin refuſed, without ſome weighty compenſation: he aſſerted, with equal firmneſs, his religious and civil claim to the ſovereignty of Paleſtine; deſcanted on the importance and ſanctity of Jeruſalem, and rejected all terms of the eſtabliſhment, or partition, of the Latins. The marriage which Richard propoſed, of his ſiſter with the ſultan's brother, was defeated by the difference of faith: the princeſs abhorred the embraces of an infidel; and Adel, or Saphadin, would not renounce a plurality of wives. A perſonal interview was declined by Saladin, who alleged their mutual ignorance of each other's language; and the negociation was managed with much art and delay by their interpreters and envoys. The final agreement was equally diſapproved by the zealots of both parties, by the Roman pontiff, and the caliph of Bagdad. It was ſtipulated that Jeruſalem and the holy ſepulchre ſhould be open, without tribute or vexation, to the pilgrimage of the Latin Chriſtians; that, after the demolition of Aſcalon, they ſhould incluſively poſſeſs the ſea-coaſt from Jaffa to Tyre; that the count of Tripoli and the prince of Antioch ſhould be compriſed in the truce; and that, during three years and three months, all hoſtilities ſhould ceaſe. The principal chiefs of the two armies ſwore to the obſervance of the treaty; but the monarchs were ſatisfied with giving their word and their right-hand; and the royal majeſty was excuſed from an oath, which always implies ſome

ſuſpicion of falſehood and diſhonour. Richard embarked for Europe to ſeek a premature grave; and the ſpace of a few months concluded the life and glories of Saladin. The orientals deſcribe his death, which happened at Damaſcus, March 4, 1193; but they ſeem ignorant of the equal diſtribution of his alms among the three religions, or of the diſplay of a ſhroud, inſtead of a ſtandard, to admoniſh the eaſt of the inſtability of human greatneſs. The unity of empire was diſſolved by his death; his ſons were oppreſſed by the ſtronger arm of their uncle Saphadin; the hoſtile intereſts of the ſultans of Egypt, Damaſcus, and Aleppo, were revived; and the Franks or Latins gained ſtrength in their fortreſſes along the Syrian coaſt.

The nobleſt monument of the ſultan's fame, and of the terror which he inſpired, is the Saladine tenth, a general tax which was firſt impoſed on the laity, and even the clergy, of the Latin church for the ſervice of the Holy War. The practice was too lucrative to expire with the occaſion; and this tribute became the foundation of all the tithes and tenths on eccleſiaſtical benefices, which have been granted by the Roman pontiffs to catholic ſovereigns, or reſerved for the immediate uſe of the apoſtolic ſee. This pecuniary emolument muſt have tended to increaſe the intereſt of the popes in the recovery of Paleſtine; ſo that after the death of Saladin they preached the neceſſity of the cruſades by their epiſtles, their legates, and their miſſionaries.

The ſultan Saladin was only fifty-ſeven years old when he died, leaving ſixteen ſons and a daughter. His extenſive dominions were divided among his children, and ſplit into various petty ſtates and principalities; but none of the ſons were found to poſſeſs either the genius or virtues of their father. Afdhal, the eldeſt, inherited the kingdom of Damaſcus and Samoſata; and Malek-el-Aziz, the ſecond, became ſoldan or ſultan of Egypt. But no ſooner had the young Egyptian monarch ſeated himſelf firmly on the throne, than he began to wage war with his elder brother, reduced him to the narrow limits of Samoſata, and ſeized on Damaſcus for himſelf. The unwarlike Afdhal made little oppoſition, but quietly retired to the principality allowed him. Aziz reigned only five years, and was ſucceeded by his ſon Malek-el-Manſur, A. D. 1198; who being but nine years of age, his uncle Afdhal, prince of Samoſata, was deputed by the emirs to rule the empire during the minority, by the title of *Atabek* of Egypt and Damaſcus; but from the ſupineneſs of Afdhal, and the want of authority in the young ſultan, the ſovereign authority was uſurped, A. D. 1200, by Adel-Seif, brother to Manſur; who at the head of the Arabs, ſeized upon Peluſium, and, advancing to Cairo, ſeated himſelf on the Egyptian throne without difficulty or oppoſition. During the reign of Adel-Seif, the Franks penetrated into Egypt; but were quickly obliged to retire, though not without laying waſte part of the country, and carrying off conſiderable booty. In the year 1218, Malek-el-Kamel, the ſon of Adel-Seif, ſucceeded to the throne of the Egyptian ſultans, and maintained a vigorous war againſt the Franks. The fourth cruſade was diverted from Syria and Paleſtine, by being ſent againſt Conſtantinople. In the fifth, two hundred thouſand Franks were landed at the eaſtern mouth of the Nile. They reaſonably hoped, from the diſorders of the Moſlems, that Paleſtine would be ſubdued in Egypt, the ſeat and ſtorehouſe of the ſultan; and, after a ſiege of ſixteen months, the Moſlems had to deplore the loſs of Damietta. But the Chriſtian army was ruined by the pride and inſolence of the legate Pelagius, who, in the pope's name, aſſumed the character of general: the ſickly Franks were encompaſſed by the waters of the Nile and the Oriental forces; and it was by the evacuation of Damietta, after a conflict of three years, from A. D. 1218 to 1221, that they obtained a ſafe retreat, ſome conceſſions for the pilgrims, and the reſtitution of the relic of the true croſs. The failure of the Chriſtians may in ſome meaſure be aſcribed to the abuſe and multiplication of the cruſades, which were preached at the ſame time not only againſt the Saracens and Turks, but againſt the Pagans of Livonia, the Moors of Spain, the Albigeois of France, and the kings of Sicily of the imperial family.

In 1228, another army of cruſaders arrived, under the command of Frederic the Second, emperor of Germany; who, after various ſucceſſes, finally obtained from the ſultan the reſtitution of Jeruſalem, of Bethlem and Nazareth, of Tyre and Sidon: the Latins were alſo allowed to inhabit and fortify the city; an equal code of civil and religious freedom was ratified for the ſectaries of Chriſt, and thoſe of Mahomet; and, while the former worſhipped at the holy ſepulchre, the latter might pray and preach in the moſque of the temple. The Chriſtian clergy deplored this ſcandalous toleration; and the weaker Moſlems were gradually expelled; but every rational object of the cruſades was by this mode accompliſhed without bloodſhed; the churches were reſtored, the monaſteries were repleniſhed; and in the ſpace of fifteen years, the Latins of Jeruſalem exceeded the number of ſix thouſand. This peace and proſperity was interrupted by the irruptions of the ſavage hords of Carizmians. Flying from the arms of the Moguls, thoſe ſhepherds of the Caſpian rolled headlong on Syria; and the union of the Franks with the ſultans of Aleppo, Hems, and Damaſcus, was inſufficient to ſtem the violence of the torrent. Whatever ſtood againſt them, was cut off by the ſword, or dragged into captivity; the military orders were almoſt exterminated in a ſingle battle; and in the pillage of the city, in the profanation of the holy ſepulchre, the Latins confeſs the greater modeſty of the Turks and Saracens.

In the year 1239, Malek-el-Kamel died, and was ſucceeded by his ſon Malek-Adel; but after reigning only one ſingle year, this prince was ſupplanted by his brother Malek-Salah, who entered Egypt with a conſiderable force, and driving out Adel, cauſed himſelf to be proclaimed ſultan, in Cairo and Alexandria, A. D. 1240. He reigned nine years; in the latter part of which, Egypt was again invaded by the Franks. The two laſt cruſades were undertaken by Louis IX. of France; who loſt his liberty in Egypt, and his life on the coaſt of Africa. In him was united the virtues of a king, an hero, and a man; his martial ſpirit was tempered by the love of private and public juſtice; and he was at once the father of his people, the friend of the Chriſtians, and the terror of the infidels. For the invaſion of Egypt, Louis covered the ſea of Cyprus with eighteen hundred ſails, and fifty thouſand men; and, if we might truſt his own confeſſion, he diſembarked nine thouſand five hundred horſe, and one hundred and thirty thouſand foot, who performed their pilgrimage under the ſhadow of his power.

In complete armour, A. D. 1249, Louis, emulating Richard Plantagenet of England, leaped foremoſt on the beach; and the ſtrong city of Damietta, which had coſt his predeceſſor a ſiege of ſixteen months, was abandoned on the firſt aſſault, by the trembling Egyptians. But Damietta was the firſt and the laſt of his conqueſts; and in the fifth and ſixth cruſades, the ſame cauſes, almoſt on the ſame ground, were productive of ſimilar calamities. After a ruinous delay, which introduced into the camp the ſeeds of an epidemical diſeaſe, the Franks began to advance from the ſea-coaſt towards the capital of Egypt, and ſtrove to ſurmount the unbounded inundation of the Nile, which oppoſed their progreſs. In this interval the ſultan Malek Salah died, and was ſucceeded by his ſon Touran Shah, who loſt no time in providing for the ſafety of Cairo, by oppoſing a numerous army to the front of the approaching Chriſtian troops. But under the eye of their intrepid monarch, the barons and knights of France diſplayed their invincible contempt of danger and diſcipline: his brother, the count Artois, ſtormed the town of Maſſoura; and the carrier pigeons announced to the native inhabitants of Cairo, that all was loſt. But

a ſoldier, who afterwards uſurped the ſceptre, rallied the flying Egyptian troops: the main body of the Chriſtians was far behind their vanguard; and count Artois was overpowered and ſlain. A ſhower of Greek fire was inceſſantly poured on the invaders; the Nile was commanded by the Egyptian galleys, the open country by the Arabs; all proviſions were intercepted; each day aggravated the ſickneſs and famine; and about the ſame time a retreat was found to be neceſſary and impracticable. The Oriental writers confeſs, that Louis might have eſcaped, if he would have deſerted his ſubjects: he was made priſoner, with the greateſt part of his nobles; all who could not redeem their lives by ſervice or ranſom, were inhumanly maſſacred; and the walls of Cairo were ſurmounted with innumerable heads of the vanquiſhed Chriſtians. The king of France was loaded with chains; but the generous victor, Touran, great grandſon of the brother of Saladin, ſent a robe of honour to his royal captive; and his deliverance, with that of his ſoldiers, was decreed, by the reſtitution of Damietta, and the payment of four hundred thouſand pieces of gold. The king of France was made priſoner by the ſultan of Egypt, on the 5th of April, 1250; and it was not until a month after this fatal conflict, that Louis, and his captured nobles, were permitted to leave Cairo. For amid the exultations of victory and the tumult of ſavage war, a moſt unforeſeen and degrading revolution was to take place in the imperial city of Egypt: it was now that the dynaſty of the fugitive race of Mamalukes was to be founded in blood and rapine; an event that at once aſtoniſhed and ſhocked mankind, and which, for upwards of five centuries, hath ſubjected the rich and fertile province of Egypt to the dominion of its own ſlaves. In a ſoft and luxurious climate, the degenerate children of Saladin were incapable of reſiſting the flower of European chivalry: they triumphed chiefly by the arms of their ſlaves or mamalukes; for in the language of the country, *mamaluke* means *ſlave*. Theſe were the hardy natives of Tartary, who at an early age were purchaſed of the Syrian merchants, and educated in the camp and palace of the ſultan. Thus Egypt afforded a new example of the danger of introducing prætorian bands; the rage of theſe ferocious animals, who had been let looſe on the Franks, was finally provoked to devour their benefactor. In the midſt of victory, Touran Shah was murdered by his mamalukes, on the 1ſt of May, 1250; and the moſt daring of the aſſaſſins entered the chamber of the captive king of France, with drawn ſcymetars, and their hands imbrued in the blood of their ſultan. The firmneſs of Louis, however, commanded their reſpect; their avarice prevailed over cruelty and zeal; the treaty was accompliſhed; and the king of France, with the relics of his army, was permitted to embark for Paleſtine, on the 6th day of the ſame month. He then waſted four years within the walls of Acre, unable to viſit Jeruſalem, and unwilling to return without ſome noble exploit to welcome him to his native country.

The affairs of Egypt, in the mean while, were in the utmoſt confuſion. The aſpiring mamalukes, as if overcome for the moment with ſhame and remorſe, knew not on whom to confer the ſupreme authority. In this interval of dread and conſternation, they haſtily aſſigned the ſceptre to an intriguing female, the ſtep-mother of Touran Shah, the murdered ſultan; but feeling aſhamed of being governed by a woman, a ſlave of the haram, they proclaimed a child of ſix years old to be their ſultan, the only deſcendant they could find of the Ajubite family, and in him cloſed the domination of the race of Saladin in Egypt. Ezzed-din Moaz Ibegh, the mamaluke who had rallied the flying Egyptians in the conteſt with the French count Artois, married the ſtep-mother of Touran Shah; ſoon after which he found means to dethrone the infant ſultan, and aſſumed to himſelf the regal authority. This enterpriſing ſlave was at the head of the *Baharite* Mamalukes, who were ſo ſtiled from having been originally employed as *mariners*, which that word implies, on board the ſhips of the ſultans of Egypt: they were Tartars. Ezzed-din Moaz began to reign, as the founder of the Baharite mamalukes, A. D. 1254; but he was aſſaſſinated the firſt year, and his ſon Nureddin Ali ſucceeded as ſultan of Egypt in 1255. The celebrated Bondocdar, or Bibars, ſupplanted Nureddin, and was proclaimed ſultan of Egypt and Syria, A. D. 1260. In his reign Louis the Ninth undertook the laſt of the cruſades. After ſixteen years of repoſe, the French king embarked with freſh confidence at the head of ſix thouſand horſe and thirty thouſand foot. The loſs of Antioch had provoked the enterpriſe: a wild hope of baptiſing the king of Tunis, tempted him to ſteer for the African coaſt; and the report of an immenſe treaſure reconciled his troops to the delay of their voyage to the Holy Land. But inſtead of a proſelyte, he found a ſiege; the French panted and died on the burning ſands; Louis expired in his tent; and no ſooner had he cloſed his eyes, than his ſon and ſucceſſor gave the ſignal of the retreat. "It is thus," ſays Voltaire, "that a Chriſtian king died near the ruins of Carthage, waging war againſt the ſectaries of Mahomet, in a land to which Dido had introduced the deities of Syria."

A more abſurd conſtitution cannot be deviſed, than that which condemned the Egyptians to perpetual ſervitude, under the arbitrary dominion of ſtrangers and ſlaves. Yet in this ſtate of Egypt the Franks were finally overthrown. With ſome breathing intervals of peace and order, the mamaluke dynaſties are marked as a period of rapine and bloodſhed: but their throne, however ſhaken, repoſed on the two pillars of diſcipline and valour; their ſway extended over Egypt, Nubia, Arabia, and Syria; their cavalry was multiplied to twenty-five thouſand; with one hundred and ſeven thouſand foot, and the occaſional aid of ſixty-ſix thouſand Arabs. Men of ſuch power and ſavage ſpirit would not long endure on their coaſt an hoſtile and independent nation; and if the ruin of the Franks had been poſtponed, they were indebted to the cares of an unſettled reign, to the invaſion of the Moguls, and to the occaſional aid of ſome warlike pilgrims. Among theſe, the Engliſh reader will recollect the name of our firſt Edward, who aſſumed the croſs in the life-time of his father Henry. At the head of a thouſand ſoldiers, the future conqueror of Wales and Scotland delivered Acre from a ſiege; marched as far as Nazareth with an army of nine thouſand men; emulated the fame of his uncle Richard; extorted by his valour a ten years truce; and eſcaped, with a dangerous wound, from the dagger of an aſſaſſin. Antioch, whoſe ſituation had been leſs expoſed to the calamities of the holy war, was finally occupied and ruined by the ſultan Bibars, on the 12th of June, 1268; the Latin principality was extinguiſhed; and the firſt ſeat of the Chriſtian name was diſpeopled by the ſlaughter of ſeventeen, and the captivity of one hundred thouſand of her inhabitants. The maritime towns of Laodicea, Gabala, Tripoli, Berytus, Sidon, Tyre, and Jaffa, and the ſtronger caſtles of the Hoſpitalers and Templars, ſucceſſively fell; and the whole exiſtence of the Franks was confined to the city and colony of St. John of Acre, then deſcribed by the more claſſic title of Ptolemais.

The power and proweſs of Bibars, his frequent victories over the Moguls, and ſtrict adminiſtration of juſtice, were the probable cauſes of his long reign without any attempt of aſſaſſination, or domeſtic feud. He was ſucceeded as ſultan of Egypt and Syria by Kalil Aſcraf, who aſcended the throne in 1290, and who, the next year, wholly exterminated the power of the Chriſtians in Paleſtine. After the loſs of Jeruſalem, Acre or Ptolemais, which is about ſeventy miles diſtant from the holy city, became the metropolis of the Latin Chriſtians, and was adorned with ſtrong and ſtately buildings, with aqueducts, an artificial port, and a double wall. The population was increaſed by the inceſſant ſtreams of pilgrims and fugitives: in the pauſes of hoſtility, the trade of the eaſt

and

and weſt was attracted to this convenient ſtation; and the market could offer the produce of every clime and the interpreters of every tongue. But in this conflux of nations, every vice was propagated and practiſed: of all the diſciples of Jeſus and Mahomet, the male and female inhabitants of Acre were eſteemed the moſt corrupt; nor could the abuſe of religion be corrected by the diſcipline of law. The city had many ſovereigns, and no government. The kings of Jeruſalem and Cyprus, of the houſe of Luſignan, the princes of Antioch, the counts of Tripoli and Sidon, the great maſters of the hoſpital, the temple, and the Teutonic order, the republics of Venice, Genoa, and Piſa, the pope's legate, the kings of France and England, aſſumed an independent command; ſeventeen tribunals exerciſed the power of life and death; every criminal was protected in the adjacent quarter; and the perpetual jealouſy of the nations often burſt forth in acts of violence and blood. Some adventurers, who diſgraced the enſign of the croſs, compenſated their want of pay by the plunder of the Mahometan villages: nineteen Syrian merchants, who traded under the public faith, were deſpoiled and hanged by the Chriſtians; and the denial of ſatisfaction enraged and juſtified the arms of the ſultan Kalil. He marched againſt Acre, at the head of ſixty thouſand horſe and one hundred and forty thouſand foot: his antique train of artillery was numerous and weighty; the ſeparate timbers of a ſingle engine were tranſported in one hundred waggons; and the royal hiſtorian Abulfeda, who ſerved with the troops of Hamah, was himſelf a ſpectator of the holy war. Whatever might be the vices of the Franks, their courage was rekindled by enthuſiaſm and deſpair; but they were torn by the diſcord of ſeventeen chiefs, and overwhelmed on all ſides by the powers of the ſultan. After a ſiege of thirty-three days, the double wall was forced by the Moſlems; the principal tower yielded to their engines; the mamalukes made a general aſſault; the city was ſtormed on the 18th of May, 1291; and death or ſlavery was the lot of ſixty thouſand Chriſtians. The convent, or rather fortreſs, of the Templars reſiſted three days longer; but the great maſter was pierced with an arrow; and, of five hundred knights, only ten were left alive, leſs happy than the victims of the ſword, if they lived to ſuffer on a ſcaffold in the unjuſt and cruel proſcription of the whole order. The king of Jeruſalem, the patriarch, and the great maſter of the hoſpital, effected their retreat to the ſhore: but the ſea was rough; the veſſels were inſufficient; and great numbers of the fugitives were drowned before they could reach the iſle of Cyprus, which conſoled Luſignan for the loſs of Paleſtine. By the command of the ſultan, the churches and fortifications of the Latin cities were demoliſhed: a motive of avarice or fear ſtill opened the holy ſepulchre to ſome devout and defenceleſs pilgrims; and a mournful and ſolitary ſilence has almoſt ever ſince prevailed along the coaſt which for ſo many years reſounded with the DEBATE OF ARMS!

Thus fell the laſt heroes of the Holy War; and Kalil returned in triumph to Cairo; but his reign was diſturbed by the frequent inroads of the Moguls, who ſtill contended for the poſſeſſion of Syria. The arms of the ſultan were finally victorious; and gave to Nazr Mahomet, his ſucceſſor, a long and peaceful reign, in which he diſtinguiſhed himſelf by the encouragement he gave to agriculture and the arts. This prince died in 1341, after which the throne was filled by the ſhort reigns of various mamalukes, moſt of whom fell by retaliated aſſaſſination. In 1348, a moſt deſtructive peſtilence appeared in Egypt, brought originally from Syria; and which ſpread over a great part of Europe. In 1365, Shaban Aſcraff was the reigning ſultan, who diſtinguiſhed himſelf by iſſuing a decree, that the real deſcendants of Mahomet only, ſhould be allowed to wear the green turban. In his reign Peter de Luſignan, king of Cyprus, is ſaid to have beſieged Alexandria, which he was obliged to abandon for want of proviſions; but this event appears to remain in conſiderable obſcurity. Shaban was ſucceeded by his ſon Hadgi Salah, who was a minor, and the laſt of the Baharite dynaſty, which gave place to the Circaſſian mamalukes, in the year 1382.

The origin of this race of ſlaves was briefly as follows: after the Baharite dynaſty had ſeated itſelf upon the throne, the Tartar ſultans were in the habit of purchaſing vaſt numbers of ſlaves, which they obtained principally from Circaſſia, where the people, though they profeſſed Chriſtianity, were, and ſtill are, accuſtomed to ſell their children. Theſe Circaſſian ſlaves were educated for the army, in the ſame way that the Tartar mamalukes had formerly been. As their numbers increaſed, they were diſpoſed of in fortreſſes erected throughout the country, in order to keep a check upon the native Egyptians; and becauſe in their language ſuch a fort is called *borge*, they acquired the name of *Borgite mamalukes*. In the era above-mentioned, they were become extremely numerous and powerful; and the young Hadgi Salah having been placed under the guardianſhip of Barkuk-Dahar, a borgite of conſiderable eminence, who was made atabek or governor during the minority; he perfidiouſly depoſed his pupil, and calling in the aid of the Circaſſian tribes, ſeized upon the ſupreme authority before any reſiſtance could be made to his ambitious views. In him therefore commenced the dynaſty of Borgite Mamalukes, A. D. 1382.

In the reign of Barkuk, Timur invaded Syria at the head of a numerous army of Moguls; but the new Circaſſian ſultan obtained two deciſive victories over him, and obliged his ſhattered forces haſtily to withdraw. In 1399, Faradj, ſon of Barkuk, ſucceeded to the Egyptian throne; but himſelf, and few of the ſultans who followed, reigned above a year, being either aſſaſſinated or dethroned, until the year 1442, when Burſbai began to reign. It was this ſultan who ſent a fleet againſt Cyprus, which took Lymiſſos and Nicoſia, and brought king John II. and moſt of his nobility, captives to Cairo. Syria alſo remained a conſtant appanage to Egypt. Burſbai reigned ſixteen years, and in 1461 was ſucceeded by Abul-Fathe-Achmed. This ſultan laid an annual tribute upon the kingdom of Cyprus, and aſſigned the crown to James, natural ſon of John III. Of the ſucceeding ſultans we find nothing remarkable; and the mamaluke ariſtocracy began to render their ſtation more and more precarious. Whoever aſpired to be ſultan, formed a party; and after having murdered his rival, waited for a favourable opportunity to ſeize the reins of government. Whoever aſſaſſinated the ſultan was generally proclaimed in his place; and ſometimes two or three reigned at the ſame time in Syria, Upper Egypt, and Cairo, who were continually at war, till the moſt daring and enterpriſing had deſtroyed the others. In 1501, Kanſu-Elghuri was raiſed to the throne; and in 1516, Selim II. emperor of the Turks, having declared war againſt him, defeated and ſlew him near Aleppo, and ſeized upon all Syria. The mamalukes immediately raiſed Toman Bey to the vacant throne, and made every preparation for oppoſing the victorious arms of Selim. A moſt obſtinate and ſanguinary battle was fought between the Ottoman troops and the mamalukes, on the 24th of January, 1517, at Rodania near Cairo, in which Selim at length prevailed. After another obſtinate conflict, Toman Bey was again defeated by Selim, taken priſoner, and hanged at one of the gates of Cairo, on the 13th of April the ſame year. Thus fell the dynaſty of Borgite mamalukes; and Egypt, thus conquered, became ſubject to the Turks of Conſtantinople.

Selim, finding it impoſſible to compel his new ſubjects to ſubmit to a deſpotic government, did not attempt to give them new laws, but delegated the chief power, under his own authority, to an apoſtate bey, who, by baſely betraying Toman, his former maſter, had been the chief cauſe of his defeat. In this manner Selim II. quitted the country, ſix months after his firſt entry into Cairo, leaving little order or regulation, and the mamalukes

were ſtill maſters of Egypt. It was left for Solyman, ſurnamed the Legiſlator, the ſucceſſor of Selim, to give a new conſtitution, not only to Egypt, but to all the different provinces which compoſed that heterogeneous maſs of empire. He found it in the firſt place neceſſary to eſtabliſh a counterpoiſe for the power and influence of the mamalukes; to effect which, he eſtabliſhed the corps of *cajacklis* or militia, conſiſting of the natives of Egypt, into which a mamaluke was on no account to be admitted. To theſe corps he gave great powers; to the mamalukes he left nothing but a ſubordinate military authority, and a few villages for their principal officers or chiefs, who were to be in number twenty-four, diſtinguiſhed by the honorary title of *beys*. He eſtabliſhed a pacha as his own immediate repreſentative, who was to be the captain or head of the government; thence called, by different writers, the *capitan* or *capoutan pacha*; and who had the nomination of the different officers of the ſtate. The beys had alſo the choice of a ſucceſſor, to fill up any vacancies among themſelves, but they were obliged to preſent the perſon ſo choſen to the pacha in a full divan, to be inveſted with the dignity, and approved, by him. Hence the office of pacha of Egypt was often the road to the Turkiſh vizirate, and was ſometimes an honourable retreat for a diſgraced vizier. He could be formally depoſed by the corps of militia in the divan, and made to ſettle his accounts before he left the country. The reaſons for his being ſo diſmiſſed were previouſly tranſmitted to Conſtantinople, where he was always replaced; and indeed it rarely happened that a pacha died in this ſituation, they were ſo frequently changed.

The divan, which aſſembled twice a week to deliberate on all the affairs of ſtate, was compoſed of the twenty-four beys, the principal officers of the militia, and the great lawyers. The pacha, as ſupreme, was the preſident of the aſſembly. The tribute annually paid to the Porte was to be twelve hundred purſes of piaſtres, (about fifty thouſand pounds,) beſide conſiderable quantities of rice, corn, &c. In this manner the government went on, without any event of importance, at leaſt with nothing more than the uſual intrigues, ſometimes between the mamalukes and militia to depoſe the pacha; ſometimes between the pacha and militia, to check the daring attempts often made by the mamalukes to regain their ancient influence; and ſometimes between the mamalukes and the pacha, to repreſs the aſpiring ambition of ſome chiefs of the militia. This conſtitution laſted till the middle of the eighteenth century, when a variety of cauſes conſpired to overturn it. The beys were then beginning to take the lead in all political affairs, and the pachas were reduced to mere ciphers, ſcarcely poſſeſſing the ſhadow of their original authority.

About the year 1748, a pacha of a more determined caſt was appointed, who, finding it impoſſible to aſſert his ſuperiority, without ſtriking ſome deciſive blow, took a reſolution to deſtroy the beys at once by aſſaſſination. Accordingly, as they were coming to take their places at the divan, ſeventeen of them were murdered; the reſt eſcaped. Such a daring and open violation of juſtice and humanity had not the intended effect; for the indignation of all claſſes againſt the pacha ran ſo high, that he was obliged to quit his ſituation, and ſave his life by eſcaping to Conſtantinople. At that period Ibrahim Caya Bey, a determined and ambitious mamaluke, had got by intrigue into the corps of militia, in which he held a very high ſituation. He aſpired to be elected Shiek-el-Belled, or chief of the mamalukes, and to reſtore them to their former authority; and he managed ſo well, that in a few years he had inſinuated all the mamalukes of his party into the militia, which gave him ſuch an aſcendancy, that he eaſily kept the remainder quiet. Had he lived, he would in all probability have ſucceeded in making himſelf a ſultan of Egypt independent of the Porte; but he was poiſoned by an emiſſary of the court of Conſtantinople, who hoped, by deſtroying this aſpiring chief, to regain their authority in Egypt, which was ſo completely ſhaken.

Ali Bey the Great, a man of more talents, with equal ambition and intrepidity, ſucceeded Ibrahim, A. D. 1766. He was the firſt mamaluke who openly declared the bold deſign of freeing Egypt for ever from the nominal ſovereignty of the court of Conſtantinople. Throwing off the maſk entirely, he aſſumed perfect independence; expelled the pacha, refuſed the tribute, and coined money in his own name. Iſmael Bey and Mahomed Bey conſpired againſt him, and drove him into Syria, where he took refuge with the celebrated Daher, who had rendered himſelf maſter of Syria, and laughed at all the feeble efforts of the Porte to reduce him. Ali Bey, having received ſome ſmall aſſiſtance from the Ruſſians, as well as from Daher, croſſed the deſert to meet his adverſaries. A battle was fought near Salahieh, in which Ali was wounded by one of his own party, ſuppoſed to have been Mourad Bey, and was in conſequence taken priſoner. He was treated with great reſpect, and carried to Cairo, where he died a few days after: ſome ſay by poiſon. This aſpiring ſlave was born in Anatolia, or rather Natolia, a province of the Turkiſh empire. He was brought young into Egypt, where he was purchaſed in the ſame manner as the other mamalukes, and raiſed himſelf by his enterpriſing and ambitious ſpirit to that ſituation, which made the Porte tremble for the remains of its power in Egypt. Mourad Bey, as chief of the faction of Ali, ſoon ſet up for himſelf, and drove his opponents, Iſmael and Mahomed, from Cairo for ſome time; but they regained poſſeſſion of the capital, and kept it, till they both died natural deaths. Mahomed Bey died firſt, at Aere, after having taken the town. At the death of Iſmael, Mourad Bey again aſſumed the government; but it was ſoon after agreed to be conjointly ſhared between Mourad and Ibrahim Bey, who reſtored the Turkiſh pacha, and ſent the arrears of tribute to Conſtantinople, which had not been paid for ſix years, and which was thus made the olive-branch of peace.

There was never a Shiek-el-Belled, or chief of the mamalukes, whoſe reign was of longer duration than that of Ibrahim Bey. From the year 1776 to 1803, a few interruptions excepted, he has retained poſſeſſion of the ſupreme power. For this continuance in the exerciſe of the ſovereignty, in a country where authority ſeldom remains long in the ſame hands, he was indebted to his unbounded liberality and great courage. It is remarkable, that during all the revolutions among the mamalukes for the laſt ſixty years, the pacha has been nothing more than an empty repreſentative of the authority which the court of Conſtantinople claimed to exerciſe in Egypt; the whole power having been uſurped by the Shiek-el-Belled, ſupported by the reſt of the beys. The functions of the pacha, during this period, were merely confined to receiving and tranſmitting the miri or tribute to the grand ſeignor, whenever the beys thought proper to pay any. It was uſeleſs for him to diſpute the will of the all-powerful beys, and accordingly he never made any heſitation at obeying their orders. Without troops, and without any means of enforeing his authority, he could not do otherwiſe. It may here be proper to mention the moſt celebrated beys who bore the ſway in Egypt at the cloſe of the eighteenth century. Ibrahim, as the elder, being then upwards of ſixty years of age, and at the head of a ſtrong party, was eſteemed the chief; though it is the uniform cuſtom for all the beys to take precedence from the ſtrength or number of their mamalukes: of theſe mercenaries Ibrahim maintained upwards of a thouſand. Mourad Bey, his colleague in the government, and once his ſuperior, was originally a ſlave of Mohammed Bey: about fifty years of age; bold and intrepid, yet deliberate and ſagacious; maintaining ſeventeen hundred mamalukes. Next in power was Mohammed Bey *Elfi*, about thirty-five years of age; his name imports that he was bought for a thouſand ſequins. His maſter was

Mourad

Mourad Bey, above-mentioned. He poſſeſſed eight hundred mamalukes, who were daily increaſing; and he had the character of great ſagacity, courage, and intrepidity in action. Ibrahim Bey *Uali*, a name derived from having been the ſlave to the ſecond magiſtracy in the city. He married the daughter of the elder Ibrahim; about thirty-ſix years old; of a ſedate, firm, and reſolute character; with ſeven hundred mamalukes. Aiub Bey *Zogheir*, or junior; eſteemed a cool and courageous leader; eminent in ſagacity and diſcernment; near forty years old; with five hundred mamalukes. Oſman Bey *Tambergi*, ſo named as having been a mamaluke drummer: intrepid, bold, and vigilant, he was greatly eſteemed by Mourad. Other beys were the Black Caya Bey, Oſman Bey Aſcar, Mahomet Bey Mafice, Iſaak Bey, called the French Bey, from his long reſidence in France; he ſpoke ſeveral languages, and was interpreter to the other beys. Oſman Bey Berdici, Selim Bey, Achmed Bey, Aſſan Bey, &c. to the number of twenty-four, according to the original inſtitution of Solyman the Legiſlator.

Such was the ſtate of the government of Egypt, when general Bonaparte, on the firſt of July, 1798, landed at Alexandria, with an army of 40,000 men. Whether this expedition was undertaken by the French with the ſole deſign of ſubduing that country, or of attempting to direct their arms by the Red Sea, againſt the Britiſh poſſeſſions in India, is not known, though the latter opinion has prevailed. The town of Alexandria appears to have been the firſt object of the French commander, which he took almoſt without reſiſtance, after putting to flight the Arabs and mamalukes who defended it, and of whom he killed about three hundred. The conduct of the invader, however, ſeems highly reprehenſible, ſince it ſavoured more of Saracen barbarity, than of the forbearance and humanity of Chriſtian warfare. The city was taken by ſurpriſe, attacked and ſtormed, and numbers innocently put to death, without even giving the garriſon the option of capitulation; and the ſoldiers were ſuffered to ſack, and raviſh, and plunder, the inhabitants for three hours, as an encouragement for them to proceed with avidity in this unprovoked and rapacious war. Bonaparte then aſſembled the magiſtrates, and with more than Mohammedan diſſimulation, aſſerted "that his only motive for viſiting Egypt, was glorioufly to effect the deliverance of the country, from the tyranny and uſurpation of the beys, who were equally the enemies of the Porte and of the French people." And having required from them an oath that they would neither injure nor betray him, he permitted the greater number to retain the places which they occupied. Having continued three days in Alexandria, to organize the city, of which general Kleber was left in command, the French army commenced a difficult and dangerous march acroſs the deſert to attack Roſetta. Unaccuſtomed to the heat of a tropical climate, unuſed to traverſe barren and ſandy ſoils, and unobſervant of the orders which had been iſſued, the ſoldiers exhauſted their proviſions, or ſuffered them to ſpoil, before they reached two-thirds of their journey. Roſetta, however, which made no reſiſtance, terminated many of their difficulties. Having left a garriſon in this place under the command of general Menou, and another at Rhamanieh, a town farther up the river, at the entrance of the canal of Alexandria, whither a column of the army had been detached at the ſame time with that to Roſetta, Bonaparte continued his march along the banks of the Nile towards Cairo.

Hitherto no obſtacle had preſented itſelf to the French invader; but on the arrival of the army near Gizeh, Bonaparte found that Mourad Bey had aſſembled his forces in the neighbourhood of a village called Embabeh, where he intended to diſpute and oppoſe his farther progreſs. The mamalukes amounted to ten thouſand men, and fought with deſperate courage; but the action, though bloody, was neither long nor doubtful. Part of the army of the mamalukes was either exterminated by the ſword, or drowned in the river; the reſt with Mourad Bey, retreated to Upper Egypt. This action, which was denominated the *battle of the pyramids*, convinced the French, from the obſtinate reſiſtance made by an inferior army, unſkilled in European tactics, that they had no ordinary enemy to combat and overcome; particularly when it was conſidered that the whole country was taken by ſurpriſe, when no one garriſon was in a ſtate of defence, and when no enemy, either foreign or domeſtic, was expected on the Egyptian ſhores. The ſpoils of the ſlain were found extremely valuable, as each mamaluke carries with him in his march the amount of his fortune, or his plunder.

In conſequence of the event of this battle, Bonaparte ſent for, and was waited on, by the magiſtrates of Cairo, which city the army entered in triumph, having nothing to oppoſe them. The French commander now parted his troops into three diviſions, one of which was ſent under the command of general Deſaix, to poſſeſs himſelf of Upper Egypt; the ſecond was left at Cairo; and with the third he followed Ibrahim Bey, who had retired into Syria to recruit his army. The moſt hazardous and embarraſſing part of the whole campaign, was certainly that which was carried into Upper Egypt, under the indefatigable perſeverance of general Deſaix, who had not only to contend with the burning heat of the tropical ſun, and the horrors of a barren deſert, but with the brave and dexterous generalſhip of Mourad Bey. He ſet out on this important expedition on the 26th of Auguſt, 1798, with a flotilla on the Nile to convoy his march. Mourad Bey in the interim collected his forces, and encamped on an eminence in the neighbourhood of Sedinan, where he waited to diſpute the progreſs of the French arms. Deſaix approached, impatient to give him battle; and coming within ſight of the lofty mamaluke camp, which betrayed the utmoſt oriental magnificence, he encouraged his troops with the hope of plunder; pointing out, by the help of his glaſs, or pretending to point out, the perſon of Mourad Bey, reſplendent with gold and precious ſtones, and ſurrounded with all the richly decorated beys and kiachefs under his command. The night was paſſed in feaſting in the camp; while, in the dark, parties were ſent out to menace the advanced poſts of their enemy. At the firſt dawn of the morning the French army formed in a hollow ſquare, in the midſt of a large plain, with two platoons on their flanks. Mourad approached at the head of his formidable mamalukes, and ſeveral thouſand Arabs, who charged with uncommon intrepidity, and quickly ſurrounded the whole body of the French. A dreadful carnage enſued; great numbers fell on both ſides; but the mamalukes could make no ſerious impreſſion on the ſolid ſquare, which rendered their ſcymetars of no avail, and their numbers uſeleſs. The mamalukes fighting on horſeback, chiefly with the ſabre, which they uſe moſt dexterouſly, were received by the French on the point of the bayonet; who thus wounding their horſes, threw them perpetually into confuſion. Diſappointed and enraged, the mamalukes advanced as cloſe as poſſible to the lines, firſt diſcharging their piſtols, and then throwing them violently at the enemy, together with their battle-axes and other weapons, until the ground was covered with their arms. They then retired, not beaten, though leaving the French maſters of the field of battle.

Deſaix now, perceiving the impetuous kind of enemy he had to deal with, procured from Bonaparte a conſiderable reinforcement both of cavalry and infantry, with which he continued to penetrate the interior of Upper Egypt. He paſſed on from poſt to poſt, extirpating all who appeared inimical to the French intereſt; ſeizing their proviſions and effects, violating their women, burning their habitations, and deſolating the country. Thoſe who ſubmitted to their yoke, who were willing to pay a tribute, and provide the army with neceſſaries and proviſions, were protected and ſpared. Yet theſe, in turn, became a ſacrifice to the exaſperated mamalukes, who in revenge fell upon them whenever they recovered the

country, ſparing neither man, woman, nor child. Mourad Bey, aided by his ſuperior knowledge of the roads, and by the expertneſs of his numerous mamaluke cavalry, was conſtantly able to haraſs the rear of the French, and would often ſeize and carry off their ſtragglers and foraging parties, even within fifty yards of the main body. But Mourad now began to act principally on the defenſive, not only by haraſſing the enemy's rear, but alſo by lying in ambuſh, laying waſte the country, driving off the cattle in the line of his march, and weakening his force by ſudden and repeated ſkirmiſhes. In this manner Deſaix purſued the Egyptian Fabius, until he reached the city of Girgeh, the capital of Upper Egypt, ſituated halfway between Cairo and Syene. Mourad now reſolved again to diſpute his further progreſs; and with that intent pitched his camp near Samanhut, a conſiderable village in the neighbourhood of Girgeh. In this city, which ſtands on the Nile, Deſaix waited from the 30th of December to the 20th of January, 1799, for the arrival of their flotilla, which had alſo been haraſſed and attacked by the mamalukes and Arabs, and one of their veſſels taken. On the 21ſt the ſupplies were got on ſhore; and Deſaix quitted Girgeh on the 22d, marching directly to Samanhut. On the 24th the mamalukes appeared, diſcloſing a front of an immenſe extent. Deſaix formed his army in three compact ſquares; two of infantry for the wings, and one of cavalry in the center, with the artillery on the angles. Mourad Bey began the battle with his uſual impetuoſity, and the mamalukes at once aſſailed the whole body of the French, prancing around them with uplifted ſcymeters, making a moſt brilliant diſplay of their glittering accoutrements, and of their ſkill in horſemanſhip, as well as of their contempt of danger, and boldneſs of attack. But the rigid ſeverity of the northern tactics preſented a ſpectacle equally commanding, and more formidable. Numbers of the French fell in the action; but their lines could not be broken. The artillery was likewiſe a bulwark of defence, mowing down the mamalukes and Arabs in all directions. One of their chiefs fell ſo near the French lines, that he could not be recovered by his own people; and while his foot hung in the ſtirrup, the horſe, without abandoning his rider, would not let the French ſoldiers approach him, notwithſtanding all their endeavours to ſeize the rich gold which glittered on the dreſs of this unfortunate chief, who was thus dragged back by his horſe, and made to ſuffer the horrors of death in many forms. Mourad now retreated into the boſom of the deſert, conceiving that this would prove an inſuperable barrier againſt the further purſuit of his enemy, unprepared for, and unaccuſtomed to, ſuch a frightful waſte, which eternally preſents a diſconſolate idea to all who have once beheld it—a boundleſs horizon of barrenneſs, which oppreſſes the mind by immenſity of diſtance, and whoſe appearance, where level, is only a dreary expanſe; and where broken hills intervene, they only ſhew another feature of decay and decrepitude; whilſt the ſtill ſilence of inanimate nature is never broken but in the dead of night, by the fearful howlings of ferocious beaſts. But theſe held out no terrors to the indefatigable Deſaix.

The French army entered the deſert on the 28th of January, 1799, paſſed the ancient cities of Tentyra, Thebes, Eſneh or Latopolis, and Etfu the ancient Hieraconpolis; following as cloſe as poſſible on the heels of Mourad Bey and his mamalukes, until it reached its deſtination at Aſſuan or Syene, the frontier town of Upper Egypt, where the fertile Nile enters the Egyptian territory, by flowing over the laſt of the cataracts at the beautiful iſland of Elephantina. Here the French inſcribed the termination of their march through Egypt upon a rock of granite; and then returned to organize the new government of Syene, which was in no condition to oppoſe theſe novel uſurpers. Deſaix immediately formed a plan of fortifying the town, conſtructed a citadel or fort which commanded all the approaches, and, with the profeſſed vanity of imitating Probus, actually converted his army into artificers, architects, and labourers. In the mean while, general Dahouſt was ſent in queſt of Aſſan Bey, on the right bank of the river oppoſite Etfu, where he was in conſiderable force with ſupplies, ready to co-operate with Mourad. The eagerneſs of the French to get poſſeſſion of the ſtores, expoſed them to a terrible conflict for about half an hour. The field of battle remained with the French; but Aſſan Bey obtained his main point, that of carrying off his baggage and ſtores; ſo that neither party had much to boaſt, though Aſſan was wounded in the leg, and many of the mamalukes killed.

After having thus rapidly advanced through the whole extent of Upper Egypt, and placed the inhabitants of Syene under the temporary controul of the French nation, Deſaix, on the 25th of February, after a campaign of ſix months, commenced his return to Cairo; but this was a work of more difficulty and danger than was at firſt ſuſpected. To ſoften the rigour of the march, as well as to ſcour the country of the mamalukes and Arabs, who now acted in detachments, and were diſperſed in various directions on both ſides the Nile, Deſaix divided his army into two parts: with one diviſion he ſtill purſued the vigilant Mourad Bey; while the other, under the command of general Beliard, was ſent, on the other ſide the river, in queſt of Oſman Bey Aſcar, who having been joined by a numerous body of Meccan ſoldiers, had entrenched themſelves at Benhute, in order to co-operate with Mourad, and way-lay the French troops on their return to Lower Egypt. General Beliard attacked theſe entrenchments, which after a moſt bloody and deſperate conflict of three days, he carried; and in which the moſt heroic achievements appear to have been performed on both ſides, with the conſequent loſs of innumerable lives. On the next day, the 23d of March, general Beliard, perceiving the folly of purſuing theſe people in a country where they had every advantage, haſtened to meet the commander Deſaix at Keneh, where he arrived on the 11th of April. Deſaix in the mean time had compelled Mourad Bey to take ſhelter in the Oaſis, and had detached general Friant to the right bank of the Nile, to preſerve a line parallel to his own, and to clear the country of Elfi Bey and his remnant of mamalukes. After theſe operations the two French generals met at Keneh, which for a time they made their head quarters.

General Deſaix now conceived the plan of blocking up the mamalukes in the deſert, or at leaſt of cutting off their communication with the Nile, and of impeding their movements, by preventing them from ſeparating their forces without the riſk of being cut off, and of finally reducing them by famine. In the valley which leads from Coſſeir to the Nile, there are four wells or fountains, the latter of which is of great importance when the deſert is to be occupied by an invading army, ſince it is ſituated at the confluence of three roads, which are ſo many paſſes from the deſert into Egypt. The firſt of theſe roads, which runs to the ſouth-weſt, leads to Rediſi, where it terminates. The ſecond, which runs almoſt due weſt, terminates at Nagadi; and the third, which takes a north-weſt direction, leads to Birambar. From Biramber three roads lead to Kous, to Coptos, and to Keneh. Deſaix, after having left a garriſon at Keneh, took up his poſition at Birambar; and Beliard was ſent with his diviſion to occupy the paſſage of Nagadi; while that of Rediſi was incautiouſly neglected; for if the ſtrait of Rediſi could have been occupied, all the beys on the right bank of the river muſt have ſurrendered, or ſtarved in the deſert; in which caſe, Mourad Bey, who was in force on the left bank, would have been the only army he could have had to contend with. Beliard repaired to Nagadi, where his troops were compelled to take up their quarters in the ſubterraneous tombs or burial places of the dead, while ſcouting parties were employed to learn the motions of the enemy. Beſides the mamalukes, a conſiderable body of Meccans were in force, with ſome or other of whom the

the patroles were continually falling in, and who were hunted down and deſtroyed like animals obnoxious to ſociety. In this dreary ſituation, however, proviſions were conſtantly brought in to their quarters in the tombs, by the ſhepherds and merchants who were in dread of being plundered by the mamalukes. Theſe movements brought on the battle of Birambar, wherein Dupleſſis, a chief of brigade, and ſeveral French officers loſt their lives, and wherein Aſſan Bey and Oſman Bey Aſear were ſeverely wounded. The French, as uſual, were the victors; and the defeated mamalukes took the unguarded paſs by the ſtrait of Rediſi, and formed a junction with Mourad Bey on the oppoſite bank of the Nile. Theſe beys now concerted the plan of cutting off the communication of the French army with Cairo; and with this view Elfi Bey was deputed to hang upon the flotilla, and ſcour the banks of the Nile; Oſman and Selim Bey were diſpatched to retake and reduce the French fortifications at Syene; and Mourad Bey, with the flower of the mamalukes, hung upon the French army to keep it in check, to watch favourable opportunities of attack, and to overawe the natives, and prevent ſupplies.

Theſe promiſing ſchemes, however, did not ſucceed. Beneadi, a town on the verge of the deſert, containing twelve thouſand inhabitants, where a rich caravan from Fur had juſt arrived, gave every aſſiſtance to Mourad Bey, who had excited them to arms againſt the French. To this town, therefore, Defaix immediately diſpatched general Davouſt with the cavalry, and a ſtrong detachment animated with the hope of plunder, who fell furiouſly upon the town, maſſacred almoſt all the inhabitants, pillaged and burnt the houſes; and then following the few who had eſcaped to join the Meccans at Miniet, they were all put to the ſword in a ſecond encounter. Another detachment was ſent under captain Renaud back to Syene, to diſlodge Oſman and Selim Bey, who had poſſeſſed themſelves of the town. Emboldened by the ſmall number of the enemy, they marched out and attacked the French with their uſual impetuoſity; but in the action Selim Bey was ſeverely wounded, and Oſman ſoon after retreated above the cataracts, leaving Syene once more in the hands of the French. In the mean time Defaix had driven back Mourad Bey to his ſtrong hold in the Oaſis; whilſt Beliard was getting ready a detachment to croſs the deſert, and take poſſeſſion of Coſſir or Coſſeir, on the banks of the Red Sea. This ſervice was performed with conſiderable adroitneſs and expedition. The detachment, all mounted on camels, left the head quarters at Keneh on the 26th of May, 1799, paſſed the ſtrait of Birambar, or *well of wells*, on the edge of the deſert, where they took their ſupply of water, and arrived at Coſſir on the fifth day. The defenceleſs town and barren ſuburbs were inſtantly ſurrendered; and the French, after holding poſſeſſion two days, and erecting the tri-coloured flag, returned back in only four days to Keneh. "To this central ſeat of our conqueſts in Upper Egypt," ſays Denon, "we found a number of merchants of all nations reſort, pleaſed with our new government, and ſoliciting paſſports for their ſafe journey through the deſert. By this intercourſe with the natives of different countries, remote diſtances ſeemed to be contracted, and when we began to reckon the days required for a journey, and the neceſſary means of effecting it, the ſpace to be paſſed over ceaſed to be immenſe; we no ſooner found ourſelves actually engaged, than many difficulties, formidable at firſt, inſenſibly ſeemed to diminiſh, and at length totally diſappeared. The Red Sea, Gidda, Mecca, ſeemed like neighbouring places to the town where we were; and *India itſelf was but a ſhort way beyond them!* In the oppoſite direction the Oaſes were actually no more than three days journey from us, and ceaſed to appear to our imagination as an undiſcovered country. From Oaſis to Oaſis, by eaſy marches of one or two days, we arrive at Sennaar, one of the capitals of Nubia, which ſeparates Egypt from Abyſſinia and Fur, in the road to Tombuctoo, whoſe inhabitants are ſtill the chief object, in Africa, of European curioſity, and whoſe very exiſtence was a ſhort time ago problematical. Many Turkiſh, Meccan, and Mooriſh, merchants, came to exchange their coffee and Indian cotton for our corn; yet notwithſtanding this quiet ſubmiſſion of the ſuperior claſſes, the maſs of the nation, from an error in their religion, and the dread of the beys, were ſtill againſt us."

Whilſt theſe acquiſitions in Upper Egypt were ſecured by the point of the bayonet, the general in chief, Bonaparte, had marched with his diviſion of the main army into Syria and Paleſtine, where he had defeated the mamalukes and Arabs under Ibrahim Bey, and had ſtormed and taken the city of Jaffa, the ancient *Joppa* of our ſcripture hiſtory. Owing to its rocky and ſhelving coaſt, Jaffa is at all times ſecure from an immediate attack by ſea; and being defended on the land ſide by a ſtone wall, provided at certain diſtances with alternate ſquare and round towers, it made a moſt obſtinate reſiſtance to the French troops, obliging them to break ground, and to erect batteries againſt it to the ſouthward; and it was not until a breach had been effected, that the forces under Bonaparte could make any impreſſion; after which he gallantly ſtormed and carried the place. But we are ſorry to record, that the laurels thus nobly acquired, were tarniſhed by a conduct more cruel, baſe, and unmanly, than ever diſgraced the ſavage war of either Indies, or the unrelenting tyranny of Robeſpierre. In cold blood, Bonaparte is ſaid to have cauſed near four thouſand of the wretched inhabitants of Jaffa to be maſſacred, in reſentment of their obſtinate reſiſtance; and becauſe the ſick and wounded of the French army were in ſuch numbers at Jaffa, and dreading the fatal ravages of the plague among his troops, he is ſaid to have cauſed upwards of five hundred of his unfortunate diſeaſed countrymen to be put to death, by poiſon! The French troops held poſſeſſion of Jaffa forty days, during which time it underwent a complete pillage; and the ſoldiers, not content with foreing the women and female children, afterwards robbed them of the trifling ornaments which decorated their heads, necks, and ears; moſtly conſiſting of coins, ſuch as paras, ſequins, piaſtres, &c. Bonaparte had it next in contemplation to attack and ſtorm the city of Jeruſalem, ſituated about twenty miles from Jaffa; and he was heard vauntingly to declare, "that ſhould he obtain poſſeſſion of the holy city, he would plant the tree of liberty on the ſpot on which the croſs of Jeſus ſtood; and would bury the firſt Frenchman who ſhould fall in the attack, in the ſepulchre of our Saviour." But the threatening ravages of the plague, the prevailing ſickneſs of his army, and the want of many neceſſaries, deterred the Corſican hero, for the preſent, from purſuing the conqueſt of Paleſtine. Having returned to Cairo, Bonaparte employed himſelf in arranging the details of the adminiſtration of Lower Egypt; and eſtabliſhed lazarettos to oblige every ſhip that came from infected countries, to perform quarantine. He alſo commanded workſhops to be conſtructed at Gizeh, for furniſhing different materials for the army; formed an adminiſtration for coining money; and publiſhed tables of the relative value of French and Egyptian currency.

Thus did the ſubjugation of all Egypt appear to be complete, though a dreadful deſtiny had befallen the fleet which conveyed thither this ſucceſsful commander. On the 1ſt of Auguſt, the Britiſh admiral, Nelſon, who had received the command of a conſiderable number of ſhips, appeared off the mouth of the Nile, and made diſpoſitions for attacking the enemy. The French fleet, which conſiſted of one ſhip of one hundred and twenty guns, three of eighty, and nine of ſeventy-four, beſides others of ſmaller ſize, was at anchor in the bay of Aboukir. The admiral placed them as near the ſhore as poſſible, in a ſtrong and compact line of battle, flanked by four frigates and many gun-boats, and protected in the van by a battery. By one of thoſe daring and ſkilful

manœuvres, which diſtinguiſh the commanders of the Britiſh navy, the Engliſh admiral having penetrated with the half of his ſquadron between the French fleet and the ſhore, placed the enemy between two fires, and commenced the attack. At ſun-ſet the action began, and ſoon appeared to be in favour of the Engliſh. Both parties fought with great ſpirit and bravery. Bruyes, the French admiral, was deprived of his life by a ball; and, in the ſpace of an hour after, his ſhip, l'Orient, took fire, and blew up with a dreadful exploſion. This event decided the victory. The Engliſh took nine ſail of the line, and another was burnt by order of her commander. This important victory, which will ever appear with luſtre in the annals of hiſtory, deſtroyed the whole naval force of the French in the Mediterranean, inſulated the army of Egypt from their country, and precluded all means of obtaining ſupplies from France.

Thus left to the reſources of his own invention, Bonaparte continued his civil and military operations with wonderful activity. At Belbeis and Salahieh forts and redoubts were conſtructed, which might reſiſt the attacks of the enemy, on the ſide of Syria; and plans were projected for the better defence of Alexandria and the city of Cairo. A national inſtitute was eſtabliſhed, ſome of whoſe objects were the purification of ſalt-petre; the conſtruction of wind and water mills, which ſerved for the purpoſe of raiſing the water into ciſterns, on account of its acquiring a brackiſh taſte by lying on the ground, and alſo for the grinding of corn; the compoſition of bread; and a preparation of fermented liquors, as a ſubſtitute for wine; beſides natural hiſtory, arts, antiquities, and other reſearches of ſcience and literature. The ſhieks of different provinces were alſo convened, who diſcuſſed with calmneſs and dignity certain topics of juriſprudence and political œconomy. As the feſtival of the anniverſary of the French republic happened at this period, theſe Egyptian ſages joined in the celebration, which took place at Cairo with great ſolemnity, notwithſtanding the deſtruction of their fleet. By ſuch courteous manners, Bonaparte endeavoured to obtain the confidence of the native Egyptians, which a continuance of victories over the beys and mamelukes, their oppreſſors, had ſeemed to confirm.

But it being rumoured at Cairo, that the grand ſignior, Selim III. had diſpatched a numerous army againſt the French invaders of Egypt, an inſurrection broke out; in the firſt commotions of which general Dupuis, the commandant of the city, and ſeveral ſoldiers, were maſſacred. The houſe of general Caffarelli was beſieged by the inhabitants, and taken, and all that had defended it were put to death. The French, however, recovering from their ſurprize, made a ſtrong and ſpeedy reſiſtance; their cannon was pointed in every direction; and the Turks and Arabs, who compoſed the maſs of the revolt, were ſoon put to flight, and compelled to ſeek refuge in their moſques and temples. Theſe they conſidered as ſafe and inviolable aſylums, becauſe the French had never preſumed to enter them, from a regard to the religious uſages and opinions of the people, to which the commander in chief had jeſuitically affected to be a convert, as his proclamations evince. Bonaparte ſummoned the inſurgents to deliver up their principals in the revolt; but the Turks refuſing, the moſques were forced, and every ſoul periſhed.

This revolt rather ſerved to confirm the power and influence of Bonaparte. The native Egyptians were not concerned in inſurrection; and the Greeks, who had hitherto remained neuter, joined the French. This was deemed by the general a favourable opportunity for publiſhing the declaration of war, made againſt him by the Ottoman Porte; and, having ſecured the continuance of internal tranquillity, he prepared for extending his conqueſts; or, to uſe his own language, "*for the further deliverance and regeneration of the eaſtern world.*"

England, however, could not endure the eſtabliſhment of a French colony in Egypt, ſo near and hoſtile to her Eaſt India territories, and had therefore combined with Selim III. emperor of the Turks, in a plan of general attack, which was intended to expel the French from their conqueſts and uſurpations. The preparations were made in Syria, and committed to the care of the pacha Djezzar, who was to traverſe Aſia Minor, and to attack Egypt with a powerful army. At the ſame time a ſtrong diverſion was to be made towards the mouths of the Nile, and by the troops of Mourad Bey in Upper Egypt, united to the other hoſtile parties. Whilſt Bonaparte was diſtantly employed with the members of the inſtitute, in making ſurveys of the canal of Suez, of which veſtiges were found ſtill remaining, he was informed of the preparations and movements of Djezzar, whom the grand ſignior had now appointed pacha of Egypt. He reſolved, therefore, to march into Syria, with an army of thirteen thouſand men, and to attack the enemy before they ſhould have time to commence offenſive operations. During this abſence of Bonaparte, general Dugua was charged with the command of Cairo; general Menou was ſtationed at Roſetta; and general Almeyras at Damietta, the fortifications of which he had orders to repair. General Marmont was entruſted with the command of Alexandria, which became daily of more importance, and was threatened both by the Engliſh, and the plague. General Deſaix ſtill continued with his detachment of troops in Upper Egypt, endeavouring, by redoubled diligence and activity, to keep in awe the mamalukes, and to prevent Mourad Bey from taking advantage of the expedition into Syria.

On the 17th of March, 1799, part of the French army croſſed the river, which runs within fifteen hundred yards of the walls of Acre, during the night. A bridge being erected early next morning, the remainder of the troops paſſed over, and aſcending the heights which command the place, beheld the town prepared for a ſiege, and, to their no ſmall chagrin and aſtoniſhment, diſcerned the Engliſh colours flying in the harbour.

St. Jean d'Acre, ſo celebrated during the time of the cruſades, at this moment contained within its walls two ſingular men, who, with the romantic heroiſm of the days of chivalry, united all the knowledge appertaining to the modern art of war. Sir W. Sidney Smith, after attaining the rank of poſt-captain in the Britiſh navy, had offered his ſervices to the king of Sweden, and conducted himſelf with ſuch bravery during an action with the Ruſſian fleet, that the croſs of the order of the Sword was conferred upon him by Guſtavus III. The war with France ſoon after afforded new opportunities of diſtinguiſhing himſelf, and it was to his care that lord Hood had entruſted the deſtruction of the fleet in the port of Toulon. Become a priſoner to the French, in conſequence of an exertion of perſonal bravery, he was immured within the walls of the Temple, and every attempt for his exchange or enlargement rejected; at length, however, the gates were thrown open, his liberty procured, and his return to England facilitated, by means that favour of romance rather than of hiſtory. Appointed to the command of a ſmall ſquadron, the commodore repaired to Conſtantinople; formed a treaty of alliance with the Ottoman Porte, in conjunction with his brother, then ambaſſador there; and after procuring the liberation of a number of French priſoners, repaired to Egypt. While a Turkiſh army was preparing to ſail for the eaſt, he endeavoured to defer the expedition to Syria by bombarding Alexandria; and when he found that the army was preparing to croſs the deſert, Phellippeaux was ſent to the aſſiſtance of the intimidated pacha. This officer, bred in the ſame academy with Bonaparte, and the companion of his ſtudies and his amuſements, had taken a different ſide in politics. Attached to the monarchy from principle, he had emigrated on the annihilation of the throne, and appeared in arms in favour of his prince, but againſt his country. It was he who, at the riſk of his life,

life, had rescued his friend sir Sidney from bondage, and restored him to his liberty. After accompanying him to the Levant, he had been sent into Syria, and had employed all his talents as an engineer in fortifying Acre, so as to resist the efforts of his school-fellow, now become one of the most renowned captains of his age.

The commodore, who had arrived but two days before the French, on perceiving the works in such a formidable state of defence, contributed, along with Phellippeaux, to soothe the fears and encourage the hopes of the pacha, who, perceiving the enemy victorious every where, had determined to abandon his palace, and carry his women and his treasure with him to a place of safety. But no sooner did he perceive that he was so ably supported, than Djezzar determined to stand a siege, and participate in the glory of stopping the career of the conqueror. Nor was he mistaken either in respect to the industry or the talents of his new allies; for the English squadron, in the course of the next day, discovered, in the neighbourhood of mount Carmel, a corvette and nine sail of gun-boats laden with artillery and ammunition, intended to assist in the reduction of Acre. Seven vessels belonging to this flotilla, containing all the battering train, were captured: and this fortunate incident contributed greatly to save the city, as well as to harass the invaders; for the prizes, being manned with British sailors, were anchored near the town, and employed in impeding the enemy's approaches, while the cannon were mounted on the ramparts, so as to annoy that army for which they were intended to ensure a certain triumph.

In the mean time the French had encamped before Acre, and the generals Dommartin and Cafarelli, after carefully reconnoitring the works, were of opinion, that the front of the saliant angle on the east side was the proper point of attack. It soon became evident, however, notwithstanding the acknowledged talents of the commander in chief and the number of able engineers in the army, that but little pains had been taken to ascertain the nature of the works; for in rushing forward it was discovered, that a ditch of fifteen feet was to be passed, while the counterscarp was almost untouched, and the breach, which was not large, had been effected upwards of six feet above the level of the works. Notwithstanding these obstacles, a body of grenadiers, headed by an officer belonging to the staff, descended into the ditch, and attempted to ascend; but their leader was shot, and it being discovered that the only effect produced by the late explosion was a small opening in the glacis, nothing could be achieved. The garrison was at first seized with terror, and many of the besieged ran towards the harbour; however, it was no sooner discovered that the opening in the wall was several feet above the rubbish, than they returned to the charge, and showered down stones, grenades, and combustibles, upon the assailants, who were obliged to retire, after losing two adjutants-general, and a great number of men. This event afforded so much encouragement to the troops of the pacha, that they sallied forth a few days after, April 5, and killed several of the besiegers, among whom was an officer of rank. Djezzar also dispersed his firmans among the Naplousians, as well as the towns in the Saïd, and sent presents at the same time to Damascus, and even as far as Aleppo, requesting the true believers to rise on purpose to overwhelm the infidels, who were destitute of artillery.

In the mean time, the British squadron was forced by the equinoctial gales to abandon the unsheltered anchorage in the bay of Acre, and the French being emboldened, and the Turks dispirited, by its absence, the assailants pushed on their approaches to the counterscarp, part of which they blew up, and even succeeded in making a lodgement in the north-east angle of the town-wall, whence they proceeded to undermine the tower, on purpose to increase the breach. Notwithstanding colonel Phellippeaux had by this time mounted all the prize-guns, and the besiegers were forced to slacken their fire, yet on the return of the squadron it was deemed proper to make another sally on the 7th, in the course of which the British seamen and marines were to force their way into the mine, while the Turks attacked the trenches to the right and left. But although the noise of the latter prevented the possibility of surprise, an English officer, who was desperately wounded upon this occasion, entered the aperture at the head of a body of pikemen, after which the retreat was effected without much loss, in consequence of the fire from the Theseus; while the Mussulmans, according to their usual barbarous practice, were more active in collecting heads than in annoying the enemy.

But it was not only with Acre that Bonaparte had to contend, for all the neighbouring districts were now in arms; and the Samaritan Arabs pushed their audacity so far, as to make incursions even into his camp. On this he was obliged to dispatch, first the general of brigade Junot, and then Kleber, against the enemy, whom he was determined to drive across the Jordan. He accordingly reinforced the former detachment by means of a thousand infantry and a regiment of cavalry under Murat, and soon after set out himself to assume the command. Having repaired through Fouli, along the passes of the mountains, he at length (April 16) perceived Kleber's division, consisting of two thousand Frenchmen, fighting with, and nearly encircled by, upwards of twenty thousand horse. On this he immediately formed his infantry and cavalry into three squares, with a design to annoy the assailants, cut off their retreat towards Jenny, where their magazines were established, and drive them before him in the direction of the river, on the banks of which they would be overwhelmed by Murat. He accordingly detached the adjutant-general Leturq with the cavalry and two pieces of cannon against the Mameluke camp, which he descried at some distance, while general Rampon was ordered to take the enemy in flank, and general Vial to intercept them in their flight. No sooner did Kleber receive intimation by the discharge of a twelve-pounder that he was about to be succoured, than he immediately attacked and carried the village of Fouli with the bayonet; after this he charged the cavalry, which had been already thrown into confusion by the French horse under Rampon, and obliged them, after experiencing much loss, to retire behind mount Tabor. While Bonaparte was burning the Naplousian villages, and killing such of the inhabitants as had appeared in arms against him, general Murat chased the Turks from Jacob's Bridge, and surprised the son of the governor of Damascus; Leturq at the same time seized on the camp of the mamalukes, and brought away five hundred camels, with all their provisions; so that the barbarians, unacquainted with the nature of combined movements, were astonished to find themselves beaten at the same moment along a line of twenty-seven miles by an inferior body of the enemy.

On his return to the army before Acre, the commander in chief pushed on the siege, and at length beheld the completion of the mine destined to destroy the tower, which had so long withstood all his efforts; but, on setting fire to it, the operation was found to be incomplete. Although one of the angles of the wall was carried away, the breach proved to be as impracticable as before; notwithstanding the repeated efforts of the besiegers, a lodgement could not be effected, and some of their best officers were either killed or wounded upon this occasion. The garrison, invigorated by the presence of the English, and defended by the skill of Phellippeaux, who unfortunately perished soon after, had by this time erected cavaliers, and constructed two places of arms, together with batteries, so contrived as to flank the tower, and produce all the advantages arising from a cross fire; a counter-attack was also attempted under ground, on purpose to drive the besiegers from their galleries. At length rear-admiral Pérée having reached Jaffa, disembarked nine pieces of artillery, consisting of twenty-four and eighteen pounders; these having been mounted, were

immediately employed to batter in breach, after which a fourth attempt was made to enter by aſſault; but by this time the Theſeus was moored on one ſide and the Tigre on the other, ſo as to flank the town walls, while two advanced ravelins, occupied by their marines, precluded the advance of the aſſailants, by pouring in ſuch a tremendous fire as to render their deſperate valour unavailing.

Bonaparte now gave orders to change the plan of operations, and effect a new breach in the eaſtern curtain, by means of a ſap and a mine, which was to blow up the counterſcarp; but the enemy not only diſcovered his intentions, but, by making approaches under ground, entered the gallery, deſtroyed the frame-work, and counteracted all the operations. It therefore became neceſſary to direct the attack once more againſt the tower, and a freſh attempt to effect a lodgement in the glacis proved as ineffectual as before. Even gunpowder began to fail, and the troops, hitherto always victorious, began to loſe their confidence and audacity. In the midſt of theſe diſaſters, about forty ſail of Turkiſh veſſels from Rhodes and the neighbouring iſlands, under the command of Haſſan Bey, made their appearance, with a ſupply of proviſions, ammunition, and a reinforcement of ſoldiers. Knowing that the landing of freſh troops would be productive of great diſadvantages to the beſiegers, the French general determined to anticipate that event, by a new and ſtill more deſperate attempt to ſtorm the place. The neceſſary orders were accordingly given, and at ten o'clock at night the two places of arms and the approach to the glacis were carried, and a lodgement completely effected. The generals Bon, Vial, and Rampon, advanced upon this occaſion at the head of their demi-brigades; and ſo great was the number of the ſlain, that the dead ſerved as a cover to the living. A ſupply of gunpowder having arrived at the ſame time from Ghazah, the tower and curtain were battered once more; and the latter having fallen, Bonaparte repaired thither and ordered an aſſault: on which the general of brigade Rambaud, ſupported by general Laſnes, ruſhed forward with the grenadiers, two hundred of whom actually entered the town through the breach. But their progreſs was ſoon arreſted by the fire from the houſes, the barricadoes, and the palace of Djezzar; the ſabre and poniard of the Turks were alſo employed with effect; and ſuch inceſſant diſcharges were poured in upon them in front, flank, and rear, that they were obliged not only to abandon two pieces of cannon and a couple of mortars which they had ſeized, but to withdraw as faſt as poſſible. The conduct of the Engliſh upon this occaſion fully entitled them to the gratitude of their allies. While Djezzar was ſitting in a conſpicuous place, ſurrounded by the mutilated members of the aſſailants, and by turns rewarding ſuch as brought him heads and diſtributing muſket-cartridges, they were buſily employed in preſerving his reſidence and himſelf from deſtruction. One petty officer did great execution with an eighteen-pounder, mounted in the light-houſe caſtle; another ſuperintended a twenty-four-pounder, placed on the north ravelin; and both, by reiterated diſcharges of grape, ſwept away the head of the attacking column, which, like that of the hydra, was renewed only to be cut off again. In the mean time the center was aſſailed by a couple of ſixty-eight-pound carronades, mounted in two gerues near the mole, whence ſhells were thrown with ſuch preciſion, as to annoy the advancing foe, and render a nearer approach fatal. Nor was this all; for ſir Sidney Smith, after haſtening the arrival of the boats, placed himſelf at the head of Haſſan Bey's troops, and ruſhed on with them to the breach; he alſo found means to overcome the moſt ſtubborn maxims of oriental jealouſy, and actually obtained permiſſion to introduce the Chiffilik regiment, diſciplined under ſultan Selim's own eye, into the garden of the ſeraglio, whence they ſallied out and took the aſſailants in flank.

Bonaparte, burning with rage and ſhame, had now placed himſelf on an eminence, called Richard Cœur de Lion's mount, where he was ſeen ſurrounded by his generals, to whom he appeared to indicate by his geſticulations the neceſſity of renewing the attack. Accordingly, a little before ſun-ſet, a maſſive column was deſcried deſcending to the breach, which was now wide enough to admit fifty men abreaſt. On this occaſion a ſtratagem of war, adopted at the inſtance of the pacha, proved eminently ſucceſsful; for a certain number of the enemy having been allowed to approach, they were immediately attacked on their entering Djezzar's garden; and on this occaſion the ſword and dagger of the beſieged appears to have proved more than a match for the ſcrewed bayonet of the aſſailants. It was in vain that general Laſnes attempted to rally the fugitives, for he himſelf was wounded by a muſket-ſhot near the wall; while Rambaud periſhed in the city, of which he vainly imagined that he had obtained poſſeſſion. A few days after this, with a zeal expreſſive of temerity rather than of true courage, the French commander ordered a new aſſault to be given; but the troops ſelected for the occaſion refuſed to mount the fatal breach over the putrid bodies of their unburied countrymen. On hearing this, the grenadiers of the twenty-firſt demi-brigade ſolicited and obtained the honour of ſtorming the place: on advancing for this purpoſe it was diſcovered, however, that the enemy had completed three lines of defence, which it became impoſſible to carry; ſo that after an uſeleſs maſſacre, in the courſe of which general Bon, adjutant-general Fowler, and one of Bonaparte's aides-de-camp, were killed, and ſeveral officers ſeverely wounded, a retreat was beaten, and the diſcomfited volunteers returned to the camp.

In proportion as the troops relaxed in their zeal, and the capture of Acre became dubious, chagrin and deſpair began to be viſible in the face and actions of Bonaparte, who for the firſt time in his life beheld himſelf foiled, and that too by a town ſcarcely defenſible according to the rules of art; while the ſurrounding hills were crowned by a multitude of armed ſpectators, who waited the reſult of the conteſt on purpoſe to declare for the victor. Nor was this all; for the intelligence received from Cairo was far from being conſolatory. Although the capital and the principal cities had remained tranquil, the mamalukes began to give uneaſineſs; and the provinces of Beniſouef, Charkié, and Bahire, had been in a ſtate of inſurrection. A wandering Arabian tribe, from the heart of Africa, had at the ſame time made inroads into Gizeh; the kiaya of Egypt, although elevated by the French to the important ſtation of emir hadjy, or commander of the caravan to Mecca, had declared againſt them; while, to complete the whole, an impoſtor, who gave himſelf out to be the angel El Mahdi, announced in the Koran, had collected a number of followers, and carried ſeveral poſts. The plague, too, had by this time got into the French camp, and ſeven hundred men had already fallen martyrs to that terrible malady: in ſhort, an immediate retreat was now become neceſſary; and Bonaparte, after having beſieged Acre during ſixty days, and ſent notice to Cairo that he would return a conqueror, was forced to evacuate his lines and retire like a fugitive, on the 20th of May.

The laſt moments of his ſtay were dedicated to revenge; for, not content as formerly to direct his artillery againſt the fortifications, he gave orders to deſtroy an aqueduct, bombarded all the principal edifices in the city, and endeavoured to reduce the palace of Djezzar to a heap of ruins. But, on the other hand, Bonaparte, although diſcomfited and overwhelmed with calamities, never appeared greater than upon this critical occaſion. He began by publiſhing a proclamation to his troops, in which he ſtated the exploits performed by them during this ſhort campaign. Having traverſed the deſerts which ſeparate Africa from Aſia with greater rapidity than an Arab tribe, they deſtroyed, he ſaid, on mount Tabor, the army intended for the invaſion of Egypt; while the Turkiſh ſquadron, which ſailed for the defence of the capital of

Djezzar,

Djezzar, had been intended for the ſiege of Alexandria. "After having carried on the war with a handful of men during three months in the heart of Syria, taken forty cannon, fifty ſtand of colours, made ſix thouſand priſoners, and demoliſhed the fortifications of Ghazah, Jaffa, Caiffa, and Acre," adds he, "we are about to return. But a few days more, and you might have ſeized the pacha in the midſt of his palace; however, at this critical ſeaſon the capture of Acre is not worth the time that would have been ſpent before it."

After blowing up the fortifications of Jaffa and Ghazah, and inflicting a terrible vengeance on thoſe who had defended their country againſt the invaders, the French paſſed over the deſert (where it was imagined they would have periſhed), and, inſtead of entering Cairo like a vanquiſhed army, were received as victors by the inhabitants, who, ignorant of recent events, had prepared triumphal arches to celebrate their return. Unabaſhed by his late check, and unintimidated by the ſiniſtrous communications of a ſoldiery who had ſo lately murmured againſt, and even menaced, their chief, Bonaparte diſtributed recompences to ſome, inflicted marks of ignominy on others, and ſo far regained the confidence of all, that in the courſe of a few days they offered to encounter new toils and new dangers in Egypt, under a commander whom they were on the point of ſacrificing to their reſentments in Syria.

Meantime, Seid Muſtapha Pacha aſſembled at Rhodes the Ottoman troops deſtined for the attack of Alexandria; European officers were appointed to direct the details of this enterprize; and the combined Engliſh and Turkiſh fleets failed unoppoſed for the coaſt of Egypt. The movements of the mamalukes and Arabs indicated the projects of the allies, and the approach of their armament. Bonaparte had been called to the aid of general Deſaix in oppoſing Mourad Bey near the pyramids of Gizeh, where he received intelligence from Alexandria, that a Turkiſh fleet of one hundred ſail had anchored in the road of Aboukir, from which the Turks had landed three thouſand men, with artillery, on the ſhore of the peninſula, and carried the fort by ſtorm. All the generals commanding detachments of troops, which were in motion, were now ordered to march towards the place of landing, and to make Rhamanieh the place of rendezvous, where the army ſoon after aſſembled.

Having attacked the French garriſon, and obtained poſſeſſion of Fort Aboukir, the Turks began to entrench themſelves, and to form magazines. Their force, which increaſed daily, was eſtimated at ten thouſand men, and they appeared to be waiting for greater reinforcements, and for the junction of Mourad Bey, in order to inveſt the city of Alexandria. Bonaparte, perceiving that the enemy intended to fortify and maintain themſelves in the peninſula, determined immediately to attack them; and having marched his troops to the wells between Alexandria and Aboukir, and received information reſpecting the poſition of the Turks, he formed his plan of engagement. Muſtapha Pacha defended the entrance of the peninſula by two lines of troops, and by entrenchments, which were ſtill imperfect. The centre of his forces occupied the redoubt, which had been taken from the French at the moment of landing, and ſince converted into an entrenchment. The attack of Bonaparte was deſperate and dreadful. By a ſkilful manœuvre, two thouſand Turks were diſlodged and ſurrounded, and periſhed by the fire of the enemy, or were drowned. After ſuffering various repulſes, the French, ſeizing the moment when the Turkiſh forces ſallied from their entrenchments, attacked the redoubt and carried it. In vain did Muſtapha Pacha endeavour, by every poſſible effort, to rally his troops, which were now forced on every point. The Turks fled on all ſides, and threw themſelves into the ſea; the greater part could not reach the veſſels, which were moored too far off, and they periſhed in the waves; the remainder of the army, with Muſtapha Pacha, was ſurrounded and made priſoners, with the exception only of a few hundred men. The fort of Aboukir, after a bombardment of eight days, again ſurrendered to the French; and the ſon of the pacha, and two thouſand men, threw down their arms, and were made priſoners of war. This victory over the Turks was attended with conſiderable loſs to the French, who had a great number killed and wounded. After this ſanguinary battle, Egypt for a moment became tranquil; the forts and the batteries on the coaſt were well armed and proviſioned; and the mamalukes and beys were in an obvious conſternation. Bonaparte, weighing well this momentary advantage, but foreſeeing the ſpeedy ſubverſion of his plan, left a letter, containing the nomination of Kleber to the chief command in Lower, and of Deſaix to that in Upper Egypt, and ſecretly ſailed for France. In the directions given, however, to general Kleber, he was inſtructed to negociate with the Ottoman court, which Bonaparte had himſelf commenced; and which proves that the commander in chief did not conſider Egypt as tenable, after the deſtruction of his fleet by lord Nelſon, and the abſolute nullity of the French marine.

After various conferences and correſpondence between Kleber and ſir Sidney Smith, at the deſire of the grand ſeignor, it was agreed that the French army ſhould embark with their ſhips, arms, baggage, and effects, and be tranſported to France, as well in its own veſſels, as in others to be furniſhed by the Porte. This treaty was ſigned at El-Ariſch. But the court of London, after the deciſive advantages it had gained, and the freſh levies it had ſent out under ſir Ralph Abercrombie and admiral lord Keith, conſiſting of a well-appointed army of 13,330 effective troops, with a fleet to cover its operations, could not, in compliment to the Ottoman Porte, ſuffer the enemy's ſhips and veſſels to be given up, nor other requiſitions ſubmitted to, which, under ſuch circumſtances, it was unreaſonable for a capitulating army to expect. Theſe reſolutions of the Britiſh court, being forwarded by lord Keith from on-board the Foudroyant to ſir Sidney Smith, were immediately communicated to general Kleber; who feeling indignant at this unexpected turn of affairs, reſolved to fight till the very laſt, for which he prepared his troops by reading to them the new propoſitions of lord Keith, and animadverting on the duplicity of the Turks, who were collected in great force near Heliopolis, for the purpoſe of laying ſiege to Cairo. The French army partook of the indignation of their general; and, without more delay, haſtened to attack the grand vizier, who, expecting peace, was totally unprepared for ſuch an aſſault. Both armies, however, being drawn out in order of battle, a furious and dreadful engagement enſued. The Turks, after long reſiſtance, were ultimately thrown into diſorder, and their whole army, conſiſting of forty thouſand men, as ſtated by the French general Reynier, betook themſelves to flight in all directions; their camp was abandoned; and the rout became general. The Turks had eight thouſand men killed or wounded, whilſt the loſs of the French, whoſe army amounted only to fifteen thouſand, was comparatively ſmall. After the battle, as the French were carleſsly returning into Cairo, elated with the laurels they had juſt acquired, Ibrahim Bey, at the head of three thouſand choſen mamalukes, fell unexpectedly on their rear, and penetrated into the very heart of the city, making great ſlaughter among the French, and expecting to be joined by the diſaffected inhabitants. Here he maintained a long and deſperate conteſt with the victorious Kleber; but at length, overpowered with numbers, he retreated, and rejoined the diſcomfited troops of the grand vizier. Kleber now puniſhed the cruelties which, during his abſence, had been inflicted by the inhabitants on the friends and partizans of the French.

After the battle of Heliopolis, or the Pyramids, the French army ſeemed to be ſurrounded with the moſt brilliant circumſtances. Kleber formed the Greeks and Copts into battalions, whom he trained to the uſe of arms, and

clothed in the uniform of his country. But juſt as the ſuperior abilities of this German commander had thus began to unfold themſelves, he was ſtabbed whilſt walking on his terrace in Cairo, and his blood ſtill marks the railing againſt which he ſtaggered. The aſſaſſination of an officer ſo generally beloved, ſo much reſpected and eſteemed by all parties, enemies as well as friends, appears a myſtery which even time itſelf may never unravel. His body was conveyed to France, with the ſkeleton of the aſſaſſin. This wretched ſlave, Solyman el Aleppi, was impaled alive, and lived in that ſtate for three days. Neither in the cutting off his hand, nor the dreadful operation which humanity and manhood revolt at, did he betray the leaſt fear: his only cry was for water, and occaſionally a bitter curſe againſt thoſe who had perſuaded him into a confeſſion, under the promiſe of a pardon. It has been ſuppoſed that Kleber's aſſaſſination reſulted from the private revenge of ſome of the principal inhabitants, in conſequence of the recent puniſhments he had inflicted.

The chief command of the French army now devolved upon general Menou; who being fully aware of the ſerious attack that was about to be made upon him, adopted every meaſure that prudence and valour could dictate, for the ſafety of his army, and the defence of Egypt. At length the Engliſh fleet appeared making for Aboukir Bay; and on March 2, 1801, it came to anchor exactly where the glorious battle of the Nile was fought in 1798. On the 8th of March, ſir Ralph Abercrombie gave orders for landing the troops, which was effected in flat-bottomed boats, under a ſevere and continued fire from the enemy. The ſoldiers were ordered to ſit down on the bottom, holding their firelocks between their knees. All the boats in the fleet were employed; yet only five thouſand troops could at firſt be landed; and theſe were penned up ſo cloſe as to be unable to move, and expoſed to a galling and deſtructive fire, without the power of returning it, or of taking any meaſures of defence. Numbers of the Engliſh now periſhed, being ſhot in the boats, or bayonetted in the act of ſtepping out; for the enemy lined the water's edge, and diſputed every inch of ground. But a landing could not be effected without ſuch a ſacrifice. The carnage continued for about twenty minutes; when the French finding their exertions ineffectual, they fell back, and retreated along the banks of lake Mahadie, now called the lake of Aboukir. The force that oppoſed conſiſted of about 2500 men, under the command of general Friant, commandant of Alexandria; who loſt upwards of four hundred men in killed, wounded, and taken. The loſs of ſir Ralph Abercrombie was ſix hundred and fifty-two, in killed, wounded, and miſſing; excluſive of thoſe of the navy. The reſidue of the Engliſh army was now landed without moleſtation, and preparations made for offenſive operations. The French, having augmented their force, took a ſtrong poſition at the extremity of an open ſpace, defended by a range of hills, upon which they formed their line; defended by a numerous artillery, and rendered ſtill more formidable by the aid of heavy cannon taken from the works of Alexandria. On the morning of the 13th of March, it was determined to attempt driving the enemy from this ſtrong poſition. As the Engliſh advanced, the French commenced a very deſtructive fire from their artillery, which enfilading the depths of the Britiſh columns, made prodigious havoc. The enemy, taking advantage of this ſucceſs, came down from the heights, and began a cloſe engagement. Their numerous cavalry made a ſpirited and impetuous charge upon the nineteenth regiment, who, with the coolneſs and intrepidity of veterans, received them unbroken on the points of their bayonets. The French were then obliged to retreat, having received a well-directed volley as they wheeled about, which brought numbers to the ground. Their attacks on other parts of the line were attended with no better ſucceſs, being repulſed in every quarter. As the French retreated, the Engliſh ſlowly advanced; and at four o'clock took up the poſition on the heights which the French had occupied in the morning. In this action the Engliſh loſt 1300 men in killed and wounded, and had near 14,000 troops in the field; they took four pieces of cannon, and one howitzer. The French in this affair conſiſted only of between ſix and ſeven thouſand men, commanded by general Lanuſſe, who loſt about ſeven hundred in killed and wounded. Conſidering the advantages poſſeſſed by the French, the victory of this day was highly honourable to the aſſailants, notwithſtanding their ſuperiority of number, and conſequent greater loſs. The French retreated under the works of Alexandria, and loſt no time in fortifying their poſition, and providing againſt a ſiege, which they were convinced was now near at hand. General Menou had not yet arrived from Cairo. He had been obliged to cooperate with the army of Upper Egypt, in an attack upon Mourad Bey, whom Deſaix had now determined finally to conquer, or periſh in the attempt. The French armies had in conſequence ſucceeded in hemming up the mamalukes, and placing Mourad between two fires, whereby his deſtiny became inevitable; yet he made a moſt heroic reſiſtance; ſuch as became a ſuperior politician, and a great general. Finding all was loſt, he offered to capitulate upon terms of amity with the French, provided he might be reinſtated in a part of Upper Egypt. Deſaix, with the generoſity of a true conqueror, met the mamaluke chief on his own terms, admired and praiſed his military prowеſs and ardour, and aſſigned him and his own private mamalukes the diſtrict he ſolicited, under a ſolemn engagement of their becoming friends to the French.

In the mean while ſir Ralph Abercrombie puſhed on the Engliſh army to a choſen poſition nearer Alexandria, and in ſight of the French camp on the heights of Nicopolis. The poſition thus choſen for the Britiſh, croſſed the great road from Alexandria to Aboukir, having their right wing towards the ſea, near what is called the Roman camp, and their left oppoſite the point of the lake Aboukir or Mahadie. This poſition ſir Ralph Abercrombie proceeded to fortify with the utmoſt alacrity. Various and contradictory reports of Menou's movements were circulated; and among others, that he had formed a junction with Lanuſſe, with a reinforcement of eight thouſand men. Very little credit was unfortunately given to this rumour; and ſtill leſs apprehenſion entertained of his attacking the poſition, which was fortified with two redoubts, though not yet finiſhed, for they were ſtill open in the rear, one on the right wing, in front of the old ruins of Kafr Kiaſera, or caſtle of the Cæſars, mounting two twenty-four-pounders; another along the canal on the left, with one twelve-pounder; and ſeveral ſmall flêches, with one or two guns, occaſionally diſpoſed at intervals along the front of the line. Such was the ſtate and poſition of the Engliſh, on the 20th of March. On the 21ſt, at half paſt three in the morning, the troops were getting under arms, when they were alarmed by a ſmart fire of muſquetry proceeding from the fartheſt flêche toward the left wing. This was conceived to be nothing more than a feint; for ſir Ralph Abercrombie was yet ignorant of the junction of all the French forces at Alexandria. However, on the firing continuing for ſome time, with now and then a cannon ſhot, brigadier-general Stuart was actually on his march with his brigade, to ſupport the point attacked, when he was ſtopped by a very heavy fire both of cannon and muſquetry, which haſtily commenced on the right. In this falſe attack on the left, the enemy, rapidly advancing, entered a ſmall flêche at the ſame time with the out centinels. They immediately turned the twelve-pounder, which was mounted in it, upon the Engliſh, and had actually fired one ſhot from it, when a redoubt in the rear of this flêche opening its fire upon them, they quickly retreated, carrying off with them three officers, one ſergeant, and ten rank and file of the fifth brigade. They had one officer and four privates killed in the flêche, but took away their wounded.

The

The French, thinking to have drawn every attention to the left, had haſtily advanced with their whole body, after having driven in the picquets. Their object, as it afterward appeared, was firſt by a ſudden and ſpirited attack to turn and overthrow the reſerve, which by its advanced poſition was ſeparated a little from the reſt of the army. This accompliſhed, their next aim was to force the center with their united troops; and, while the attention of the left was fully occupied by the falſe attack, the whole force of their cavalry, in which they were very ſtrong, was to avail itſelf of a favourable opportunity, and, by an impetuous charge, drive all before them into lake Aboukir, thus at one blow deciding the conteſt. For this purpoſe, general Lanuſſe's diviſion, forming their left wing, advanced boldly againſt the right of the Britiſh line; general Sylly's brigade marched ſtraight upon the redoubt; while another, under general Valentin, proceeded along the ſea-ſide, to penetrate between it and the old ruins. General Sylly's brigade took poſſeſſion of a ſmall redan, in which there was a gun; but ſtaggered by the heavy fire from the redoubt, was obliged to fall back. The brigade moving along the ſea was ſtopped in its progreſs by the fire from the old ruins, which were defended by the twenty-third and fifty-eighth regiments, and the flank companies of the fortieth. Still attempting to force its way between them and the redoubt, the ſixty-ninth French demi-brigade was taken in flank by one of the twenty-four-pounders loaded with grape, and nearly exterminated. On this the remainder of the corps refuſed to advance; when general Lanuſſe, uſing his utmoſt efforts to rally them, and bring them to the charge, had his thigh carried off by a cannon ſhot. Complete confuſion then enſued, and a general diſperſion of this column took place. General Sylly's troops, not being able to clear the ditch of the redoubt, attempted to turn it, but were repulſed with great loſs by the ſpirited oppoſition of the twenty-eighth regiment poſted in it.

While this was paſſing on the right of the line, general Rampont's diviſion made an attack on the center, extending as far towards the left as the ninety-ſecond. It attempted to turn the left of the brigade of guards, which was a little advanced; but was received with ſo warm and ſteady a fire from the third regiment of guards, whoſe left was thrown back, and from the royals, as to be forced, after a ſharp conteſt, to retreat with great loſs. General Deſtin, with his diviſion, penetrated through the hollow, leaving the redoubt on his left, and endeavoured to reach the old ruins. He was there warmly received by the forty-ſecond, and attempted to withdraw his troops; but a battalion of the twenty-firſt demi-brigade having advanced too far, was ſurrounded, and obliged to lay down its arms, and ſurrender to the forty-ſecond and fifty-eighth regiments. Repulſed in every quarter with the ſame obſtinate reſolution, and finding it impoſſible to penetrate through any part of the Britiſh line, the French infantry at length gave way, and diſperſed in all directions behind the ſand-hills.

At this juncture the French general in chief, Menou, foiled in all his attempts, determined to make one laſt deſperate effort at carrying the Engliſh camp. For this purpoſe he ordered the main body of the cavalry, under brigadier-general Roize, to charge; and general Regnier, at the head of the diviſions of Lanuſſe, Rampont, Friant, and the eighty-fifth demi-brigade, to ſupport it. General Roize, convinced at once of the inutility and hazard of the attempt, twice remonſtrated; and it was only at the third peremptory order that he obeyed. Accordingly the third and fourteenth French dragoons, under general Bouſſart, came up with all the impetuous fury of men certain of being ſacrificed, and charged through the forty-ſecond regiment, reaching quite up to the tents. Here, however, they were effectually ſtopped; the horſes, entangled in the cords, were, for the moſt part, killed, and many of the men were obliged to ſeek their ſafety on foot. A circumſtance, too, as fortunate as it was unexpected, contributed alſo very materially to the overthrow of the French cavalry. The ground in the rear of the forty-ſecond was full of holes, between three and four feet deep. Theſe excavations had been made by the twenty-eighth regiment, as conveniencies to ſleep in, previous to the landing of the camp equipage. The enemy's cavalry, charging over theſe, was completely broken and routed. At this juncture the Minorca regiment came to ſupport the forty-ſecond, and drew up in the vacant ſpace between the redoubt and the guards. The ſecond line of French cavalry, compoſed of the fifteenth, eighteenth, and twentieth, dragoons, with general Roize at their head, made another deſperate charge upon theſe regiments. As it would have been impoſſible to withſtand the ſhock, they opened a line with the moſt deliberate compoſure to let them paſs; then, facing about, they poured upon them ſuch volleys, as brought numbers, both of men and horſes, to the ground. The cavalry now endeavoured to force its way back, but this they were unable to effect; and the greater part were killed or wounded in the attempt, general Roize himſelf falling on the ſpot. A flag, called the invincible ſtandard, covered with the military exploits of the corps to which it belonged, fell into the hands of the Minorca or Queen's German regiment. It was taken by a private, named Antony Lutz, for which he received a certificate from the adjutant-general, and the ſum of twenty dollars. This man, never having learned to write or read, was incapable of being made a ſergeant, to which poſt he would otherwiſe have been advanced. In the early part of the action, this ſtandard had been wreſted from the French by the forty-ſecond regiment; it was, however, unfortunately retaken from them, at the moment of the impetuous charge of the enemy's cavalry; which Lutz perceiving, cut his way to the officer who was carrying it off, ſhot him dead, and bore it back in triumph! The French infantry, unable to give any aſſiſtance, retired, after loſing a great number of men. General Beaudot was mortally wounded; and, when the broken remains of the cavalry formed again in the rear of their infantry, not one-fourth of thoſe who had charged could be collected.

It muſt have been at this period that the gallant ſir Ralph Abercrombie received the wound, which deprived Great Britain of that diſtinguiſhed and moſt able commander. It is impoſſible to aſcertain the exact moment, becauſe he never complained, or revealed the circumſtance of his being wounded to any one, till it was perceived by thoſe about him. No entreaty could even then prevail on him to leave the field, till convinced by his own eyes of the enemy's retreat, and of the victory gained by the troops he commanded. The loſs of the Engliſh amounted to 1,464 in killed, wounded, and miſſing; which, though very conſiderable, was ſlight when compared with that of the enemy, which, at a moderate calculation, muſt have amounted to four thouſand men, for no leſs than 1,160 were counted by the provoſt-marſhal left dead upon the field of battle, excluſive of thoſe within the French vedettes, which of courſe he could not reckon, and of which there were certainly many; generals Lanuſſe, Roize, and Beaudot, were killed; and generals Deſtin, Sylly, Eppler, and ſeveral other officers of rank, wounded. In the pocket-book of general Roize were found ſome intereſting papers, which proved that nearly the whole of the French army in Egypt was brought together by forced marches, to ſupport this battle, under a confident expectation of ſharing the ſpoils of the Britiſh camp. The whole force of the Engliſh in the field this memorable day, amounted to no more than 11,739 rank and file, whilſt the concentrated forces of the French amounted to upwards of twenty thouſand, as afterwards appeared by the returns of the capitulations of Cairo and Alexandria. In this engagement the Engliſh took 250 priſoners, two pieces of cannon, and one ſtandard. On the ſide of the Engliſh the commander in chief was mortally

tally wounded, and died in the night of the 28th of March; major-general Moore, brigadier-general Hope, adjutant-general to the army, and brigadiers-general Oakes, Lawſon, and ſir Sidney Smith, were likewiſe wounded.

At one time, during the engagement, the Engliſh were in the greateſt diſtreſs imaginable for want of ammunition; ſeveral guns were left with ſcarcely one round, and many regiments were in a ſimilar ſituation. This circumſtance was owing to the want of means of conveyance. Had it not been for this temporary deficiency, the loſs of the enemy would have been much more conſiderable. General Menou built his chief hopes of ſucceſs upon the ſudden overthrow of the right wing of the Britiſh, and the conſequent conſternation of the army; he therefore preferred making his approach while favoured by the night, that he might arrive cloſe and unperceived, and thus avoid the deſtructive fire of the entrenchments and gun-boats. In fact, the attack was as ſudden, as it was unexpected; and certainly put the Engliſh army under a fair trial of its native ſkill, unſhaken courage, and cool intrepidity. The Turks which had been landed from the capitan pacha's ſhips in the bay of Aboukir, remained in the rear during the whole action. When the danger was over, they paraded in front of the Britiſh lines with their numerous flags flying.

When ſir Ralph Abererombie had ſeen the enemy retreat, he attempted to get on horſeback; but his wound, which was probed and dreſſed in the field by an aſſiſtant ſurgeon of the guards, having become extremely ſtiff and painful, he could not mount, and reluctantly ſuffered himſelf to be placed upon a litter, from which he was removed into a boat, and carried on-board the Foudroyant. Here lord Keith received him with all poſſible affection, and every care and attention, which his ſtate required, were early paid him: but it was his enviable lot to die on the bed of honour. The command of the army in conſequence devolved upon major-general Hutchinſon. This able commander, aware of the advantages which muſt accrue from the poſſeſſion of Roſetta, as it would open the Nile, and enſure ſupplies, determined to make himſelf maſter of the place. To carry on the active operations of the army on the Roſetta ſide, it became neceſſary to ſecure the old poſition, as a means of acting on the defenſive, againſt any future attack. For this nothing could be of greater utility, than letting the waters of lake Mahadie or Aboukir, into the ancient bed of the Mareotis; as the left wing would thus be rendered more ſecure, ſince to turn it would become impracticable; and at the ſame time the gun-boats would be enabled to get in and annoy the enemy. The ſite of lake Mareotis had been accurately ſurveyed, and its level found to be nearly ten feet lower than that of Aboukir. It was therefore obvious, that by cutting through the canal of Alexandra, which was the only ſeparation between the two lakes, the water would flow in very copiouſly. Accordingly on the 12th of April, a numerous working party began to cut through the canal; and, on the 13th, the water ruſhed in with impetuoſity through ſeven channels made for the purpoſe, to the great joy of the whole army. The violence of the water, flowing in through the cuts in the canal, was ſo great, as not only to deſtroy every thing in its way, but to unite four cuts of the ſeven. By this the gap was rendered too wide to admit a bridge, and the communication was ſupported by means of boats ſtationed near the opening. This gave wonderful effect to the operations, and, on the 14th, the Britiſh troops entered the town of Roſetta without oppoſition. The French garriſon, compoſed of two battalions, abandoned it, and retreated acroſs the Nile to Fouah.

Rear-admiral ſir John Borlaſe Warren, with ſeven ſail of the line, joined lord Keith on the 22d, off Alexandria, after having chaſed the French ſquadron under Gantheaume, of which he loſt ſight in a fog. The fleet now conſiſted of eighteen ſhips of the line, including three Turkiſh men of war under the Capitan Bey, who landed 5000 troops; and 15,000 more were marching through the deſert from Jaffa, under the immediate command of the grand vizier, to join and co-operate with the Britiſh army.

Major-general Coote was left in command of the troops in the poſition before Alexandria, while general Hutchinſon proceeded with a detachment of the army in purſuit of general Lagrange, who had taken a ſtrong poſition at Elaſt, near El Hamed. On the 3d of May, ſir Sidney Smith arrived in camp from Roſetta. An Arab courier alſo arrived the ſame day with diſpatches from Oſman Bey Tambourgi, announcing the death of the celebrated Mourad Bey. This chief was on his way to join the Engliſh army, when the plague untimely cut him off. He was of an open, ſincere, and generous, character. When compelled to make peace with the French, he avowed that his only reaſon for it was his inability longer to continue the war. In his previous correſpondence he had aſſured the Engliſh general, that if his army ſhould advance towards Cairo, he would join him, but obſerved, that he dare not make a deciſive movement previouſly; and in a letter to ſir Sidney Smith, he wrote, "How can I be attached to the French? Have they not deprived me of my ſovereignty, my honour, and revenue? but it is on the Engliſh faith alone I muſt depend. The Turks have no right to my confidence." Alluding to the hoſtility of the Turks againſt him, and the unnatural inveteracy of people profeſſing the ſame faith, he beautifully expreſſes himſelf, "Melancholy is it to reflect, that the arrow which has ſtuck in the eagle's wing, was an arrow made of an eagle's feather." He was ſeized with the plague, whilſt gradually deſcending the Nile, on the 22d of April, 1801. Twice in the former part of his life he had been cured of this malady, but his conſtitution was latterly impaired by his anxieties. The mamalukes that year had ſuffered ſeverely from the plague; for in Upper Egypt it had raged ſo violently, as to deſtroy ſixty thouſand people, and forty thouſand in Cairo were attacked with it. On his death-bed Mourad charged Oſman Bey Tambourgi, whom he had recommended to Ibrahim Bey as his ſucceſſor, to attach himſelf to the Engliſh. The beys and mamalukes all ſincerely regretted the death of this extraordinary perſonage; and when they buried him at Saouague, near Tahta, they paid the compliment to his valour of breaking his ſabre into his grave, as an expreſſion that none of them was worthy after him to wear his arms. Mourad Bey had fought for his independence as long as there was a proſpect of ſucceſs; but, deſerted by his allies, and preſſed by general Deſaix, he had no other alternative than to be driven from the whole of his government, or compromiſe for a part; and he judiciouſly choſe the moment to treat, when his means ſtill made his alliance deſirable to the French; but he never was, in heart, reconciled to them: his religion and pride forbad the friendſhip, independent of other motives. The following anecdote is related, as the cauſe of his laſt perſonal inveteracy againſt them. Some French officers of rank aſſembled at the houſe of the wife of Mourad Bey, who was the widow of the great Ali Bey, and who entertained them with all the hoſpitality ſhe could poſſibly manifeſt. When they retired, ſhe preſented the young Beauharnois with a ring of conſiderable value. A few days afterwards a contribution was laid on her property, of far greater extent than her proportion had previouſly been fixed at, and much beyond her means to pay. On complaint being made, ſhe received for anſwer, "that as it was underſtood ſhe ſtill poſſeſſed very coſtly ornaments, no mitigation could be pleaded." This exaction appeared to be founded on the preſent ſhe had ſo generouſly, but, as it proved, imprudently, given to the relative of Bonaparte, with the motive of ſhewing honour to that general. As ſuch it was conſidered as the groſſeſt breach of faith and hoſpitality, nor could Mourad Bey ever ſpeak of the tranſaction without the bitterest expreſſions of indignation.

Denon,

Denon, who made the campaign of Upper Egypt with general Deſaix, has given the following portrait of this celebrated mamaluke chief: "Calm amidſt all his misfortunes, this Egyptian Fabius, knowing well how to unite a patient courage with all the reſources of active policy, had calculated his means, and knew how to appreciate juſtly their effects, amidſt the various occurrences of a diſaſterous war. Although he had to oppoſe at the ſame time a foreign enemy, and all the rival pretenſions of his jealous equals, he continued to preſerve a firm authority over his party, by taking his full ſhare of the privations brought upon them by their rapid marches, and their defeats: he was become their only rallying point, the ruler of their deſtiny, and of all their movements; and commanded them as abſolutely as in the times of his greateſt proſperity. By long experience he had learnt the great art of accommodating himſelf to the times; nor did he chooſe by a vain bravado to put all to hazard: he knew that the weaker party ought to make this uſe of their misfortune, and fight only with the ſcythe of time; and when no longer able to command events, that true ſkill conſiſts in ſo far yielding to them, as hence to derive the means of carrying on a more active oppoſition. By this fertility in reſources Mourad Bey ſhewed himſelf an adverſary worthy of Deſaix: nor can it be decided whether the ingenious and reiterated attacks of the one, or the circumſpect reſiſtance of the other, are the moſt to be admired."

On the approach of the detachment of the army under major-general Hutchinſon to Elaft, general Lagrange retired toward Rahmanieh with his corps, conſiſting of nearly 4500 men, 900 of which were the flower of the French cavalry.

The inundation of the Mareotis having nearly reached its proper level, and the force of the current at the cut being much diminiſhed, major-general Coote, anxious both to ſecure his own poſition, and to annoy that of the enemy, got ſix gun-boats into this new lake. Alexandria was thus cut off from all communication with the interior, except through the deſert on the weſt.

On the 9th, major-general Hutchinſon moved forward from Elaft toward the enemy, who were poſted near the fort of Rahmanieh, behind the canal of Alexandria, which ran entirely along their front. Their cavalry was on the right, near the Nile, and their left was covered by a low fort mounting four guns. A detachment under colonel Stewart marched at five in the morning to attack the French at Deſſoug, while the main army was to attack them at Rahmanieh. A ſkirmiſh enſued, which ending greatly in favour of the Engliſh, Lagrange quitted the place, and retreated with all poſſible expedition toward Cairo. One hundred men, who were left in the fort of Rahmanieh, together with a number of ſick and invalids, ſurrendered the next day. A convoy of ſeventy germes, with proviſion, ammunition, and clothing, for the French troops, and about five thouſand pounds in money, alſo fell into the hands of the Engliſh. This convoy had come down the Nile from Cairo, paſſed through the canal of Menouf, and was proceeding to Rahmanieh, ignorant of the capture of the place. A ſmall detachment of French cavalry, conſiſting of three officers and forty men, going from Alexandria to Rahmanieh, were likewiſe made priſoners by a party of dragoons. They were going from Alexandria to Cairo, as an eſcort to one of general Beliard's aides-de-camp, charged with diſpatches from Menou. This party had ſlept at Demanhour the night before, and knew nothing of the capture of Rahmanieh.

On the 17th, an Arab arrived in general Hutchinſon's camp at Algam, with the intelligence, that a body of the enemy were moving on his right through the deſert, with the ſuppoſed intention of puſhing from Alexandria to join Lagrange, who had reached Cairo. In conſequence of this information, major-general Hutchinſon ordered brigadier-general Doyle to follow them into the deſert with the cavalry, and his own brigade; and major-general Cradock was directed to be prepared to give his ſupport in caſe of neceſſity. At one o'clock, brigadier-general Doyle, with the cavalry, not 250 in number, came up with the enemy, after a purſuit of ten miles through the heavy ſands; and the whole convoy, after ſome demur, ſurrendered without reſiſtance. This corps, which had been ſent to collect proviſion and forage in the province of Bahireh, conſiſted of two hundred of the French dromedary corps, ſixty-nine artillery men, 330 infantry, with one piece of cannon, and a ſtand of colours, and eſcorted a train of 460 camels. It left Alexandria on the 13th of May; but, finding moſt of the villages abandoned, and deſtitute of proviſion, the chief of brigade, Cavalier, determined to puſh for Cairo; not ſuſpecting that general Hutchinſon had yet left Rahmanieh, and was on his way for that place, when he perceived the Engliſh flotilla upon the Nile. Cavalier then attempted to penetrate into the deſert, where he was ſoon overtaken by general Doyle. The regiment of dromedaries had been a very uſeful corps to the French. It was compoſed of picked men, choſen from the whole army, who, mounted upon theſe ſwift animals, were employed in purſuing the Arabs through the deſert, and overtaking them where it would have been impoſſible for any other troops. Tribes of Arabs retiring into the deepeſt parts of the deſert, where they thought themſelves ſecure, were ſoon diſperſed by them, and their numerous flocks of ſheep, ſometimes as many as two or three thouſand, became the property of the captors, among whom the value was afterwards divided. By theſe means, ſeveral individuals of this corps had accumulated to the amount of forty or fifty thouſand livres, (ſixteen or twenty hundred guineas,) with which they were anxious to return to France. When attacked by a ſuperior force of Arabs, the men uſually diſmounted from their dromedaries, and making them lie down, placed themſelves behind them, the animal thus ſerving as a parapet to his rider, over which he fired in ſecurity. Since the period of general Hutchinſon's departure from before Alexandria, nearly one thouſand of the enemy had fallen into his hands, with the loſs only of four men killed, and eighteen wounded.

On the 19th of May a Turkiſh officer arrived at Algam, with the agreeable intelligence of a victory gained by the grand vizier over the French at El-Hanka, a village about ſix miles from Cairo. The Turkiſh chief had marched from Jaffa on the 25th of February, where the plague had carried off ſeveral thouſand of his troops. At Yabna he was reinforced by five hundred of Djezzar Pacha's troops, well armed and appointed, ſent as a proof of the Pacha's ſincerity and attachment to the Porte. After unavoidable delays attendant upon ſo ill-organized an army, the vizier advanced on the 12th of March, and on the 15th reached Gaza. On the 22d, Tahir Pacha, with a choſen corps of three thouſand cavalry, proceeded to El-Ariſh; and, on the 28th, the vizier moved forward for that place with his army, where he arrived on the 30th. On the 2d of April, the diviſion under Tahir Pacha, accompanied by captain Leake of the royal artillery, left El-Ariſh, and advanced toward Katieh and Tinieh. On the 5th he was followed by the ſecond diviſion, commanded by Mohammed Pacha, which was accompanied by captain Lacy of the engineers. The grand vizier, with the remaining part of his army, and the military miſſion under lieutenant-colonel Holloway, moved forward on the 19th; and, after a very arduous and haraſſing march of four days acroſs ſeventy miles of deſert, ill ſupplied with proviſions, water, and the neceſſary means of conveyance, arrived at Katieh. The road was ſtrewed with the dead bodies of men and cattle, and the average heat was from 105 to 112 degrees in the tents.

On the 8th of May the Turkiſh army reached Belbeis, where the grand vizier began to form magazines, of which he was in the utmoſt want, to put his diſorganized army into ſome kind of order; and to increaſe it with

Bedouine Arabs, mamalukes, and inhabitants of the country, allured to his ſtandard by the hope of plunder. In this poſition he entrenched himſelf, and avowed his fixed determination of waiting for the French under general Beliard, who, it was ſuppoſed, would march out of Cairo, to force him back into the deſert, before the arrival of the Britiſh forces to ſupport him. On the 30th, the vizier boldly ſent major Hope of the Britiſh artillery to ſummon the town of Cairo to ſurrender, previous to which ſome mamalukes and Turkiſh cavalry, forming his advanced patroles, had been ſlightly engaged in a ſkirmiſh with a party of French dragoons, near the village of Menayer.

General Beliard had been reinforced ſucceſſively at Cairo by general Donzelot from Upper Egypt, the garriſons of Salahieh, Belbeis, and Birket-el-Hadge, and general Lagrange's diviſion, which joined him on the 12th of May. Theſe troops, united with his own garriſon, made a body of upwards of eight thouſand men, excluſive of Greeks and Copts. With this force general Beliard determined to proceed to Belbeis, there to attack the grand vizier, and drive him back to Salahieh, before general Hutchinſon ſhould approach nearer Cairo. For this purpoſe he marched out on the 15th, with four thouſand infantry, one thouſand cavalry, and near thirty pieces of cannon. At night he halted at El-Menayer, after having repulſed the advanced patroles of the Turks. The grand vizier, informed of his approach, and wiſhing to anticipate his attack, ſent the Tahir Pacha, with about two thouſand cavalry, and a few pieces of cannon, to obſerve the enemy's motions. Before daybreak the Tahir Pacha's troops came up with the French advanced guard in a wood of date-trees. Both parties halted, and remained on their arms till daylight, when the Turks kept the French at bay till the main body of the vizier's army came up. A ſharp firing then enſued, the Turks firmly maintained their ground, and after an action, which laſted near eight hours, and during which the Ottoman cavalry greatly annoyed the French, general Beliard thought proper to retreat, but was not purſued. Such was the battle of El-Hanka, in which the loſs of the French did not amount to more than fifty killed and left on the ground; with perhaps two or three hundred wounded. That of the Turks muſt have been more conſiderable, on account of the great ſuperiority of the enemy in artillery. This victory, trifling as it may appear, was of great conſequence to future proſpects; it was the firſt the Turks had gained over the French; and it happened to be on the very ſpot where the ſame grand vizier had been defeated by general Kleber, in conſequence of reſcinding the treaty of El-Ariſh. On the 20th of May, the vizier's army was reinforced by the thirtieth and eighty-ninth regiments, and detachments of cavalry and artillery.

On the 21ſt of May, major-general Coote eſtabliſhed a poſt of two hundred infantry, twenty cavalry, and two field pieces, upon the canal of Alexandria, near Bedah. The brigade of guards furniſhed the detachment, which was commanded by colonel Turner of the third regiment The object of this poſt was to maintain an uninterrupted communication with Rahmanieh, Demanhour, and the interior of the country. By theſe means the camp-market was extremely well ſupplied; and the operations went on proſperouſly before Alexandria.

On the 24th, major-general Hutchinſon, with the capitan pacha, proceeded to wait on the grand vizier. At the diſtance of about five miles from Birchamps, he paſſed the Nile on a bridge of pontoons, thrown acroſs for the purpoſe of eſtabliſhing an eaſy communication between the two armies. Five miles further north brought him to the advanced Turkiſh camp, commanded by Tahir Pacha, who ſo gallantly oppoſed the French in the wood of date-trees at the battle of El-Hanka. They proceeded in a long proceſſion to the vizier's tent. Here, in the midſt of oriental magnificence, and ſeated upon the moſt beautiful embroidered cuſhions, they found his highneſs. Around him were all the principal commanders of his army. The venerable mamaluke chief, Ibrahim Bey, the Reis Effendi, Mahomet Pacha of Jeruſalem, Tahir Pacha, and the Beer Bachis, were preſent. Chairs were provided for the Engliſh officers, who alone were permitted to ſit in the preſence of the grand vizier. After the uſual routine of civility and ſalutations, coffee, ſweetmeats, the never-omitted pipes, &c. the general took his leave, and retired to a very ſuperb tent provided for him; and a guard of honour, compoſed of janiſſaries, and one of the vizier's chief men, were ſtationed about his perſon. This was followed by a grand dinner, in the Turkiſh ſtile, at which the principal characters of the Ottoman empire were aſſembled. The vizier, about ſixty-ſix years of age, had the misfortune to loſe an eye, but has retained his ſituation ever ſince the year 1799, notwithſtanding the unfortunate battle of Heliopolis. The capitan Pacha diſplayed high military qualifications, which obtained him great renown in this campaign. The Reis Effendi, or principal ſecretary of the Turkiſh empire, is well known in England, where he was ſecretary to the Turkiſh embaſſy. His knowledge of European manners and politeneſs procured him the greateſt advantages in the intercourſe with the Engliſh army. The reaſon of the chief officers of the Ottoman empire, civil as well as military, accompanying the army, is, that the Porte, or court, is always ſuppoſed to be with it; and all orders of the ſultan are deemed to be iſſued by him from his ſtirrup. Such was the caſe in former wars, when the high-ſpirited ſultans commanded their armies in perſon.

On the 25th of May, major-general Hutchinſon attended a meeting of the divan, or council, in the vizier's tent; and, on June the 1ſt, Oſman Bey Tambourgi arrived with his mamalukes, and joined the main army. They appeared to be about twelve hundred in number; every individual ſuperbly mounted, and richly dreſſed. But the magnificence of the beys, and kiachefs or officers, was beyond any thing that can be conceived. They were lodged in ſpacious tents, divided in ſeveral apartments, the inſides lined with rich ſtuffs, and the floors covered with beautiful Turkey carpets.

On the 6th of June, a French veſſel, mounting ten guns, having on-board general Damas, and the chief of ordnance Daure, was brought into Aboukir bay. In the night of the 3d of May, generals Reynier and Damas, the chef Daure, with ſeveral other officers of rank, had been ſeized by force in their houſes at Alexandria, and conducted on-board two veſſels in the harbour. They ſailed on the 19th of that month; general Reynier, in the faſt ſailing brig Lodi, eluded the vigilance of the Engliſh cruizers; but the Good Union, having on-board the other officers above-named, was taken near Candia. What might have been general Menou's reaſon for this violent meaſure was not known, but it was ſuppoſed to have originated in a diſunion between him and thoſe officers, in conſequence of ſome circumſtances which took place in the battle of the 21ſt of March. The French ſquadron under Gantheaume, conſiſting of four ſail of the line, one frigate, one corvette, and five tranſports, had been off the coaſt for ſome days. The men of war had between three and four thouſand troops on-board, all very ſickly. This fleet had anchored, by miſtake, in Lacuſte bay, greatly to the weſtward of Alexandria; but Gantheaume, fearing the approach of lord Keith's fleet, which was in ſearch of him, cut his cables, and again ſtood off to ſea. The five tranſports were taken on the 7th, and brought into Aboukir bay. They had no troops on-board, but artiſts of all kinds, beſides floriſts, gardeners, ſeedſmen, &c. in a word, quite a ſmall colony. There was alſo a company of comedians for the Cairo theatre. The tranſports ſaid they had parted with the fleet at the diſtance of near eighty leagues from Alexandria, and came under convoy of the corvette l'Heliopolis. This ſhip ſucceeded in getting into the harbour of Alexandria.

andria. She carried no troops, but brought a ſupply of arms and ammunition, and the intelligence of an intended reinforcement in Gantheaume's ſquadron. Rear-admiral ſir Richard Bickerton, with three ſail of the line, beſide one Turkiſh man of war, went in purſuit of Gantheaume, while lord Keith, with the remainder of the fleet, erniized off the port of Alexandria.

Major-general Hutchinſon having now determined upon the ſiege of Cairo, in conjunction with the grand vizier, he marched his army to the ſouthward of the point of the Delta, and took up his ground near the village of Burtos on the 8th of June. In this poſition the whole force deſtined to act againſt Cairo was conſolidated. A free and eaſy communication was eſtabliſhed with the grand vizier's army, encamped at Charlahan, on the oppoſite bank of the Nile, by a bridge of pontoons. The Capitan Pacha's troops were in front of the Britiſh, and the mamalukes, under Oſman Bey Tambourgi, were in their rear. On the 10th, two hundred men of the eighty-ſixth regiment, under the command of colonel Lloyd, joined colonel Stewart's corps, which was attached to the vizier's army. Theſe men were the forerunners of a long-expected reinforcement from India. Lieutenant-colonel Lloyd had commenced his march from Suez on the 7th of June, having received orders from general Hutchinſon to that effect. On the 14th, major-general Hutchinſon moved about three miles in front to the village of Saael; and on the 16th advanced with his army to a poſition juſt out of reach of the ſhot of the enemy's works. The ſame day he was joined by the twenty-eighth and forty-ſecond regiments, who had marched from the camp before Alexandria in twelve days. The grand vizier alſo moved forward on the right bank of the Nile, to a parallel poſition, a little below the village of Demanhour. General Hutchinſon made another movement on the 21ſt, and inveſted the town of Gizeh, oppoſite to Grand Cairo. The vizier, following his motions, encamped cloſe to the enemy's advanced works on the other ſide of the river. Some ſlight ſkirmiſhing took place in the evening on both banks of the Nile, wherein the mamalukes greatly diſtinguiſhed themſelves. On the 22d of June, general Beliard, who commanded the French troops at Cairo, finding himſelf ſurrounded on all ſides, his communication with the interior part of the country entirely cut off, and without hopes of relief, ſent a flag of truce to general Hutchinſon, requeſting that he would agree to a conference between a French and an Engliſh officer, to treat for the evacuation of Cairo, and its dependencies. To this requeſt general Hutchinſon aſſented.

The conference continued till the 28th, when a convention was ſigned for the ſurrender of Cairo. By this convention the French were allowed ſeventeen days for the final evacuation of Cairo, and its dependencies. They were then to march down to Roſetta, with their arms, baggage, field artillery, &c. to be there embarked as ſoon as poſſible, but at the lateſt in fifty days from the ratification, on-board veſſels, to be furniſhed at the entire expence of the allied powers for ſending them to ſome French port. On the evening of the 28th, the combined powers took poſſeſſion of Gizeh and Cairo, where the Britiſh and Turkiſh colours were conjointly hoiſted. The French army which ſurrendered, amounted to 10,856 fighting men.

The ſiege of Alexandria next occupied the mind of general Hutchinſon, who very ſoon gave the neceſſary orders to the allied army to march on that ſervice. Rear-admiral ſir Richard Bickerton had returned on the 13th of June, and joined the fleet off Alexandria, without having ſeen or heard any thing of Gantheaume's ſquadron: it was ſuppoſed, therefore, to have gone back to Toulon. About this time the Monmouth man of war, with the Leda and Active frigates, arrived in Aboukir bay from England, with reinforcements of men and money; alſo a convoy of troops arrived from Malta, who had volunteered their ſervices for Egypt. On the 16th of July, diſpatches likewiſe arrived for general Hutchinſon, from major-general Baird, commander of the Indian troops, with the long-expected intelligence of his having reached Keneh on the Nile, (which the French had lately made their capital in Upper Egypt,) with a part of his army. The project of tranſporting a formidable body of troops from India to Egypt, through the Red Sea, was well conceived; and, in caſe of a more ſerious reſiſtance on the part of the enemy, would have proved extremely beneficial. We have mentioned the arrival of a ſmall portion of that force at Suez, under lieutenant-colonel Lloyd of the eighty-ſixth regiment. This corps had ſailed with rear-admiral Blanket to Suez, at an earlier period, from the coaſt of Malabar. The army from India, under the command of major-general Baird, did not all come from the ſame part, every preſidency furniſhing a certain quota; and had the whole of the intended force arrived in Egypt, it would have amounted to nearly ten thouſand men. This army was landed at Coſſir, and marched acroſs the deſert to Keneh, the former track of the French; and from the exceſſive heat, Mr. Dudley Rider, paymaſter-general, periſhed in the deſert, as did many of the troops. This army did not join until after the ſurrender of Alexandria.

On the 12th of Auguſt, orders were given for the inveſture of that city. The diviſion of troops to be employed on the weſt of Alexandria, was to be under the command of major-general Coote. The flotilla of gun-boats, conſiſting of twenty-four, ſailed up the inundation on the morning of the 13th, and anchored in a line abreaſt of that of the French. This poſition rendered the enemy's boats uſeleſs, and gave the Engliſh the entire command of the inundation. The reſerve under major-general Moore marched into the camp before Alexandria on the ſame day; but no regular plan of encampment was to take place, till major-general Coote's corps had gained their ſtation to the weſtward. The whole French line was under arms, and very vigilant, during the night of the 13th, as, from the ſailing of the gun-boats, arrival of troops, and other movements, general Menou was apprehenſive of an attack. When the troops had taken their ſtation to the weſtward of Alexandria, general Hutchinſon ordered an attack to be made along the whole of the enemy's front to the eaſtward of the town. This movement took place about four in the morning, and was intended not only to gain ground, but as a diverſion in favour of major-general Coote. The attack of a green hill, a little advanced on the right of the enemy's poſition, was confided to major-general Cradock; and the brigade under general Doyle was deſtined to carry it into execution. The thirtieth regiment was to march up to a ſmall redoubt on the right, and the fiftieth to another on the left; the ninety-ſecond remaining in a central poſition in the rear, to ſupport either, if neceſſary. The two battalions of the twentieth were alſo placed in ſuch a manner, as to be in readineſs to move up to any point required. On the left of the enemy there was a ſmall hill of ſand, called the Sugarloaf-hill; of this major-general Moore took poſſeſſion with very little reſiſtance; and thence he was enabled to reconnoitre the enemy's works. This poſition, however, it was not poſſible to retain, as it lay completely expoſed to the enemy's croſs fires, and from its ſize afforded little or no ſhelter. During theſe movements the French kept up a very warm and ſevere cannonade from their works. The manner in which their guns croſſed each other in every direction was truly wonderful, and gave an ample idea of the ſtrength and judicious plan of their extenſive lines.

Colonel Spencer, of the fortieth regiment, had volunteered his ſervices, and was actively employed with part of general Doyle's brigade. At five in the evening of the 18th, major-general Coote moved forward about two miles, without any other oppoſition than a few ſhots exchanged between his advanced guard and the enemy. He then took up his poſition in the following manner:

the guards extending acroſs the quarries in two lines, with their right to the inundation; and majors-general Ludlow and Finch's brigades, both formed fronting the ſea. At day-break on the 19th, major-general Coote opened a battery of two twelve-pounders, and two eight-inch howitzers, againſt the fort of Marabout. The Turks, under the Capitan Pacha, had formed a junction with general Hutchinſon, and encamped near the depôt on the 20th. On the 22d, major-general Coote determined immediately to move forward to attack the enemy, and take as advanced a poſition near the town of Alexandria, as prudence and ſecurity would permit. Accordingly, at break of day, all the troops were under arms, with the addition of 150 of the Lowenſtein riflemen, who had landed late at night from the eaſtward. The troops advanced at half after ſix, and the ſhips of war in the harbour, and the numerous gun-boats on the inundation, under captain Stevenſon of the royal navy, got under way at the ſame moment. The troops marched to meet the enemy, who was very ſtrongly poſted on a ridge of high rocky hills, having his right ſecured by the ſea, and by two heavy guns; and his left by the inundation, and two batteries containing three more guns of the ſame calibre. Beſide theſe, numerous pieces of flying artillery were placed in the intervals of his line. The Engliſh moved through the ground in three columns; the guards forming two upon the right, under major-general lord Cavan, near the inundation; and major-general Ludlow's brigade forming the third, upon the left, cloſe to the ſea, having the firſt battalion of the twenty-ſeventh regiment in advance. Major-general Finch's brigade compoſed a reſerve, and was deſtined to give ſupport wherever it might be required. In this manner the troops continued to move with the greateſt coolneſs and regularity, under a heavy fire of muſketry and cannon. As the Engliſh advanced, the French retreated; till cloſe under the works of the town. Here was a general halt, and the enemy gave no further diſturbance during the remainder of the day. The loſs of the Engliſh was trifling, when compared to the advantages gained. The loſs of the French, from the conſtant fire of the ſhips and gun-boats on both their flanks, added to that of the advancing troops, was evidently very conſiderable.

Information having been received that general Menou was preparing to attack major-general Coote in force, before the troops ordered to join him could arrive, the commander in chief directed a diverſion to be made in general Coote's favour along the eaſtern front of the enemy's line. Accordingly, at four in the morning of the 23d, the troops appeared in the plain at day-break; while the Turks, on the right, advanced and took poſſeſſion of the Sugarloaf-hill. The French immediately opened all their guns, by which five or ſix of the Britiſh were killed. Early in the morning colonel Spencer landed to the weſtward, with brigadier-general Blake's brigade, ſupported by a body of mamalukes. General Hutchinſon, with major-general Cradock, and the chief engineer, went round by the inundation to reconnoitre general Coote's, and the various other poſitions, which they highly approved. Ten or twelve ſhips of war, under the command of captain Stephenſon of the Diane, now entered the harbour, and formed in a line a-head, protecting general Coote's left flank. Thus every thing was completely ready for a general aſſault on the city of Alexandria, and every advantageous poſition ſecured, with the interruption only of ſome ſlight ſkirmiſhes, in which a few of the troops had been killed and wounded. The greateſt loſs was Achmed Bey, who was killed in reconnoitring the fort of Marabout.

The enemy was not inſenſible of theſe advantages gained; and at half after four in the evening of the 26th, an aid-de-camp of general Menou preſented himſelf with a letter, requeſting a ceſſation of hoſtilities, to give time for a capitulation. This was granted by general Hutchinſon; and, on the 2d of September, 1801, at twelve o'clock, the Engliſh army took poſſeſſion of the French lines. The Britiſh and Turkiſh flags were immediately hoiſted together, and the whole was conducted with the greateſt preciſion and regularity. The terms granted to the enemy were the ſame as had been extended to the garriſon of Cairo, and the number of effective troops which now ſurrendered, amounted to 10,508. In the harbour of Alexandria was taken one ſhip of ſixty-four guns, three frigates, two ſloops of war, and two hundred ſail of merchantmen.

It is a remarkable circumſtance, that, on the ſurrender of Alexandria, the French frigate la Juſtice fell into our hands; and that the capture of this ſhip completed the total annihilation of the fleet of admiral Brueys. Of the four ſail, which eſcaped under admiral Gantheaume, on the morning of the 2d of Auguſt, the Genereux, Guillaume Tell, and la Diane frigate, had been at different periods captured by the Britiſh cruizers; la Juſtice alone had, till this capitulation, ſurvived the defeat in Aboukir bay.

The following is an official return of the diſpoſal of the French army in Egypt, by the Britiſh forces:

	Military.	*Civil.*
Killed in the different actions, and dead of wounds	3,000	
Priſoners taken in battle, in the different convoys, and the garriſons of the forts	3,500	
The garriſon of Cairo, to which is to be added 500 deſerters, whom nothing could reſtrain from ſelling themſelves to become mamalukes, and excluded 760 auxiliaries embarked	13,672	82
The garriſon of Alexandria, including the marines doing duty, and about 200 auxiliaries	10,508	686
Soldiers dead by the plague and other maladies ſince the landing of the Engliſh	1,500	
Total	32,180	768

Thus ended the European war in Egypt, and thus terminated a campaign, which will for ever reflect the brighteſt glory on the army and navy of Great Britain, whoſe united exertions in ſo ſhort a period, annihilated an uſurpation as dangerous as it was unjuſt and unprecedented, and reſtored the ſovereignty of Egypt to its ancient conſtitution and government. That the policy of Bonaparte had led him to ſeize upon this rich and extenſive domain, with a view to reduce it to the ſtate of a French colony, there can no longer be a doubt; becauſe we have ſeen that a civil eſtabliſhment, with all the ſubordinate characters neceſſary for ſuch a purpoſe, was abſolutely aſſigned. The great object of this policy was not only the acquiſition of a rich territory "flowing with milk and honey," but it had in view a competitorſhip with Great Britain in her Eaſt-Indian commerce, and finally, perhaps, the ſeizure of Hindooſtan.

Weak minds are ſtruck with admiration and aſtoniſhment at the rapid progreſs of the French arms, and the blaze of glory attributed to Bonaparte, in having made a complete conqueſt of the whole territory of Upper and Lower Egypt, in the ſhort compaſs of only fourteen months! But this blaze will ſubſide, and all wonder vaniſh, the moment it is recollected that this vaſt conqueſt was made againſt an almoſt defenceleſs people, who were taken by ſurpriſe, who every where withdrew from the ſavage ſword of a northern depredator, who were worn down by inteſtine broils, and who had neither fortifications, nor troops, nor artillery, to oppoſe to the attacks and inroads of ſuch an unlooked-for enemy. The only ſtand that could be made, was heroically made by the undiſciplined mamalukes; and we have ſeen, that had their exertions been ſupported by an army of infantry verſed in European tactics, and put on an equal footing in point of ordnance, this conqueſt perhaps had never been

been attempted; or if it had, its completion would have been impoſſible. That we might reſt on this concluſion as the abſolute fact, will become evident on reflecting upon the complete reduction of theſe invincible French, who, though abſolute maſters of the country, and fortified up to the chin, were in a ſhort time compelled to ſubmi, and yield up all their conqueſts, to an army of little more than half their number, but as well diſciplined, and as invincible in courage. To prove likewiſe, beyond the power of contradiction, the defenceleſs ſtate of Egypt, and the facility with which this prey might have fallen to the lot of any deſcription of freebooters, we need only repeat, from the elegant and elaborate work of Vivant Denon, the friend and companion of Bonaparte, his deſcription of the eaſy acquiſition of Alexandria, the ſtate of its fortifications, and the panic of its inhabitants, to eſtabliſh the fact: "On the *fourth* day after our landing, (ſays Denon,) the commander in chief gave a ſupper, to which the members of the newly-conſtituted authorities were invited. They ſaw with equal ſurpriſe and admiration the martial elegance of our generals and the aſſemblage of officers, on whoſe countenances beamed health and vigour, glory and hope. They were ſtruck by the noble phyſiognomy of the commander in chief, the expreſſion of which ſeemed to augment his ſtature. The commotions which had taken place in the city on our arrival, had occaſioned the ſhutting up of the coffee-houſes, and other places of public amuſement. The more reſpectable inhabitants, not yet recovered from their aſtoniſhment at the ſudden events which had taken place, kept themſelves within doors; while our ſoldiers, heated by wine and by the climate, inſpired ſo much terror among the tradeſpeople and the lower claſſes, that they ſhut up their ſhops, and hid their females. This fine city, *where we ſaw no one but ourſelves*, appeared dull to us. The ſtate of the forts, baſtions, and fortifications, ſeemed to announce to the army that nothing could impede its progreſs, and that *it had only to march to victory*."

Caught by the flow of words in the declaration of the Firſt Conſul, "that his motive for the conqueſt of Egypt was *the deliverance and regeneration of the eaſtern world*," too many have been led to admire his unbounded philanthropy, and dignity of mind. But in what noble or moral act, are either of theſe to be found? Are we to look into the preſcriptive *right*, which ought to have been the firſt foundation, whereon to ſeek his excluſive claim to the ſovereignty and ſoil of Egypt? Does he found it upon any ancient plea of conqueſt gained by St. Louis, and attached to the throne of thoſe princes, whoſe power he has uſurped in France? or, by turning muſſulman, has he proved the conſanguinity exiſting between his race and that of the great Saladin? But were either or all of theſe points to be admitted, ſtill his ſeizure of Egypt would only be raiſing a modern uſurpation upon the ruins of an ancient one, without eſtabliſhing any better claim to the territory, than one buccaneer would have by driving out another, and thus converting the property of the rightful owner to his own uſe. In perfect uniſon with ſuch a right, has been the philanthropic conduct of Bonaparte. Where ever the affrighted Egyptians would pay the *miri*, or tribute, and raiſe contributions of ſupplies for the army, they were permitted to live; but where they dared to aſſume the common right of man, that of defending his own indefeaſible property, they were, in the words of Denon, "hunted down like wild beaſts inimical to ſociety." The ſame French author alſo recounts, but not without ſentiments of extreme horror, that thouſands of the defenceleſs inhabitants of various towns and villages were from time to time extirpated from the face of the earth, their houſes plundered, and their lands laid waſte! At Beneadi alone, twelve thouſand ſouls periſhed at once by the relentleſs ſwords of this regenerating army, merely becauſe Beneadi was conſidered as a "dangerous volcano, that was inceſſantly threatening them." The iſland of Philoë, at the extremity of Upper Egypt, ſhared a ſimilar fate. The peaceful inhabitants offered their ſupplies, but refuſed admiſſion to the French troops on their iſland, contending that Philoë was an Ethiopian territory, and not under the mamalukes of Egypt. "Theſe obſtinate people (ſays Denon) ſignified to us, that if we were to come there every day for two months ſucceſſively, they would never ſuffer us to land. But as it would have given a bad example to ſuffer them to brave us with ſuch inſolence ſo contiguous to our new eſtabliſhments, we reſolved the next day to make them change their tone. Accordingly the army, early in the morning, excited by the certainty of plunder, croſſed the channel, began the attack under cover of the artillery loaded with grape-ſhot, and quickly made a dreadful havoc among them. Terror and diſmay were ſeen on every ſide; men, women, and children, plunged promiſcuouſly into the river to eſcape by ſwimming, but where moſt of them periſhed: and ſtill preſerving their ferocious character, we ſaw mothers drowning their children whom they could not carry away, and mutilating the girls, to prevent their being enjoyed by the victors. I found one girl ſo brutally cut, as to prevent her from performing the moſt preſſing neceſſity of nature. In a word, the whole iſland was at once depopulated, and the miſerable inhabitants ſuffered by their obſtinacy a moſt ſerious and irreparable loſs, which a long ſucceſſion of years cannot retrieve. Our ſoldiers were now employed in ranſacking the houſes and emptying the ſtores, which afforded a ſeaſonable ſupply to the troops." Yet Denon has theſe ſingular exclamations: "O man! from what ſource do you draw your virtues, if ſuch ignoble paſſions lurk in the moſt honourable of all profeſſions, that of WARFARE! O war! thou art brilliant in hiſtory, but frightful when viewed with all thy attending horrors, naked, and undiſguiſed!" In ſhort it is manifeſt, from the facts ſtated by Denon himſelf, that the lives of no leſs than forty thouſand defenceleſs people were thus ſported with, and periſhed under the regenerating auſpices of the French army in Upper Egypt alone!

In Lower Egypt, the wanton waſte of human blood was immenſe! In none of the battles, dignified by the fine and emphatic titles beſtowed on them, were the French troops reſtrained from blood and carnage, though the wretched fugitives threw down their arms and implored for mercy. Does this conduct, this regard for moral obligation, favour of philanthropy and dignity of mind? And yet theſe are facts gloried in by the French hiſtorians, general Regnier, and Vivant Denon. But if ſuch relentleſs cruelties, exerciſed perhaps in the heat of action, and during the exultations of conſequent victory, are inglorious and brutal, in what light muſt we regard the man, or in what indignant words expreſs his baſeneſs, who could direct the horrid maſſacre of the innocent inhabitants of Jaffa, or the premeditated murder of his own ſick and diſeaſed countrymen? Yet ſuch a man is the invincible Bonaparte, the Firſt Conſul of France, the triumphant conqueror of Egypt, whoſe "countenance beamed with glory and hope, and whoſe noble phyſiognomy appeared to exalt his ſtature!" Unwilling as the mind of man may be to credit ſuch unheard-of acts of ſavage barbarity in a civilized and Chriſtian age, ſtill the evidence of truth is forced upon our ſenſes in ſo incontrovertible a manner, that in the ſame moment that our feelings would lead us to hope ſo ſhocking a report might be founded in malice and miſrepreſentation, we are conſtrained to admit the fact, becauſe not a doubt occurs to impeach the charge. Would we pauſe, and yet hope that this heavy charge might eventually be refuted, ſtill there is no defence—no denial of the fact—nor one friendly advocate to palliate or ſoften this deliberate act of human ſlaughter—the genuine offſpring of muſſulman ſtratagem, and ſavage policy. That unbiaſſed poſterity might be enabled to judge impartially of theſe facts, we ſhall here ſtate the particulars, as given by two moſt reſpectable writers; and in their own words.

Lieutenant.

Lieutenant-colonel Wilſon, in his Hiſtory of the Britiſh Expedition to Egypt, publiſhed in 1802, ſtates as follows: "Bonaparte having carried the town of Jaffa by aſſault, many of the garriſon were put to the ſword; but the greater part flying into the moſques, and imploring mercy from their purſuers, were granted their lives; and let it be well remembered, that an exaſperated army in the moment of revenge, when the laws of war juſtified the rage, yet heard the voice of pity, received its impreſſion and proudly refuſed to be any longer the executioners of an unreſiſting enemy. Soldiers of the Italian army, this is a laurel wreath worthy of your fame, a trophy of which the ſubſequent treaſon of an individual ſhall not deprive you!

"Three days afterwards, Bonaparte, who had expreſſed much reſentment at the compaſſion manifeſted by his troops, and determined to relieve himſelf from the maintenance and care of 3800 priſoners, ordered them to be marched to a riſing ground near Jaffa; where a diviſion of French infantry was formed againſt this defenceleſs multitude. When the Turks had entered into their fatal alignement, and the mournful preparations were completed, the ſignal-gun fired. Vollies of muſquetry and grape inſtantly played againſt them; and Bonaparte, who had been regarding the ſcene through a teleſcope, when he ſaw the ſmoke aſcending, could not reſtrain his joy, but broke out into exclamations of approval; indeed, he had juſt reaſon to dread the refuſal of his troops thus to diſhonour themſelves. Kleber had remonſtrated in the moſt ſtrenuous manner, and the officer who commanded (for the general to whom the diviſion belonged was abſent) even refuſed to execute the order without a written inſtruction; but Bonaparte was too cautious, and ſent Berthier to enforce obedience.

"When the Turks had all fallen, the French troops humanely endeavoured to put a period to the ſufferings of the wounded, but ſome time elapſed before the bayonet could finiſh what the fire had not deſtroyed, and probably many languiſhed days in agony. Several French officers, by whom theſe details are partly furniſhed, declared, that this was a ſcene, the retroſpect of which tormented their recollection, and that they could not reflect on it without horror, accuſtomed as they had been to ſights of cruelty.

"Theſe were the priſoners whom Aſſalini, in his very able work on the Plague, alludes to, when he ſays that for three days the Turks ſhewed no ſymptoms of that diſeaſe, and it was their putrifying remains which contributed to produce the peſtilential malady which he deſcribes as afterwards making ſuch ravages in the French army.

"Their bones ſtill lie in heaps, and are ſhewn to every traveller who arrives; nor can they be confounded with thoſe who periſhed in the aſſault, ſince this field of butchery lies more than a mile from the town.

"Such a fact ſhould not, however, be alleged without ſome proof, or leading circumſtance ſtronger than aſſertion, being produced to ſupport it; but there would be a want of generoſity in naming individuals, and branding them to the lateſt poſterity with infamy for obeying a command when their ſubmiſſion became an act of neceſſity, ſince the whole army did not mutiny againſt the execution; therefore to eſtabliſh further the authenticity of the relation, this only can at preſent be mentioned, that it was *Bonn's diviſion* which fired, and thus every one is afforded the opportunity of ſatisfying themſelves reſpecting the truth, by enquiring of officers ſerving in the different brigades compoſing this diviſion.

"The next circumſtance is of a nature which requires, indeed, the moſt particular details to eſtabliſh, ſince the idea can ſcarce be entertained that the commander of an army ſhould order his own countrymen (or if not immediately ſuch, thoſe amongſt whom he had been naturalized) to be deprived of exiſtence, when in a ſtate which required the kindeſt conſideration. But the annals of France record the frightful crimes of a Robeſpierre, a Carriere; and hiſtorical truth muſt now recite one equal to any which has blackened its page.

"Bonaparte, finding that his hoſpitals at Jaffa were crowded with ſick, ſent for a phyſician, whoſe name ſhould be inſcribed in letters of gold, but which, from important reaſons, cannot be here inſerted; on his arrival he entered into a long converſation with him reſpecting the danger of contagion, concluding at laſt with the remark, 'that ſomething muſt be done to remedy the evil, and that the deſtruction of the ſick at preſent in the hoſpital, was the only meaſure which could be adopted." The phyſician, alarmed at the propoſal, bold in the confidence of virtue and the cauſe of humanity, remonſtrated vehemently, repreſenting the cruelty as well as the atrocity of ſuch a murder; but, finding that Bonaparte perſevered and menaced, he indignantly left the tent, with this memorable obſervation: 'Neither my principles, nor the character of my profeſſion, will allow me to become a murderer; and, general, if ſuch qualities as you inſinuate are neceſſary to form a great man, I thank my God that I do not poſſeſs them.'

"Bonaparte was not to be diverted from his object by moral conſiderations; he perſevered, and found an apothecary, who (dreading the weight of power, but who ſince has made ſome atonement to his mind by unequivocally confeſſing the fact) conſented to become his agent, and to adminiſter poiſon to the ſick. Opium at night was diſtributed in gratifying food; the wretched unſuſpecting victims banqueted; and, in a few hours, five hundred and eighty ſoldiers, who had ſuffered ſo much for their country, periſhed, thus miſerably by the order of its idol.

"If a doubt ſhould ſtill exiſt as to the veracity of this ſtatement, let the members of the inſtitute at Cairo be aſked what paſſed in their ſitting after the return of Bonaparte from Syria; they will relate, that the ſame virtuous phyſician who refuſed to become the deſtroyer of thoſe committed to his protection, accuſed Bonaparte of high treaſon, in the full aſſembly, againſt the honour of France, her children, and humanity; that he entered into the full details of the poiſoning of the ſick, and the maſſacre of the garriſon, aggravating theſe crimes by charging Bonaparte with ſtrangling, previouſly at Roſetta, a number of French and Copts, who were ill of the plague; thus proving that this diſpoſal of his ſick was a premeditated plan, which he wiſhed to introduce into general practice. In vain Bonaparte attempted to juſtify himſelf; the members ſat petrified with terror, and almoſt doubted whether the ſcene paſſing before their eyes was not alluſion. Bonaparte pleaded that he ordered the garriſon to be deſtroyed, becauſe he had not proviſions to maintain them, or ſtrength enough to guard them; and that it was evident if they eſcaped, they would act againſt the French, ſince amongſt the priſoners were five hundred of the garriſon of El-Ariſh, who had promiſed not to ſerve again; and that he deſtroyed the ſick to prevent contagion, and ſave themſelves from falling into the hands of the Turks!"

"To thoſe who may imagine that my repreſentations of general Bonaparte's conduct, are improper at this moment to be brought forward, I muſt premiſe, that if they are concerned only for the character of that general, I am happy to afford them an occaſion to be better acquainted with this celebrated man, who, by his great fortune and uninterrupted career of victory, (with one exception of Acre, that glorious monument of Britiſh conduct,) has dazzled the underſtandings of the maſs of mankind, and prevented the reſults of thoſe enquiries having proper influence, which thoſe, with whom the opinions of the day do not paſs current, have inſtituted on his pretenſions to the admiration of poſterity.

"To thoſe whoſe motives of diſapprobation proceed from a regard for tranquillity, exciting the wiſh that a general amneſty of oblivion might be extended to the paſt, firſt I will ſay, that the diſſemination of this principle

ciple would tend to produce more wickedneſs in the world than has ever been yet committed; for what is there to intimidate ambition, in full poſſeſſion of power, but the pen of the hiſtorian? What can guarantee mankind from the atrocities of a liceutious deſpotiſm, but an aſſurance that the memory of great crimes is perpetuated in the records of hiſtory?

"If the charges are not founded, the man yet lives to exonerate his injured character. If he cannot refute them, then muſt he ſink into his grave loaded with the heavy weight of ſuch offences, and the miſerable preſcience that execration ſhall attach to his memory, inſtead of the fame he coveted."—Thus far lieutenant-colonel Wilſon, p. 74, &c.

Doctor William Wittman, phyſician to the royal artillery, in his Travels in Turkey, Syria, and Egypt, publiſhed in 1803, ſtates as follows: "It was probably owing to the obſtinate defence made by the Turks at Jaffa, that the French commander in chief was induced to give orders for the horrid maſſacre which ſucceeded. Four thouſand of the wretched inhabitants who had ſurrendered, and who had in vain implored the mercy of the conqueror, were, together with a part of the late Turkiſh garriſon of El-Ariſh, (amounting, it has been ſaid, to five or ſix hundred,) dragged out in cold blood, *four days after the French had obtained poſſeſſion of Jaffa*, to the ſand-hills, about a league diſtant, in the way to Gaza, and there moſt inhumanly put to death. I have ſeen the ſkeletons of theſe unfortunate victims, which lie ſcattered over the hills, a modern Golgotha, which remains a laſting diſgrace to a nation calling itſelf civilized. It would give pleaſure to the author of this work, as well as to every liberal mind, to hear theſe facts contradicted on ſubſtantial evidence. Indeed, I am ſorry to add, that the charge of cruelty againſt the French general does not reſt here. It having been reported that, previouſly to the retreat of the French army from Syria, their commander in chief had ordered all the French ſick at Jaffa to be poiſoned, I was led to make the enquiry, to which every one who ſhould have viſited the ſpot would naturally have been directed, reſpecting an act of ſuch ſingular, and it ſhould ſeem wanton, inhumanity. It concerns me to have to ſtate, not only that ſuch a circumſtance was poſitively aſcerted to have happened; but that, while in Egypt, an individual was pointed out to me, as having been the executioner of theſe diabolical commands."—See Dr. Wittman's Travels, 4to ed. p. 128.

In alluſion to this ſhocking event, the following paſſage might be aſcribed, taken from the work of the philoſophic Denon: "In marching we muſt abandon our wounded, *and give them up to certain deſtruction*—a moſt diſtreſſing circumſtance in all wars, and eſpecially in the ſavage conteſt in which we were now engaged!"

The reader will perhaps be leſs ſurprized at theſe atrocities, when he reflects that they were decreed by a man who had apoſtatized from the mild doctrines of the Chriſtian diſpenſation, to embrace the tenets of Mahomet. His own official documents eſtabliſh this fact: and having adopted the ideas, the ferocious character naturally follows. Read but the hiſtory of the Caliphate or Moſlem empire, and the maxims of the modern conqueror of Egypt will be found exemplified in almoſt every reign of the Saracen tyrants. And it may here be proper to remark, that the indecent treatment of lord Whitworth, the late Engliſh ambaſſador at Paris, probably aroſe from a ſpirit of revenge in the firſt conſul, who complained of the charges contained in lieutenant-colonel Wilſon's book, calling the work a *libel* on the French nation, and meanly requiring that the author ſhould be puniſhed, and the charges publicly retracted; without offering the ſmalleſt evidence to diſprove the fact. Thoſe, therefore, who have believed that the Maltanean war aroſe in great meaſure out of the reſentment of the firſt conſul on this occaſion, might not have adopted an entirely unfounded creed. The natural ferocity of the muſſulman character, may, in ſome meaſure, be appreciated from the following baſe and cruel tranſaction:

After the reſtoration of peace to the deſolated province of Egypt, it was the wiſh of general Hutchinſon to reſtore its civil government, and call back to their reſpective ſtations all thoſe under whoſe official departments it had been conducted. The extreme jealouſy of the Porte, however, in its anxious care once more to get firm hold of Egypt, had ſecretly determined on the extirpation of the preſent race of beys; the only men in the country who had made head againſt the common enemy. This political but ſanguinary meaſure was confided to the management of the grand vizier. On the 21ſt of October 1801, all the beys then in Alexandria, with the capitan pacha, were invited to dine on-board ſir Richard Bickerton's ſhip, then lying in the harbour. With this intention they were taken into the capitan pacha's barge; but while they were ſailing through the lake Mareotis, a cawouaſh, or meſſenger of ſtate, appeared on the ſhore, and hailing them, informed the capitan pacha that he had brought diſpatches of the utmoſt conſequence for him from Conſtantinople. Upon this the capitan pacha left the beys, and went away in a boat; after which, as they were paſſing under the ſtern of a Turkiſh gun-boat at anchor, a volley of muſketry was fired at them, and ſeveral boats full of men aſſailed them on every ſide. After a gallant and deſperate reſiſtance, rendered more furious by the idea of being treacherouſly ſacrificed, they were overpowered by numbers, and made priſoners. In the conteſt, Oſman Bey Tambourgi, Oſman Bey Aſcar, Mahomet Bey Maſice, and the black Caya Bey, were killed in the barge. Oſman Bey Berdici, and Solyman Aga, were very ſeverely wounded, but fortunately recovered. The ſurvivors were then taken and confined on-board the capitan pacha's ſhip, the Sultan Selim. Immediately upon the above tranſaction being made known to general Hutchinſon, he ordered brigadier-general Stuart, at the head of his regiment, and with guns and lighted matches, to proceed to the Turkiſh camp on the eaſtward of Alexandria, and to inſiſt upon the bodies of the beys being given up to the Britiſh. This, after ſome heſitation, was acceded to by the capitan pacha, and the remaining beys were liberated the next day, and ſent to Alexandria, where the bodies of thoſe who had been ſlain were buried by the Britiſh army, with all poſſible military honours. While theſe things were paſſing at Alexandria, the grand vizier, by preſents, and other demonſtrations of friendſhip, having lulled the mamaluke beys at Cairo into perfect ſecurity, he made, on the 20th of October, an attempt to ſeize them. Several of them thus fell treacherouſly into his hands; but Selim Bey, and a party of his officers and men, effected their eſcape. After innumerable hardſhips and difficulties, they arrived at Gizeh, where they were received and kindly treated by the commandant, colonel Ramſay. As ſoon as general Hutchinſon was made acquainted with this tranſaction, he diſpatched brigadier-general Stuart to the grand vizier, with a peremptory letter, inſiſting on the unconditional delivery of the beys, whom he kept priſoners in Cairo. This demand was, after ſome heſitation, complied with; and on the 16th of November the beys came into Gizeh, where they were placed under the protection of the Britiſh army. General Hutchinſon, after this ſcandalous behaviour of the grand vizier, determined to bring back the government to the ſtrict regulations formed for it by Solyman the Legiſlator, in 1521. He directed that the number of beys ſhould be augmented to their full complement of twenty-four; that the capitan pacha ſhould be the ſupreme preſident in the divan; that the new-elected beys ſhould be ſubject to his approval; and that he ſhould no longer remain a cypher in the ſtate, but have an army under his command, ſufficient to enforce his legal authority. Thus, at the commencement of the year 1802, the ſovereignty of Egypt was reſtored by the valour of the Britiſh arms, to its ancient privileges and

conſtitution, under the nominal dominion of the grand ſeignor.

ANTIQUITIES AND CURIOSITIES.

It is generally agreed, that the remoteſt ſubjects of antiquity now exiſting in the world, are to be found in Upper Egypt, among the auguſt remains of the ſtupendous works of its primitive kings and prieſts; the firſt, perhaps, that were greatly eminent for civilization and an elegant expanſion of the human mind, from the days of Noah. That this country ſhould have been choſen as the primitive ſeat of the earlieſt monarchy of the earth, is no way ſurprizing, when we conſider its eligible ſituation: a luxuriant and extenſive vale, annually inundated by the fineſt river in the world, by which the moſt abundant harveſts are produced, almoſt without the labour of man. This land of plenty, eternally bleſſed with a clear and clement ſky, fell to the lot of the children of Ham, whoſe race were eſteemed a wiſe and learned people; Acts vii, 22: and ſo powerful and populous were they in the days of Amaſis, that this monarch is ſaid to have reigned over no leſs than thirty thouſand cities. Lower Egypt, from its ſituation on the coaſt of the Mediterranean ſea, having been from time to time expoſed to the deſolating hand of numberleſs invaders, affords but few objects of antiquity of a higher date than the eras of the Greek and Roman conqueſts. Our enquiries will, therefore, be primarily directed to the principal ſubjects of curioſity and reſearch in Upper Egypt. With this view, we have choſen to follow the perſevering ſteps of the ingenious Vivant Denon, an eminent artiſt, and a man of learning and intelligence; and who, diveſted of his natural partiality towards his countrymen, and the light and airy notions inſeparable from the conſtitution of a Frenchman, appears to be confeſſedly the moſt able, and indeed the only, hiſtorian of Upper Egypt, who has written from actual ſurvey and perſonal obſervation; delineating every part as he went, with the correct and faithful pencil of a connoiſſeur; whence his book is become of peculiar value, the fine paper copies and firſt impreſſions of which ſell in London for no leſs than thirty guineas each.

This enterpriſing traveller had firſt intended to accompany the Arabian caravan in its return from Cairo, with a view to explore the route of Tor, the ancient journey of the Iſraelites, in order to gain further information of the wonderful part of the expedition of Moſes, from the time of his departure from Memphis, the capital city of Pharoah, to his arrival at the deſert of Pharan. "Thus (ſays Denon) I ſhould have been able to viſit Mount Sinai, without a reſidence of forty years, and croſs a part of the world, the annals of which amount to the higheſt antiquity, the cradle of three religions, and the native country of three legiſlators, all deſcended from the family of Abraham, who have governed the opinions of the world. But ſo ſoon as I made my wiſhes known to the chief of the Arabs, he told me, that for all the gold in Egypt he would not undertake the care of me; that it would be riſking my life, and that of all the monks in Mount Sinai, and of every individual of his caravan; ſince two powerful tribes, the Ovatis and the Ayaidis, had vowed vengeance againſt the French, becauſe they had been aſſured that they devoured Arabs."

After this, general Deſaix being charged with the conqueſt of Upper Egypt, (ſee p. 329,) it afforded Denon a ſeaſonable opportunity of examining the claſſical documents of the ancient civilization and magnificence of the country, under the protection of a military eſcort, and with that ſafety and unity of plan, which had hitherto been denied to others, on account of the danger perpetually ariſing from thoſe everlaſting enemies to civilized man, the ferocious hords of the deſert. The army marched on this deſtination in the month of Auguſt 1798, and, after ſubduing the fertile territory of Feyyum, ſoon arrived at the height of Manſurah, on the frontier of the deſert. Here, quitting that incloſed and fruitful province, it came up with the enemy at Sedinam; and, having obtained its firſt victory, ſat down for a time at Beneſuef. On the left bank of the Nile, oppoſite Beneſeuf, the Arabian chain of mountains lowers, retires further off, and forms the valley of Araba, or the *chariots*, terminated by Mount Kolſun, rendered famous by the grottoes of two cenobite patriarchs, St. Anthony and St. Paul, the founders of the monaſtic order, and creators of this contemplative ſyſtem, ſo uſeleſs to mankind, but which has been ſo long reſpected by credulous people. On the ſoil which covers the two grottos, which theſe two hermit ſaints inhabited, two monaſteries ſtill exiſt, from one of which it is ſaid Mount Sinai, beyond the Red Sea, may be diſcerned. The mouth of this valley, towards the Nile, exhibits nothing but a dreary plain, the only cultivated part of which is a narrow ſlip of land on the bank of the river: ſome veſtiges of villages overwhelmed by the ſand may be diſcovered, and they preſent the afflicting ſight of daily devaſtation, produced by the continual encroachment of the deſert on the ſoil, inundated with ſand. Nothing can be more melancholy to the feelings, than to march over theſe ruined villages, to tread under foot the roofs of the houſes, and the tops of minarets; and to think that theſe were once cultivated fields, flouriſhing trees, and the habitations of man—every thing living has diſappeared, ſilence is within and around every wall, and the deſerted villages are like the dead, whoſe ſkeletons ſtrike with terror.

From hence we croſſed the canal, and arrived at Davalta, a fine village ſurrounded by a moſt beautiful country; for in Egypt, when nature is charming, it is ſo in ſpite of all that man can add to it, or of the detractors of Savary, who have quarrelled ſo much with his luxurious deſcriptions. Nature here, in the fertile parts, produces ſpontaneouſly groves of palms, under which flouriſh the orange-tree, the ſycamore, opuntia, banana, acacia, and pomegranate; and theſe trees form groups of the fineſt mixture of foliage and verdure; and, when theſe delightful thickets are ſurrounded, as far as the eye can reach, with fields covered with ripe dourra, with mature ſugar-canes, with fields of wheat, flax, and trefoil, which ſpread a downy carpet over the land, as the inundation retires; when, in the months of our European winter, we have before our eyes this rich proſpect of ſpring, which promiſes the abundance of ſummer, we may well ſay with Savary, that "nature has organiſed Egypt in a moſt aſtoniſhing manner, and that there only want woody hills, with brooks flowing down their declivities, and a government which would render the people induſtrious, and prevent the incurſion of the Bedouin robbers, to render it the beſt and moſt beautiful country on the face of the earth."—"Theſe reflections (ſays Denon) led me to conſider that the moſt intereſting of my travels were now to begin. I was going to break up, as it were, a new country; to be the firſt to ſee, and to ſee without prejudice; to make reſearches in a part of the earth hitherto covered with the veil of myſtery, and for two thouſand years ſhut out from the curioſity of Europeans. From the time of Herodotus to the preſent, every traveller in Egypt, following the ſteps of his predeceſſor, had only rapidly aſcended the Nile, not daring to loſe ſight of his boat, and only quitting the ſhore for a few hours to hurry a hundred yards off, and viſit with anxiety the neareſt objects. For every thing beyond the vicinity of the river, the oriental hiſtories alone had hitherto been conſulted. Eager, therefore, to aſcertain whether the arts had had an epoch and a chronology in this country, it was my anxious wiſh to haſten to Thebes."

If the priſtine arts were brought to maturity in Egypt, their remains were certainly to be ſought at Thebes, which had been the principal reſidence of its early kings; and if there were in reality epochs in the arts, the reſult of the firſt eſſays and rudiments muſt ſtill have their ſtrongeſt features in that city; luxury and magnificence having departed progreſſively from this firſt point of ſimplicity,

plicity, merely through the opulence and ſuperfluity by which they were accompanied. From a projecting ſpot on the ſide of the contiguous mountain, we all at once diſcover the ſite of this ancient metropolis in its whole extent: the famous city which Homer has characterized by the ſingle expreſſion of,—*with a hundred gates*; alike celebrated for the number of its kings whoſe wiſdom raiſed them to the rank of demi-gods; for laws which have been ever revered without being promulgated; by ſcience, involved in pompous hieroglyphical inſcriptions, the firſt monuments of ancient learning, which are ſtill ſpared by the hand of time; this once ſacred and renowned city, now ſurrounded with barbariſm, and made common again with the deſert, from which, in part, it had been firſt drawn forth; enveloped in the veil of myſtery, and the obſcurity of ages, whereby even its own coloſſal monuments are magnified to the imagination, and ſtill impreſs the mind with ſuch gigantic phantoms, that the French army, ſuddenly and with one accord, ſtood in amazement at the ſight of its ſcattered ruins, and clapped their hands with delight, as if the end and object of their march, and the complete conqueſt of Egypt, were accompliſhed and ſecured by taking poſſeſſion of the ſplendid remains of this ancient metropolis.

The ſcite and ſituation of the city of Thebes, the great Dioſpolis, is as fine as can well be imagined; and the immenſe extent of its ruins convinces the aſtoniſhed ſpectator that fame has not at all magnified its ſize; for the diameter of the vale of Egypt not being ſufficient to contain it on both ſides of the Nile, its monuments reſt upon the two chains of mountains which are its oppoſite boundaries; whilſt its tombs occupy the vallies towards the weſt, far on into the deſert.

Browne, who viſited this deſolated country in 1792, obſerves that "ancient Thebes, the capital of Egypt, the city of Jove, *the city with a hundred gates*, muſt inſpire every intelligent ſpectator with awe and admiration. Diffuſed in an extent of nine miles on each ſide the Nile, which is here three hundred yards wide, and reaching to the mountains on the eaſt and weſt, its circumference muſt have been at leaſt twenty-ſeven miles." Wiſhing to examine the Necropolis, or city of the dead, he applied to Mohammed Bey Elfi at Cairo for an authority ſo to do; but Elfi Bey informed him it would require a guard of twenty men to protect him from the wild Arabs, who inhabit thoſe ſubterranean abodes in common with the dead. "They are indeed a ferocious clan, (ſays this author,) differing in perſon from other Egyptians. They ſtand at the mouth of theſe tombs or dens, with ſpears twelve or fourteen feet in length, which are deadly weapons in their hands." Denon, aſſiſted by a detachment of French troops, ſeriouſly invaded theſe dark and diſmal caves, making large ſulphureous fires within the mouths of the tombs to force out the fugitives, or ſuffocate them on the ſpot.

"That the paſſage in Homer (ſays Mr. Browne) referred not to the gates of the city, muſt readily be allowed; yet it appears to me that Thebes was walled. From the ſituation of remains evidently of this nature, ſeen with a teleſcope at great diſtances in the directions of weſt and north, and another of equal diſtance to the ſouth, occupying exactly thoſe three cardinal points, led me to believe that theſe may have been three gates." Volney, in his Ruins of Empires, accounts ſtill more reaſonably for the appellation of Homer. He calls the city, "*Thebes with its hundred palaces*;" and adds the following note. "The idea of a city with a hundred gates, in the common acceptation of the word, is ſo abſurd, that I am aſtoniſhed the equivoque has not been before felt. It has ever been the cuſtom of the Eaſt to call palaces and houſes of the great by the name of *gates*, becauſe the principal luxury of theſe buildings conſiſts in the ſingular gate leading from the ſtreet into the court, at the fartheſt extremity of which the palace is ſituated; under the veſtibule of this gate, converſation is held with paſſengers, and a ſort of audience and hoſpitality given. All this was doubtleſs known to Homer; but poets make no commentaries, and readers love the marvellous.

The ſpace occupied by the ruins of this incomprehenſible town, now infolds eight large villages or hamlets; namely, Luxor, Karnak, Theba, and Guedime, on the right of the Nile; and Hermontes, Medinet-Abu, Memnonium, and Kernu, on the left bank; beſides the ancient Necropolis, or repoſitory of the dead; ſo that the river, by the ſinuoſity of its courſe, ſeems ſtill proud of flowing through its center. Luxor, the principal village in theſe environs, is formed on the ſcite of the ruins of a temple of prodigious magnitude, and in a tolerable ſtate of preſervation, the maſſes not having as yet fallen through time. The moſt coloſſal parts conſiſt of fourteen columns of nearly eleven feet in diameter, and of two ſtatues in granite, at the outer gate, buried up to the middle of the arms, and having in front of them the two largeſt and beſt-preſerved obeliſks in the world. It is, without doubt, flattering to the pomp of Thebes, that the richeſt and moſt powerful republic in the world ſhould have deemed its means inſufficient to hew out theſe two monuments, which are no more than a fragment of only one of the numerous edifices of that aſtoniſhing city. This gate was the grand entrance into the city, which is now become the common road into the village of Luxor. Nothing can be more grand, and at the ſame time more ſimple, than the number of ſmall objects of which this entrance is compoſed. No city now exiſting makes ſo proud a diſplay at its entrance as this obſcure village, which contains about three thouſand ſouls, who have taken up their abodes on the roofs and beneath the galleries of this temple, which has nevertheleſs the air of being uninhabited.

A peculiarity belonging to the temple of Luxor, is, that a quay, provided with an epaulment, ſecured the eaſtern part, which was near the river, from the damages the inundations might otherwiſe have occaſioned. The epaulment, which ſince its original ſtructure has been repaired and augmented in brick-work, proves that the river has not changed its bed; and its preſervation is an evidence that the Nile has never been banked by other quays, ſince no traces of ſimilar conſtructions are elſewhere to be met with. "The entrance (ſays Denon) of the village of Luxor, affords a ſtriking mixture of beggary and magnificence. What a gradation of ages in Egypt is offered by this ſingle ſcene! What grandeur and ſimplicity in the bare inſpection of this one ruin! It appears to me to be at the ſame time the moſt picturеſque group, and the moſt ſpeaking repreſentation of the hiſtory of thoſe times: never were my eyes and my imagination ſo forcibly ſtruck as by the ſight of this monument. I often came to meditate on this ſpot, to enjoy the paſt and the preſent, to compare the ſucceſſive generations of inhabitants by their reſpective works which were before my eye, and to ſtore in mind volumes of materials for future meditations. One day the ſheik of the village accoſted me, and aſked if it was the French or the Engliſh who had erected theſe monuments; and this queſtion completed my reflections." Here were found ſome fine medals of Auguſtus, Adrian, and Trajan, with a crocodile on the reverſe, ſtruck in Egypt in fine bronze with Greek inſcriptions; and a great number of medals of Conſtantine.

The two obeliſks are of roſe-coloured granite, and are ſtill ſeventy feet above the ground; and to judge by the depth to which the figures ſeem to be covered, we may reckon about thirty feet more concealed from the eye, making in all one hundred feet for the height of theſe monuments. Their preſervation is perfect, the hieroglyphics with which they are covered are cut deep, and in relief at the bottom, and ſhew the bold hand of a maſter, and a beautiful finiſh: what an admirable temper muſt the gravers be that could touch ſuch hard materials! what time required for the labour! what machines to drag ſuch enormous blocks out of the quarries, to

tranſport

tranſport them hither, and to ſet them upright! The two coloſſi of the ſame material are worn and decayed, but the parts that remain ſhew, that they had been completed in the moſt laboured and finiſhed manner. The two large maſſes which formed the gate are covered with ſculpture, partly effaced, repreſenting battles between chariots drawn by two horſes, and a ſingle conductor. The annexed engraving exhibits a correct view of this grand ruin, as given by Denon.

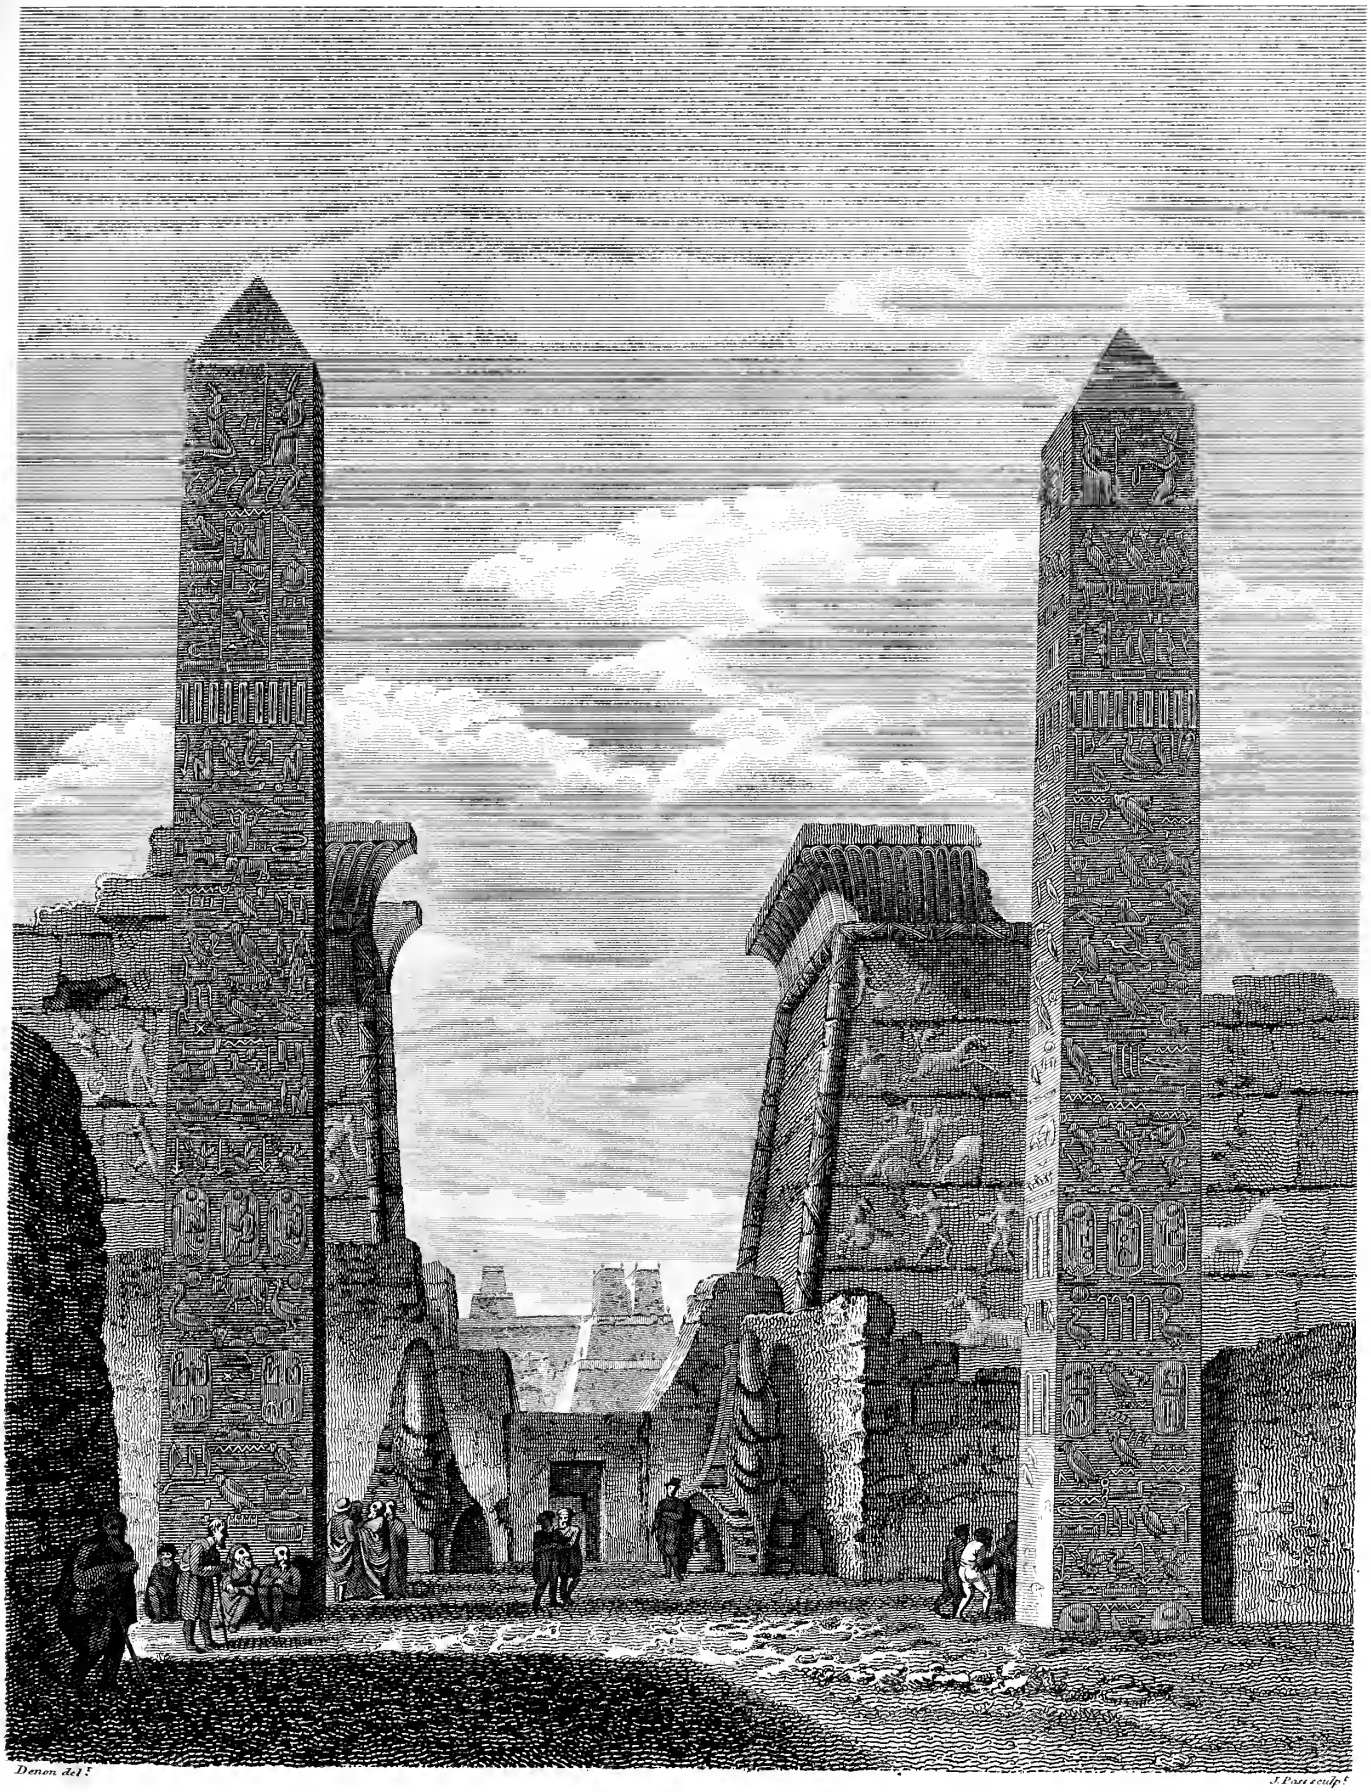
Karnak, the next diſtrict of Thebes, is a village built on a ſmall part of the ſite of a ſingle temple, the circumference of which would require half an hour to walk round. Herodotus, by whom it was not viſited, has, notwithſtanding, given a correct idea of its grandeur and magnificence. Diodorus and Strabo, who examined it in its ruinous ſtate, appear to have given the deſcription of its preſent condition; and all the travellers by whom they have been copied, have here miſtaken a great extent of maſſes, for the meaſure of beauty. It is probable that the temples of Karnac and Luxor were built in the time of Seſoſtris, when the flouriſhing condition of the Egyptians gave birth to the arts among them, and when theſe arts were, perhaps, diſplayed to the world for the firſt time. The vanity of erecting coloſſal edifices, was the firſt conſideration of opulence; and it was not as yet known, that a perfection in the arts beſtows on their productions a grandeur which is independent of their magnitudes. It is the ſumptuouſneſs alone of the Egyptians which is to be ſeen at Karnak, where not only quarries, but mountains are piled together, and hewn out into maſſive proportions, the ornaments of which are as feebly executed, as the parts are clumſily connected; and theſe maſſes are loaded with uncouth bas-reliefs, and taſteleſs hieroglyphics, by which the art of ſculpture is diſgraced. The only objects here which are ſublime, both with regard to their dimenſions, and the ſkill which their workmanſhip diſplays, are the obeliſks, and a few of the ornaments of the outer gates, the ſtile of which is admirably chaſte. If, in the other parts of this edifice, the Egyptians appear to us to be giants, in theſe latter productions they are geniuſes. It would therefore appear that theſe ſublime embelliſhments were poſteriorly added to the coloſſal monuments of Karnak; though it muſt be granted, that the plan of the temple is noble and truly grand. To the known deſcriptions of this great edifice ſhould be added, that it was but a temple, and could be nothing elſe. All that exiſts at preſent in a ſomewhat entire ſtate relates to a ſmall ſanctuary, and had been diſpoſed in this way to inſpire a due degree of veneration, and to become a kind of tabernacle. On examining the enſemble of theſe ruins, the imagination is wearied with the idea of deſcribing them. Of the hundred columns of the portico alone of this temple, the ſmalleſt are ſeven feet and an half in diameter, and the largeſt twelve. The ſpace occupied by its circumvallation contains lakes and mountains. In ſhort, to be enabled to form a competent idea of ſo much magnificence, it is neceſſary that the reader ſhould fancy what is before him to be a dream, as he who views the objects themſelves rubs his eyes to know whether he is awake. With reſpect to the preſent ſtate of this edifice, it is, however, neceſſary at the ſame time to obſerve, that a great part of the effect is loſt by its very degraded ſtate. The ſphinxes have been wantonly mutilated, with a few exceptions, which barbariſm, wearied with deſtroying, has ſpared, and on examining which, it is eaſy to diſtinguiſh that ſome of them had a woman's head, others that of a lion, a ram, a bull, &c. The avenue which leads from Karnac to Luxor was of this latter deſcription; and this ſpace, which is nearly half a league in extent, contains a conſtant ſucceſſion of theſe chimerical figures to the right and left, together with fragments of ſtone-walls, of ſmall columns, and of ſtatues. This point lying in the center of the city, the part which was the moſt advantageouſly placed, there is ſome reaſon to ſuppoſe that the palace of the kings was ſituated here. The paſſage through the circumvallation or exterior wall is by ſix gates that yet remain, three of which are preceded by avenues of ſphinxes: within the circuit was contained not only the great temple, but three others entirely diſtinct from it, having each its own gates, porticoes, courts, avenues, and boundary-wall. What could be their uſe? Were they temples, or palaces? Were their ſovereigns lodged in the porticoes of the temples, or were their palaces ſimilar in conſtruction to the ſacred edifices; or, perhaps, from their ſuperior lightneſs, unable to reſiſt the injuries of time? It is at leaſt obvious, that if they did really inhabit theſe buildings, which from their diſtribution may be regarded as dependencies of the great temple, their accommodations here were only of a temporary nature. Another objection is, that moſt of theſe chambers contained little tabernacles, in which, no doubt, were incloſed either the figure of the divinity, or the particular animal emblematical of it, or the ſacred treaſure; and to any of theſe none but the prieſts would be admitted. Probably, therefore, the vaſt circuit of theſe buildings was occupied by numerous colleges of prieſts, the depoſitaries of the ſcience, the power, and the influence, of the country.

What monotony! what melancholy wiſdom! what auſtere gravity of manners! We might ſtill admire with awe the organization of ſuch a government; its ſtupendous remains yet excite the mingled ſenſations of reſpect and dread. The divinity, in ſacerdotal habits, pourtrayed in the ſculptures, holds in one hand a hook, and in the other a flail; the former, no doubt, to reſtrain, and the latter to puniſh: every thing is meaſured by the law, and enchained by it. The fine arts, ſubject to the ſame ſevere reſtrictions, bend under the weight of fetters, and their ſoaring genius is pinioned to the earth. The unveiled emblem of generation traced even in the ſanctuary of the temples, announces, that to deſtroy pleaſure it was converted into a duty: not a ſingle circus, not a ſingle theatre, not a ſingle edifice for public recreation; but temples, nothing but temples, myſteries, initiations, prieſts, ſacrifices: ceremonies were uſed for pleaſures; for luxury, ſepulchres.

The temple of Theba, we are told by Dr. Bryant, was no leſs than 280 cubits in length; built in commemoration, and after the form, of the ark. Its ſhrine, he ſays, was inlaid and plated with gold and ſilver. It was a temple ſacred to Oſiris at Theba; or, to ſay the truth, the temple itſelf was called Theba: and both the city of Thebes, as well as the province, was undoubtedly denominated from it: το αρχαιον η Αιγυπτος Θηβαι καλουμενη. Now Theba, תבה, is the very word uſed for the ark by the ſacred writer, Gen. vi. 15: ſo that we may be aſſured of the prototype after which this temple was faſhioned; but the remains of it are undefined.

There is a conſiderable ruin on the ſcite of Thebes to the north-eaſt, at the village of Guedime, half a league in the rear, which in this direction makes the whole length of the monuments and other remains of this ancient city equal to about eight miles, on the right bank of the Nile. This ruin conſiſts of four columns, ſtill ſurmounted by three maſſy ſtones of the entablature, in front of which are viſible the foundations of two buttreſſes, at preſent a ſhapeleſs maſs of fragments. Theſe are the only remnants of a vaſt pile of building, whoſe chief merit at preſent is to ſerve as a fixed point from which to compute the original extent of the monuments and temples of Thebes on this ſide the river.

Croſſing the Nile from Luxor, we approach Hermontes, celebrated for the temple dedicated to Typhon, or Anubis. Beſides this temple, there remain the features of ſeveral ruins in this ancient quarter, highly ornamented with hieroglyphics. To the eaſt of this temple is a large reſervoir lined with fine ſtone, with four ladders for deſcending into it. Four hundred yards further, in the ſame direction, are the ruins of a Chriſtian church, built



The Grand Entrance of ancient Thebes.

London. Published as the Act directs. May 4. 1804. by J. Wilkes.

in the fifth century, out of the ruins of the fineſt Egyptian antiquities: the nave was decorated with ſplendid columns of granite, but the whole is overthrown, and nothing is left ſtanding but a few fragments of the choir, and the arches of the outer encloſure: this deſtruction is by the hand of man, for the church was too well built not to have reſiſted the wear of time to the preſent day.

From Hermontes we enter the village of Medinet-Abu, in which is a vaſt palace, built and enlarged at different periods. The lower part of this palace, which abuts againſt the foot of the Lybian mountain, is the moſt ancient in its conſtruction, and is covered with hieroglyphics, cut very deep, and without any relief. In the fourth century the Chriſtians made a church of it, adding two rows of pillars to ſupport a covered roof. The church itſelf had only occupied the ſecond portico of the temple; but from the teſtimony of a number of little doors, decorated with flowered croſſes, it appears evident, that the body of the edifice, which is two hundred feet long, had to all appearance ſerved as a convent for ſome orders of monks of the earlier ages of Chriſtianity. In the portico, where the church had been ſituated, the ſculptures on the inner wall ſtill repreſent the exploits and the triumph of Seſoſtris, who had carried his arms into foreign countries, and had obtained victories in India, as all theſe bas-reliefs ſeem to point out. Here is the figure of a hero alone purſuing a whole army, who are flying before him, and, to eſcape from his blows, throwing themſelves into ſome river, perhaps the Indus. This hero, who is mounted on a ſmall chariot, in which there is only room for himſelf, drives two horſes, holding the reins on a level with his girdle: bucklers and heaps of arms are hung all about him, and around his car; his ſtature is gigantic, and he holds an immenſe bow, from which he is ſhooting arrows upon a bearded and long-haired enemy, who have not the leaſt reſemblance with the known forms of Egyptian heads. Further on, he is repreſented ſitting on the back of his car, the horſes of which are held by pages, and one perſon is counting out before him an immenſe group of hands cut off from the enemy killed in battle, whilſt another is inſcribing the number, and a third appears to be proclaiming the ſum. Some travellers have deſcribed a ſecond heap of mutilations of an indecent kind, which ſhew that the hero has not been fighting againſt Amazons. Priſoners are alſo brought to him, confined in different ways; they are all clothed with flowing and ſtriped robes, their hair is long and matted, and tables of hieroglyphics follow, fifty feet in diameter, which, could we read them, would unqueſtionably explain the meaning of the figures that precede them. Returning to the left by another ſide of theſe galleries, a long bas-relief is ſeen, that repreſents, in two lines, a triumphal march: it is probably the ſame hero returning from his conqueſts; ſome ſoldiers covered with armour prove that the triumph is military, though a little further on nothing is to be ſeen but prieſts, or perſons of the claſs of the initiated, without arms, and with long and tranſparent tunics: the arms of the hero are covered with theſe garments; he is borne on the ſhoulders of men, on a palanquin, with all the attendants of a divinity; before and behind him march prieſts, bearing palm-branches and calumets, and incenſe is preſented to him. He arrives in this ſtate at the temple of the tutelar deity of Thebes, and offers to the god a ſacrifice, in which he officiates as prieſt; the march continues, and the god is borne by twenty-four prieſts; the bull Apis, with the attributes of divinity, marches before the hero, and a long train of perſonages follow, holding each a banner, on the greater number of which are the repreſentations of different deities. When arrived at the altar, a child appears with his hands tied behind his back, who is about to be immolated before the conqueror, who has ſtopped to receive this horrible ſacrifice, or to aſſiſt at this execrable holocauſt; beſide them ſtands a prieſt who is breaking the ſtem of a flower, and birds who are flying away, emblems of the ſeparation of the ſoul from the body. The account which Longus and Apuleius, in their romances of Theagenes and the Golden Aſs, have tranſmitted to us of human ſacrifices among the Egyptians, is therefore not a fable, and theſe poliſhed people ſtill retained ſome reſemblance to barbarians. Next the hero himſelf makes a ſacrifice to the god Apis, of a ſheaf of wheat; a protecting genius accompanies him throughout; he changes his dreſs in the different parts of the ceremony, which perhaps marks his various dignities or degrees of initiation, but the ſame phyſiognomy is conſtantly preſerved, which ſhews, that it is a portrait; his air is noble, auguſt, and mild. In one picture he is holding nine perſons confined by the ſame chain. Are theſe the paſſions perſonified? or, do they repreſent nine conquered nations? Incenſe is offered to him in honour of theſe victories: a prieſt writes his annals, and conſigns them to ſacred memorial. It is therefore proved, that the ancient Egyptians had written books; the famous *Toth* was then a book, and not inſcribed tablets ſculptured on walls, as has been often ſuppoſed. While ſurveying theſe curious remains of antiquity, Denon had the good fortune to obtain poſſeſſion of a manuſcript found in the hand of a mutilated mummy. It conſiſted of a roll of papyrus, on which the ſacred manuſcript was inſcribed, perhaps the oldeſt of all manuſcripts in the known world. What were its contents, has not yet been made known.

Deep under the foundations of the moſt ancient part of the temple at Medinet-Abu, at the baſe of one of the principal pillars of the edifice, we diſcover foundation ſtones, on which are ſculptured numerous hieroglyphics, as finely executed as thoſe that decorate the outer part of the building. From this circumſtance, how great muſt we ſuppoſe the antiquity to be of edifices ſo decorated? and how many preceding ages of civilization would it require to be able to erect ſuch buildings? The annals of this wonderful country are ſtill myſterious, obſcure, and infinite.

In the quarter extending to the village of Kurnu, we are preſented with a temple of the higheſt antiquity, as is manifeſt from its ruinous appearance, its thorough antique hue, its conſtruction, which is leſs perfect than the reſt, the extreme ſimplicity of its ornaments, the irregularity of its outline, and eſpecially the coarſeneſs of its ſculpture. At a ſmall diſtance are the remains of another ancient edifice, much more conſiderable, and in a better ſtate of preſervation; oppoſite to which is a ſtatue of black granite or baſalt, which is the material of the magnificent Egyptian lions which ſtand at the foot of the flight of ſteps leading to the Roman capitol. At the entrance of this temple two ſquare mounds flank an immenſe gate, and againſt the inner wall are engraved, in two bas-reliefs, the victorious combats of ſome Egyptian hero. This piece of primitive ſculpture is in the moſt irregular ſtyle of compoſition, without perſpective, plan, or diſtribution, like the firſt conceptions of the unimproved human mind. Here the hero is gigantic, and the enemies whom he is overthrowing are twenty-five times ſmaller than himſelf; if this early ſtage of hieroglyphic delineation could be meant for a piece of flattery in the arts, it was certainly ill-contrived, ſince the hero ought to gain no honour by fighting pygmies. At ſome paces from this gate are the remains of an enormous coloſſal figure. It has been wantonly ſhattered; for the parts which are left have ſo well preſerved their poliſh, and the fractures their edges, that it is evident, if the ſpirit of devaſtation in mankind had truſted to time alone to ruin this monument, we ſhould ſtill ſee it entire and unimpaired. Suffice it to ſay, to give an idea of its dimenſions, that the breadth of the ſhoulders is twenty-five feet, which would give about ſeventy-five for the entire height: the figure is exact in its proportions, and the execution perfect; when overſet, it fell upon its face, which hides this intereſting part; the drapery being broken, we can no longer judge by its attributes whether

it is the figure of a king, or a divinity. Is it the ſtatue of Memnon, or that of Oſymandyas?—the deſcriptions hitherto given of this monument throw more confuſion than light upon this queſtion. If it be the ſtatue of Memnon, which is the decided opinion of Denon, every traveller for two thouſand years muſt have miſtaken the object of their curioſity. One foot of this ſtatue remains, which is broken off, and in good preſervation; and it may give to us in Europe a ſcale of compariſon of the monuments of this ſpecies, and may ſerve as a companion to the coloſſal feet which are in the court of the capitol at Rome. The ſpot where this figure ſtood might be either a temple or a palace, or both at the ſame time; for, if the bas-relief would belong more properly to a royal reſidence, the figures of eight prieſts, which are in the front of two porticoes in the inner part, would peculiarly indicate a temple, except indeed they were introduced to remind the ſovereign that, conformably to the law of the times, the prieſts ought always to ſerve and aſſiſt in the exerciſe of monarchical power. This ruin, which is ſituated on the ſlope of the mountain, and has never been inhabited in later times, is ſo well preſerved in the parts that are ſtill ſtanding, that it appears more like a new and unfiniſhed building: ſeveral columns are ſeen here to their very baſes; their proportions are grand, but the ſtile, though purer than that of the firſt-mentioned temple, is, however, not comparable to one of a ſimilar kind at Tentyra, neither for the majeſty of the general deſign, nor for the delicacy in the execution of particular parts.

In the adjacent plain, is the Memnonium, and its two coloſſal ſtatues, in a ſitting poſture; between which, according to Herodotus, Strabo, and thoſe who have copied the relation of theſe writers, ſtood the famous ſtatue of Oſymandyas, the largeſt of all the coloſſal figures in Egypt. Oſymandyas had prided himſelf ſo much on the execution of this bold deſign, that he had cauſed an inſcription to be engraven on the pedeſtal of the ſtatue, in which he defied the power of man to deſtroy this monument, as well as that of his tomb; the pompous deſcription of which now appears only a fantaſtic dream. The two outermoſt ſtatues ſtill left ſtanding, are doubtleſs thoſe of the wife and the daughter of this prince; mentioned by Herodotus as the mother and ſon; but that of the king himſelf has diſappeared: the ſcythe of time, and the corroding tooth of envy, appear to have united in compaſſing its deſtruction. Nothing of it now remains but a ſhapeleſs rock of granite; ſo that it requires the perſevering ſcrutiny of the amateur, accuſtomed to this kind of examination, to diſtinguiſh any portions of the figure which have eſcaped deſtruction; and even thoſe are ſo inſignificant, that they can throw but little light on its original dimenſions. The two ſtatues ſtill exiſting are in the proportion of from fifty to ſixty-five feet in height, ſeated, as they are, with their two hands on their knees; all that remains of them ſhews a ſeverity of ſtile, and a ſtraightneſs of poſition. The bas-reliefs, and the ſmall figures cluſtered round the ſeat of the ſouthernmoſt of theſe ſtatues, are not deſtitute of elegance and delicacy in the execution. On the leg of the ſtatue the moſt to the north, the names of the many illuſtrious and ancient travellers who came to hear the myſtical ſound of the ſtatue of Memnon, are written in Greek. We may here ſee the great influence which celebrity exerciſes over the minds of men, ſince, when the ancient Egyptian government and the jealouſy of the prieſts no longer forbade ſtrangers to touch theſe monuments, the love of the marvellous retained its empire over the minds of thoſe that came hither as viſitors. Thus, in the age of Adrian, which was enlightened by philoſophy, Sabina, the wife of this emperor, and herſelf a literary woman, condeſcended, along with the learned men who accompanied her, to acknowledge that ſhe had heard ſounds which no phyſical cauſe could have produced. "But the vanity of inſcribing one's name on ſuch antiquities, (ſays Denon,) might very eaſily have produced the firſt on the liſt, and the natural deſire of becoming an aſſociate in this kind of glory might have added the reſt, and this is doubtleſs the reaſon of the numberleſs inſcriptions of names which we find here, with ſo many dates, and in ſo many languages."

Theſe coloſſal figures have nothing of expreſſion or action to ſeduce the judgment; but yet their proportions are faultleſs, and their ſimplicity of attitude have ſomething of majeſty and ſerioufneſs, which cannot fail to ſtrike the beholder. If the limbs of theſe figures had been diſtorted in order to expreſs ſome violent paſſion, the harmony of their outline would have been loſt, and they would be leſs conſpicuous at the diſtance at which they begin to ſtrike the eye, and produce their effect on the mind of the ſpectator; for they may be diſtinguiſhed at the diſtance of four leagues. To pronounce upon the character of theſe ſtatues, it is neceſſary to have ſeen them at ſeveral intervals, and to have long reflected on them; and after this it often happens, that what is at firſt conſidered as the work of the infancy of art, becomes aſſigned to its maturer age. If the group of the Laocoon, which ſpeaks to the ſoul as well as to the eyes, were executed in a proportion of ſixty feet, it would loſe all its beauty, and would not preſent ſo ſtriking a maſs of workmanſhip as this; in ſhort, if theſe ſtatues were more agreeable, they would be leſs beautiful, as they would then ceaſe to be, what they now are eminently *monumental*; a character which ſhould belong peculiarly to that outdoor ſculpture, which is intended to harmonize with architecture, a ſtile of ſculpture which the Egyptians have carried to the higheſt ſtate of perfection. "I again examined (ſays Denon) the block of granite, which lies between theſe two ſtatues, and I am convinced that it is the ruins of the famous coloſſal ſtatue of Oſymandyas, who, on the inſcription, braved both the ravages of time, and the pride of men. I am likewiſe perſuaded, that in a much later period, travellers have choſen to imagine one of the yet remaining ſtatues to be that of Memnon, that they might not be ſuppoſed to have come away from Egypt without ſeeing it, and, according to the uſual progreſs of enthuſiaſm, that they have *fancied* they heard the ſound which it was famed for uttering *at the riſing of the ſun*."

In this part of the territory of ancient Thebes, and at the diſtance of three quarters of a league from the river, are the ruins of a large temple, which has not been noticed by any traveller; and which may give an idea of the immenſity of that city on the left ſide of the Nile, ſince, if we ſuppoſe that it was the laſt edifice towards the eaſt, it is more than two leagues and an half diſtant from Medinet-Abu, where the moſt weſtern temple is ſituated.

In the ancient Necropolis, or City of the Dead, are innumerable ſubterranean habitations, once the burial places of the Theban commonalty. Strong in theſe dreary retreats, the preſent lawleſs inhabitants come out, like ſpectres, only to alarm men; culpable by their many other crimes, they conceal and fortify their depredations in the obſcurity of theſe excavations, which are ſo numerous as of themſelves to atteſt the immenſe population of ancient Thebes. It was acroſs theſe humbler ſepulchres, that the magnificent ſovereigns of Egypt were carried, two leagues from the palace, into the ſilent valley that was to become for the future their peaceful abode; and which is ſtill dignified by the name of "the tombs of the Theban kings." This valley to the northweſt of Thebes becomes inſenſibly narrower, and flanked as it is with perpendicular rocks, whole ages have been able to produce only very ſlight alterations of its ancient form. Towards the extremity, the opening between the rocks even now offers ſcarcely ſpace enough to paſs by the tombs, ſo that the ſumptuous proceſſions which no doubt accompanied the ceremony of royal interment, muſt have produced a ſtriking contraſt with the frowning aſperity of theſe arid rocks: if, however, they went by this

this road, it was probably only for the purpoſe of obtaining a longer ſpace, in which to roll the ſolemn tide of funereal pomp; for the valley even from its commencement tending towards the ſouth, the ſpot where the tombs are, cannot be a great diſtance from the Memnonium. Far advanced in this deſert valley, and in the midſt of the rocks, we firſt obſerve ſome obſcure openings parallel to the ground: theſe openings diſplay no other architectural ornaments than a door in a ſimple ſquare frame, with a flattened oval in the center of the upper part, on which are inſcribed in hieroglyphics a beetle, the figure of a man with a hawk's head, and beyond the circle, two figures on their knees in the act of adoration. As ſoon as the threſhold of the firſt entrance is paſſed, we diſcover long galleries twelve feet wide and twenty in height, caſed with ſtucco ſculptured and painted; the arches of an elegant elliptical figure, long erroneouſly attributed to a more modern date, are covered with innumerable hieroglyphics, diſpoſed with ſo much taſte, that notwithſtanding the ſingular groteſqueneſs of the forms, and the total abſence of demi-tint, or aerial perſpective, the ceilings make an agreeable whole, and a rich and harmonious aſſociation of colours. Paſſing from one tomb to another, at the end of the galleries are the ſarcophagi unconnected with each other, compoſed of a ſingle block of granite, twelve feet long by eight in breadth, ornamented with hieroglyphics both within and without; at one end they are rounded, and at the other ſquared, like that in the moſque of St. Athanaſius at Alexandria: the tombs are covered by a lid of the ſame material, and of an enormous maſs, ſhutting with a groove; but neither this precaution, nor theſe vaſt blocks of ſtone, brought from an immenſe diſtance, and at a vaſt expence, have been able to preſerve the relics of the ſovereigns from the attempts of avarice; all the tombs are violated, plundered, and robbed: not a ſingle mummy is to be found perfect! On the lid of the firſt ſarcophagus that we meet with, the figure of a king, or of ſome protecting divinity, is ſculptured; but the figure itſelf is ſo worn, that it is impoſſible to diſtinguiſh by the dreſs whether it is a king, a prieſt, or a divinity. In other tombs the ſepulchral chamber is ſurrounded by a pilaſtered portico, whoſe galleries bordered with receſſes ſupported in the ſame manner, and lateral chambers hollowed into the rock, are covered with a white and fine ſtucco, on which are coloured hieroglyphics in a moſt wonderful ſtate of preſervation: the colours of the ceilings, exhibiting yellow figures on a blue ground, are executed with a taſte that might decorate our moſt ſplendid ſaloons.

On the walls of ſome of the chambers are repreſented all kinds of arms, ſuch as panoplies, coats of mail, tyger's ſkins, bows, arrows, quivers, pikes, javelins, ſabres, caſques, and whips: in others there appear innumerable houſehold utenſils, ſuch as caſkets, cheſts of drawers, chairs, ſofas, and beds, all of exquiſite forms, and ſuch as might well grace the apartments of modern luxury: as theſe were probably accurate repreſentations of the objects themſelves, it is almoſt a proof that the ancient Egyptians employed for their furniture Indian woods, carved and gilt, which they covered with embroidery. Beſides theſe, there are repreſented various ſmaller articles, as vaſes, coffee-pots, ewers with their baſons, a tea-pot and baſket, &c. Other chambers are conſecrated to agriculture, in which are repreſented all its various inſtruments, a ſledge ſimilar to thoſe in uſe at preſent, a man ſowing grain by the ſide of a canal, from the borders of which the inundation is beginning to retire, a field of corn reaped with a ſickle, fields of rice with men watching them. In another chamber is a figure clothed in white, playing on a harp with eleven cords: the figure is repreſented with ornaments, and was made of the ſame kind of wood as modern ones. Many figures appear without heads, or as having the head cut off; theſe all repreſent black men; but thoſe who had cut the heads off, and were ſtill holding the ſword, the inſtrument of puniſhment, are coloured red. Could theſe be human ſacrifices? Was it the cuſtom to immolate ſlaves on the tombs; or was it the repreſentation of an act of juſtice, and the puniſhment of the guilty? Here are alſo ſome figures of divinities, cut in ſycamore-wood with uncommon elegance, and a ſmall foot of a mummy, which does no leſs honour to nature, than the other fragments do to art. It was, no doubt, the foot of a young princeſs, the perfect form of which had never been cramped by the abſurdity of faſhion. The myſtery and magnificence obſervable within theſe excavations, in incalculable labour, and the number of doors by which they are protected, convince us that the religious worſhip which had ſcooped out and decorated theſe ſubterraneous royal ſepulchres, was the ſame as that which had raiſed the pyramids.

The burial-places of the commonalty, above-mentioned, are alſo conſtructed with order and magnificence, conſiſting of a regular double gallery ſupported by pillars, behind which is a row of chambers, often double, and highly ornamented. Were it not for the tombs, and ſome remains of mummies, we might be tempted to believe that theſe were the dwellings of the primitive inhabitants of Egypt; or rather that, after having firſt ſerved for this purpoſe, theſe ſubterranean caves, had become the abode of the dead, and had, at laſt, been reſtored by the preſent ferocious occupiers to their original deſtination. In proportion as the height of theſe grottos increaſes, they become more richly decorated; and, by the magnificence both of the paintings and ſculptures, and of the ſubjects which they repreſent, they are many of them obviouſly the tombs of great men or heroes. Thoſe which are believed to belong to the ancient kings in the vale of rocks above deſcribed, are only diſtinguiſhed from theſe by the magnificence of the ſarcophagi, and the myſterious ſolitude of their ſituation. The ſculpture in all is incomparably more laboured and higher finiſhed than any we find in the temples; it is the work of the chiſel itſelf; and we might ſtand in aſtoniſhment at the high perfection of the art, and of its ſingular deſtiny, to be fixed in places devoted to eternal ſilence and darkneſs, and obſcurity. In the working of the galleries, beds of a very fine-grained calcareous clay have occaſionally been croſſed; and here the lines of the hieroglyphics have been cut with a firmneſs of touch, and a preciſion, of which marble offers but few examples; the figures have an elegance and correctneſs of contour, which modern improvement can ſcarcely exceed.

Denon continually ranſacked theſe tombs, in the hope of finding an unrifled mummy, as well as to diſcover the manner in which they were laid within the ſepulchres; and which the inhabitants had always obſtinately concealed, as the ſituation of their village had given them almoſt an excluſive trade in this ſingular article of commerce. After many painful and fruitleſs reſearches, he at laſt arrived at a hole, before which were ſcattered numerous fragments of mummies: the opening was narrow, and there was riſk in going down. Determined to perſevere, he ſtruck a light, and entered the narrow paſſage, groping on his hands and knees. Having crawled along nearly a hundred paces over a heap of dead and half decayed bodies, the vault became loftier, more ſpacious, and decorated with a conſiderable degree of care. He now found that this tomb had already been ſearched; that thoſe who had firſt entered it, not having torches, had uſed bruſhes to give them light, and that theſe had ſet fire firſt to the linen and afterwards to the gum or reſin of the mummies, which had cauſed ſuch a combuſtion as to ſplit ſome of the ſtones, melt the gums and reſins, and blacken all the ſides of the cave. He could obſerve, however, that this vault had been intended for the burial place of two conſiderable perſons, whoſe figures were ſculptured in emboſſment, ſeven feet in height, holding each other by the hand. Above their heads was a baſ-relief, repreſenting two dogs in a leaſh lying on an altar; and kneeling, two figures had the appearance of worſhipping,

ping, which makes it probable that two friends were buried here, who were unwilling to part even in death. Beſides this, there were lateral chambers unornamented, and fitted with corpſes that had been embalmed with more or leſs care; ſhewing that though the tombs had been conſtructed and decorated by perſons of conſequence, they received not only the corpſes of the founders, but of their children, friends, relations, and perhaps all the ſervants of their houſe. Several bodies ſwathed up, but without any coffin, were lying on the ground, and there were as many of theſe as could be laid in a regular order. From a number of bodies which were not ſwathed up, it appeared that circumciſion was a conſtant rite among them, that depilation was not practiſed among the women, that their hair was long and flexible, and the character of the head was in a fine ſtyle. He next deſcended with ſome inconvenience into ſeveral deep pits, where he found fragments of more mummies, and large long pots of baked earth, with covers repreſenting human heads; they contained nothing but a kind of reſin, the ſubſtance with which the mummies appeared to have been embalmed.

The plan of theſe excavations is wholly inexplicable. There are ſome which are ſo vaſt and complicated, that one would take them for labyrinths, or ſubterranean temples. After paſſing many apartments, adorned in an elegant ſtyle, we enter long and gloomy galleries, which wind backwards and forwards in numerous angles, and ſeem to ocupy a great extent of ground; they are melancholy, repulſive, and without any decoration; but from time to time open into other chambers covered with hieroglyphics, and branch out into narrow paths that lead to deep perpendicular pits, which we deſcend by reſting our arms againſt the ſides, and fixing our feet into ſteps that are cut in the rock. At the bottom of theſe pits are other adorned chambers; and lower ſtill, a freſh ſeries of perpendicular pits, and horizontal chambers. It would require ſeveral days to form an idea of the diſtribution of theſe ſubterranean works, and to take plans of ſuch intricate labyrinths; if the magnificence diſplayed in the houſes of the living was at all equal to that of theſe ultimate habitations, as we have ſome reaſon to ſuppoſe, from the ſumptuous pieces of furniture painted in the tombs of the kings, how much muſt we regret that no veſtige of them remains! What can have become of palaces that contained ſuch opulence? how can they have diſappeared? they cannot be buried under the mud of the Nile, ſince the quay which is before Luxor ſhews, that the elevation which the ſoil has undergone is very inconſiderable. Were they built of unbaked, and therefore periſhable, earth? or did the great men, as well as the prieſts, inhabit the temples, and the people only huts?

The interior of all theſe ſepulchral chambers is coated over with a ſmooth ſtucco, on which are painted, in every colour, ſubjects of funereal proceſſions, much leſs laboured indeed than the bas-reliefs, but equally intereſting, from the ſubjects which are repreſented; the remains of which are ſtill perfect, and atteſt their extreme magnificence. The painted figures of the gods are here carried by prieſts upon litters, with banners waving over their heads, and followed by perſonages bearing golden vaſes of ſeveral forms, calumets, arms, loaves of bread, victuals of different kinds, and coffers of various conſtructions.

Fragments of mummies are here in plenty. Denon offered an unlimited reward to any who ſhould procure him one whole and untouched; but the cupidity of the Arabs deprived him of ſuch a curioſity; for they ſell at Cairo the reſin which they find in the belly and ſkull of theſe mummies, and there is no preventing them from committing this violence on the dead; and beſides, the fear of ſelling one that might contain ſome treaſures, makes them always break the outer wooden covering, and tear that of painted cloth, which wraps round the whole body, wherever much coſt and pains have been taken in the embalming.

The art of embalming the dead, was the peculiar province of the phyſicians; and of which there were three modes of preparation. One was truly exquiſite, appropriated to the kings and nobles, and coſt a talent of ſilver, or 258l. 6s. 8d. ſterling; the ſecond was for inferior perſons, and only amounted to twenty minæ, or a fourth part of the former ſum; and the third, being for the lower orders of the community, coſt but a trifle. To prepare the mummies according to the firſt or ſuperior method, the embalmers took the corpſe, and with a crooked iron inſtrument drew the brains through the noſtrils, and filled up the vacuity with a variety of rich perfumes. A perſon, called the paraſchiſtis, then cut open the left ſide of the belly, and drew out all the inteſtines; another cleanſed the entrails, waſhing them with wine of palms, and perfuming them with ſeveral aromatic drugs; the cavities were then filled with pounded myrrh, caſſia, &c. The inciſion being ſewed up, the corpſe was carefully anointed for thirty days with a balm calculated to ſtop up all the pores. At the expiration of this term, every part was covered with fillets of fine linen, overſpread with gum, and incruſted with the moſt exquiſite perfumes; and this was done ſo curiouſly, that the very hairs on the brows and eye-lids remained uninjured, and the countenance was preſerved ſo admirably as to be eaſily recogniſed. The embalmers having thus prepared the body, delivered it to the relations, who put it in a wooden coffin, and placed it in an upright poſition, either in a ſepulchre or in one of their own apartments; for many of the Egyptians kept their dead at home, eſteeming it a great comfort to behold the lineaments of their anceſtors, in this ſtate of preſervation. The ſecond mode of preparation was effected by ſyringing oil of cedar the common way, without inciſion, and by laying the body in nitre for the ſpace of ſeventy days, at the expiration of which the entrails came away, ſhrunk and putrified, the nitre having conſumed the fleſh, and left nothing but the ſkin and bones: the corpſe was then delivered to the relations without farther ceremony. The third method, uſed for the lower claſs, was performed by cleanſing the belly with injected lotions, and laying the corpſe in ſalt for ſeventy days, after which it was carried to the ſepulchre. The method of embalming uſed by the modern Egyptians, according to Maillet, is to waſh the body ſeveral times with roſe-water; which, he obſerves, is more fragrant in that country than with us; they afterwards perfume it with incenſe, aloes, and a quantity of other odours, of which they are by no means ſparing; they then bury the body in a winding-ſheet, made partly of ſilk and partly of cotton, and moiſtened, as is ſuppoſed, with ſome ſweet-ſcented water or liquid perfume, though Maillet uſes only the term *moiſtened*; this they cover with another cloth of unmixed cotton, to which they add one of the richeſt ſuits of clothes of the deceaſed.

Denon, purſuing his rout to the extremity of Upper Egypt, viſited Eſneh and Etfu. The modern Eſneh is the ancient Latopolis. Some remains are ſtill viſible of its port or quay on the bank of the Nile, which has been often repaired, but, notwithſtanding all that has been done for it, ſtill it remains in a very miſerable condition. This town contains the portico of a temple, which appears to be one of the moſt perfect monuments of ancient architecture. It is ſituated near the bazar in the great ſquare, and would make an incomparable ornament to the ſpot, if the inhabitants had any idea of its merit; but inſtead of this they have deformed it by the moſt miſerable ruined hovels, and have devoted it to the vileſt purpoſes. The portico is well preſerved, and poſſeſſes a great richneſs of ſculpture: it is compoſed of eighteen columns, with broad capitals; all of which are noble and elegant. The hieroglyphics in relief, with which it is

Ruins of the Temple at Apollinopolis Magna or Etfu.

London Published As the Act directs April 21st 1804 by J. Wilkes

covered within and without, are executed with great care; they contain, among other fubjects, a zodiac, and large figures of men with crocodiles' heads: the capitals, though all different, have a very fine effect; and, as a proof that the Egyptians borrowed nothing from other people, we may remark that they have taken all the ornaments, of which thefe capitals are compofed, from the productions of their own country. It is fingular, however, that in this ruin we find no repreſentation of the fifh *latus*, from which the town was named Latopolis.

On the oppofite fide of the Nile is the precinct of Contra-Latopolis; where we find a temple in a very ruinous ſtate, but very picturefque and fingular in its plan, as well as in ſeveral of its parts. It conſiſts of a portico with four columns in front, two pilaſters, and two columns in the depth, with a ſanctuary in the middle, and two lateral apartments, one of which, on the right hand, is ſcarcely to be traced. Within the portico is a door cut out of the lateral wall to the right, which muſt have been the entrance of a ſmall ſanctuary in which the offerings were made. Another ſingularity in the elevation of this edifice is, that the capitals of the two columns in the middle of the portico are in relief at their ſummit, while thoſe of the columns at each extremity are guttered. This building is in a more ruinous ſtate than almoſt any other in Egypt; and the decay has undoubtedly arifen from the nature of the free-ſtone with which it was built. The circumvallation of the temple, within which were contained the lodgings of the prieſts, may be pretty diſtinctly made out; and the whole of this enclofure is ſomewhat elevated above the ſmall city of Contra-Latopolis, which was built round the compaſs of this monument. It would appear to have been the practice that all the great cities on the bank of the Nile ſhould have a ſmall city or port on the oppoſite bank, which was probably placed there for the convenience of commerce.

In the road from hence to Etfu, we paſs Aſfun, about two leagues and a half from Eſneh. This village is built over vaſt heaps of rubbiſh, among which it appears more natural to look for the ruins of Aphroditopolis, Aſphinis, or Aſphunis, than among thoſe of the temple above deſcribed. What Strabo ſays of this town agrees better with its diſtance from Latopolis; and the reſemblance of the name Aſfun to Aſphunis, of which there are many ſimilar examples in Egypt, ſtrengthens this opinion. Sofinis, indeed, half a league further on, has alſo eminences of decayed ruins, though leſs conſiderable; but as neither village is poſſeſſed of any monuments above the graſs, we muſt wait for ſome excavations to be made, before it can be decided to which belongs the honour of having been the city of Venus.

Etfu is the ancient city of Apollo; and here are the ruins of the once celebrated Hieraconpolis, which conſiſt of the remains of a gate belonging to an edifice of very conſiderable magnitude; as appears alſo from the ſize of the ſtones, the extent of ground occupied by the fragments, and the diameter of the defaced capitals, which lie ſcattered on every ſide. The ſtone of which this temple is built, is of ſo friable a quality, that the form of the edifice is entirely loſt, and none of the plan can be made out. Some yards further, the ruins of another immenſe building is with difficulty diſtinguiſhed, owing to the great decay; the other remains of the town are only a few heaps of highly-burnt bricks and ſome blocks of granite.

Apollinopolis Magna, once ſo celebrious, ſtill enjoys its unique ſituation, commanding in its ſcite the river, and the whole vale of Egypt; where its magnificent temple towered over the reſt like a large citadel, which keeps the adjacent country in awe. This compariſon is, indeed, ſo naturally ſuggeſted by the ſituation of this immenſe fabric, that it is only now known to the natives by the name of the *fortreſs*. This edifice, in extent, majeſty, magnificence, and high preſervation, ſurpaſſes almoſt every thing elſe in Egypt, or elſewhere. The building compriſes a long ſuite of pyramidal gates, of courts decorated with galleries, of porticoes, and of covered naves, conſtructed, not with common ſtones, but entire rocks. The excellent preſervation of this ancient edifice forms a wonderful contraſt with the grey ruins of modern habitations built within its vaſt inclofure; a part of the population of the village is contained in huts built in the courts, and around the fragments of the temple; which, like ſwallows neſts under the eaves of our houſes, deſile them without concealing or injuring their general appearance. This ſublime temple of Apollinopolis Magna, was built at a period when the arts and ſciences had acquired all their ſplendour in Egypt; the workmanſhip of every part is equally beautiful, the hieroglyphics are admirably executed, the figures more varied, and the architecture of a higher order, than in the edifices at Thebes; the building of which muſt be referred to an earlier age. A correct view of this ſuperb ruin is given in the annexed engraving.

Still aſcending the left bank of the Nile, on which Eſneh and Etfu are ſituated, Denon, with eager ſteps, at length reached Syene, and the iſland of Elephantina. Aſſuan, or Syene, is ſituated at the extremity of Upper Egypt, on the confines of Ethiopia. Here the convent of St. Lawrence, once ſo celebrious, is now a ruin. Above it is a watch-tower, from the lofty ſummit of which a moſt ſingular view preſents itſelf of the beautiful iſland of Elephantina, and the chaotic rocks, over which the Nile flows in all its majeſtic grandeur, to poſſeſs the rich and fertile vale of Egypt, from the cataracts to the Delta. The firſt effects of its bounties are ſeen around the granite rocks, in the hollows of which the ſand and ſlime brought down by the waters are depoſited, forming a baſis for vegetation, which continues to increaſe, and to embrace a larger and wider field. At Elephantina, the cultivation, the trees, and the habitations, exhibit ſuch a picture of perfection in the gifts of nature, that it has received the Arabian name of *Kezirat-el-Sag*, or the Flowery Iſland, in the midſt of the Nile. The entrance of this prolific river into Egypt, after flowing through the granite blocks which defend the iſland of Elephantina, ſeems to triumph over ruins of the higheſt antiquity. Syene muſt have been once a very conſiderable city, if the edifices on the right and left of the Nile, and thoſe of Elephantina in the middle, formed but one town; which may be preſumed, ſince they are only ſeparated by a channel that in this place is deep but not broad; the Arabic ruins are grouped on a rock to the eaſtward; below are Roman remains, which are alſo found in ſeveral of the monuments at Elephantina. On the Syene ſide of the river there are no other remains of the original Egyptian towns, than the ruins of a ſquare temple ſurrounded with a gallery, but ſo ſhattered and ſhapeleſs, that nothing can be ſeen but the embraſure between two pillars, with the capitals and a ſmall part of the entablature; this fragment is what Savary, who confeſſes that he never was at Syene, relates on hear-ſay to be probably the remains of the ancient obſervatory, in which, according to him, the nilometer, or gauge of the annual increaſe or inundation of the Nile, ſhould be ſought for. But it is here proper to deſtroy the error; of which, however, this elegant writer is not the author; for he has only copied, and thus related every thing, pointed out every thing, and painted in a ſurpriſing manner, *what he had never ſeen*.

It was at the ſouthern extremity of the iſland of Elephantina, that the Egyptian town and the Roman habitations were ſituated, and the Arabian buildings which ſucceeded them. The part occupied by the Romans can only now be made out by the bricks, the teſſellated pavements, and the ſmall images of porcelain and bronze, which are ſtill found; the Arab quarter is only diſtinguiſhed by the dunghills, with which they have covered the ſoil, a common feature to all the ruins of the ſuperb edifices of this country! Every thing poſterior has diſappeared, ſo as to leave ſcarcely the leaſt trace of its

exiſtence; whilſt the original Egyptian monuments remain, devoted to poſterity, having reſiſted equally the ravages of man and of time. In the midſt of this field of ruins, a very ancient temple is ſtill left ſtanding, ſurrounded with a pilaſtered gallery, and two columns in the portico. It is covered both within and without with hieroglyphics in relief, very neatly cut, and in good preſervation. This is ſuppoſed to be the temple of Cneph, the benevolent genius among the Egyptian gods, who approaches the neareſt to our ideas of the Supreme Being. There is alſo a temple of this deity about ſix hundred paces more to the north, of the ſame form and ſize, though more in ruins, all the ornaments of which are accompanied by the ſerpent, the emblem of wiſdom and eternity, peculiar to the god Cneph.

In the middle of the iſland there are two frames of a large outer door, made of blocks of granite, and ornamented with hieroglyphics. Theſe remains certainly indicate monuments of great magnificence. At the eaſt is another fragment of a very highly-finiſhed edifice; and the hieroglyphics that remain are perfectly well ſculptured. This temple obviouſly communicated with a narrow paſſage, which, to judge by the traces of a number of ſucceſſive buildings, terminated on a gallery open to the Nile, and reſting on a large embanked facing, which defended the eaſtern part of the iſland from being worn away by the current of the river. Three porticoes of this gallery ſtill remain, and a flight of granite ſtairs, which dip into the river. "May not this gallery, (aſks Denon,) and this ſtair-caſe, be the obſervatory and the nilometer which travellers have in vain fought for at Syene?" Strabo, however, who had obſerved Syene with care, and has deſcribed it minutely, ſays, that this nilometer was a well which received the Nile waters, and that the marks by which the height of the inundation was eſtimated, were engraved on the ſides of this well.

All theſe buildings are founded upon maſſes of rock, covered with hieroglyphics, engraved with more or leſs care. Further on, turning towards the north, are two portions of parapet, which leave between them an opening, through which one may deſcend to the river: on the inner ſide of the right parapet is a bas-relief in marble, repreſenting the figure of the Nile four feet in height, in the ſame attitude with a coloſſal ſtatue of the ſame ſubject which is at Rome. This copy of the ſame idea proves both that the edifice is Roman, and that this people, in their eſtabliſhment at Syene, having had opportunity of adding the ornaments of luxury and ſuperfluity to works of the firſt neceſſity, had eſtabliſhed rather a powerful colony there than a mere military poſt: the baths and valuable bronze utenſils, which are daily found there, ſupport this opinion of the richneſs and permanency of this colony, which extended above the cataracts.

The quarries of the cataracts above Syene conſiſt of granite rocks, whence the blocks ſeem to have been taken which formed the material of the coloſſal ſtatues, that have been the object of admiration to ſo many ages, and the ruins of which ſtill ſtrike us with aſtoniſhment. It ſeemed as if the framers wiſhed to preſerve the memorial of the maſſes that have produced theſe blocks, by leaving on the place hieroglyphical inſcriptions, intended, perhaps, to record the event. The texture of this granite is ſo hard and compact, that the rocks which are met with in the current, inſtead of becoming worn and ſhattered by decompoſition, have acquired a poliſh by the daſhing of the waves. The fineſt and moſt abundant of this kind of ſtone, is the roſe-coloured granite; the grey is often too micaceous; between theſe blocks are found veins of very brilliant quartz, ſtrata of a red ſtone, which partakes of the nature and the hardneſs of porphyry, and maſſes of that black and hard ſtone, which has been ſo long taken for baſalt, and which the Egyptians have often employed for ſtatues of moderate ſize.

After paſſing the cataracts, the rocks grow loftier, and on their ſummit rocks of granite are heaped up, appearing to cluſter together, and to hang in equipoiſe, purpoſely to produce the moſt pictureſque effects. Through theſe rough and rugged forms the eye all at once diſcovers the magnificent monuments of the iſland of Philoë, which form a brilliant contraſt, and one of the moſt ſingular ſurprizes that the traveller can meet with. The Nile here makes a bend, as if purpoſely to form this enchanting iſland, where the monuments are only ſeparated by tufts of palm-trees, or rocks that appear to be left merely to contraſt the forms of nature with the magnificence of art, and to collect, in one rich ſpot, every thing that is moſt beautiful and ſublime. The enthuſiaſm which the traveller ſo conſtantly experiences at the ſight of the monuments of Upper Egypt, may appear to the reader a perpetual and monotonous exaggeration; it is, however, only the ſimple expreſſion of feeling which the ſublimity of their character excites; and which raiſes involuntary expreſſions of ſurprize and admiration, every time they impreſs the aſtoniſhed beholder. The road leading towards Philoë acroſs the deſert, has one peculiarity, which is, that there are evident remains of its having been tracked out, and raiſed as a cauſey, and that there was much traffic on it in former times. This is the only part of Egypt in which a high road is abſolutely neceſſary; for the Nile here ceaſing to be navigable on account of the cataracts, all the merchandize of the Ethiopian trade which is landed at Philoe, muſt be conveyed by land to Syene, to be there re-embarked. All the large blocks of ſtone on the road ſide are covered with hieroglyphics, as if intended for the amuſement of the paſſengers. One of the moſt ſingular of them preſents the form of a ſeat cut out of the ſolid rock, with a flight of ſteps to climb up to it; and the whole ornamented with hieroglyphics executed with great care. Another ſingular object, is the ruins of military lines made of bricks baked in the ſun, the baſe of which is from fifteen to twenty feet in thickneſs. This entrenchment extended along the valley by the road-ſide, and terminated at rocks and forts near three leagues from Syene. Though the materials of which theſe walls were built were cheap, yet the expence of putting them together muſt have been very great, and ſhews the importance attached to the defence of this point. Theſe are ſuppoſed to be the remains of the famous wall raiſed by a queen of Egypt, named Zuleikha, daughter of Ziba, one of the Pharaohs, which extended from the ancient Syene to the place where El-Ariſh is now ſituated, the fragments of which the Arabs call *Haiſ-el-adjowz*, or the old woman's wall.

It is imagined that it was to produce a ſtriking effect upon ſtrangers entering their territory, that the Egyptians had raiſed upon their frontier ſuch a ſplendid group of monuments. Philoë was the *entrepôt* of a commerce of barter between Ethiopia and Egypt; and wiſhing to give the Ethiopians a high idea of their reſources and their magnificence, the Egyptians erected ſo many ſumptuous edifices on the confines and natural frontier of their empire. The ruins in Philoë conſiſt of a ſanctuary, faced by a portico of four columns with very elegant capitals, to which had been added at a later period another portico, which doubtleſs was attached to the circumvallation of the temple. The moſt ancient part, which was alſo conſtructed with more care, was ornamented in a higher degree than the reſt; the uſe ſince made of it in the rites of the Chriſtian religion has impaired the original character, by adding ſquare arched door-ways. In the ſanctuary, cloſe to the figures of Iſis and Oſiris, may ſtill be ſeen the miraculous impreſſion of the feet of St. Anthony, or St. Paul the hermit. Here are other convincing proofs that theſe buildings had been conſtructed at different periods, by ſeveral nations, and had belonged to different forms of religious worſhip; and the union of theſe various edifices, each of them in itſelf regular, and crouded together in a narrow ſpace, forms an irregular group of moſt pictureſque and magnificent objects.

jects. We might here diſtinguiſh eight ſanctuaries or ſeparate temples, of different dimenſions; yet avoiding, with great dexterity, falſe angles and general irregularities. This kind of confuſion of the architectural lines, which appear like errors in the plan, produce in the elevation a picturesque effect, which geometrical rectitude cannot give; it multiplies objects, forms elegant groups, and offers to the eye more richneſs than cold ſymmetry can ever command. The mode of building with the ancient Egyptians was, firſt to erect large maſſes, on which they afterwards beſtowed the labour of ages, in the particulars of the decoration, beginning their work with ſhaping the architectural lines, proceeding next to the ſculpture of the hieroglyphics, and concluding with the ſtucco and the painting. All theſe diſtinct periods of work are very obvious here, where nothing is finiſhed but what belongs to the higheſt antiquity: whereas a part of the ſubordinate buildings, which ſerved to connect the various monuments, had been left in many particulars without finiſh, without ſculpture, and even incomplete in the building.

This ſingularly magnificent pile exhibits the whole of theſe different periods of workmanſhip; and it would be difficult to aſſign any uſe to this edifice, if the preſence of certain ornaments, repreſenting offerings, had not pointed it out to be a temple. Yet it has neither the form of a portico, nor of a temple; the columns which compoſe its outer circumference, and which are engaged in the wall only half their height, ſupport nothing but an entablature and a cornice, without roof or platform: it only opened by two oppoſite doors without lintels, which made a ſtraight paſſage through in the longitudinal direction. As it was doubtleſs built in the later period of the Egyptian power, it ſhews the perfection of their art in the higheſt purity; the capitals are admirable in beauty and execution, the volutes and the foliage are as gracefully waved as the fineſt Greek architecture.

The innermoſt temples contain ſtill more myſterious ſanctuaries, ſuch as monolithic temples, or tabernacles of a ſingle ſtone, intended perhaps as the repoſitories of what was moſt precious and moſt ſacred to the worſhippers; perhaps even the ſacred bird, which repreſented the preſiding deity of the temple; the hawk, for example, the emblem of the ſun, to whom the building, according to Dr. Bryant, was conſecrated. On the ceilings of the ſame portico are painted aſtronomical pictures, the theories of the elements; on the walls, religious ceremonies, images, prieſts, and gods; by the ſide of the gates gigantic portraits of victorious ſovereigns, or emblematical figures of ſtrength or power threatening a group of ſuppliant figures, which they hold with one hand by the hair of the head. Here are alſo the remains of a domeſtic ſcene, which appears to be that of Joſeph and Mary, in their flight into Egypt; done in a ſtyle of the utmoſt truth and intereſt. This building altogether affords a high proof of the noble ſimplicity of Egyptian architecture; and would ſhew, in a ſtriking manner, that it is character, and not extent alone, which gives dignity to an edifice.

Beſides the Egyptian monuments, Greek and Roman ruins are found at the ſouth-eaſt of the iſland of Philoë, which appear to be the remains of a ſmall port, and a cuſtom-houſe, of which the wall of the façade is decorated with pilaſters and arcades of the doric order: ſome ſtanding fragments of columns ſhew an open gallery, or a kind of portico in front; between theſe ruins and the Egyptian monuments, the ſurbaſe of a Chriſtian church may be remarked, which is built of antique fragments, mixed with croſſes and Greek ornaments of the later ages; for in theſe countries catholiciſm has been too feeble to remove entirely her own worſhip from the pomp of idolatrous temples. After having eſtabliſhed her ſaints in the face of the Egyptian deities, ſhe has often painted a St. John, or St. Paul, by the ſide of the goddeſs Iſis, and diſguiſed Oſiris into St. Athanaſius; or elſe, quitting the heathen temples altogether, ſhe has dilapidated them, and taken the ready-made materials to conſtruct her own edifices of religious worſhip.

The quarries, of which Pocock ſpeaks, terminated the march of the French army in its conqueſt of Upper Egypt; which event general Deſaix carefully inſcribed on one of the granite rocks near the ancient monaſtery of cenobites. This original ſeat of the community is ſituated in a ſmall valley, ſurrounded with ſhattered rocks, and with ſands produced by their decompoſition. The cells of the monks are mere receſſes, about ſeven feet ſquare, enlightened only by a diſmal window, ſix feet from the ground: this refinement of auſterity, however, only concealed from the eye of the recluſe the view of the vaſt expanſe of heaven, an equally boundleſs horizon of ſand, and a bright uninterrupted light, varied neither by clouds nor rain; hence more melancholy than night, more waſting to the corporeal frame, and perhaps more impreſſive of the gloomy picture of their ſolitude. In this dungeon a bed of bricks, and a receſs ſerving as a cloſet, were all the conveniences which had been added to this ſpace between four walls; and a tower placed by the ſide of the gate, ſhews alſo that even the auſtere repaſt of theſe cenobites was taken in ſolitude. Nothing now indicates the remains of the habitation of man, but ſome ſhort ſentences written on the walls; and an extenſive court or area, with lofty embattled walls, covert ways, and embraſures for cannon; which ſeem to announce that the ſtorms of war had ſucceeded the horrors of ſilence in this retired place; and that this edifice, torn from the cenobites, who had raiſed it with ſo much zeal and perſeverance, had at different periods ſerved as a retreat to the vanquiſhed, or as an advanced poſt to ſome victorious army.

Returning from Aſſuan by the right bank of the Nile, Denon firſt reached the ancient Ombos, where the crocodile was ſaid to be worſhipped, and which is ſtill called Com-Ombos, *the mountain Ombos*; and it is ſituated on an eminence, which commands the country, and projects out to the very margin of the river. If all the fragments which are here ſeen belonged to a ſingle edifice, it muſt have been immenſe. In the center is a grand portico of columns with wide capitals, in very large proportion; on the ſouth, one gate is preſerved entire; it joined a wall of circumvallation, which is deſtroyed; at the weſt, and on the bank of the Nile, an enormous mole was raiſed, which is at preſent in ruins at its upper part; the inundations of the river have laid bare its foundations for ſixty feet in depth, they were conſtructed with the ſame ſolidity and magnificence as the ornamental part. Towards the north, in the ſame direction, the remains of a temple or gallery may be ſeen, in ſmaller proportion, with columns and capitals. In the open ſpace between theſe two laſt edifices, was a parapet made of hewn ſtone, which opened to the view the grand temple in the middle, and muſt have produced a theatrical and magnificent effect. Whatever compoſed the remainder of the ancient town of Ombos, it could not but offer a very majeſtic view when entire; ſince, dilapidated as it is, and encumbered with vile huts, the forms of beauty which it diſplays produce a moſt magic picture of ſplendid antiquity.

The rocks or quarries of Gebel Silſilis, are ſituated between Eſne and Ombos. The ſtone of theſe quarries being of an equal grain and uniform texture, blocks may be cut out of them as large as can be deſired; and it is doubtleſs to the beauty and unalterability of this material, that we owe the vaſt ſize and fine preſervation of the Egyptian buildings, which are our admiration at the preſent time, ſo many centuries after the date of their conſtruction. From the immenſe excavations, and the quantity of fragments which may ſtill be ſeen in theſe quarries, we may ſuppoſe that they were worked for ſome thouſands of years; and they alone might have ſupplied the materials employed for the greater part of the temples of Egypt. The diſtance would, in fact, prove no obſtacle,

ſince the Nile, during its inundation, would conſtantly convey theſe materials to the places of their deſtination. The mania of erecting monuments among the Egyptians, ſhews itſelf on every ſide in theſe quarries; which, after having furniſhed materials for the erection of temples, were themſelves conſecrated by monuments, and decorated with religious edifices. On the ſhore of the Nile may be ſeen portieoes with columns, entablatures, and cornices, covered with hieroglyphics, all cut out of the ſolid roek; and likewiſe a large number of tombs, alſo hollowed out of the mountain. Theſe tombs are ſtill very curious, though they are diſfigured with trenches and rubbiſh. In ſeveral of them ſmall private chambers are found, many of which contain large ſealed figures; theſe chambers are adorned with hieroglyphies traced on the rock, and terminated with coloured ſtucco, repreſenting offerings of bread, fruits, liquors, fowls, &c. The ceilings, alſo of ſtucco, are ornamented with painted ſcrolls in an exquiſite taſte; the floor is inlaid with a number of tombs of the ſame dimenſions and form as are given to the caſes of mummies, and equal in number to the ſculptured figures: thoſe that repreſent men have ſmall ſquare beards, with a head-dreſs hanging behind over the ſhoulders; the women have the ſame dreſſes, but falling down in front over their naked necks. Theſe latter are commonly repreſented with one arm paſſing within the arm of the figure beſide them, and the other holding a lotus flower, a plant of Acheron, the emblem of death. The tombs that contain but a ſingle figure are probably thoſe of men who have died in celibaey; where three are contained, they repreſent perhaps a huſband who had two wives, either at one time or ſueceſſively. The doors are all deeorated with jambs covered with hieroglyphics, and ſurmounted with a coping, which forms a eornice, and an entablature on which a winged globe is always ſculptured. The choice of this ſituation for the habitations of the dead, ſhews, that at all times in Egypt, the ſilenee of the defert has been the aſylum of death, ſince even now the Egyptians carry their dead into the deſert three leagues from their habitations, that the dryneſs of the ſands may preſerve them from eorruption; and they go thither every week to pray over their remains.

The banks of the Nile from Ombos to Tentyra are greatly infeſted with crocodiles; but they ſeem to prefer certain reaches of the river, and abound moſt of all near Hermontes, called alſo *Crocodilopolis*. At the laſt-mentioned place Denon ſaw three of them; one, much larger than the reſt, was nearly twenty-five feet long; they were all aſleep, ſo that he could approach them within twenty paces, and had time to diſtinguiſh all the peculiarites which give them ſuch a hideous aſpect: he ſays they reſembled diſmounted cannon. He fired on one with a heavy muſquet; the ball ſtruek him and rebounded from his ſcales; he made a leap of ten feet, and dived into the river. They are not to be ſeen about Syene; but re-appear above the cataracts.

From Ombos and Siſilis the road leads to Chenubis. Within a quarter of a league of this city are two tombs hewn out of the rock, and a ſmall ſanctuary ſurrounded by a gallery, having a portico in front. Of profound antiquity are the temples of Chenubis, the ruins of which, as well as thoſe of the city itſelf, are in ſo diſjointed a ſtate, and ſo varied in their proportions, that it is very difficult to form any correct idea of their plan. The moſt conſiderable and moſt elevated parts conſiſt of ſix columns, the capitals of three of which belly out, while thoſe of the three others, which are parallel to them, are guttered, and united by an entablature. In the front of this fragment of ruins, to the ſouth, are the baſes of a portico, which appears not to have been finiſhed; and, in the ſame direction, is a block of granite which ſeems to have belonged to a coloſſal ſtatue. In an eaſtern direction is a fine baſin of water, the circumferenee of which is lined and decorated by a gallery formed of columns. In the weſtern part of the city the gate of a ſanctuary preſents itſelf, together with two very minute fragments. In the front is a lining in the form of a quay on the Nile. Among theſe architectural remains are ſeveral ruins of ſculpture; among others a group of two figures coupled together, three feet in height, the heads of which have been broken off. What is moſt curious at Chenubis, is an incloſure, the walls of which are built of unbaked bricks, and are of a conical ſhape, having at their baſe a thickneſs of upwards of twenty-ſeven feet. This extraordinary work, of which hiſtory makes no mention, is in many parts in an entire ſtate. It has been ſuppoſed that it was of Arabie conſtruction; but as there are no traces of Arabic edifices on the ſcite of Chenubis, it is preſumable that it is a work of high antiquity, and in this caſe there can never be occaſion to conſtruct fortifieations of any other deſcription in Egypt, with the exceptions of the jambs and embraſures, together with ſuch other parts as are expoſed to friction. In this inſtanee all the great maſſes have completely reſiſted the ravages of time, and may ſtill be employed in any defenſive meaſures. At a conſiderable diſtanee are the remains of two temples, the plans of which could not be traced. Theſe ruins ſeemed to be depoſited there merely to point out the ſcite of the city of Juno Lucina, which the infallible d'Anville has laid down in this latitude.

Repaſſing Thebes on the right ſide of the river, we approaeh Kous, which is the ancient Apollinopolis Parva. It is ſituated at the entranee of the opening of the deſert which leads to Berenice and Coſſir, and is ſtill beautiful on the ſouth ſide. Its immenſe plantations of melons, and its numerous and abundant gardens, muſt for ever make it delicious to the inhabitants of the ſhores of the Red Sea, and to the thirſty travellers who croſs the deſert. It has ſucceeded to the commerce and Chriſtian eſtabliſhment of Coptos; for the Copts are its moſt numerous inhabitants. Here is the top of a gate, the only remnant that is left of the ancient Apollinopolis Parva. This ſingle fragment appears larger than all the reſt of the town, and offers a ſtriking picture of the eternity that characterizes the Egyptian architecture. The other parts of the edifiee are doubtleſs buried under the mountain of rubbiſh that is occupied by the modern town. This gate bears an inſcription greatly poſterior to the original monument, and affords a curious example of ſkilful flattery in a preſect of Upper Egypt, in the time of the Ptolemies, and who, on account of ſome repairs twenty or thirty centuries after the firſt building of the temple, ventured to dedicate it to his maſters, to inſcribe the gate with their names, in order to tranſmit them to poſterity. Thus the glory of kings can only reſiſt the flood of time by being exalted on the monuments raiſed by the arts; deprived of this ſupport, they are buried in the overwhelming ſtream, leaving behind them only empty names that hiſtory repeats in vain. What would become of Achilles without his immortal monument, the Iliad of Homer; or of Seſoſtris, without the remains of theſe his coeval temples? The names of Pericles, of Auguſtus, of the Medicæan Lorenzo, are illuminated by the torch of literature and the arts; while the tombs of Genſeric, Attila, Tamerlane, and the other barbarian deſtroyers, are loſt among the common ruins of time!

The ruins of Keft or Coptos, once ſo famous for its commerce with the eaſt, are ſeen at a little diſtance from Kous. Nothing of its ancient ſplendour can now be diſtinguiſhed; but the extent of the heaps of ruins with which it is ſurrounded, points out the ſcite of the ancient city. The old town is as deſolate as the deſert, on the border of which it ſtands. It remains in nearly the ſame ſtate in which it was left by the conflagration which terminated the long ſiege that deſtroyed it in the third century, under the perſecutions of Diocletian. The old limits of the city have been abandoned, and to this has ſucceeded an Arab town, with a boundary wall of unbaked

The Egyptian Zodiac in the Temple of Tentyra.

London Published as the Act directs June 9th 1804 by J. Wilkes

baked bricks; beyond which, verging to the weſt, is the hamlet of Keft, which ſtill exiſts. Was Coptos the original name of this town? (See the article COPTOS, vol. v, p. 179.) And did the ancient Copts take their name from that of Coptos; where zeal collected their numbers, and made them ſuſtain ſo obſtinate and diſaſtrous a ſiege in the time of Diocletian? One may evidently diſtinguiſh the different ruins of two temples of high antiquity, and thoſe of a Chriſtian church, in which, taſte and art in the conſtruction were certainly leſs remarkable than the magnificence and richneſs of the materials employed: the fragments of porphyry and granite columns and pilaſters, ſcattered over a vaſt ſpace of ground, remain to atteſt the opulence and luxury of the firſt believers; but the ſculpture on the doric friezes, ſome fragments of which are ſtill viſible, ſhew that at this period the efforts at embelliſhment, which art could command, only impoveriſhed the ſumptuous magnificence of the materials. All theſe monuments lie without form and order on the ground, a very few portions of which are left ſtanding.

From Coptos we are led to Keneh, or Kenneh, which the French had intended to make the centre of commerce in Upper Egypt. Keneh has ſucceeded Kous, as Kous had ſucceeded Coptos. Its ſituation has this advantage, that it is immediately at the entrance of the deſert on the eaſtern bank of the Nile. It has never been ſo flouriſhing as the above-mentioned cities, becauſe its exiſtence is dated after the commerce of India had been diverted, and in a manner annihilated, either by the diſcovery of the route to India by the Cape of Good Hope, or by the tyranny of the Egyptian government. Its commerce, being confined to the paſſage of the pilgrims, is very inconſiderable, unleſs at the time when the great caravan is on its route. It is here that the pilgrims of the Oaſis on the ſide of Lybia, together with thoſe of Upper Egypt, and a few Nubians, take in their ſupplies, providing not only what is neceſſary for the paſſage acroſs the deſert to Coſſir, but alſo for the journey to Gidda, Medina, and Mecca, as well as for their return from thence. They are under the neceſſity of doing this, becauſe, the above cities being ſituated on a flinty deſert, the inhabitants have no other reſource except the gold they amaſs, inſomuch, that if, thanks to fanaticiſm, Mecca has continued to be a point of contact between India, Africa, and Europe, it has likewiſe become an abyſs, in which a population of an 120,000 ſouls abſorbs the gold of India, of Aſia Minor, and of every part of Africa.

Nearly oppoſite to Keneh, acroſs the river, ſtands Dendera, once the magnificent city of Tentyra, whoſe ſuperb remains ſtill aggrandize the weſtern ſhore of the Nile. To this ancient ſeat of Egyptian literature we muſt now conduct the reader; where, on the ceilings of their colleges or temples are beautiful zodiacs, planetary ſyſtems, and celeſtial planiſpheres, emblems of the conſtellations of the heavens, diſplayed in a curious and taſteful arrangement; the walls are covered with groups of hieroglyphical pictures, exhibiting the religious rites of this once learned people, their labours in agriculture and the arts, and their moral precepts. Here the Supreme Being, the firſt cauſe, ſeems every where depicted by the emblems of his attributes. Every part and member of theſe immenſe ſtructures appear equally important, and ſeem to have coſt the labour of ages to conceive, to put together, and to decorate. Throughout the whole is ſhewn equal care, and equal aſſiduity; which would lead us to believe that theſe edifices were not the works of their kings, but that they were conſtructed at the expence, and for the uſe, of the nation, under the direction of colleges of literati, and by artiſts whoſe labours were circumſcribed by invariable rules. From the modern Dendera to the remains of this grand temple or college, the diſtance is nearly two miles; and this is the only quarter that now bears the name of Tentyra, and which is called by the Arabs, *Berbeh*. After comparing this ſtructure with all the other Egyptian monuments, it confeſſedly appears to be the moſt perfect in its execution, and conſtructed at the happieſt period of the arts and ſciences in Egypt. No ornament has been here aſſumed without ſome end in view, without contributing in a greater or leſs degree to the perfection and harmony of the whole. The greateſt curioſity of this temple is certainly the zodiac, which decorates the two oppoſite plat-bands of the portico or grand entrance; and the celeſtial planiſphere, which occupies part of the ceiling of a moſt elegant apartment or chamber, built over the nave of the great temple. Denon profeſſes to have copied theſe ſuperb embelliſhments with the utmoſt correctneſs. The ceiling is divided into two compartments, by a large figure that ſeems to be an Iſis: her feet reſt upon the earth, her arms are extended towards heaven, and ſhe appears to occupy all the ſpace between. In another part of the ceiling is a large figure, probably repreſenting the year, with its hands and feet on the ſame level, and enfolding with the curvature of the body fourteen globes, placed on as many boats, diſtributed over ſeven bands or zones, ſeparated from each other by numberleſs hieroglyphics, but too much covered with ſtalactites and ſmoke to allow of being copied. Behind this firſt chamber is a ſecond, which receives light only through the door: this alſo is covered with moſt intereſting and admirably-executed hieroglyphical pictures. It is difficult to imagine what could be the uſe of this part of the edifice, ſo carefully finiſhed and ornamented with pictures ſo evidently ſcientific: thoſe on the ceilings appear to relate to the motions of the heavenly bodies, and thoſe on the walls have probably ſome reference to the earth, and the influences of the air and water. The earth is univerſally repreſented by the attribute or figure of Iſis, who was the preſiding divinity in all the temples of Tentyra, and whoſe emblem is found in every part. Her head is ſeen forming the capital of the columns belonging to the portico, and the firſt chamber of the great temple: it is alſo in the centre of the aſtragal, and ſculptured in gigantic proportions, on the outſide of the foundation wall: it is the diſtinguiſhing object in the ornaments of the frieze and the cornice, and is conſpicuous in all the pictures with her proper attributes. It is Iſis to whom all the offerings are made, when they are not preſented by herſelf to her huſband Oſiris: her figure is inſcribed on the outer gates of the encloſure, and to her are dedicated the little temples that are there repreſented; in that on the right hand of the entrance, ſhe is triumphing over two evil genii; in that which is behind the great temple, ſhe is variouſly deſcribed as holding Horus in her arms, defending him from every hoſtile attempt, entruſting him only to figures like cows, and ſuckling him at every age, from infancy to puberty. There are now neither doors nor even hinges to the gates, which formerly ſecluded from prophane eyes thoſe myſteries of which the prieſts were ſo jealous, and alſo, perhaps, concealed the treaſures of the ſtate. The chambers conſecrated to eternal night, the myſterioufneſs of the worſhip, obſcure as the temples themſelves, the ſecret initiations, ſo difficult to be obtained, and for ever ſhut againſt ſtrangers, and the ſudden overthrow, both of the government and religion, as ſoon as Cambyſes had violated the ſanctuaries, overthrown the divinities, and carried off the treaſures, all combine in announcing, that within theſe temples was contained the eſſence of all; and that hence emanated all the national learning, civil doctrine, and religious authority, of the ſtate.

Although the race of human beings which we now find in Egypt are wrapt in profound ignorance, it is nevertheleſs apparent, from the maſterly ſculptures and exquiſite workmanſhip diſplayed in the ſtructure of this temple, that not only the arts, but the ſublimer ſciences muſt have flouriſhed among its earlier inhabitants, who appear to have diffuſed their knowledge over all parts of the civilized globe. The ſtile and conſtruction of their

zodiac is an irrefragable proof of their deep knowledge in aſtronomy. It is enveloped by two large human figures, which are ſuppoſed to repreſent the year. A winged emblem placed before their mouth, may repreſent eternity, or elſe the paſſage of the ſun to the ſolſtices; the diſk at the joining of the thighs of the figure, is the ſun, whence proceeds a beam of light that falls on the head of a crowned Iſis, which repreſents either the earth, or the moon; the ſun, ſituated in the ſign cancer, which is depicted and crowned at the joining of the thighs of the oppoſite figure, may perhaps ſhew the period of the erection of the temple; the figures joined to, or between the reſpective ſigns, may mean the fixed ſtars; and thoſe ſtanding in the boats below the revolving heavenly bodies, the planets, and comets. The figures are all ſculptured and painted in a large ſize, completely filling the broad plat-bands of the portico; and the characters are repreſented of their natural colour, on a blue ground, ſtudded with yellow ſtars. One ſmall part is entirely defaced.

The apartment which contains the planiſphere, if we may judge by the ſubjects which are there ſculptured, muſt have been devoted to aſtronomy, and was probably attached to an obſervatory, where the ſcience was taught. The entrance to this building was through a ſmall ornamented door; the firſt room has no roof, and appears to be a ſmall cloſed court, but decorated with the ſame care as the other apartments; againſt the ſide wall on the right is repreſented a mummy reclined, under which is a long inſcription: from this open court a door leads into the aſtronomical room, which receives light through two large caſements; and on the ceiling of this apartment is ſculptured the planiſphere of the heavenly bodies, together with another ſubject, apparently aſtronomical, which is ſeparated from the firſt by the tall figure of Iſis abovementioned. The innermoſt room is almoſt entirely dark, receiving neither air nor light from any quarter, except the ſmall door; its ceiling is decorated with two appropriate bas-reliefs, one of which repreſents an altar, upon which ſeems to reſt the ark of the covenant, over which are two doves, with their wings united. Theſe ingenious decorations plainly indicate that the Egyptians had a planetary ſyſtem, and that their knowledge of the heavens was reduced to fixed principles. The exact ſimilarity between the ſigns here depicted, and thoſe of our zodiac, ſhew how the Greeks have firſt borrowed them from Egypt, and the Romans from Greece, whence they have reached our own times: and the more the importance of theſe curious figures is conſidered, the more will it influence the learned in Europe to inveſtigate and explain them.

At Tentyra is to be ſeen an inſcription in large and beautiful Greek characters, placed on the liſtels to the right and left of the top of one of the outer gates, to the ſouth of the great temple. The following is the inſcription, with a tranſlation:

Υπερ αυτοκρατορος Καισαρος Θεϋ υιϋ Διος ελευθεριϋ σωτηριας ὁτ επι Ποπλιϋ Οκταϋιϋ ηγεμονος και Μαρκϋ Κλωδϊϋ Ποσθμε επιστρατηγϋ Τρυφωνος στρατηγεντος οι απο της μετροπολεως ιερωσαν εκ νομϋ το προπυλος Ισιδι Θεαι μεγιστη και τοις συνναοις Θεοις ετϋς λα Καισαρος Θωυθ σεβαστη.

"On account of the emperor Cæſar, God, the ſon of Jupiter the Deliverer, when Publius Octavius being governor, Marcus Claudius Poſtumus commander in chief, and Tryphon general, the deputies of the metropolis conſecrated, in virtue of the law, the propylæum to Iſis, the greateſt of the goddeſſes, and to the aſſociated gods of the temple, in the thirty-firſt year of Cæſar." Theſe few Greek characters, in the midſt of innumerable Egyptian inſcriptions and hieroglyphics, form an extraordinary and ſtriking contraſt.

Haw, or Dioſpolis Parva, is ſeated a few miles below Tentyra, and on the ſame ſide of the river. It is a fine military ſituation, but it poſſeſſes no antiquities.

Between Dioſpolis Parva, and Girgeh, is the ancient Abydus, where Oſymandyas had erected a temple, and where Memnon had a palace: but the ruins are now proſtrate, and the whole an immenſe heap of rubbiſh.

Nagadi, an ancient town on the contrary ſide of the Nile, is ſituated at the entrance of the deſert, on one of the roads which lead to Coſſir. Here is a large ruin, which had been converted into an entrenched convent inhabited by Copts, and afterward became a moſque; but a greater part conſiſts of an ancient vaulted burial place, containing the tombs of the dead; and which ſerved for ſome time as miſerable quarters to the French army in Upper Egypt; and where the merchants and Arabs taken in the deſert were brought as priſoners, to undergo examination. Nagadi is a place of importance, and will eventually become the moſt frequented route of the deſert, ſince it is the ſhorteſt by a journey of one whole day. This road alſo leads by the Kittah, a very ſingular fountain, ſince it is ſituated on a higher level than all the ſurrounding ground. This fountain conſiſts of three wells ſix feet in depth; the ſtrata of which are, firſt, a bed of ſand, and beneath, a free-ſtone rock, through which the water filtrates, and ſlowly fills the holes that are dug. Here is a ſmall moſque, or caravanſary, which ſerves for ſhelter to the way-worn traveller deſtined to traverſe the dry and dreary deſert. And here we may be convinced of the great importance of thoſe wells ſo often mentioned in the Old Teſtament, as abſolutely neceſſary to ſatisfy the moſt preſſing of all wants in this burning climate, thirſt.

In deſcending the Nile, we next approach Girge or Girgeh, the nominal capital of Upper Egypt: it is a modern town that contains nothing remarkable. The name of Girgeh, or Djergeh, is derived from a large monaſtery built previouſly to the town, and dedicated to St. George, which is pronounced *Girgeh* in the language of the country. The Nile razes its walls, and is conſtantly waſhing away a part of them; and it would require a conſiderable expence to make here but an indifferent harbour for boats. This town is therefore intereſting only as being ſituated half way between Cairo and Syene, and in a very rich territory.

Small and inſignificant are now the remains of Aphroditopolis, and Ptolemais, cities which once populated and enriched this diſtrict; and of which we are furniſhed with very unſatisfactory accounts. Herodotus himſelf has only deſcribed their ruins from the falſe repreſentations which were given to him, and which modern travellers have only been able to notice ſuperficially, ſurrounded by every cauſe of anxiety, without daring to loſe ſight of the river, plundered on every pretence by the reis, by their interpreter, by every ſheik, baſha, kiachef, and wandering Bedouine, into whoſe hands they might happen to fall. Theſe travellers, under ſuch circumſtances, cannot be blamed in tranſmitting very imperfect accounts of countries ſo curious, but at the ſame time ſo dangerous to viſit. Aphroditopolis is but little better than a mountainous ruin of bricks; and Minchieh, the ancient Ptolemais, is quite annihilated. The only remains of this large Greek city is a quay, in but an indifferent ſtate of preſervation, though of a better conſtruction than the Egyptian works of this kind: of the ruins is built a large village, inhabited chiefly by Chriſtians. Ptolemais was the port of Arſinoe, which concurred to form the Nomos Heracleotes. The Ptolemais deſcribed by Strabo, is the preſent *Ptolometa*, built by the Greek prince Ptolemy Philadelphus, where are the remains of an Ionic temple, ſuppoſed to be done in the moſt ancient manner of executing that order, and which was delineated and deſcribed by Bruce. The Ptolemais which is now called Acca, or Acre, in Syria, and which was twice rendered celebrious by the glory of the Britiſh arms, in the time of the croiſades under Richard I. and in the late Egyptian war, under the ſuperior generalſhip of ſir Sidney Smith, was not *founded* by any of the Ptolemies, but was ſo named

Planisphere taken from the Temple of Tentyra.

London Published as the Act directs May 5th 1804 by J. Wilkes.

in honour of one of them, who fortified and improved it. The original name of this place was *Accho*, mentioned in the book of Judges, i, 31.

Three miles lower down on the right bank of the river, are the remains of Chemmis or Panopolis, now called Achmin: there ſtill is to be ſeen a building buried up to the very roof, which, no doubt, is the temple formerly dedicated to Pan, and conſecrated to proſtitution: a number of almees and women of the town ſtill ſubſiſt there, as at Metubis; if not under the ſpecial protection, yet at leaſt acknowledged and tolerated by the government. It is ſaid that on a particular day in every week, they aſſemble in a moſque near the tomb of the ſheik Harridi, where, mingling the ſacred and profane, they commit all kinds of indecencies. Achmin is large and well ſituated on a tongue of land projecting into the Nile, and ſhouldered up by the chain of the Mokatam mountains, which, bending round in this place, forms a deep and difficult paſs.

Siut is the modern town built on the ſcite of the ancient *Lycopolis*, or City of the Wolves. No antiquities are now to be found in Siut; but the Lybian chain, at the foot of which it ſtands, exhibits ſuch a vaſt number of tombs, that without doubt it muſt have been a very ancient and flouriſhing city. The Lybian chain of mountains appears like an immenſe ruin of nature, formed of horizontal and regular ſtrata of calcarcous ſtones more or leſs crumbling, and of different ſhades of whiteneſs, divided at intervals with large mammillated and concentric flints, which appear to be the nuclei, or, as it were, the bones, of this vaſt chain, and ſeem to prevent its total annihilation. Yet its decompoſition is daily happening by the impreſſion of the ſalt air, which penetrates every part of the calcareous ſurface, decompoſes it, and makes it, as it were, diſſolve down in ſtreams of ſand, which at firſt collect in heaps at the foot of the rock, and are then carried away by the winds, and, encroaching gradually on the cultivated plain and the villages below, change them into barrenneſs and deſolation. The rocks are excavated by a vaſt number of tombs of different dimenſions, and decorated with more or leſs magnificence. If one of theſe excavations was a ſingle operation, as the uniform regularity of the plan of each would ſeem to indicate, it muſt be an immenſe labour to conſtruct a tomb; but we may ſuppoſe that ſuch a one, when once finiſhed, would ſerve for ever for the ſepulture of a whole family, or even race, and that ſome religious worſhip was regularly paid to the dead; elſe where would have been the uſe of ſuch finiſhed ornaments of inſcriptions never read, and of a ruinous, ſecret, and buried, ſplendour? At different periods or annual feſtivals, or when ſome new inhabitant was added to the tombs, funereal rites were doubtleſs performed, in which the pomp of ceremony might vie with the magnificence of the place; which is the more probable, as the richneſs of decoration in the interior part forms a moſt ſtriking contraſt with the outer walls, which are only the rough native unembelliſhed rock. Further on to the ſouth, are remains of large quarries, the cavities of which are ſupported by pilaſters: ſome of theſe quarries have been the abode of the cenobites, who, among theſe vaſt retreats, united the auſtere aſpect of an inhabitant of the deſert to the gentle majeſty of one who partakes of the bounties beſtowed by a river, which diſpenſes to its banks plenty and fertility. This was the emblem of their life; before their retreat, cares, wealth, agitation; afterwards, calm and contemplative enjoyments; the ſilence of nature, too, imitated the reſerve to which they were compelled: in theſe regions, the unchanging and auguſt ſplendour of the ſky forcibly impels to conſtant but chaſtened admiration; the dawn of day is not enlivened by the cries of joy, or the bounding of animals; the ſong of no bird proclaims the return of morn; even the lark, which in our climates enlivens and animates our fields, in theſe burning regions only calls to his mate, but never chants his happineſs; the grave dignity of nature ſeems to inſpire with the deep ſenſe of humble acknowledgment, ſo that the grotto of the cenobite ſeems to have been placed here by the order and choice of the Deity himſelf; and every animated being partakes with him in his grave and ſilent meditation.

Hermopolis Magna is ſeated on the ſame ſide of the Nile as Siut, conſiderably below Beneadi. In approaching the eminence on which the portico of the great temple was built, we are ſtruck with its outline in the horizon, and its gigantic features. A peaſant who ſhould be drawn out from his cottage, and placed before ſuch a building as this, would believe that there muſt exiſt a wide difference between himſelf and the beings who were able to conſtruct it; and, without having any idea of architecture, he would ſay, "This is the work of a god, a man could not dare to inhabit it." If a drawing can ſometimes give an air of greatneſs to little things, it always diminiſhes the effects of great objects: ſo, in this inſtance, the capitals, which appear too heavy in proportion to the baſes, have, in reality, ſomething in their maſſiveneſs which ſtrikes with wonder, and diſarms criticiſm: but what is truly admirable, is, the beauty of the principal outlines, the perfection in the general conſtruction, and in the uſe of ornaments, which are ſufficient to give a rich effect without injuring the noble ſimplicity of the whole. The immenſe number of hieroglyphics which cover every part of this edifice, not only have no relief, but entrench upon no part of the outline, ſo that they diſappear at twenty paces diſtance, and leave the building all its uniformity. Among the hillocks, within three or four hundred yards of the portico, enormous blocks of ſtone may be ſeen half buried in ſand, and regular architecture beneath them, which appear to form an edifice containing columns of granite, juſt riſing above the preſent level of the ſoil. Further on, but ſtill connected with the ſcattered fragments of the great temple of Hermopolis, is built a moſque, in which are a number of columns of cipoline marble, retouched by the Arabs; then comes the large village of Achmunin, peopled by about five thouſand inhabitants.

On the oppoſite ſide of the river, beyond Malui, are ſeen, on the eaſtern bank, near the village of Shek-Abade, the ruins of Antinoe, built by Adrian, in honour of his favourite Antinous, who ſacrificed his own life in Egypt to ſave that of his ſovereign. It is unfortunate that ſuch ſublime heroiſm ſhould be found in alliance with infamous morals, ſo as to authorize a great man, under the ſacred title of gratitude, to publiſh his regrets, which have been long ago conſigned by nature to myſtery and ſhame. It is not eaſy to imagine what could have decided the choice of a ſituation for the town of Antinoe, at the foot of the melancholy Mokatam, in a ſtrait between two deſerts; except that Beſa, a more ancient town than Antinoe, and upon the ruins of which this latter had been built, was the place where the emperor was ſtopped by the diſorder that menaced his life; and the prieſts of this city, at that time in high repute, declared, upon being conſulted, that the patient would die, except ſome one devoted himſelf in his place! By the ſide of the river appears one of the city gates, reſembling a triumphal arch. It is decorated with eight Corinthian pillars, between which are three arches ſpringing from a buttreſs, ornamented with pilaſters: this group of ruins is the moſt conſiderable of all that now remain at Antinoe. From this point there ſeems to have been a ſtreet paſſing in a ſtraight line acroſs the town to the oppoſite gate: both ſides of this ſtreet appear to have been adorned with a colonade of Doric pillars, under which one might walk in the ſhade. There are ſtill viſible ſome of the ſhafts, and a few capitals, very much worn, on account of the friable nature of the lime-ſtone uſed in their conſtruction. The houſes were built of brick. The circuit of Antinoe was very great, if the ruins of Beſa, by being mixed with its own, have not increaſed its extent.

But

But after contemplating the remains of the great Diospolis, Latopolis, Apollinopolis, and Tentyra, and the other glories of Egyptian architecture, the ruins of Antinoe appear mean and paltry.

Again croſſing the Nile, and paſſing the town of Miniet, or Minyeh, we come to Behneſe, or Beneſech, the ancient Oxyrinchus, the capital of the thirty-third *nome*, or province, of Egypt. Nothing, however, remains of this city but ſome fragments of ſtone pillars, marble columns in the moſques, and a ſingle column left ſtanding, along with its capital; and part of the entablature, which ſhew that it is the fragment of a portico of the compoſite order. This ſolitary monument brings a melancholy ſenſation to the mind; Oxyrinchus, once a metropolis ſurrounded by a fertile plain, two leagues off the Lybian range of hills, has diſappeared beneath the ſand; and the new town has been obliged to retreat from this deſolating invaſion, leaving to its ravages houſe after houſe, and the inhabitants will at laſt be driven beyond the canal Juſef, on the border of which they will ſtill be menaced. In this diſtrict are valleys, and petrified wood; there have therefore been rivers and foreſts; theſe laſt have been deſtroyed, and after this have diſappeared the dew, the miſt, the rain, the rivers, and with them all the animated beings. In the moſque of Beneſech are a number of columns of different marbles, which are doubtleſs the ſpoils of the ancient Oxyrinchus, but which were not of the ſtile of ancient Egypt.

Quitting Oxyrinchus, we again reach Beneſuef, and Sedinan; and then paſſing Arſinoe or Feyyum, we enter the plain of the pyramids, or Saccarah, the ſcite of the ancient Memphis. The pyramids of Saccarah mark out that immenſe number of monuments which decorated the field of death, the necropolis of Memphis, and bounded that city on the ſouth, as the pyramids of Gizeh did on the north. This place is now called the *plain of the mummies*. We might ſtill be ſeeking in vain the ſcite of that ſuperb city, which exceeded the metropolitan dignity of Thebes, and even eclipſed its grandeur, if theſe ſumptuous tombs did not atteſt its exiſtence, and aſcertain indubitably the extent of ground it once occupied. Moſt of the diſcuſſions publiſhed on this ſubject, and which render its ſituation uncertain, have been written by learned men, who never viſited Egypt, and were therefore incapable of judging how ſcrupulouſly exact are the deſcriptions of it given by Herodotus and Strabo. If the ſcite of Memphis, as Denon ſuggeſts, extended from the pyramids of Gizeh to thoſe of Saccarah, its magnitude muſt indeed have been immenſe, allowing for its eaſtern and weſtern boundaries. The pyramids are in number about twenty, diſperſed over this border of the Lydian deſert; but the three largeſt, which have ſo long excited the curioſity of travellers, are ſituated near Gizeh, almoſt in a line acroſs the river to the weſtward of Cairo. It is in the rich territory which ſurrounds them that fable has placed the Elyſian fields: the canals which interſect them being the fancied Lethe, and the Styx. The largeſt of theſe pyramids might well have been conſidered as one of the wonders of the world. The north ſide of the ſtructure, being meaſured by a radius of ten feet in length, taking two ſeveral ſections, was found by Mr. Greaves to be 693 Engliſh feet. The other ſides were examined by a line for want of an even level, and a convenient diſtance to place the inſtruments. The altitude, if meaſured by its perpendicular, is 481 feet; but if it be taken as the pyramid aſcends inclining, then it is equal, in reſpect of the lines ſubtending the ſeveral angles, to the latitude of the baſis. If we picture to ourſelves four equilateral triangles on the ſides of the ſquare baſis, mutually inclining till they terminate in a point, (for ſuch is the appearance of the top to thoſe who ſtand below,) we ſhall obtain an accurate idea of the true figure and dimenſions of this pyramid, the area of whoſe baſis contains 480,249 ſquare feet, or ſomething more than eleven Engliſh acres of ground, a proportion ſufficiently monſtrous to ſtagger our belief, if the fact were not eſtabliſhed beyond diſpute. The meaſurement taken by the French engineer Groſbert, in the year 1800, agrees very nearly with that of Mr. Greaves.

The aſcent to the ſummit of this pyramid is contrived by a ſucceſſion of ſteps, which running about the building in a level, made a narrow walk, when the ſtones were entire on every ſide. Theſe ſteps are made of maſſy poliſhed ſtones. The lowermoſt is about four feet deep, and three broad, but they diminiſh in ſize towards the top, and they end not in a point as mathematical pyramids do, but in a little flat or ſquare conſiſting of nine ſtones, beſides two which have fallen from the corners. The entrance into this wonderful monument of human induſtry is by a narrow paſſage, which opens on the ſixteenth ſtep, in the midſt of the north ſide. It goes declining with an angle of twenty-ſix degrees, and is in breadth exactly $3\frac{4}{6\,3}$ Engliſh feet, and in length ninety-two feet ſix inches. At the end of this paſſage there is another, ſimilar in appearance but a little riſing, where the lowermoſt ſtone of the roof forms a ſharp ridge, beneath which there is ſometimes ſo ſmall a ſpace that a man muſt proſtrate himſelf on the ground in order to paſs through. This difficulty, however, is chiefly owing to the ſand which is blown in by the wind, as the paſſage, when cleared, is of the ſame dimenſions with the entrance. Beyond this ſtraight is a ſteep maſſy ſtone, by which the curious traveller may aſcend to the lower end of the firſt gallery. This has been deſcribed as five feet broad, five feet high, and 110 feet long; the pavement, conſiſting of white poliſhed marble, riſes with a gentle acclivity; and the ſides and roof are conſtructed of unpoliſhed ſtone, leſs compact than that of the pavement. At the end of this gallery are two paſſages, one low and horizontal, and the other high and riſing. At the commencement of the lower paſſage, on the right hand, is a circular well, lined with white marble, and meaſuring ſomewhat more than three feet diameter. Pliny aſſerted that this well was eighty cubits deep, but it is now almoſt filled up with rubbiſh, and does not poſſeſs a depth of more than twenty feet. About fifteen feet diſtant from this well is another paſſage of exquiſite workmanſhip, which runs in a level 110 feet, and then terminates in an arched vault or chamber, ſtanding due eaſt and weſt, called the Queen's Chamber. The length of this room is nearly twenty feet, its breadth about ſeventeen, and its height rather leſs than fifteen; the walls are coated over with white cement, and the roof is covered with large ſmooth ſtones, which are placed in a ſhelving poſition, and meet above in an angle.

The ſecond gallery, divided from the firſt by the wall in which is the entrance to the laſt-mentioned paſſage, is by no means inferior either in curioſity of art or richneſs of materials to the moſt ſplendid buildings; it riſes with an angle of twenty-ſix degrees, and is 154 feet in length from the well beneath, but if meaſured on the pavement it is ſomething leſs, on account of a vacuity of about fifteen feet. The height of it is twenty-ſix feet, and the breadth ſix feet ſix inches, in which muſt be included two parapets, each nineteen inches in diameter, pierced with holes wherein to faſten ſome machines for raiſing the ſarcophagus. The ſtone of which this gallery is conſtructed is white marble, very evenly cut in large tables, and finely poliſhed. Beyond this admirable gallery is a ſquare hole, which leads into two cloſets or ſmall anti-chambers lined with a rich and ſpeckled kind of Thebaic marble. The firſt of theſe is almoſt equal to the ſecond, and of an oblong figure, one ſide containing ſeven feet, and the other three feet ſix inches: the height is about ten feet, and the floor is perfectly level. The inner anti-chamber is ſeparated from the former by a ſtone of red granite, about two feet lower than the roof, and three feet above the pavement. This ſecond cloſet leads to another ſquare paſſage, formed entirely of granite, and opening to a ſumptuous and well-proportioned room, ſituated in the center of the pyramid, equi-diſtant from all the ſides, and

almoſt in the midſt between the baſis and the top. The floor, the ſides, and the roof, conſiſt exclufively of fine marble. The ſtones which cover this room are of a furpriſing length, and actually reſemble a number of large beams deſigned to ſuſtain the enormous weight of the pyramid above. The length of the chamber on the ſouth ſide, where the firſt and ſecond row of ſtones meet, is $34\frac{3}{80}$ Engliſh feet; the breadth of the weſt ſide, meaſured in the ſame manner, is $17\frac{1}{10}$; and the height is about 19 feet 6 inches. It is curious to remark, that at the top of the laſt-mentioned gallery is a ſmall platform, in which is a thick block of granite, like an immenſe cheſt imbedded in the ſolid building, and hollowed out ſo as to leave alternate projections and retirings, into which, blocks of the ſame material, with correſponding grooves and projections, are let in, which were intended for ever to conceal and protect the entrance to the principal chamber which is behind them. It muſt have required immenſe labour to conſtruct this part of the edifice, and not leſs to have broken an opening through; ſo that the zeal of ſuperſtition has here been oppoſed to the eagerneſs of avarice, and the latter has prevailed. After mining through thirteen feet of ſolid granite, a door, three feet three inches ſquare was diſcovered, which is the entrance to the principal chamber. This magnificent chamber contains the ſarcophagus of Cheops, or Chemmis, whoſe body, however, was not depoſited in the pyramid. It conſiſts of one piece of fine ſpeckled marble, cut ſmooth and plain, without any ſculpture or inſcription; its figure is that of an altar, or of two cubes finely ſet together; its poſition is exactly in the meridian, and almoſt at an equal diſtance from all ſides of the room, except the eaſt, from which it is twice as remote as any of the reſt. A hollow ſpace is obſervable beneath it; and a large ſtone has been removed from the pavement at the angle next adjoining it. In the ſouth and north ſides of the chamber are two inlets evenly cut in the walls oppoſite to each other, which ſeem to have been deſigned for the reception of lamps. The tomb is ſix feet eleven inches long, three feet wide, and three feet one inch and a half in depth: it is empty and open, and no traces of any cover can be perceived. Here terminates the interior of this immenſe edifice, in which the work of the hand of man appears to rival the gigantic forms of nature; and for no other purpoſe than to incloſe in the center of it the ſmall ſarcophagus above deſcribed, which was intended to receive the mummy of its projector, Cheops; but the Almighty Diſpoſer of human events permitted not the pride and vanity of the founder to be thus gratified. Plutarch has noticed a curious echo in this pyramid, as anſwering four or five times, and which M. Lucas aſſerts will repeat ten or twelve times diſtinctly. We are, however, at no loſs to account for this effect, when we contemplate the narrow entrance, the long galleries which lie in one continued line, and the termination of thoſe paſſages in the center of the pyramid.

The ſecond pyramid, ſituated at a ſmall diſtance from the former, has been but imperfectly deſcribed either by ancient or modern writers. Herodotus merely aſſerts, that its magnitude falls ſhort of the other, though its altitude is equal, and that it contains no ſubterraneous chambers. Diodorus informs us, that its architecture reſembles the former, but that the dimenſions are leſs by one hundred Grecian feet; and Pliny makes the difference to be ſtill greater by forty-ſix feet: yet Strabo has ventured to affirm that both theſe pyramids are equal; and Mr. Greaves, on the credit of a perſon who meaſured the ſecond with a line, aſſures us that the baſes of both are alike, and that the height is not inferior to that of the firſt. This ſtructure has no entrance; the ſtones of which it is built are much ſmaller than thoſe of the firſt; the ſides, inſtead of riſing by degrees, are ſmooth and equal; and the whole fabric, except on the ſouth ſide, is quite entire. This is the pyramid of Cephrenes.

The third pyramid, erected on an advantageous acclivity, at the diſtance of a furlong from the ſecond, is mentioned by Herodotus as meaſuring three hundred feet on every ſide, and as being built to the center with Ethiopic marble. Diodorus, who gives the ſame dimenſions of the baſis, aſſerts, that the walls were raiſed fifteen ſtories with black ſtone like Thebaïc marble; and that this piece of workmanſhip, on which the name of Mycerinus, the founder, was engraved, far exceeds the other pyramids in its architecture and the richneſs of its materials.

Why the Egyptian monarchs ſhould have burdened themſelves or their people with ſuch an enormous expence, as muſt of neceſſity have been attached to the building theſe pyramids, is an enquiry not eaſily ſolved. Ariſtotle has ſuppoſed them the work of tyranny, and Pliny imagines that they were built partly from oſtentation, and partly out of ſtate policy. But the true deſign might have ſprung from the Egyptian theology, which taught its votaries that ſo long as the body was preſerved from decay, the ſoul continued with it; and hence we may obſerve the great pains and curious precautions of the Egyptians to preſerve the bodies of their deceaſed friends. The reaſon why a pyramidal figure was generally choſen for the monuments ſeems to have been, becauſe it is the moſt permanent form of ſtructure; for, by reaſon of the gradual conſtruction towards the top, it is neither overburdened with its own weight, nor ſubject to the ſoaking of rain, as other buildings are. But it may be proper to obſerve that all the Egyptian pyramids are not of the ſame form, ſome being round and almoſt conical, and others riſing with a leſs inclination, and not ſo pointed at the top. Pliny and Diodorus agree in the aſſertion that no leſs than three hundred and ſixty thouſand men were employed in erecting the firſt pyramid; and it is ſaid that twenty years were ſpent in the work. Such is the aſtoniſhing bulk of theſe pyramids, that engravings of them have ever tended to miſlead the mind in forming due conceptions of their immenſe magnitude; for as it is impoſſible to repreſent their relative bulk on paper, ſo all drawings made to ſhew their form, naturally diminiſh the idea of their ſize in the imagination of the obſerver. The utmoſt uncertainty alſo exiſts as to the time in which theſe pyramids were firſt violated, as does even that of their conſtruction; the latter, which is loſt in the night of ages, gives an immenſe period to the annals of art; and in this view we cannot too much admire the accuracy of the pyramidal ſtructure, the permanency ſecured by their form and conſtruction, and by ſuch immenſe proportions, that theſe gigantic monuments may be conſidered as the laſt link in the chain of the coloſſi of art and nature.

Near theſe pyramids ſtands the gigantic monument of the ſphinx; and near Sacarrah are the caves of the Egyptian ibis, with thouſands of mummies of that venerated bird; which ſeems now almoſt loſt to Egypt, ſince few modern travellers have been able to deſcribe it from a living ſubject. Theſe caves are on the ſouth of the Necropolis, or city of the dead, of ancient Memphis, and where the tombs and ſepulchres have been highly ornamented and filled with mummies, exactly ſimilar to thoſe deſcribed at Thebes.

By what is related of the celebrated ſtructure, ſituate in the Heracleotic nome, near Arſinoe, and diſtinguiſhed by the name of the *Labyrinth*, it ſeems to have been deſigned as a pantheon of all the Egyptian deities that were worſhipped in the provinces, and as a place for the accommodation of the general aſſembly of magiſtracy of the whole nation. For this reaſon every nome had a hall or palace appropriated to itſelf: the whole edifice, according to Herodotus, containing twelve. Theſe halls were vaulted, and had an equal number of doors oppoſite to one another, and encompaſſed with the ſame wall. This truly magnificent building contained no leſs than three thouſand chambers, fifteen hundred of which were ſubterraneous, and ſet apart either for the ſepulchre of the kings who built the labyrinth, or for the abodes of the ſacred crocodiles. Theſe were never ſhown to ſtrangers;

ers; but Herodotus informs us that he viewed every room in the upper part, in which he found ſufficient to engage his attention and to fill him with aſtoniſhment. Innumerable exits by different paſſages and infinite returns, afforded a thouſand occaſions of wonder, while his conductor led him from a ſpacious hall to a chamber, from thence to a private cabinet, and then through other paſſages that led to the more ſumptuous rooms, where the roofs and walls were completely incruſted with fine marble, and adorned with exquiſite ſculptures. The halls were ſurrounded with beautiful poliſhed columns, and at the termination of the labyrinth ſtood a pyramid of two hundred and forty feet high, decorated with large figures of various animals. Other writers have aſſerted that this edifice was ſituate in the midſt of an immenſe ſquare, and completely ſurrounded with buildings; that the porch was of Parian marble, the floors paved with vaſt flags, and the roof appearing like a canopy of ſtone; that the interior conſiſted of the temples of ſeveral deities, and galleries that were adorned with a profuſion of exquiſite pillars, images of the gods, and coloſſal ſtatues of the kings; that the paſſages were ſo numerous and intricate as to render a guide indiſpenſably neceſſary, and that ſeveral of the rooms were ſo conſtructed, that a noiſe like that of thunder reverberated through them on opening the doors. Such is the general deſcription of this wonderful ſtructure; a conſiderable part of the ruins of which, it is ſaid, may yet be ſeen at the ſouthern extremity of the lake Mœris, and thirty miles diſtant from the ruins of Arſinoe. M. Pauw, however, is of opinion, that there is no *certainty* of thoſe being the remains of it.

The lake Mœris or Bathen, called by the Turks Birket-el-Kerun, is a vaſt lake inland, in the province of Feyyum or Arſinoe. Herodotus pronounces this lake the nobleſt and moſt wonderful of all the works of the Egyptian kings. The ancients deſcribed it as meaſuring 3600 ſtadia in circumference; but modern travellers agree that its breadth does not exceed half a league; that it is about a day's journey in length, and that its circumference is about twelve or fifteen leagues, which will be found ſufficiently prodigious, when we conſider that it was formed by human labour, as appeared from two pyramids, which, in the time of Herodotus, raiſed their heads to the height of three hundred feet above water in the centre of the lake. This lake in the deepeſt part has fifty fathom water: it ſtretches from north to ſouth, and is fed by water from the Nile by means of a channel cut for that purpoſe. Its conſtruction is attributed to a king of Egypt called Mœris, who formed his great deſign for the purpoſe of correcting the irregularities of the Nile, either by preventing the ſtagnation of the water in other places to the detriment of the lands, or by preſerving an ample ſupply when the river failed in its uſual prolific inundations. An iſle, of about one league in circumference, may be ſtill ſeen in the middle of this lake; but no veſtiges are diſcernible of the two pyramids which formerly ſtood here; though ſeveral ruins of tombs and temples have been diſcovered, with large figures of men and animals.

Gizeh, which is conſidered as part of the ſcite of ancient Memphis, is a large ſtraggling town, where Bonaparte erected founderies and manufactories of arms, ammunition, &c. It has little of antiquity about it, except the pyramids. Here is a palace, which was the reſidence of Mourad Bey, elegantly furniſhed, and ſituated at the extremity of an orange grove, by which all its apartments are richly perfumed. Here the oriental luxuries exhibit their charms, and fill the ſenſes with voluptuous pleaſure. We do not here find, indeed, thoſe long alleys which are the pride of the French gardens, nor the taſteful ſerpentine walks of the Engliſh, where health and appetite are the reward of the exerciſe required to ſurvey them; but in the eaſt, where indolent repoſe forms one of the chief luxuries, the tents or kioſks are pitched under the thick branches of a cluſter of ſycamores, and open at pleaſure upon a fine lawn and fragrant underwood of orange and jeſſamine. To this is added the voluptuous pleaſure of enjoyments ſtill but imperfectly known to us, but which we may eaſily conceive; ſuch, for inſtance, as to be attended by young ſlaves, who unite to elegance of form gentle and careſſing manners; to be indolently ſtretched on vaſt and downy carpets, ſtrewed with cuſhions, in company with ſome favourite beauty, breathing perfumes, and intoxicated with deſires; to receive ſherbet from the hands of a young damſel, whoſe languiſhing eyes expreſs the contentment of willing obedience, and not the conſtraint of ſervitude. Surrounded with theſe delights, the burning African need not envy the inhabitant of Europe; and man may find happineſs wherever there is beauty and grace, whether in the gardens of Trianon, or repoſed on the banks of the Nile. Gizeh is ſituated on the weſtern ſide of this river, and nearly oppoſite Cairo, having the iſland of Rhoda, or Roudah, almoſt in the center between both. The communication is by a bridge of pontoons on each ſide the iſland, one of which communicates with Gizeh, the other with Cairo, at fort Ibrahim. The old town of Kahira, Forſtah, or Forſtat, is ſituated a little above, and more in a line with Gizeh.

Modern Cairo, or the City of Victory, falls much below the expectation of every European traveller, who has read of "the ſuperb town, the holy city, the delight of the imagination, greateſt among the great, whoſe ſplendour and opulence made the prophet ſmile;"—for thus the eaſtern people deſcribe it. We indeed ſee a numerous population, and a vaſt extent of buildings, but not a ſingle handſome ſtreet, nor one fine monument. The palaces of the beys, &c. in this town, are all ſurrounded by walls, which render the ſtreets gloomy inſtead of enlivening them; and the miſerable habitations of the poor add to the afflicting view of extreme poverty. However, within theſe fortified places much of convenience and luxury is to be found; they are adorned with handſome marble baths, and fragrant vapour-ſtoves, with moſaic ſaloons, in the middle of which are baſons and fountains of water, large divans compoſed of tufted carpets, raiſed beds covered with rich ſilks, and ſurrounded with magnificent cuſhions, which generally fill three ſides of each room. The windows, however, when there are any, never open; and the light principally comes in through a dome in the center of the ceiling.

There are ſome remarkable edifices at Cairo, ſuch as the palace of Joſeph, the well of Joſeph, the granaries of Joſeph; all of which have been promiſcuouſly referred to the high antiquity of the patriarch Joſeph, the ſteward or miniſter of Pharoah. Were this the caſe, Cairo ſhould be as ancient as Memphis; whereas the ſtructures of that city are built of ruins more ancient than the edifices themſelves; and they all bear the general marks of the muſſulman architecture of theſe regions. Dr. White, profeſſor of Arabic in the univerſity of Oxford, in his tranſlation of the celebrated Arab hiſtorian Abdollatiph, publiſhed in 1800, has been enabled ſatisfactorily to correct the above errors, into which travellers of conſiderable eminence have fallen. "Abdollatiph informs us that, in the reign of Saladin, (whoſe proper title was *Salah-el-din Joſeph Ebn Job,*) Caracuſh, one of his officers, built the wall which ſurrounds Foſtat and Cairo, and the ſpace between them, together with the caſtle; and that he alſo formed two wells within the caſtle, of wonderful conſtruction. Though Abdollatiph here uſes the dual number, yet there is in fact but one well, divided into *two* diſtinct parts; there being a reſting place at the depth of 146 feet, to which the water is firſt drawn up by a wheel, which is there fixed, and worked by buffaloes; and it is afterwards raiſed to the ſurface by the operation of a ſecond wheel of a ſimilar nature. This well has always been known under the name of Joſeph's Well; and the appellation has miſled Paul Lucas, and almoſt all our modern hiſtorians, to attribute the work to the patriarch

Joſeph. De Maillett, and biſhop Pococke, indeed, have aſſigned it to a grand vizier of ſultan Mahomet, the ſon of Calaun, whoſe name was Joſeph; and Shaw, from conjecture merely, ſuppoſes it to have been effected by the Babylonians. The exact date of the work, and the reaſon of the name, are here clearly aſcertained; and both are evidently to be referred to that Saladin Joſeph Ebn Job, who was cotemporary with, and the patron of, Abdollatiph."

The aqueduct which brings water from old Cairo to the caſtle, by a route of 160 fathoms, would be a work of art worth celebrating, if in its courſe it was not rendered faulty by many imperfections. The caſtle is built without plan, or any real ſtrength; the only remarkable room in it is the hall of the divan, in which the beys aſſemble, and which is often the ſcene of angry debates and bloody ſtrife in this contentious government. Joſeph's palace, *i. e.* the palace of Saladin, is planned in a fine ſtile; and we here ſee with admiration the uſe which the Arabian architects have made of the antique fragments, which they have incorporated in their own works, and the ingenuity which they have ſhewn in occaſionally mixing with them ornaments of their own invention. The minarets and the tombs are the only buildings which preſerve the Arabian ſtile in any degree of purity; and if they do not preſent that appearance of full ſecurity, which is the perfection of architecture, at leaſt they gratify the eye by a richneſs of ornament, which does not degenerate into heavineſs, and a ſymmetry of parts combined with ſo much elegance, as to remove all idea of meanneſs and poverty of ſtile. The cemetery, or burying-place, of the mamalukes, is an example of this: in quitting the rubbiſh of Cairo, the ſtranger is aſtoniſhed to ſee a diſtrict all built of white marble, where edifices raiſed on columns, and terminated by domes, or by painted, carved, and gilt, palanquins, form a cheerful and inviting picture; trees alone are wanting to render this funereal retreat a delightful ſpot; ſo that it would ſeem as if the muſſulmans, who baniſh gaiety from their houſes when alive, wiſhed to bury it with them in the tomb.

Bulak, or Boulac, is the port of Cairo, which forms a ſuburb extending a mile below the city. Here all the merchandize from Lower Egypt, and the proviſions from Upper Egypt, are diſcharged. In the corn-market, the grain is expoſed to ſale in large heaps, as unladen from the barks. Oppoſite is the village of Embabey, which acquired celebrity from being the ſcene of the battle of the pyramids. The iſle of Rhoda, or Gardens, ſtands oppoſite the caſtle, and is a moſt delightful ſpot. At the extreme point is the mekkias or nilometer, which is a graduated column erected for the purpoſe of ſhewing the degrees of the increaſe of the Nile. Looking down from the diſtant hills upon the various appendages of Gizeh, Old Cairo, Bulak, Rhoda, the cemetery of the caliphs, and the moſques and minarets proceeding from the gardens on the banks of the river, the whole gives to Grand Cairo a noble and magnificent appearance; but, as we approach, the illuſion vaniſhes and diſappointment enſues. See the article CAIRO, vol. iii. p. 600.

A few miles below Cairo, leaving the ruins of the ancient Heliopolis, or city of the ſun, to the eaſtward, the Nile divides itſelf into two principal branches; the one leading to Damietta, called the Peluſian branch, on the right; the other to Roſetta and Alexandria, called the Canopic branch, on the left; thus forming the elevation or point of the Delta. In this advantageous and delightful ſituation, the French had projected to build a new city, as the grand metropolis and depôt of Lower Egypt. Damietta is the ancient Thamiatis, whoſe bay or road is now the great eaſtern mouth of the Nile, contiguous to the north-weſtern extremity of Lake Menzaleh, and about ſeventy miles from the point of the Delta. (See the article DAMIETTA, vol. v. p. 575.) At the other extremity of Lake Menzaleh, within an ample bay of the Mediterranean, ſtood the ancient Peluſium or key of Egypt, now in ruins. On or near its ſcite is built the modern Tineh, about fifty miles from Cairo. The Canopic branch, which diſembogues at Roſetta, to the weſtward of Lake Brulos, or Bourlos, forms the great weſtern mouth of the Nile; and from it runs the canal of Alexandria. On the coaſt, between theſe two laſt-mentioned towns, is ſituated the port and bay of Aboukir. The whole country embraced by theſe two great arms of the Nile, preſenting an elongated triangle ſimilar to the fourth letter of the Greek alphabet, is thence called *Delta*; but this name cannot be of higher antiquity than the era of the Grecian ſovereignty.

The ancients divided Lower Egypt into three provinces; theſe were, Phacuſa or Arabia; Bubaſtus; and Heliopolis, whoſe capital was the On of the ſcriptures, ſo famous for its temple and religious rites, and whoſe inhabitants are reported to have been the wiſeſt of the Egyptians. The temple is ſaid to have been very magnificent: and its original name was Ain Shems, or Beth-Shemeſh, 'the fountain of the ſun:' from whence the whole province received its name, being called at different periods Ain, Aven, and On. Bubaſtus was ſituated to the eaſt of this, and renowned alſo for its magnificent temple, which was dedicated to the goddeſs Beſheh or Beſhet, the Αρτεμις αγρια, or Diana agreſtis, of the Greeks and Romans. This nome and the chief city of it are the Phibeſeth of the ſcriptures: and they are often mentioned in conjunction with On or Heliopolis, which was next in ſituation. The third great province was the nome of Arabia; ſo called, not becauſe it was in Arabia, which it was not, but from the Arabian ſhepherds, who had formerly ſettled in theſe parts, and held them for many years. The true Arabian nome was the land of Goſhen, of the ſcriptures, called by the Seventy Γεσσεμ της Αραβιας. This diviſion was probably anterior to the complete formation of the Delta.

Roſetta is the ancient Raſchid; and the branch of the Nile on which it ſtands is alſo called the Bolbitine branch, from the city of Bolbitinum, the ruins of which are near its mouth, and have ſince formed the tower and convent of Abu-Mandur. Leo Africanus ſays, that Raſchid was built by a governor of Egypt, during the empire of the caliphs. He does not mention, however, the name of the caliph in whoſe reign it was built, nor the time of its foundation. Roſetta is a place of conſiderable commerce, but contains nothing curious. Its ancient circumvallation implies, that it was once larger than it is at preſent. Its original compaſs is aſcertained by the ſand-banks by which it is covered from weſt to ſouth.

A few leagues to the weſtward of Roſetta, is Lake Mahadie, called alſo Lake Aboukir, which ſeparates the plain of the deſert from the peninſula, at the extremity of which Aboukir is built. This deep and extenſive lake was only a remnant of the ancient Canopic branch, which the Nile has abandoned; but in the year 1778, the ſtone pier which had been erected before its mouth, was ſuddenly broken down by the fury of the waves, and the water ruſhing in with impetuoſity, deſtroyed ſeveral villages, and thus recently formed the lake Mahadie. This encroachment, ſtill daily gaining ground, threatens eventually to deſtroy the iſthmus which attaches Aboukir to the main land. The Arabian princes began to ſtrengthen the pier or mound, but it was never finiſhed; and therefore yielded to the efforts of the waves, impelled during a part of the year by the northerly winds. At preſent there are no other remains of their work than two piers, one on each bank.

But lake Edko, ſeparated from lake Mahadie only by a narrow ſpace of ground towards the eaſt, is of ſtill more recent date, having been formed during the overflowing of the Nile in 1800. The dam of the canal of Derout having been broken down, the waters of the river found already paſſage, flowed copiouſly into the low grounds, and opened themſelves a communication with the ſea into the bay of Aboukir. When the Nile retired to its bed, the

ſea

ſea entered through the opening which had been thus made, and gave permanency to the lake. It is very ſhallow, yet aſtoniſhingly abundant in fiſh.

At the upper part of the lake Mahadie is a raiſed cauſeway, behind which paſſes the canal which carries the water of the Nile to Alexandria; the ſame which the Engliſh cut through after the battle of Alexandria, in 1801; and thus made an entire iſland of the peninſula of Aboukir, inundated the whole territory of Alexandria, and reſtored the ancient lake Mareotis, which had for ages been dry. This lake is now ſaid to extend fifteen leagues from eaſt to weſt, and about ten from north to ſouth, and from one to two fathoms deep.

After croſſing the mouth of the lake Mahadie, we arrive at the ſuburb of Aboukir. The fortreſs is founded upon a rock, which there is every reaſon to ſuppoſe was the fort or caſtle of Canopus, or of Heraclea, which Strabo places at or near this ſpot. Contiguous are ſeveral mounds of ruins, and fragments of earthen pots, blended with the ſand of the deſert which the wind has carried thither. It has been ſuſpected that Arabic towers had been ſunk on this ſpot, or, perhaps, that it had been the ſcite of a manufactory of pottery, or that theſe were the ruins of Heraclea. Some fragments of granite on the moſt elevated part of the ground certainly countenance this latter opinion; particularly as at no great diſtance are the fragments of a ſtatue thirty-ſix feet in height; the unperiſhable granite, workmanſhip, and ſtile of which, pronounce it to have been an Iſis holding a nilometer. Near it are ſeveral fragments of architecture, the dimenſions of which evince that they once belonged to a capacious and noble edifice, perhaps the temple of Serapis. Theſe ruins have for ſeveral centuries been waſhed by the waves, without having been deſtroyed; inſomuch that it would appear to be the lot of Egyptian monuments of every deſcription to reſiſt alike the ravages of time and of man. Nearer to the ſea-ſide, and ſurrounded by the fragments of this coloſſal monument, is the ſtatue of a ſphinx, fourteen feet high, the head and fore-legs of which are mutilated. Farther on are a great number of fragments of columns of roſe-coloured granite, fluted, and all of them of the ſame ſize, of the ſame ſubſtance, and wrought with the ſame care, being inconteſtably the ruins of a large and ſuperb temple of the Doric order. From the accounts which Strabo has tranſmitted to us relative to this part of Egypt, there is not the ſmalleſt doubt but theſe are the ruins of Canopus, and thoſe of its temple, built by the Greeks, the worſhip of which vied with that of Lampſacus: of that miraculous temple in which old men recovered their youth, and the ſick their health. A ſpacious bath, the ruins of which are contiguous, was, perhaps, one of the means the prieſts employed to work theſe wonders.

The ſoil has preſerved none of the luxurioufneſs of the ſcite of ancient Canopus. A few hillocks of ſand and ruins in brick, large ſquare blocks of granite, without hieroglyphics, and without any determinate ſhape to atteſt to what kind of edifices and to what age they belonged; and, laſtly, a few ſmall valleys, as barren as the heights by which they are formed, are all that remain of a city, once ſo delightful, the ſcite of which has now a wild and diſmal aſpect. It is true that the canal of which Strabo ſpeaks, which extended from Alexandria to Eleuſina, and a branch of which reached and beſtowed a refreſhing coolneſs on Canopus, has ſo entirely diſappeared, that the traces of it cannot be diſtinguiſhed, nor the poſſibility of its exiſtence at preſent conceived. There are no longer any remains of water in its environs, unleſs in a few wells or ciſterns, which contain an inconſiderable quantity, and which are ſo narrow and dark, that neither their dimenſions nor depth can be meaſured. In ſhort, that city, the ſeat of voluptuous delights, to which the votaries of pleaſure reſorted, is now become a deſert, frequented by nothing but jackals and the Bedouin Arabs, though at no greater diſtance than twelve miles from Alexandria.

We are now to approach a city, long celebrated in the page of hiſtory, which has undergone many revolutions, and even removed from its original ſeat of ſplendour. But the account of Alexandria already given by Volney, ſuperſedes the neceſſity of much detail from us. Every thing in that city is repreſented by him with ſuch a degree of truth, that, had he deſcribed all Egypt in the ſame way, no one could ever have thought it neceſſary to undertake any further inveſtigation. See alſo our article ALEXANDRIA, vol. i. p. 272.

The exterior walls of Old Alexandria, flanked with numerous mouldering towers, form beautiful ruins, pleaſing to the eye of the antiquarian, even amidſt the melancholy ſcenes of cruel deſolation. The circumference of this wall, its maſſive pillars of granite, and venerable aſpect, prove it to have been a city extremely ancient, and moſt probably the magnificent Alexandria, founded by Alexander the Great, a city then without a rival in the world. Within the wall are the extenſive ruins of the Temple of the Sun; where many gigantic pillars of granite remain, which impreſs the mind with the higheſt idea of its former grandeur. The gate which leads from hence to Roſetta, is an elegant ſpecimen of the Saracen taſte in architecture. On the ſpace between the walls and the ſea are lying innumerable blocks and pillars of granite, porphyry, and marble, the ruins, probably, of the ancient Alexandria, and which ſeem to have been made uſe of by the Turks as monumental ſtones, ſince this ground formed their burial place.

Subterraneous reſearches might ſtill more correctly aſcertain the ſcite of the ancient city, when its commerce and ſplendour rendered it immenſe. That of the caliphs, which is the preſent town, was but a diminution of the former city, notwithſtanding it comprehends within its lines what may be termed plains and deſerts. This circumvallation being built almoſt wholly of ruins, the edifices bring unceaſingly to the remembrance deſtruction and ravage. The jambs and lintels of the doors of the dwelling-houſes and fortreſſes conſiſt entirely of columns of granite, which the workmen have not taken the pains to ſhape to the uſe to which they have applied them. They appear to have been left merely with a view to atteſt the grandeur and magnificence of thoſe buildings, the ruins of which they are. In other places, a great number of columns have been applied to the conſtruction of the walls, to ſupport and level them; and theſe columns, having reſiſted the ravages of time, now reſemble batteries. In ſhort, theſe Arabian and Turkiſh edifices, the productions of the neceſſities of war, diſplay a confuſion of epochs, and of various induſtries, more ſtriking and more approximated examples of which are no where elſe to be found. The Turks, more eſpecially, adding abſurdity to profanation, have not only blended with the granite, bricks and calcareous ſtones, but even logs and planks; and from theſe different elements, which have ſo little analogy to each other, and are ſo ſtrangely united, have preſented a monſtrous aſſemblage of the ſplendour of human induſtry, and its degradation.

The quarter of the Arabs, or rather the part which was encompaſſed by their walls, appears almoſt a deſert; containing, indeed, a few incloſures, which, during the months of the inundation, are gardens, and which at other times afford nouriſhment to a greater or ſmaller number of trees and vegetables, in proportion to the ſize of the ciſtern with which each is provided. This ciſtern is the ſource and principle of their exiſtence: when it fails, the gardens are once more converted into ſand and rubbiſh. At the gate of each of theſe gardens are to be ſeen monuments of a benevolent and charitable feeling. Theſe are reſervoirs into which water is pumped as often as it is neceſſary, and which preſent to men and cattle a moſt gratifying beverage in the ſcorching heat of ſummer.

The

The great pool, or conſervatory of water, at Alexandria, is one of the principal antiquities of the middle age of Egypt, and one of the fineſt monuments of that deſcription, whether its ſize be conſidered, or the intelligence which its conſtruction diſplays. Notwithſtanding one part of it is in a very ruinous ſtate, and the other in need of repairs, it contains a quantity of water which ſuffices for the conſumption of men and animals during two years.

Towards the harbour we obſerve the capitals of many connected columns, of the Doric order, the ſhafts of which, though ſunk below the level of the ſea, are ſtill to be ſeen. Strabo has obſerved, that the baſe of the palace of Ptolemy was waſhed by the ſea. Theſe ruins may at one and the ſame time prove the veracity of Strabo's relation, and aſcertain the ſcite of that palace. In the lower part of the harbour by the ſea-ſhore, ruins of edifices of different ages are to be found, having ſuffered alike from time and from the waves. Veſtiges of baths are here to be diſtinguiſhed, ſeveral apartments of which ſtill exiſt, having been poſteriorly fabricated in walls of more remote antiquity. Theſe edifices appear to be of Arabic conſtruction; and, for their preſervation, a kind of pile-work in columns has been made, which has now the reſemblance of floating-batteries. Their immenſe number evinces the magnificence of the palaces they once decorated. After having paſſed the extremity of the harbour, large Saracen buildings are met with, having an air of grandeur, and a mixture of ſtile, by which the obſerver is perplexed. Friezes ornamented with Doric triglyphs, and ſurmounted by arched vaults, would lead one to imagine that theſe edifices were conſtructed from antique fragments, which the Saracens blended to adapt them to the ſtile of their architecture. The doors of theſe edifices may give an idea of the indeſtructible quality of the ſycamore wood, which has remained unaltered, while the iron-work of the doors has yielded to time, and entirely diſappeared. Behind this kind of fortreſs are Arabian baths, moſt magnificently decorated.

In the middle of the court-yard of the principal moſque is a ſmall octagonal temple, which contains a bowl of Egyptian black marble, with white and yellow ſpots, of incomparable beauty, both on account of the ſubſtance of which it is formed, and of the innumerable hieroglyphical figures with which it is covered, both within-ſide and without. This monument, which is, without doubt, a ſarcophagus of ancient Egypt, is a very valuable antique, and juſtly eſteemed as one of the greateſt curioſities of Lower Egypt. In ſhort, Alexandria is a city of great local curioſity, where the monuments of every epoch, and the wrecks of the arts of ſo many nations, are heaped together confuſedly; and where the ravages of wars, ages, and of a humid climate, impregnated with ſea-ſalt, have been productive of greater changes, and have wrought more miſchief, than in any other part of Egypt.

The great harbour of Alexandria, the Magnus Portus, lies between the ſmaller light-houſe to the left, and the ruins of the palace of the Ptolemies to the right. The port of entrance from Roſetta, is the Porta Canopica. The Pharos of the port of Alexandria is apparently a Turkiſh caſtle, and in its preſent ſtate it is of more ſervice to lodge a garriſon, than to defend the town. The rock before it is called the *Diamond*. It is ſuppoſed that this rock was the ſcite of the famous Pharos, one of the wonders of the world; no veſtige of which now remains. At preſent it is only a ſhattered rock, worn by the waves, which beat over it from every quarter. Here are two caſtles, of the great and little Pharos, which terminate in the two horns of the ſemi-circle.

Two principal objects of curioſity at Alexandria are, Pompey's pillar, and Cleopatra's Needle. Pompey's pillar is in the predicament of almoſt every thing famous, which loſes on a near ſcrutiny. It was named Pompey's pillar in the fifteenth century, when learning began to recover itſelf from the torpid ſtate into which it had ſo long languiſhed. At that epoch, men of ſcience, but not obſervers, beſtowed names on all the monuments; and theſe names have been handed down by tradition, without being diſputed, from century to century. A monument had been raiſed to Pompey at Alexandria: it had diſappeared, and was thought to be recovered in this pillar or column; which has ſince, with as little foundation, been converted into a trophy erected to the memory of Septimius Severus. It is, however, placed on the ruins of the ancient city; and, in the time of Septimius Severus, the city of the Ptolemies was not in a ruinous ſtate. Theſe abſurdities have been rectified, and the light of truth at length caſt upon this long-ſtanding monument of error, by the indefatigable reſearch of captains Dundas and Leake, lieutenants Deſade and Squire, and Mr. William Hamilton, all attached to the Engliſh garriſon at Alexandria. Theſe gentlemen, by viſiting the pillar repeatedly during the few moments when the ſun ſhone in ſuch a direction upon the pedeſtal as to mark the letters by their ſhade, were enabled to diſcriminate them one after another. Thus they executed a taſk in ſix weeks, which none of the French literati appear even to have attempted during their long ſtay in the country; and thus they have corrected a popular error, which appears to have exiſted for upwards of five hundred years. We ſhall give the inſcription as it was made out by theſe officers, and ſubjoin an Engliſh tranſlation.

ΤΟΝ ΤΙΜΙΩΤΑΤΟΝ ΑΥΤΟΚΡΑΤΟΡΑ
ΤΟΝ ΠΟΛΙΟΥΧΟΝ ΑΛΕΞΑΝΔΡΕΙΑΣ
ΔΙΟΚΛΗΤΙΑΝΟΝ ΤΟΝ CΕΒΑCΤΟΝ
ΠΟΝΤΙΟΣ ΕΠΑΡΧΟΣ ΑΙΓΥΠΤΟΥ.
"ΗΡΟCΚΥΝΕΙ."

TO DIOCLETIANUS AUGUSTUS
MOST ADORABLE EMPEROR,
THE TUTELAR DEITY OF ALEXANDRIA,
PONTIUS, PREFECT OF EGYPT,
CONSECRATES THIS.

This celebrated column ſtrikes with its vaſt magnitude. It is of the Corinthian order, eighty-eight feet ſix inches in height; the ſhaft is formed of one entire block of red granite, retaining the fineſt poliſh: this is ſixty-four feet in height, and eight feet four inches in diameter; the pedeſtal is ten feet, the baſe five feet ſix inches, and the capital nine feet. The pedeſtal is conſidered to be deficient in height, and the column leans a little to the ſouth-weſt. The ſhaft is ſtill in a high ſtate of preſervation, except on the north-weſt quarter, which has ſuffered from the conſtant winds blowing from that point the greater part of the year. The Greek inſcription is on the weſtern face of the pedeſtal. The French repaired the foundation of the pedeſtal, which had been deſtroyed in part by the rapacity of an Arab; who, imagining ſome treaſure lay concealed under it, attempted in vain to blow it up. A cap of liberty had been erected upon a pole on the top of it, placed there by the French, a ſhort time after their arrival in the country; but it was brought down by one of the Engliſh officers, by means of a paper kite. The day after the ſurrender, a centinel was placed over this pillar, ſome officers having unthinkingly broken off ſmall pieces from the pedeſtal, as curioſities for their friends in Europe.

Cloſe to the ſea-ſide, ſouth-by-eaſt of the Pharos, ſtands Cleopatra's Needle. Near it lies its fellow obeliſk, which had always been ſuppoſed to be broken, part of it being buried in the ſand; but the French cleared away the rubbiſh all round it, and found it to be perfectly whole. It is preciſely the ſame as the one now ſtanding, both as to ſize, and the hieroglyphics with which it is covered. Thoſe on the north and weſt faces of the erect obeliſk, are in a very good ſtate of preſervation; thoſe on the other ſides are nearly obliterated. Both theſe obeliſks are ſuppoſed to have ſtood at the entrance of ſome origi-

nal Egyptian temple. Each is of one entire piece of red granite, ſixty-five feet high. The French having erected trophies and inſcriptions of their conqueſt, in moſt of the principal towns in Egypt; major-general the earl of Cavan, for the more impartial information of poſterity, erected the following inſcription on the pedeſtal of Cleopatra's Needle:

In the Year of the Chriſtian Æra, 1798,
The Republic of France
Landed on the Shores of Egypt an Army of 40,000 Men,
Commanded by their moſt able and ſucceſsful General
Bonaparte.
The Conduct of the General, and the Valour of the Troops,
Effected the entire Subjection of that Country;
But under Divine Providence it was reſerved for the
Britiſh Nation
To annihilate their ambitious Deſigns:
Their Fleet was attacked, defeated, and deſtroyed,
In Aboukir Bay,
By a Britiſh Fleet of equal Force,
Commanded by Admiral Lord Nelſon.
Their intended Conqueſt of Syria
Was counteracted at Acre
By a moſt gallant Reſiſtance
Under Commodore Sir Sidney Smith;
And Egypt was reſcued from their Dominion
By a Britiſh Army, inferior in Numbers, but
Commanded by General Sir Ralph Abercrombie,
Who landed at Aboukir on the 8th of March 1801,
Defeated the French on ſeveral Occaſions,
Particularly in a moſt deciſive Action near Alexandria,
On the 21ſt of that Month,
When they were driven from the Field,
And forced to ſhelter themſelves
In their Garriſons of Cairo and Alexandria,
Which Places ſubſequently ſurrendered
By Capitulation.
To record to future Ages theſe Events;
And to commemorate the Loſs ſuſtained
By the Death of
Sir Ralph Abercrombie,
Who was mortally wounded
On that memorable Day,
Is the deſign of this Inſcription,
Which was depoſited here in the Year of Chriſt 1802,
By the Britiſh Army on their evacuating this Country,
And reſtoring it to the Turkiſh Empire.

The formation of the Delta, or iſland incloſed by the eaſtern and weſtern branches of the Nile, is the moſt curious phenomenon in the hiſtory of Lower Egypt. The Nile is ſaid originally to have conſiſted but of one ſtream at its mouth, and to have emptied itſelf into the ſea as high up as the ancient Heliopolis. That the repulſion of the waters of the ocean, almoſt conſtantly, but particularly at the time of the inundation, driving back the ſand and ſoil perpetually brought down by the current of the Nile, produced a ſediment of ſolid land now ninety leagues in circumference, which has been the work of ages; and which, at firſt choking up the mouth of the river, divided its rivers into many leſſer channels, almoſt all of which now unite in the two branches that diſembogue at Damietta and Roſetta. This phenomenon is denied by Bruce, and ſome others; but the fact is incontrovertible, and is exactly of the ſame feature with the diviſion of the mouths of the Rhine, whoſe waters forced down the new ſoil which formed the Belgic coaſt, and eventually gave exiſtence to the whole territory of Holland. For a ſatisfactory explication of this operation of Nature, ſee the article EARTH, p. 197, and 201, of this volume.

The cauſes and effects of this phenomenon ſeem alſo to have been very ingeniouſly ſimplified by Vivant Denon. "The Delta, (ſays this writer,) appears to have been formed by the efforts made by the weight of the waters of the Nile againſt the waves of the ſea, which, at a certain ſeaſon of the year, are impelled twelve hours daily by the north wind, in a direction oppoſite to that of the courſe of the river. From this conflict of contending waters there reſults a ſand-bank, which, gradually augmenting, becomes an iſland, and divides the current of the river, forming two branches, each of which has its diſtinct ſhelf. The eddy of theſe ſhelves throws on the beach a part of the ſand which the current had ſwept along, and by this heaping up of ſand the two branches narrow by degrees, until, one of them gaining an aſcendancy over the other, the weakeſt of them is choked up, and the iſland becomes main land. The branch which remains ſoon forms another ſank-bank, an iſland, two ſmall branches, and ſo on. In this way, it appears to me, the moſt natural explanation may be given of the ancient geography of the branches of the Nile, as well as of the voyage of Menelaus in Homer, and of the various changes of the Delta, the ſcite of which might in the firſt inſtance have been a gulf, then a ſandy beach, and, laſtly, a cultivated country, covered with towns, villages, and abundant crops, and interſected by canals, which, the ſoil having been either drained or watered with ſkill, might have diſpenſed abundance over the whole of the ſurface of this new country. Afterwards, in the lapſe of time, and in conſequence of the calamities inſeparable from revolutions, ſome of the parts of this territory, thus gained from the ſea, may have been deſerted, while others may have become ſalt ſprings; and lakes may have been formed, next deſtroyed, and, finally, reproduced under a new modification of matter. Canals, choked up, may have changed their courſe, and have been loſt. If this be granted, why, in our uncertain reſearches, need we enquire where the Bolbitine and Canopic branches of the Nile, the branch of Berenice, &c. were ſituated?

"The plants which are produced in the firſt place on the new land, are three or four kinds of ſea-weeds, round which the ſand throws itſelf up in heaps. From its ſurface they ſpring up afreſh; and their ſubſequent decay furniſhes a manure which favours the vegetation of reeds. Theſe reeds give a greater elevation and a greater ſolidity to the ſoil. The date-tree now appears, and by its ſhade prevents the ſudden evaporation of the moiſture, and renders the ſoil fruitful and productive, as may be ſeen in the environs of the fortreſs of Roſetta, from whence, in the time of the emperor Selim I. the guns had a full command of the ſea, and which is now a league from the ſea-ſhore, ſurrounded by foreſts of palm-trees, beneath the ſhade of which other fruit-trees flouriſh, together with all the vegetables that are produced in the beſt cultivated gardens.

"If a conjecture may be hazarded, we might ſay, that, before the moſt ancient times of which we have any knowledge, the whole Delta was only a large gulf which received the waves of the Mediterranean; that the Nile came as far as the opening of the valley which enters the province of Fayyum; that by what is now called the *dry river*, it went to form the Mareotis, which was one of its eſtuaries to the ſea, as the *lac Madie* was that of the Canopic branch, and as the lakes of Berelos and Menzaleh are ſtill the eſtuaries of the Sebenitic, Mendeſian, Tanitic, and Peluſiac, mouths; that the lake Bahr-Belame, (or without water,) is the remain of the ancient courſe of this river, wherein are found petrifactions, vegetations, and human labours, ſhewing that the ſoil has been raiſed by the courſe of the river, and by the perpetual fluctuation of the ſands from weſt to eaſt; that the Nile, having at a certain period acquired more direction to the north than to the north-weſt as before, precipitated itſelf into the gulf which we have juſt ſuppoſed, there forming marſhes, and at laſt, the Delta. From this hypotheſis it would follow, that the firſt labours of the ancient Egyptians, ſuch as the lake Mœris, now lake Bathen, and the firſt dykes, were only made to retain part of the waters of the inundation, in order to irrigate thereby the province of Arſinoë, which threatened to become barren; and that poſteriorly, the lake Mœris, or Bathen, no longer receiving water enough, nor being able from its ſituation to

water

A View of the Sphinx at the Pyramids at Gizeh; a Patera, charged with the Portraits of Osiris and Isis, and Sculptures of Egyptian Musicians. Pompey's or Diocletian's Pillar; and Cleopatra's Needle.

London Published as the Act directs July 18.th 1804 by J. Wilkes.

water the province of Fayyum, the river was obliged to be taken higher up, and the canal Juſef was dug, which doubtleſs bears the name of the caliph who ordered this noble work: but at the ſame time, fearing that Fayyum would remain permanently inundated, this prince raiſed, from time to time, new dykes upon the old, ſuch as we now ſee, and dug the two canals of Boneke and Zaoyeh, to return the ſuperfluity of the flood back into the river.

"When the French enjoy quiet poſſeſſion of the country, (continues Denon,) we ſhall probably make obſervations on all the different levels, and on the labours of the Egyptians at different periods; we may thus aſcertain facts, inſtead of forming conjectures, and ſhew how much the Egyptians have at all times attended to the diſtribution of the waters, and how, even in times of barbariſm, they have preſerved ſome of their ancient ſagacity. After this, if the Nile ſhould ſtill continue to lean to the right, and to increaſe, as it has already done, the branch of Damietta at the expence of that of Roſetta; if it at leaſt ſhould abandon the latter, as it has ſucceſſively left the channels of the *dry river* and the branch of Canopus; if it ſhould leave the lake of Berelos and empty itſelf entirely into that of Menzaleh, or form new branches and new lakes at the eaſtern part of Peluſium; in fine, if nature, always more powerful in the end than the reſiſtance of man, has condemned the Delta to become an arid ſoil, the inhabitants will ſtill follow the Nile in its courſe, and will always find on its banks that abundance which is produced by its beneficent waters."

The Delta is a ground which has been rarely explored by any European, and, indeed, but imperfectly by any other perſons, the inhabitants excepted; even the mamalukes themſelves have ſeldom penetrated to the center of the Delta, in collecting the tributes, and regulating the avanies or fines. Denon, and his fellow *ſavans*, paſſed through it for the purpoſe of inveſtigation. From its uncommon fertility, it is covered with an immenſity of villages, which have communication by a number of canals. The principal town is Manſura; but here are no ruins which can give the ſemblance of vaſt antiquity to the ſoil. *Bathen-el-Baccara*, or the Cow's Belly, the ſouth point of the triangle of the Delta, where the French propoſed to erect the new metropolis, is one of the moſt beautiful ſituations in Egypt. Belbeis is ſituated without the Delta, under the Mokattam mountain.

The ancient Egyptians ſpeak of the encroachment of the ſands and ſoil, under the ſymbol of the myſterious entrance of Typhon into the bed of his ſiſter-in-law Iſis; an inceſt which, according to their tradition, is to change Egypt into a deſert as frightful as thoſe by which it is encompaſſed; and this great event is to happen when the Nile finds a lower level, through ſome one of the ſurrounding valleys, than the bed in which it now flows, and which is conſtantly getting higher. This idea, which at firſt appears extraordinary, may be thought more probable, when we conſider the local ſituation. The elevation of the Nile, and the riſe of its banks, have made of it an artificial canal, which would by this time have put Fayyum under water, if the caliph Juſef, as above noticed, had not raiſed new dykes upon the old ones, and dug a collateral canal below Beneſeuf, to reſtore to the river a part of the water which is every year poured by the overflowing into this vaſt baſon. If it were not for the cauſeways which ſtop the inundation, the great ſwells would ſoon convert this whole province into a large lake, which actually threatened to happen about twenty-five years ago by an extraordinary inundation, in which the river had riſen over the banks of Hilaon, and it was much feared either that the province would remain under water, or that the ſtream would reſume the old and dry channel, which it was evident it had occupied in remote ages.

All the bleſſings of Egypt appear to have been conſtantly derived from the waters of the Nile;—well, therefore, might the indefatigable Bruce have volunteered his ſervices to detect its ſource. Without this river, Egypt, ſurrounded on every ſide with natural obſtacles, ſeparated on the eaſt from Syria by moving ſands, ſkirted on the ſouth and weſt by immenſe tracts of deſerts, and where it ſcarcely ever rains, would be as uninhabitable as the dreary waſtes of Lybia. It is navigable for boats of conſiderable burden as far as the cataracts, and is a very convenient mode of communication from one extremity of the country to the other. The prevailing winds generally ſerve to ſail up; and in coming down, the current is of the greateſt advantage, eſpecially during the overflowing, when a large germe or bark will go down from Cairo to Roſetta, a diſtance of one hundred and ſixty miles, in leſs than forty hours, without ſail or oar to aſſiſt its way. This noble river is therefore the great, and indeed the only, ſource of wealth to the country; and is the moſt pleaſant and expeditious manner of travelling, particularly when it is conſidered, that there are no inns in the country, except a few miſerable caravanſeras, diſguſting to an European, where they muſt ſleep upon dirty carpets, covered with vermin, lying promiſcuouſly among Turks, Arabs, &c. Only that part of the country, which the Nile overflows, is inhabited; as is clearly perceptible by the ſpace of cultivation on each border, and by the numerous villages built only along its banks.

The annual riſing and falling of this river, and their cauſes, have been for ages conſidered as a myſtery, and as one of the greateſt wonders of Egypt. Many ſubtle reaſons have been invented to account for this phenomenon; but it is now univerſally acknowledged to be entirely owing to the heavy rains which fall in Ethiopia, the extenſive elevated country above. With reſpect to the time of its increaſe, it firſt commences in May, yet no public notice is taken of it till the latter end of June, when it has uſually riſen to the height of nine or twelve feet. The public criers then begin to proclaim it through all the Egyptian cities, and continue to publiſh its daily augmentation till it riſes to the height of twenty-four feet, when the dam of the great canal at Boulac is opened with the utmoſt ſolemnity, and the day is devoted to feaſtings, fire-works, and other demonſtrations of public rejoicing, by all the people of Cairo, and its ſeveral fauxbourgs. That the people might have an accurate knowledge of the daily progreſs of the water, and of the very hour when its increaſe has attained the height of twenty-four feet, the public nilometer was erected at the ſouth extremity of the iſle of Rhoda. If the river wants but one inch of this height, the Egyptians will not cut the dam, becauſe in that caſe no tribute is due to the Turkiſh emperor for the lands which ſhould have been watered, but which then will ſcarcely maintain the cultivators. And upon this account the pacha is ſolely reſponſible for the conſequence, if he cuts his dam before the water riſes to the proper mark. The nilometer conſiſts of a large ſquare reſervoir, into which the water of the river enters at pleaſure, and is encompaſſed with a handſome gallery. In the midſt of the baſon is an octagonal pillar of white marble, divided into twenty-two equal parts, the firſt of which is ſubdivided into twenty-four inches, and the others are all marked to the top of the column. This nilometer or mekkias was repaired by the French; and over the entrance to the gallery is placed the following inſcription in French, with an Arabic tranſlation, and another in Perſian underneath it.—"In the year 9 of the French republic, and of the hegira 1215, thirty months after the conqueſt of Egypt by Bonaparte, Menou, commander in chief, repaired the mekkias. The Nile, when at the loweſt, was at the height of three cubits ten digits of the meaſure of the pillar, the 10th day after the ſolſtice, in the year 8. On the 16th day after the ſame ſolſtice, it began to riſe at Cairo: on the 107th day after the ſolſtice it was two cubits three digits above the ſhaft of the pillar: and on the 115th day after the ſolſtice it began to decreaſe."

As

As the Nile could not of itself cover every part of the country in a due proportion, the Egyptians have, with great labour, cut a vaſt number of canals to facilitate the overflowing of their lands. The villages that ſtand on eminences on the banks of the Nile have their reſpective khalidges or canals, and the more diſtant villages have theirs alſo, even to the extremities of the kingdom, by which means the waters are ſucceſſively conveyed to the moſt remote places. It is not lawful to cut the trenches for the reception of the water till the river has attained its proper height; neither muſt all the trenches be opened together, as in that caſe ſome lands would be injured by the inundation, while others would be almoſt totally deprived of their needful refreſhment. The trenches are therefore opened with the greateſt precaution, firſt in the Upper, and afterwards in Lower Egypt; and the natives, who ſtrictly attend to the rules preſcribed in a roll or book, contrive to diſpoſe the fertiliſing flood ſo judiciouſly, that all parts of the country are plentifully watered, and the cultivators are enabled to rejoice in the anticipation of great and abundant harveſts.

But as the Egyptians ſo much depend on the Nile's increaſe for all the fruits of the earth which Nature ſends; ſo, whenever theſe waters chance to fail, the utmoſt diſtreſs is ſure to follow; and hence the deplorable famines and peſtilences of Egypt are readily accounted for. The Arabian author Abdollatiph, mentioned above as having been recently tranſlated by Dr. White, treats alſo of the riſe of the Nile, the cauſes of its increaſe, and the laws by which it appears to be regulated. The momentous importance of this ſubject to the welfare of Egypt clearly appears from his ſecond and third chapters; in which Abdollatiph details with great minuteneſs the melancholy hiſtory of a famine, occaſioned by a failure in the uſual increaſe of the waters, which occurred during his own reſidence in Egypt. The ſame cauſe, indeed, in this extraordinary country, has often produced ſimilar effects; and the narrative of Abdollatiph cannot fail to recal the attention of the ſerious reader to that famine recorded in the book of Geneſis, which, under the direction of Divine Providence, prepared the way for ſuch ſtupendous events, by inducing the patriarch Jacob and his ſons to take up their abode in Egypt. When we recollect that the produce of the land is here always proportioned to the overflowing of the Nile, we cannot but remark with what matchleſs ſimplicity, and at the ſame time with what ſtrict propriety and truth, the ſcene of Pharaoh's dream is laid by the river, while both the fat and lean kine are emphatically repreſented as coming up out of it, and feeding on its banks. See *Gen.* chap. xli.

The famine, and the peſtilence which enſued, of which Abdollatiph has ſo forcibly deſcribed the direful effects, were accompanied with peculiar horrors; and hiſtory, whether ſacred or profane, no where exhibits to our view a more dreadful picture of calamities and crimes. The narrative of the preſent author bears every internal mark and character of truth; and the judicious critic will not heſitate a moment in admitting its authenticity, though the facts which it records were before altogether unknown to the European world. Fortunately, we have it in our power to adduce a ſtrong teſtimony in ſupport of the narrative of Abdollatiph, from Elmacin, in his Univerſal Hiſtory; a part only of which was publiſhed by Erpenius, under the title of *Hiſtoria Saracenica*. "In the ſame year (597) there was a great dearth over the land of Egypt, ſo that a meaſure of wheat called an *irdab* was ſold for five Egyptian dinárs. And this diſtreſs continued nearly three years; and men were ſo deſtitute of ſuſtenance, that they were compelled to eat each other, and even their own children, and to feed on animals that periſhed. Great multitudes, therefore, of people, with their children and ſervants, emigrated to Syria, and the coaſts of the ſea."

We ſhall here ſtate a few paſſages from Abdollatiph, as given in the Monthly Review for April 1802; not merely with the view of gratifying curioſity, but becauſe it has a moſt powerful tendency to humble the pride of man, by demonſtrating his conſtant dependence on the bounty of Providence; by teaching that even the gifts of nature, as they are called, are not more permanent than thoſe of fortune; and, by reminding us that what has happened to others, may poſſibly happen to ourſelves. Page 212: "When firſt the poor Egyptians began to feed upon human fleſh, ſtories of this kind went abroad, and formed the univerſal ſubject of diſcourſe; while every one expreſſed the utmoſt horror and averſion at the crime, and aſtoniſhment at its novelty. Theſe ſenſations were afterward worn out by the force of example, and the calls of hunger: the practice became familiar; and human fleſh was fought not only as a neceſſary ſupport, but as one of the greateſt luxuries of life. It was reckoned among the firſt delicacies of the table, and was dreſſed in many different ways. Afterward, when the practice became more general, and had extended through every part of Egypt, the aſtoniſhment and abhorrence which it had formerly excited ceaſed; and to expreſs or liſten to ſuch ſentiments was no longer diſgraceful. I ſaw a woman dragged and mangled by ruffians in the market-place. They took from her a roaſted child which ſhe had provided for her ſuſtenance. The people in the market ſeemed entirely to diſregard this horrid ſpectacle, and purſued their own buſineſs and employment with the utmoſt unconcern. I obſerved no ſurpriſe, nor even diſapprobation, in their countenances; while I was ſtruck with the deepeſt aſtoniſhment at the ſight, and the inſenſibility with which they beheld it. So powerful is the effect of cuſtom, which can diveſt the moſt unnatural and prodigious crimes of their horror, by preſenting them repeatedly to the ſenſes, and reducing them to the level of the moſt common objects and trivial occurrences!"

Again, page 233. "Of the number of the poor who periſhed with hunger, it is impoſſible to form any probable eſtimate: but I will give the reader ſome information on this ſubject, whence he may form a faint idea of the mortality with which Egypt was then afflicted. In Meſr and Cairo, and their confines, wherever a perſon turned, he could not avoid ſeeing or ſtumbling over ſome ſtarved object, either already dead, or in the agonies of death. From Cairo alone nearly five hundred were daily carried out to the burying-ground; and ſo great was the mortality in Meſr, that the dead were thrown without the walls, where they remained unburied. But afterward, when the ſurvivors were no longer able to throw out the dead bodies, they were left wherever they expired, in the houſes, ſhops, and ſtreets. The limbs of the dead were even cut in pieces, and uſed for food; and, inſtead of receiving the laſt offices from their friends, and being decently interred, their remains were attended by perſons who were employed in roaſting and baking them. In all the diſtant provinces and towns, the inhabitants became entirely extinct; except in the principal cities, and ſome of the larger towns, ſuch as Kous, Aſhmunein, Mahalla, &c. and even there but a few ſurvived. In theſe days, a traveller might paſs through a city, without finding in it one human creature alive; he ſaw the houſes open, and the inhabitants lying dead on their faces, ſome grown putrid, and others who had recently expired. If he entered into the houſes, he found them full of goods, but no one to make uſe of them; and he ſaw nothing wherever he turned, but a dreadful ſolitude, and univerſal deſolation. This account reſts not on the information and authority of a ſingle perſon, but of many, whoſe ſeveral aſſertions mutually confirmed each other. One of them gave me his relation in the following words: 'We entered a city, where no living creature was to be found; we went into the houſes, and there we ſaw the inhabitants proſtrate and dead; all lying in a wretched group on the ground, the huſband, the wife, and the children. Hence we paſſed into another city, which contained,

tained, as we had heard, four hundred ſhops of weavers. It was now a deſert, like the former: the artificer had expired in his ſhop, and his family lay dead around him. A third city, which we afterward viſited, appeared like the former, a ſcene of death and deſolation. Being obliged to reſide ſome time in this place for the purpoſe of agriculture, we hired perſons to throw the bodies of the dead into the Nile, at the rate of ten for a *dirhem*. Wolves and hyenas reſorted hither in great numbers, to feed on the corpſes." Here is a proof of wolves being found in Egypt, by a perſon who reſided in the country, in contradiction to Denon.

It is highly creditable to Abdollatiph, that, though the crimes which he deſcribes were ſo extremely common, and the temptations to commit, as well as the opportunities of committing them, ſo extremely powerful and inviting, yet he never loſt ſight, even for a moment, of thoſe virtuous principles which appear to have regulated his conduct; nor does he ever ſpeak of theſe offences, without the moſt pointed abhorrence and deteſtation. Page 239. "The ſelling of free perſons had now become a common practice; and a beautiful girl might be purchaſed for a few dirhems. Two young girls were offered to me for a dinar; and I ſaw two girls, one of whom was a virgin, expoſed to ſale for eleven dirhems. For five dirhems, a woman offered to ſell me her daughter, who was beautiful beyond deſcription; and, when I upbraided her with the heinous nature of the crime, ſhe bade me take her as a preſent. Women, who had any ſhare of beauty, frequently proſtrated themſelves before men, and intreated them to purchaſe or diſpoſe of them. Many, who thought theſe practices lawful, ſent their purchaſed ſlaves into Erak, Chorafan, and other parts. What appears to me moſt unaccountable of all the wonders which I have related, is that, notwithſtanding the Koran frequently reproves mankind for their impenitence, and for plunging themſelves without remorſe into ſin, they ſhould perſiſt in their wickedneſs, as if they were entirely exempt from the common lot of humanity."

In this valuable work, Abdollatiph is led to trace conciſely, but clearly, many other principal revolutions of Egypt. Among theſe, he records particularly the conqueſt and deſolation of that country, by Nabuchodonoſor, for the ſpace of forty years; and thus moſt unexpectedly do we find in a Mohammedan hiſtorian, who certainly had no ſuperſtitious reverence for the Jewiſh or Chriſtian prophecies, and, indeed, probably no knowledge whatever of their contents, a new and unequivocal teſtimony to the exact accompliſhment of the prediction of Ezekiel, chap. xxix, ver. 9, 10, 11, 12. 19. *And I will make the land of Egypt deſolate in the midſt of the countries that are deſolate, and her cities, among the cities that are laid waſte, ſhall be deſolate* FORTY YEARS, &c. So deſolate, ſays Dr. Bryant, that not a prince of its own people could be found to reign over it, for the ſpace of upwards of two thouſand years!

ANCIENT INHABITANTS, RELIGION, LAWS, LANGUAGE, ARTS, &c.

Of the firſt inhabitants of Egypt, we appear to have the beſt accounts in the Mythology of the learned Dr. Bryant; who remarks that the antiquity of this kingdom may be ſeen from its founders Ham and Mizraim, by whoſe names the country was of old called. He adds, that they were of a collateral line with the people of Canaan; for the father of the Mizraim and the Canaanites were brothers. Egypt is therefore called *Mizraim*, in the ſcriptures; which name is perpetuated to this day by the Turks, who ſtill call the country *Miſſir*. Some conſider Mizraim as a people, not as a perſon; and the head of their family is imagined to have been Miſor, or Metzor. Stephanus Byzantinus, among other names, ſtiled Egypt Μυσαρα, the land of Muſar, or Myſar. Joſephus called Egypt, Meſtra; Euſebius and Suidas, Meſtraia; by which is meant the land of Metzor, a different rendering of Myſor. Sanchoniathon alludes to this perſon under the name of Μισωρ; and joins him with Sydic: both which he makes the ſons of the ſhepherds Amunus and Magus. Amunus is the ſame with Amun or Ham, the real father of Myſor, from whom the Mizraim are ſuppoſed to be deſcended.

The Mizraim who thus ſettled in Egypt, were branched out into ſeven families. Of theſe the Caphtorim were one; who ſeem to have reſided between Peluſium in Lower Egypt, and mount Caſius, upon the ſea-coaſt. Caphtor, from whence the people were denominated, ſignifies a tower upon a promontory; and was probably the ſame as Migdol, and the original reſidence of the Caphtorim. This people made an early migration into Canaan, where they were called Paleſtines, the Philiſtim of the Hebrews; and the country where they ſettled, was named Paleſtina. Whether the whole of their family, or only a part, are included in this migration, is uncertain. Be it as it may, they ſeem to have come up by divine commiſſion, and to have been entitled to immunities, which to the Canaanites were denied. *Amos*, ix. 7. In conſequence of this, upon the coming of the Iſraelites into Canaan, they ſeem to have been unmoleſted for years. They certainly knew from the beginning that the land was deſtined for the Iſraelites, and that they only dwelt there by permiſſion. *Gen.* xx. 15. xxi. 23. xxvi. 27. *Joſhua*, xiii. 2.

The other tribes of the Mizraim ſent out colonies to the weſt, and occupied many regions in Africa; to which part of the world they ſeem to have confined themſelves. The children alſo of Phut, the third of the ſons of Ham, paſſed very deep into the burning regions of the ſouth, and moſt of the black nations are deſcended from them. Lybia Proper was peopled by the Lubim, or Lehabim, alſo one of the branches from Mizraim. The ſons of Phut ſettled in Mauritania; where was a region and river called Phutia. Some of this family ſettled above Egypt near Ethiopia, and were ſtiled Troglodytæ. *Syncellus*, p. 47. Many of them paſſed inland, and peopled the Mediterranean country. In proceſs of time the ſons of Chus, after their expulſion from Babylonia and Egypt, made ſettlements upon the ſea-coaſts of Africa, and came into Mauritania. We accordingly find traces of them in the names which they bequeathed to places; ſuch as Chuzis, Chuſarez, upon the coaſt; a city Cotta, a promontory Cotis, in Mauritania. By their coming into theſe parts the memorials of the Phuteans were in ſome meaſure obſcured. They are, however, to be found lower down; and the country upon one ſide of the river Gambia is at this day called Phuta. It is not poſſible at this diſtance of time to diſcriminate the ſeveral caſts among the black nations. Many have thought, that all thoſe who had woolly hair were of the Ethiopian, or Cuthite, breed. But nothing can be inferred from this difference of hair: for many of the Ethiopic race had ſtraight hair. *Herodot.* l. 5. c. 1. And we are told by Marcellinus, that ſome of the Egyptians had a tendency to wool; whence Volney ſeems to have referred them to a negro origin. Darkneſs of complexion was a circumſtance more or leſs to be obſerved in all the branches of the line of Ham; but univerſally among the Nigritæ, of whatever branch they may have been.

Egypt fell under the ſubjection of a threefold race of kings: the Meſtræi, who were undoubtedly the genuine deſcendants of Mizraim, who firſt gave name to the country. The Auritæ, who were the Arabian ſhepherds, and their kings; theſe reigned here a conſiderable time, maintaining themſelves by force; till, after many ſtruggles, they were finally expelled by the natives. Laſtly, the regular Egyptian kings. The Auritæ were called by the Greeks and Romans Arabians: but their true name was Cuſhan or Cuſeans; the ſame which they gave to the province where they ſettled, which was the beſt of the land; and was ſituated within the Delta, at the extreme and higheſt part of Lower Egypt. To this place the children of Iſrael ſucceeded, after it had been abandoned by its former inhabitants; but at what interval of

time is uncertain. Joſephus, out of a deſire to aggrandize his own nation, ſuppoſes that the Shepherds who bore rule in Egypt were his anceſtors; and that hence aroſe the hatred that the Egyptians bore to them. For this reaſon he makes no difference between the twofold race of ſhepherds, which Manetho ſufficiently diſtinguiſhes. The firſt were the Cuſeans and their *paſtor* kings, who held the country in bondage: the others were the Iſraelitiſh ſhepherds, who ſucceeded to the firſt, and were themſelves afterwards held in bondage, and delivered by Moſes.

Idolatry, too, ſoon became the degrading character of the Egyptians; though, according to M. Pauw, who cloſely inveſtigated this theology, it was by no means ſo groſs as has been repreſented. They acknowledged an intelligent Being, diſtinct from matter, by the name of *Phtha*, fabricator of the world, but not the creator of matter. Here we ſeem to derive the firſt ſprings of their religion; and if the conſequent ceremonials of it have periſhed from the annals of their country, we muſt endeavour to glean them from the regions into which they have ſubſequently paſſed. Anaxagoras travelled into Egypt to ſtudy philoſophy, as was the cuſtom with his countrymen; on his return to Greece, he brought with him a ſyſtem ſo entirely new, that the Greeks, ever delighting in novelties, raiſed ſtatues to his honour, and diſtinguiſhed him by the title of Νους, the Intelligence. The heads of his ſyſtem, as brought from Egypt, are the following:

"Two things were from eternity, Mind and Matter. Theſe two beings were clearly diſtinct. Matter extended without thought, motion, or order; but divided into parts extremely minute, and poſſeſſed of qualities ſimilar and unalterable. Mind was ſimple, without material extenſion, having in itſelf thought, activity, and an executive power over matter. An infinite time had paſſed before the formation of the world. The Sovereign Mind, ſeeing that order was better than confuſion, reſolved on the meaſure. *Anaxagoras mentis infinitæ vi et ratione rerum omnium modum et deſcriptionem deſignari et confici voluit.*—The Mind watches over men with a particular attention; for them it was that the world was made. Their country is heaven, to which they are to be recalled, if, by their virtue, they deſerve it. The bodies of the firſt animals, conſequently that of man, were formed out of earth, tempered with moiſture and heat; after this, the individuals generated others, each in their own kind. Ζωα γενεσθαι εξ υγρε, και θερμε, και γεωδες, υστερον δε εξ αλληλων. *Diog. Laer.* Neither ſun, moon, nor ſtars, are gods or demons, or animated bodies; they are ſolid maſſes ſet in motion by Intelligence, the ſole cauſe of motion."—It muſt be confeſſed, that there is a ſtriking agreement (the creation of matter excepted) between this Egyptian theology, and the Moſaic ſyſtem.

Os-i-ris, in Coptic, ſignifies *conformator*; I-sis, *formarum receptaculum*, perſonifications of Mind and Matter; by which, the firſt principles of their philoſophy were raiſed by the Egyptians into the higheſt objects of their worſhip. The general doctrine deduced from theſe firſt principles was the omnipotence of a Supreme Divinity, known as to its exiſtence, unknown as to its eſſence. This was the univerſal ſource from which all beings proceeded; whether by emanation, as the rays of light; or by generation, as in animals; or by accretion and ſeparation, as in vegetables and minerals; or, in ſhort, by ſome other way unknown, without fixing the time, the manner, or entering into any philoſophical diſcuſſion of the ſubject. This was the ſyſtem of all the moſt ancient people of the earth; eſpecially of the orientals, who to theſe general ideas added a theocracy peculiar to themſelves, in which they ſuppoſed the Supreme Majeſty retired into the heaven of heavens, leaving to a chief miniſter (himſelf the iſſue of the divinity) the care of governing the world, and of keeping within bounds a certain principle of malevolence and rebellion, of which they conceived the exiſtence, from a view of the evils natural and moral by which the world was afflicted. Of moral obligation they appear to have conceived that virtue conſiſts in a ſtrict obſervance of the laws, ſubmiſſion to the magiſtrate, reſpect for ſuperiors, modeſty towards equals, and tenderneſs for inferiors. This is therefore the ſublime of pagan theology. Το δικαιον ειναι και το αισχρον ου Φυσει αλλα νομω. *Juſtum et turpe non natura conſtare, ſed lege.* Diog. Laer. in Archelao.

The Gymnoſophiſts of Africa acknowledged one Creator, incomprehenſible in his nature, but intelligible in his works; this was the origin of ſymbolic worſhip. The worſhip of ſerpents, very general throughout Africa, obtains at this day in many parts. The eneph, a ſnake, is the emblem of divine goodneſs; the viper, of power; hence the diadem of the Pharaohs was adorned with this emblem. The Egyptians uſually perſonified the divine wiſdom under the name of Neph, repreſented ſpringing out of the body of a lion; the manifeſt prototype of the Greek Minerva ſpringing from the head of Jupiter; emblem of the union of wiſdom and of power. It is remarkable that the Egyptians gave an excluſion to Neptune; they deteſted the ſea; and yet, with a ſtrange inconſiſtency, they made their Nephthis, or Venus, to ſpring out of its froth; whence the Aphroditè of the Greeks. "Almoſt all the names of the gods, (ſays Herodotus,) came out of Egypt into Greece." And the Greeks changed their names, and made the gods their own.

The Egyptian religion rejected eternity of puniſhments; admitting a purgatory, whence, in a certain time, men were to reſume their bodies; hence the practice of embalming and preparing their mummies: but philoſophers, and the truly virtuous, were to paſs directly into heaven. Similar notions that the lives of animals would be reſtored, muſt have induced the practice of embalming the ibis. On inſpecting the vaults of Saccara, Denon found more than five hundred mummies of the ibis in a ſepulchral cave. There ſeems a conſiderable variety in the degree of care beſtowed in embalming this ſacred bird; but the earthen pot, in which the whole is contained, is common to all. The difference and pains beſtowed on mummies taken from the ſame cave, proves that the price of the work varied conſiderably for theſe birds, as well as for men, and conſequently that it was done at the expence of individuals; and alſo it may be preſumed, that the embalmed birds had not all been fed in temples, or colleges of prieſts, in reward of ſervices rendered by the whole ſpecies. If the ſame had been the caſe with theſe birds as with their god Apis, a ſingle individual would have ſufficed, and theſe pots would not be found by thouſands. We may then ſuppoſe that the ibis, as it deſtroys all reptiles, was religiouſly venerated in a country in which theſe noxious animals ſo much abound at a certain time of the year; and, like the ſtork in Holland, this bird growing tame from the good reception which it met with every where, each houſe had its own winged inmates of this ſpecies, to which, after their death, the honours of ſepulture were given according to the means of the inhabitants. Herodotus relates, that he was informed that in the earlieſt times of the records of the country, the ibis abounded every where, but that in proportion as the marſhes of Upper Egypt were drained, the birds retired to the lower province in queſt of their food; which accounts for their being now ſo rarely ſeen.

In moſt nations the profuſion of the table was conſidered as the teſt of opulence, or of the progreſs of luxury; but in Egypt it was made an inlet into their religion, manners, and character. The peculiar circumſtances of their climate and ſoil made it expedient for the Egyptians to have a particular attention to their food; hence moſt of their religious obſervances: Moſes adopted many of theſe, but wiſely deſerted the ſyſtem in ſome points, conſulting the character of his people, and the circumſtances of the country in which they were to live. Pythagoras was not ſo wiſe; having paſſed into Egypt, and ſubmitted to circumciſion, he, in the true ſpirit of a

fanatic,

fanatic, would have all or none, ſo adopted the entire dietetic ſyſtem: after this, travelling into India, he embraced without reſerve the regimen of the Bramins, forbidding all animal food, as the Egyptian had done that of fiſh, and of many vegetables: thus his ſyſtem became an abſurd notion of the two; each of which had been calculated for a different climate, and neither for that in which he and his followers were to obſerve it. To a genuine bigot doctrine is every thing; common ſenſe, nothing! Leproſy, ſore eyes, and gonorrhea, were very early endemic in Egypt: the elephantiaſis, a ſpecies of leproſy peculiar to the Egyptians, above all corrupts the ſpermatic juices; this accounts for the origin of the gonorrhea, as likewiſe for the invention of circumciſion. For this reaſon the prieſts ordained abſtinence from all kinds of fiſh, as productive of ſcurvy; yet the people were indulged in the uſe of ſuch as were leaſt ſo: ſhell-fiſh, and in general thoſe of the ſcaly tribe, were deemed the moſt innocent. The firſt magiſtrates, eſpecially the Pharaohs, were not allowed to drink wine. Pythagoras adopted the prohibition; but it did not laſt long. Apollonius Tyanæus endeavoured to revive it, but in vain. The fleſh of ſwine was totally prohibited, except twice a-year, when the common people were indulged in the uſe of it. The fleſh of gooſe and pigeon was the moſt eſteemed; and therefore reſerved for the prieſts and the king.

The ancient Egyptian Lent of forty days was a dietetic inſtitution; they had ſeveral ſmaller Lents of ſix days: during all theſe the huſband was not allowed to ſleep with his wife. Their Lent was kept in the hotteſt ſeaſon of the year: at this day, the better ſort of the inhabitants, in the hot months, take their meals only in the cool of the morning and evening. Mahomet borrowed his Lent, the time of keeping it, and the abſtaining from wine, from the Egyptians:—*C'eſt en Egypte qu'il faut chercher la racine de la plus-part des inſtitutions religieuſes:*—It is from Egypt that we muſt trace the origin of moſt religious inſtitutions. The Egyptians conſecrated onions, that is, prohibited the eating of them, on account of their being ſtimulating and hurtful to the eyes: it is in this point of view that we are to conſider their conſecrations in general; for whatever was deemed hurtful was conſecrated, and not to be touched as food.

The Egyptian government was monarchical, not deſpotic; for the king was not judge; this belonged to the prieſts; nor could he tax without their conſent. In this reſpect, the prieſts were the ephori of that government. Herodotus informs us, that excluſive power and authority was lodged in the hands of the prieſts, who ruled the ſovereign, and kept the formula of their religion wrapt up in emblem and myſtery, to put a barrier between themſelves and the people. The king was ſerved and counſelled by prieſts, fed and inſtructed by them; every morning they read to him the duties of a ſovereign towards his people, and towards his religion; they then led him to the temple, where theſe duties were inculcated by prayer and ſacrifice. The only two ſovereigns who, according to hiſtory, dared to ſhake off their yoke, were Cheops and Cephrenes, who ſhut up the temples for twenty years; but theſe were regarded as impious and rebellious princes, and were recorded as ſuch in the annals which the prieſts compoſed and handed down to poſterity. The palace with a hundred chambers, the only one mentioned in the hiſtory of Egypt, was the work of a new form of government, in which the prieſts could no longer poſſeſs the ſame influence. In this ſplendid palace of the kings, the idea of uncontrouled monarchy was implied by ſculptured figures on the ſide of the gate, repreſenting heroes holding by the hair a group of conquered priſoners, and preſented by the divinities with new arms for future victories. But it does not appear that this ſtate of kingly power was of long duration.

The pontificate was hereditary, not at the nomination of the prince, who, by the original conſtitution, could not be of the order; but when Sethon, who was pontiff, made himſelf king, there was no counterpoiſe left to the royal authority, which of courſe became deſpotic. In this, as in all the mixed governments of antiquity, a third or middle power was wanting, a repreſentative of the people. From this time, the prieſts or the military diſpoſed of the throne by election from among themſelves, as either prevailed; the people were but a number, that is, ſlaves. The prince, if choſen from the military, aſſumed the prieſthood; there was no controul left. Fertility of ſoil, and facility of culture, conſtituted their wealth; hence pyramids and public works were no proof of the riches of the prince; they were the reſult of the paſſions of a people little employed in providing the means of ſubſiſtence. The Ptolemies at laſt gave them a taſte for commerce, which till then they had deſpiſed. This accounts for their having uſed no coin in early times. They had a phyſician for every malady, but no lawyers; all pleadings were in writing; no torture was inflicted in criminal caſes; perjury was made capital, and ſo was murder. If the accounts we have of the Egyptian government be imperfect and unſatisfactory, it muſt be conſidered, firſt, that the national records are loſt; and, in the next place, that the government, from the time of Sethon, becoming deſpotic, the principles of ſuch a government, if it can then be ſaid to have had any, muſt be contained in a very ſmall code, the will of the prince. The flouriſhing ſtate of the arts at the era of the Macedonian conqueſt, is, however, the moſt ſatisfactory proof of the ſtability and antiquity of their government.

The Egyptians had two languages, a popular, and an hieroglyphic. The obſcurity and indeciſion of the hieroglyphic, ſays Herodotus, fitted it to become a language of which the prieſt might keep the interpretation to himſelf. No one can conceive what is become of their popular language; it ſeems totally loſt. A conjecture on this ſubject may poſſibly be allowed. In their laws, manners, and inſtitutions, the Egyptians piqued themſelves on being ſuperior to all other nations; this was the reſult of the mean opinion they entertained of the reſt of mankind: under this impreſſion, they wiſhed to withhold all knowledge of the diſcoveries they had made in arts and ſciences from others; to this end, thoſe diſcoveries were committed to the keeping of the prieſts, their only authors and literati; the country being conquered, and the prieſthood deſtroyed, the records might periſh with the order. That the prieſts did keep thoſe records in the utmoſt privacy is manifeſt from this, that the Greek literati, who lived and ſtudied ſo many years in Egypt, never brought out of the country a ſingle volume of thoſe records, or ſpecimen of the language in which they were written; a circumſtance not to be paralleled in the hiſtory of letters: ſo that their communication with their teachers muſt have been by interpreters; a ſingularity the more likely to be adopted by the Greeks, from their known contempt of all other tongues, and pride in their own. Yet, as the Egyptian prieſts had a ſettled revenue, and ſuffered none of their order to receive legacies or donations, it is the more extraordinary that they ſhould have given into theſe extremes of prieſtcraft. Beſides, they were obliged to marry, which made them a part of the ſtate. They were likewiſe poſſeſſed of the judicial power: the firſt claſs of judges were called prophets; that is, interpreters. The forcteller of events was called Mantis; who, according to Plato, was always ſuppoſed to be out of his ſenſes; or, which was the ſame thing, to be inſpired: hence the prieſteſs of Delphos, who pronounced the oracles, aſſumed a ſemblance of phrenſy to confirm the opinion of her inſpiration.

There is not to be found in the world a ſingle book of the great library of Thebes; ſo that we know nothing of Egyptian literature but from the information of the Greek philoſophers and poets; and even they knew not much; for the Egyptian literati held the wiſeſt of the Greeks extremely cheap. "You Greeks will for ever talk like fools

fools on theſe ſubjects." Such were the communications of the Egyptian with the Greek philoſophers.

The hieroglyphic language of the Egyptians is thus deduced by Dr. Bryant: "As Egypt was the land of Ham, who, as the Sun, was ſtiled Ait, it alſo was called Ait, rendered by the Greeks Αἴα; and as the heart in the body may be eſteemed what the Sun is in his ſyſtem, the ſource of heat and life, it was therefore called Ait, which word having theſe two ſenſes, was the reaſon why they made a heart over a vaſe of burning incenſe, the firſt hieroglyphic or emblem of their country. The principal rites in Egypt were confeſſedly for a perſon loſt, and for a time conſigned to darkneſs, who was at laſt found. This was Oſiris. Hence thoſe exclamations at the feaſts of Iſis: Εὑρήκαμεν· Συγχαίρομεν. See Plutarch. If. et Oſiris, v. 1. the ultimate to which we can apply is Egypt. Every ſacred thing in Egypt was at length diſtinguiſhed by ſome ſymbol of the deity. The Egyptians had many ſubordinate deities, which they eſteemed ſo many emanations, ἀποῤῥοιαι, from the Supreme Being. They were refined in their ſuperſtition, above all nations in the world; and conferred the names and titles of their deities upon vegetables, and animals of every ſpecies; and not only upon theſe, but alſo on the parts of the human body, and the very paſſions of the mind. Whatever they deemed ſalutary, or of great value, they diſtinguiſhed by the title of ſacred, and conſecrated by ſymbol to ſome god. Thus they had many emblematical perſonages, ſet off with heads of various animals, to repreſent particular virtues, and affections; as well as to denote the various attributes of their gods. Hence the origin of their hieroglyphics. But we muſt make a material diſtinction between the hieroglyphics of old, when Egypt was under her native kings; and thoſe of later date, when that country was under the government of the Greeks: at which time their learning was greatly impaired, and their ancient theology ruined.

"If any means can be found to obtain the latent purport of the Egyptian hieroglyphics, they muſt ariſe from conſidering theſe emblems ſingly, and obſerving their particular ſcope and deſtination. When we have aſcertained the meaning of ſome individuals, we may poſſibly diſcover their drift, when conſidered collectively. Theſe, I think, are the principles upon which we muſt proceed: but after all it will be a dark reſearch, in which many have been bewildered. There are authors who mention an ancient piece of hieroglyphical ſculpture, which was to be ſeen in the city Saïs. It conſiſted of a child, an old man; and near them ſtood an hawk. After theſe a cetus, or ſea-fiſh; and laſt of all an hippopotamus. Clemens of Alexandria mentions the ſame hiſtory; but ſays, that it was at Dioſpolis. Inſtead of the river-horſe he introduces a crocodile, which he ſays was an emblem of impudence. It is to be obſerved, that the hippopotamus and crocodile were ſymbols of the ſame purport; both related to the deluge: and, however the Greeks might ſometimes repreſent them, they were both in different places reverenced by the ancient Egyptians. The interpretation given by Clemens, is this: 'All ye who are juſt come into the world, and all ye who are going out, remember, that God hates impudence.' As there are ſo many crimes of high moment, which demand animadverſion, it is ſtrange, that ſo ſolemn a caution ſhould be given merely againſt *impudence*. The inſcription ſeems to have been put up in two places: one of which was the temple of Iſis at Saïs; the other the temple at Dioſpolis, called Theba. Theſe are two remarkable places; in conſequence of which, one would imagine, that the inſcription ſhould contain ſome memorial of more conſequence: ſomething which had a reference to the temples wherein it was found. Were I to attempt the deciphering of theſe hieroglyphics, which however diverſified, ſeem to amount to the ſame purport, I ſhould begin, as in reading their common written language, from right to left, in a ſeries different from thoſe who have gone before me. I find, according to this order, that the hippopotamus, or crocodile, ſtands firſt; and then the cetus. Next comes the figure of the ſacred hawk, under which ſemblance Divine Providence was always depicted; and after this an old man, and a child. It may ſeem preſumptuous to pretend to interpret what was a ſecret two thouſand years ago: I ſhall therefore only mention what I have to ſay, as matter of opinion. I apprehend it may be read in the following manner: 'As the hippopotamus, or crocodile, ſurvives the inundation of the Nile, juſt ſo that ſacred receptacle, the cetus, or ark, through the interpoſition of Providence, weathered the deluge; by which means the aged patriarch eſcaped, and obtained a renewal of life.' How true this interpretation may be, I will not preſume to ſay: it certainly correſponds with the hiſtory of each emblem, as they have been ſeparately conſidered; and is conſonant to the general ſcope of the rites and mythology of Egypt. What is ſtill more to the purpoſe, it perfectly agrees with the deſtination of the two temples, where it is ſaid to have been found: for by Iſis was meant a ſacred receptacle; and Theba is literally the ark. The temples were both of them built in memory of that event, which the hieroglyphic ſeems to deſcribe."

Voltaire gives a curious inſtance of the force and conciſeneſs of hieroglyphical communication, which is taken from Herodotus. That hiſtorian informs us, that when Darius invaded Scythia, the Scythians ſent him the figures of a bird, a mouſe, a frog, and five arrows. By this ſymbolical admonition they informed him, that if he did not fly away as ſwiftly as a bird, or conceal himſelf like a mouſe or a frog, he would periſh by their arrows. This ſtory, ſays Voltaire, may poſſibly not be true; but it nevertheleſs furniſhes a ſtriking example of the ſimplicity of the emblems employed in thoſe diſtant ages.

The hieroglyphic language of the Egyptians, ſays ſir John Marſham, is the greateſt proof of their antiquity as a people. But, however intelligible this mode of communicating ideas might at firſt have been, it is reaſonable to conclude that when their popular language came to be refined by the invention of letters, the hieroglyphic ſymbols began to be diſuſed, and the people gradually forgot the ſignification of them. The prieſts, ſtill retaining and cultivating the knowlege of them, becauſe they were the repoſitories of their learning and hiſtory, at length applied them to the purpoſe of preſerving the ſecrets of their religion. Thus hieroglyphics became the ſource of animal worſhip in Egypt, as ſir John conjectures, *Can. Chron.* p. 58, becauſe in theſe hieroglyphics was recorded the hiſtory of their greater deities, their kings, and lawgivers, repreſented by animals, and other groſs emblems. The ſymbol of each god was well known and familiar to his worſhippers, by means of the paintings and engravings on their temples and other ſacred monuments; ſo that the ſymbol preſenting the idea of the god, and that idea exciting ſentiments of religion, it was natural for them, in their addreſſes to any particular god, to turn to his repreſentative mark or ſymbol; eſpecially when we conſider farther, that the Egyptian prieſts feigned a divine original for hieroglyphic characters, in order to increaſe the veneration of the people for them. Theſe would of courſe bring on a relative devotion to theſe ſymbolic figures, which, when it came to be paid to the living animal, would ſoon terminate in an ultimate worſhip; and which ſubſequently proved to be the fact.

In their written characters, the *A* was not the firſt letter of the Egyptian alphabet, but the *T*, in honour of Thoth, or Hermes, the genius that preſided over the ſciences and the arts. Their writing was from right to left, like the Hebrew; and it is certain that they uſed ſimilar letters ſo early as the age of Moſes. Theſe characters have been lately found upon manuſcripts in the ſwathings of their mummies, as exhibited in the annexed engraving.

"The ſubject of this engraving, (ſays Denon,) is part of a manuſcript found rolled up in a mummy. The papyrus on which it is written is prepared of two layers of the

Part of an Egyptian Manuscript found in the Swathing of a Mummy.

London Published as the Act directs May 26th 1804 by J. Wilkes.

the medullia of this plant glued to each other, with the fibres made to croſs, to give greater conſiſtence to the leaf. It may alſo be ſeen that the writing goes from right to left. The hieroglyphic deſign here repreſented is an offering made by a prieſt to Iſis, in the form of a cow; whoſe head is dreſſed like the human figures of that deity; beſides having a kind of yoke about her neck, which I have alſo met with around the god Apis, in an hiſtorical bas-relief in the temple of Medinet-Abu, at Thebes. The frame upon which the cow, or Iſis ſtands, is perhaps an altar; beneath which the figure of a mummy is depicted, intended perhaps to repreſent Nature in a dormant ſtate. Above the cow is a diſk with eagle wing, whence a ſerpent, the emblem of divine power, is deſcending. The prieſt is clothed in a white ſtriped tunic, which covers his body from his loins down to the mid-leg; it is faſtened by ſtraps, paſſing round his right ſhoulder, which otherwiſe is as naked as his arms; on his head he has a cloſe-fitting cap, which looks ſomewhat like a helmet, and is rounded off at the ears, leaving them bare: he holds in his hand a vaſe, containing two ſpecies of flowers, which I have often ſeen, without being able to make out what they are. Above the figures is an inſcription compoſed of ſeven vertical and four horizontal lines: the writing is here different from the reſt of the manuſcript, and the characters appear to be infinitely varied and numerous; ſome of the emblematical figures, met with in other places, may be here diſtinguiſhed, ſuch as the ſerpent, the eye, and birds; but theſe are mixed with others that ſeem to be purely conventional, and exhibit no kind of image. The lines at the bottom exhibit an unmixed ſpecimen of the true Egyptian written language.

"In copying the whole manuſcript I have found the return of entire phraſes, and particular characters, ſo often repeated, that they can be only articles, conjunctions, or auxillary verbs: from theſe, it would be eaſy for thoſe perſons who devote themſelves to this kind of ſtudy, to compoſe alphabets, or groups of words, which may aſſiſt in the general explanation; and a ſingle one of theſe manuſcripts would furniſh the whole of the ſet of characters, if each character only expreſſed a ſingle letter. This manuſcript belongs to the firſt conſul, who has been pleaſed to allow me the uſe of it."—From the ſeveral fragments of manuſcripts collected in Egypt by the French literati, it is ardently to be hoped and expected that their dialect may yet be recovered. With reſpect to their hieroglyphics, it is really wonderful, that in a country where this myſtical writing was ſo long in uſe, it ſhould now be wholly loſt, even to the natives themſelves, and not a perſon exiſting in the world who can be found to decypher or explain the connexion and meaning of thoſe ſymbolical characters.

It is generally agreed that the Egyptian ſymbolical writing, or hieroglyphics, was greatly anterior to their alphabetical character. They are ſaid to have firſt uſed letters ſimilar to the Ethiopic, which approach nearly to thoſe of the Hebrew; but, after all the reſearches that have been made, there appears nothing certain or deciſive, either with regard to their language, or its characters. Dr. Edmund Fry, in his Pantographia, publiſhed in 1799, has given ſeven different alphabets which are called Egyptian. The firſt and ſecond are on the authority of Theſeus Ambroſius, and are deemed the moſt ancient; an aſſertion which implies many revolutions in the people and the government; but of which hiſtory is totally ſilent. The third is given by Fournier, under the title of *Iſiac-Egyptien*, which he informs us was attributed to the goddeſs Iſis. The fourth is called by Fournier *Lettres Sacrées*; and he ſays the characters were invented by the god Thoth: this is mere fable. The fifth is ſaid, by Duret and Fournier, to be a character explanatory of their ſymbolical or hieroglyphic alphabet; but for this opinion there does not appear either reaſon or authority. The ſixth was diſcovered by the abbé Barthelemi, under a monument in Egypt; and is very different from all the preceding. The ſeventh alphabet differs entirely from all the others, both in the form of its characters, and in the mode of placing them, being written, like the Hebrew, from right to left; for which reaſon Dr. Bryant ſeems to have conſidered it as moſt likely to be the true one; and on this ground he is of opinion, that their hieroglyphics, and all their manuſcripts, are to be read backward: but this, like all the reſt, is mere conjecture. It is however to be noticed, that the firſt letter of all theſe alphabets, is the *A*, whereas Pauw aſſerts, that the firſt letter of the *true* Egyptian alphabet was the *T*, but in that given by Barthelemi, the *T* is placed laſt, and the *Z* the ſixth. It is ſtill more remarkable, that neither of the alphabets above-mentioned correſpond in the form of their characters with the manuſcripts recently diſcovered in Egypt by the French literati. See the annexed engraving of the manuſcript found under the ſwathings of a mummy in the necropolis of the ancient Memphis; from which it will appear that the Egyptians ſometimes wrote in a vertical direction, as well as in the horizontal.

Bochart muſt have been wholly unacquainted with the antiquities of Egypt, when he aſſerted that the Hebrew was the eldeſt of nations. Abraham, who lived ſix hundred years before the Trojan war, on his paſſing into Egypt, found it a great and flouriſhing kingdom; and the Jews do not pretend to trace their origin, as a people, higher than Abraham. As to Bochart's ſecond aſſertion, that the Egyptians borrowed their arts and ſciences from the Jews, it will be ſufficient to obſerve that, at the time of Abraham's viſit, the great pyramid was ſtanding; this pyramid exhibits a correct meridian, the contrivance of an aſtronomer far advanced in the ſcience; and the building itſelf could not have been raiſed without a conſummate knowledge of mechanics. The facility with which the Egyptians raiſed thoſe immenſe obeliſks which formed avenues to their temples, and which of courſe left little room for the working of engines, brings to ſhame the complicated machinery employed by Fontana in erecting the obeliſk before the church of St. Peter at Rome. Even the Romans, notwithſtanding their boaſted improvement in the arts, and deſpairing to equal the Egyptian architects, thought it a ſufficient honour to borrow from that people the moſt ſplendid ornaments of their capital. When Octavius, afterwards Auguſtus Cæſar, had reduced Egypt to a Roman province, he cauſed a pair of theſe obeliſks to be tranſported to the imperial city; but thinking it impracticable to move a third, which is ſaid to have afforded employment to twenty thouſand men in the reign of Ramiſes, he ſuffered it to remain without moleſtation. Conſtantius, however, effected what Auguſtus durſt not undertake, and actually ordered this ſtupendous monument to be carried to Rome. Theſe obeliſks formerly abounded in every part of Egypt: their ſhape was that of a quadrangular taper ſpire, terminating in a point, to ſerve as an ornament to ſome open ſquare, or to form avenues to their temples, or a ſumptuous entrance to their cities. Their poſition was perpendicular, and their decorations conſiſted of ſuch inſcriptions and hieroglyphics as were commonly uſed by the Egyptians for the purpoſe of diſplaying the myſteries of their religion. The pair of obeliſks now ſtanding at the entrance of Luxor, as ſhewn in the preceding engraving, affords an ample ſpecimen of this majeſtic decoration.

Among the proofs of their high antiquity, great and early advances in the ſciences, particularly in aſtronomy, are the moſt deciſive. The Egyptians knew, at a very early period, that the ſun was fixed, a common center to the earth and planets, which move around it. They gave the firſt hint of the ſublime idea of every ſtar being a ſun to a ſyſtem like our own. Nor did they ſtop ſhort of the inveſtigation of comets, which they held to be planets, moving in orbits ſimilar, but eccentrical, to our ſyſtem. It is admitted that the Jews, on their coming out of Egypt, one thouſand five hundred years before our era, brought with them the Egyptian year of twelve

lunar months, of thirty days each. A year of 360 days muſt have produced great confuſion in the ſucceſſions of ſeaſons: accordingly, it is known that ſo early as the Trojan war, the Egyptians had a year of 365 days; this fell ſhort of true time only twenty-five days in a century, corrected in the Julian calendar, by adding a day to every fourth year, called by us biſſextile or leap-year.

Though the Egyptians gave to the vulgar year no more than 365 days, yet they knew that the true year was ſix hours longer. This the prieſts explained in ſecret to Eudoxus and Plato, but kept the uſe they made of it among the arcana of the college; this uſe conſiſted in adding the fourth of a day to every year, calling the firſt year the firſt quarter, and ſo on to the fourth, which formed the luſtrum of four years, borrowed from them by Eudoxus, according to Strabo and Pliny. This ſecret Julius Cæſar learnt during his ſtay at Alexandria, and this led him to the reform of the Roman calendar. It is to the honour of ſcience to obſerve, that of all the events of Cæſar's life, this bids the faireſt for immortality; for, ſuch is the nature of the thing, that time itſelf muſt be loſt, before this can be forgotten. Should it be aſked, why did not the prieſts apply their luſtrum to the vulgar calendar? it may be anſwered, that they were *politicians* as well as prieſts, and thought that, in both caſes, the vulgar were beſt governed, as certain fowl are beſt fatted, by being kept in the dark. By their excluſive knowledge of true time, they alone could predict with exactneſs the annual inundation of the Nile, the ſtages of its increaſe and retreat; they alone could fix the preciſe time for obſerving the religious feaſts, moſt of which had their origin in the changes of the ſeaſons; on theſe two articles depended the natural and political exiſtence of an Egyptian. Hence it was, that the prieſts were ſo tenacious of the power this ſecret gave them over the people, that they obliged their kings, at their inauguration, to take an oath that they would never ſuffer the calendar to be altered. Hence the cunning of the prieſt ſuggeſted a ſimilar policy to the ſcience of the philoſopher. The vulgar year loſing ſix hours annually, or twenty-five days in a century, it follows that in 1465 years things muſt come right again, and the year begin where it had done at the commencement of the period; of this the aſtronomer took a moſt ingenious advantage, by converting the period of 1465 years, thence called a *cycle*, into a meaſurement of time to be applied to the prodigious age he attributed to the world.

It has been demonſtrated by modern aſtronomers, that the cycle was right in the 139th year of the Chriſtian era; conſequently, the preceding cycle muſt have begun with the Egyptians 1456 years before, and been thence carried back to the meaſurement of an aſcending period of prodigious antiquity: but here the preſent aſtronomers interpoſe, and will not allow that the Egyptians carried theſe cycles higher: yet it is ſtrange, that a ſenſible people, who knew the value of time, ſhould throw it away in forming a period of which they meant not to make uſe more than twice or thrice. But ſince the recent diſcovery made by Denon of the advanced ſtate of their aſtronomy, exemplified in their zodiac and planiſphere, ſtill extant in the great temple at Tentyra, it ſeems that they were entitled to much more intelligence and enlightened knowledge than modern writers have been willing to allow them. And after the departure of Denon, we are informed, that general Deſaix found another zodiac, ſculptured on a periſtyle at Eſneh, apparently of much higher antiquity than the former. We learn alſo from a memoir tranſmitted by C. Corabœuf, French engineer in Egypt, that the zodiac found at Eſneh is in twenty-five degrees, and that at Tentyra, the preſent Dendera, in twenty-ſix degrees, north latitude: and M. Burckhardt, who, having examined the drawing made by Denon, of the zodiac of Tentyra, finds that the ſolſtice had advanced ſixty degrees further than the place where it now is; which ſuppoſes an antiquity of four thouſand years. By ſtudying the ſurrounding figures, this poſition may, perhaps, be obtained with more accuracy. C. Fournier has likewiſe preſented to the inſtitute a memoir, containing further details on this curious ſubject. The zodiac of Eſneh, he ſays, repreſents the ſolſtice in the conſtellation of Virgo, which ſuppoſes an antiquity of ſeven thouſand years. But the poſition of the ſolſtice is there indicated in a more vague manner, and it is not impoſſible that there may be an uncertainty of ſome hundred years. This, however, appears calculated to give probability to the hypotheſis of Dupuis, who aſcribes our zodiac to the climate of Egypt when the ſummer ſolſtice was in the conſtellation of capricorn, fourteen or fifteen thouſand years before our era. See an anſwer to this under the article EARTH, p. 206, of this volume.

With aſtronomy, the fine arts ſeem to have kept pace in Egypt. Certain it is, that the Egyptians engraved the *pietre dure*, or gems, two thouſand years before our era; and to this we are wholly indebted for the correct figures and portraits, which have been tranſmitted to us from thoſe early times. What ages muſt have preceded their arrival at this point in an art of ſo great difficulty! In like manner, the moſt difficult operations in mechanics muſt have taken place in the building of their vaſt temples and pyramids, and the erection of their ſtupendous obeliſks.

The Egyptians excelled in works of glaſs, caſt large plates, but ſtopt ſhort of the mirror: they caſt ſtatues of coloured glaſs, and counterfeited the murine vaſes; but it is now unknown what thoſe vaſes were; though they are ſuppoſed to be of the nature of the onyx. They delighted in ſimple and contraſted colours; for they had no knowledge of mixed tints; accordingly, we never hear amongſt the ancients of an Egyptian painter, though Plato aſſures us that they cultivated the art, as far as related to architecture, ten thouſand years before his time. The ſtatuaries of Egypt were confined by the prieſts to certain forms and modes of repreſentation: hence Plato obſerves, that they were, in his time, juſt where they were at their firſt ſetting out, except as to greater correctneſs and beauty in the ſtile of finiſhing.

It is ſuggeſted by Ariſtotle, that the agriculture of Egypt being eaſy, and of little labour, and the conſequent idleneſs of the people thought hurtful to their health and morals, they were conſtantly employed in ſome great work. Thus the policy of the rulers became the paſſion of the people; and a maſter-ſtroke in police. It is certain that the Egyptians had little employment in navigation and commerce; what they wanted from other countries was brought to them. It is very remarkable, that they neither coined, nor made uſe of, money, till ſome time after the Perſian invaſion. Yet Monteſquieu makes this the teſt of civilization.

It appears that the errors into which we have fallen, touching the developement of the arts, have their ſource in Varro, who aſſerts, that all the arts were invented in Greece in the courſe of a thouſand years: but it now turns out that the Greeks did not invent either arts or ſciences; they went abroad to learn them, or they were brought to them: had they been confined to their own country, and had no communication with Egypt, it would probably have taken them up a thouſand years to complete an alphabet; which was brought to them in a day, and that by accident. The very ſlow progreſs of ſcience is evinced in the following inſtance: The prieſts of Thebes and Heliopolis, who thought that they had diſcovered the preciſe term of a tropical year, made a miſtake of ſome minutes, as is ſeen in the defect of the Julian year; it was but the other day that this miſtake was corrected, and this branch of ſcience brought to perfection. Caſtration, male and female, was ſaid to be practiſed in Egypt from the earlieſt times. Strange it is that this uſage ſhould not have paſſed with the Egyptian colonies into Greece, if any ſuch were. Cuſtoms, ceremonies, feaſts, &c. paſſing from Egypt into Greece, are accounted for,

by

by ſuch men as Lycurgus and Solon ſtudying legiſlation in Egypt: this ſame obſervation holds with reſpect to philoſophers and artiſts.

But the moſt prominent feature of the progreſs of the arts in ancient Egypt, was the perfection and magnificence of their architecture. Borrowing nothing from the ſtile of other nations, they have added no foreign ornament, no ſuperfluity of materials. Order and ſimplicity are the principles which they have followed, and they have carried them to ſublimity. At this point they have ſtopped, and have attached ſo much importance to preſerving the unity of deſign, that though they have loaded the walls of their edifices with bas-reliefs, inſcriptions, and hiſtorical and ſcientific reprefentations, yet none of theſe rich additions interſects a ſingle line of the general plan, all of which is religiouſly preſerved unbroken: the ſumptuous and rich decorations which appear to the eye when cloſe to the building, all vaniſh at a ſhort diſtance, and leave full to view the grand elements of architectural compoſition, which are dictated by found reaſon. It ſeldom rains in this climate; all that is wanted, therefore, is a covering of plat-bands to give ſhade; but beyond this, neither roof nor pediment are added; the plain fortification ſlope is the principle of ſolidity; they have therefore adopted this form for every main ſupporter, doubtleſs with the idea that ſtability is the firſt impreſſion that architecture ſhould give, and is an eſſential conſtituent of this art. With theſe people, the idea of the immortality of the Deity is preſented by the eternity of his temple; theſe ornaments, which are always rational, always conſiſtent, always ſignificant, demonſtrate a ſteadineſs of principle, a taſte founded upon truth, and a deep train of reaſoning; and if we even had not a full conviction of the eminent height to which they had attained in the abſtract ſciences, their architecture alone, in the ſtate in which we now find it, would give the obſerver of the preſent day a high opinion of the antiquity of this nation, of its intellectual reſources, and the impreſſive gravity of its character.

"I deſpair, (ſays Denon,) of being able to expreſs half what I felt on ſtanding under the rich portico of the maſſive temple of Tentyra. I felt that I was in the ſanctuary of the arts and ſciences. How many periods preſented themſelves to my imagination at the ſight of ſuch an edifice! how many ages of creative ingenuity were requiſite to bring a nation to ſuch a degree of perfection and ſublimity in the arts! and how many more of oblivion to cauſe theſe mighty productions to be forgotten, and to bring back the human race to the ſtate of nature in which I now found them on this very ſpot! Never was there a place which concentered in a narrower compaſs the well-marked memorial of a progreſſive lapſe of ages. What unceaſing power, what riches, what abundance, what ſuperfluity, of means muſt a government poſſeſs which could erect ſuch an edifice, and find within itſelf artiſts capable of conceiving and executing the deſign, of decorating and enriching it with every thing that ſpeaks to the eye and the underſtanding! A conſtant ſubject of aſtoniſhment is afforded by the equality of care obſervable in all the parts of ſo vaſt a whole, by that minute exactneſs of execution, and that perfect finiſh, the fruits of an obſtinacy and an inflexible perſeverance which characteriſes a monaſtic ſpirit, whoſe zeal neither periſhes nor even cools, and whoſe pride is not individual but corporate. Probably the artiſts themſelves were a conſtituent part of the colleges of prieſts; for it is ſcarcely to be ſuppoſed that theſe would have allowed the arts, that elevate and adorn the human mind, to be entruſted to any caſt but their own.

"Theſe monuments, which imprint on the mind the reſpect due to the ſanctuary of the Divinity, were certainly the open volumes, in which ſcience was firſt unfolded, morality dictated, and the uſeful arts promulgated; every thing ſpoke, every object was animated with the ſame mind. The opening of the doors, the angles, the moſt private receſs, ſtill preſented a leſſon, a precept of admirable harmony; and the richeſt ornament on the graveſt feature of the architecture, revealed, under living images, the abſtract truths of aſtronomy. Painting added a further charm to ſculpture and architecture, and produced at the ſame time an agreeable richneſs, which did not injure either the general ſimplicity or the gravity of the whole. To all appearance, painting, in Egypt, was only an auxiliary ornament, and not a particular art: the ſculpture was emblematical, as well as architectural. Architecture, therefore, was the great art, or that which was dictated by utility, and we may from this circumſtance alone infer the priority, or at leaſt the ſuperior excellence of the Egyptian over the Indian art; ſince the former, borrowing nothing from the latter, has become the baſis of all that is the ſubject of admiration in modern art, and of what we have conſidered as excluſively belonging to architecture, the three Greek orders, the Doric, Ionic, and Corinthian. We ſhould, therefore, be cautious of entertaining the falſe idea, which is ſo prevalent, that the Egyptian architecture is the infancy of this art, ſince it is in fact the complete type. Yet it is wonderful that a knowledge of this advanced ſtate of the arts in Egypt, ſhould have lain dormant for ſo many ages, and that the diſcovery of it ſhould have been left to dignify or mark the completion of the eighteenth century.

"I was particularly ſtruck with the beauty of the entrance to the ſanctuary of the temple of Tentyra, which is a moſt magnificent fragment of Egyptian architecture. I have copied with great exactneſs the different hieroglyphics, and have ſhewn the perfect preſervation of this part of the edifice; on which account the view given of it in the annexed Engraving, unites the advantage of a geometrical elevation, with a pictureſque diſplay of that ſymbolical language which is now utterly unknown. In the ſame engraving is repreſented a variety of capitals adapted to different columns, and other fragments of Egyptian architecture. In viewing ſuch variety of form, uniting ſuch richneſs of ornament, with elegance of outline, one may well be ſurpriſed that the world has allowed the Greeks, on their own aſſertion, the merit of having been the inventors of architecture, and that all the truths of this art are to be ſought for in the rules of the three Grecian orders. Might we not ſuppoſe that if ſome hiſtory, like that of the urn of the prieſteſs of Corinth, were attached to each of theſe capitals, they would each have acquired equal celebrity; or rather we may aſſert, that they require no adventitious reputation to claim the admiration of all lovers of the fine arts, as beautiful productions of human ſkill. The Egyptians, we ſee, have copied ſimple nature, ſuch as it appeared in their own country; this the Greeks have borrowed from them, and have added to it nothing but fable. Here, the calyx of a flower, ſupported by its ſtem, has furniſhed the form of the column, its baſe, and its capital; the lotus has afforded the firſt model, and this plant was expreſſive of the inundation, the emblem of the entrance of the Nile into the canals, the greateſt bounty which nature can beſtow on the Egyptians; they have therefore introduced this plant into the decoration of their temples, as a homage of gratitude to Iſis, who preſided over this bounteous gift: as goddeſs of the earth, they have alſo dedicated to her the other productions of the ſoil, the reed, the palm, the vine, &c. The following is an explanation of theſe fragments of Egyptian architecture:

Fig. 1. A golden vaſe, emblematic of the overflowing of the Nile, whoſe unlimited bounty diſpenſes the neceſſaries of life alike to man and beaſt. The richneſs of its appropriate decorations may well be admired; an inverted lotus flower ſerves as a cover; and the horſe paſſant, and the heads of goats and Arabian horſes, are in fine ſtyle. Fig. 2. The capital to the columns in the temple of Typhon or Anubis, the evil genius, or god of the

the kamſin, or deſtroying wind. His image is ſculptured on the four ſides of a cubic die, which is in fact nothing but a prolongation of the column: this member of architecture has the advantage of ſhewing the capital more completely, and preventing it from appearing to be cruſhed by the architrave; and the general effect which it produces is ſo good, that we may be ſurpriſed it has never yet been imitated. Fig. 3. Winged horſes, the hieroglyphic of ſpeed, ſculptured on the third platband of the ceiling of the portico of the great temple at Tentyra. Fig. 4. An ornament uſed in the Egyptian temples, ſimilar to the cherubims in the temple of Jeruſalem. Fig. 5. Another ornament of architecture of united doves. Fig. 6. The head of Iſis, with all the attributes of this goddeſs, crowning the columns of the temple of Tentyra. This is the moſt elegant and expreſſive of all the capitals found among the remains of Egyptian architecture. Fig. 7. One of the beautiful but very ſingular columns in the portico of the temple in the iſle of Elephantina. Fig. 8. A capital decorating the pillars of many of the temples in Upper Egypt; in which may be traced the origin of the Ionic volute, and the ſtem of the Corinthian capital. Fig. 9. A capital compoſed of the branches and leaves of the palm, and the cups or capſules of its fruit; it is perhaps the moſt chaſte of all the known capitals, and even in Europe, where it would not poſſeſs the ſame local intereſt as in Egypt, it might be ſelected as a moſt beautiful decoration for a feſtive hall. Fig. 10. Caryatides of prieſts or divinities, employed as ornaments in various edifices, and particularly in the Memnonium. Similar caryatides occur in the temple of Apollinopolis magna, and in that of Medinet-Abu. The invention of this ornament in architecture has been pompouſly, but erroneouſly, attributed to the Greeks, after their conqueſt of Carya. "I have alſo diſcovered at Tentyra, (ſays Denon,) the repreſentations of the periſtyles of temples in caryatides, which are executed in painting at the baths of Titus, and have been copied by Raphael, and which we conſtantly ape in our rooms, without once ſuſpecting that the Egyptians were the people who afforded us the firſt models of them." Fig. 11. A monolithic temple or ſanctuary, in which the ſacred birds were kept incloſed. Fig. 12. One of the pyramids ſtripped of its outſide facing, and truncated like that of Cheops. This ſhews the ſtability of principle upon which all the pyramids were erected. From the capitals here delineated, may be obviouſly traced the rudiments of the Grecian, Roman, and Gothic, architecture.

A longer ſeries of years might, perhaps, have brought the Egyptian architecture to a higher degree of perfection in ſome particulars; but each fabric appears to have been ſo equally finiſhed in all its parts, that they ſeem all to have been executed by the ſame hand; no one portion is better or worſe than any other; there appears neither negligence nor the bold ſtrokes of a more exalted genius; uniformity and harmony prevail throughout. The art of ſculpture, here made ſubſervient and attached to that of architecture, appears, indeed, to have been circumſcribed in principle, in method, and in ſtile of execution; a ſingle figure expreſſes nothing, when taken out of its exact ſtation in the group in which it is a part; the ſculptor muſt have had his deſign chalked out for him, and could not introduce any deviation which might alter the true meaning that it was intended to convey. The perfection given by the Egyptians to the repreſentations of their animals, proves that they were not without an idea of that bold ſtyle which expreſſes much character in a few lines, and their execution tended to the grave, and to ideal perfection.

"As to the character of the human figure, ſince they borrowed nothing from other nations, they could only copy from their own, which is rather delicate than fine. The female forms, however, reſemble the figure of their handſomeſt women of the preſent day, round and voluptuous, a ſmall noſe, the eyes long, half ſhut, and turned up at the outer angle, like thoſe of all perſons whoſe ſight is habitually fatigued by the burning heat of the ſun, or the dazzling white of ſnow; the cheeks round and rather thick, the lips pouting, the mouth large, but cheerful and ſmiling; in ſhort, the African character is conſpicuous, of which the negro is the caricature or exaggerated picture, and perhaps the original type. Volney, however, was extremely incorrect in calling the ancient Egyptians *negroes*. This ſuggeſtion aroſe from the following paſſage in Herodotus: "I believe, (ſays Herodotus,) the Colchi to be a colony of Egyptians; becauſe, like them, they have a black ſkin and *curled* hair:" which M. Volney choſe to tranſlate or rather torture into *frizzled* hair; and adds, "That the ancient Egyptians were therefore real negroes." The beſt anſwer to this comment, will be another from Herodotus, by which the deciſive article of *frizzled* hair is quite done away. "The prieſts of other nations have long hair, thoſe of Egypt are cloſe ſhaved: in mourning for near relations, all other people cut their hair ſhort; but the Egyptians, mourning for the dead, ſuffer the hair of the head and chin to grow long: Ανιεσι τας τριχας αυξεσθαι, τας τε εν τε κεφαλη, και τω γηνειω. *Herodot.* A change, which, from the nature of the thing, could not take place on the woolly head or chin of a negro.

It has been admitted that the Egyptians were of a dark olive complexion; Herodotus is deciſive on the point. But it is probable that the negro was not known to the Greeks ſo early as the age of this hiſtorian. Certain it is, that the ancients do not appear to have entertained the leaſt diſlike of a black complexion; nor ſhould we, after the firſt ſurpriſe, did we not connect with it the image, and with that the character, of the negro. There are throughout Aſia numerous tribes of dark olive-coloured people, but with European features, and abundant hair. From among thoſe tribes muſt have come that fable beauty, who thus aſſerts her pretenſions, in the Song of Songs: "I am black, but comely, O ye daughters of Jeruſalem!"

"Amid theſe reſearches, (ſays Denon,) I diſcovered a rule or canon of proportions traced upon a human figure, with red chalk, and afterwards covered by a thin ſtucco, a method adopted by the Egyptians to give a finer finiſh to their bas-reliefs, and render their architectural paintings indeſtructible. I made an outline drawing of the bas-relief and the lines, by which the figure was divided into proportions: hence we may infer the principles which they had adopted, their mode of applying them, and, in ſhort, that method of proceeding, which, to the advantage of preventing at once all errors, all unharmonious combinations, and ignoble proportions, unites that of attaining the conſtant equality obſervable in their works; an equality, which, if it is detrimental to the ſallies of genius and the expreſſion of delicate ſentiment, tends at leaſt to the perfection of uniformity, converts drawing into a mechanical art, and reduces ſculpture to an acceſſary proper for the decoration and enriching of architecture, to a method of expreſſing ideas, in ſhort, to writing. It is worthy of remark, that, according to the Egyptian canon, the human figure was divided into twenty-two parts and a half, of which the head took up two and two-thirds, or the eighth of the whole, correſponding in this reſpect with the heroic ſtile among the Greeks.

"The hieroglyphics, adopted as ornaments in their architecture, are executed in three different ſtiles, are alſo of three ſpecies, and may take their date from as many diſtinct periods. From the examination of the different edifices which now remain, it would ſeem that the moſt ancient of theſe characters are only ſimple outlines cut in without relief, and very deep; the next in age, and which produce the leaſt effect, are ſimply in a very ſhallow relief; and the third, which ſeem to belong to a more improved age, and are executed at Tentyra more perfectly than in any other part of Egypt, are in relief

below

I. Pass sculp.

A View of the Entrance to the Sanctuary of the Temple of Tentyra; with various Fragments of Egyptian Architecture.

London Published as the Act directs July 16th 1803 by J. Wilkes

below the level of the outline. By the ſide of the figures which compoſe theſe tabular pieces of ſculpture, there are ſmall hieroglyphics, which appear to be only the explanation of the ſubjects at large, and in which the forms are much ſimplified, ſo as to give a more rapid mode of inſcription, or a kind of *ſhort-hand*, if we may apply the term to ſculpture. A fourth kind of hieroglyphics, devoted ſimply to ornament, is termed the *arabeſque*. It was adopted by the Greeks, and in the age of Auguſtus was introduced among the Romans; and in the fifteenth century, during the reſtoration of the arts, it was tranſmitted by them to us as a fantaſtic decoration, the peculiar taſte of which formed all its merit. Among the Egyptians, who employed theſe ornaments with equal taſte, every object had a meaning or a moral, and at the ſame time formed the decoration of the friezes, the cornices, and the ſur-baſements, of their architecture. In ſhort, the Egyptian artiſts perfectly underſtood that magic of art which works on the ſoul through the medium of the ſenſes, that gradual diſplay of magnificence, that increaſe of intereſt ariſing from the myſterious impreſſion produced by faint and broken light, that kind of dramatic progreſſion which occaſions the keeneſt ſenſations, and promoted the myſterious empire of religion in their temples, the empire which, with them, was omnipotent. And can we ſtill preſume to call this the *infancy* of art, when nothing greater has been produced in its *maturity*?

In reflecting on the object of the conſtruction of their pyramids, ſo ſtupendous, ſo coloſſal, in compariſon of all other works of architecture, the gigantic pride which gave them birth appears more enormous even than their actual dimenſions; and one hardly knows which is the moſt aſtoniſhing, the madneſs of tyrannical oppreſſion which could direct the undertaking, or the ſervility of obedience in the people who ſubmitted to the labour; and in which, perhaps, we might perceive a glimpſe of that kind of oppreſſion which the Iſraelites ſuffered in Egypt. In ſhort, the moſt favourable view, for the honour of human nature, in which theſe monuments can be conſidered is, that man was thereby ambitious of rivalling nature in immenſity and in eternity, and not without ſucceſs, ſince the mountains contiguous to theſe edifices are leſs high, and ſtill leſs exempted from the ravages of time, than this work of human hands. In proof of the indeſtructibility of their fabric, we need only contemplate the following anecdote, related in Dr. White's tranſlation of Abdollatiph: "When Al-Malec Al-Aziz Othman Ben Joſeph ſucceeded his father in the government of Egypt, his fooliſh favourites perſuaded him to pull down theſe pyramids, beginning with the third, which is built with red granite. Having therefore collected great numbers of engineers, maſons, and labourers, and having convoked the grandees of the empire, he iſſued his orders to them to demoliſh that pyramid, and commiſſioned them to ſuperintend the performance. They immediately pitched their tents on the ſpot, collected artificers and workmen from all parts, and maintained them at an enormous expence. Here they continued for eight months, with horſe and foot; pulling down, in the ſpace of a whole day, after the moſt painful efforts and the utmoſt difficulty, one ſtone only, or two at the fartheſt. The labourers from above forced downward every ſtone with wedges, levers, and iron-crows; while thoſe below pulled it with cables and ropes: when it fell, ſo violent was its fall, that the noiſe was heard at a ſurpriſing diſtance, the mountains trembled, and the earth ſhook; and the ſtone was buried in the ſand, whence they at length extracted it with additional labour and fatigue. They then applied their wedges to it in crevices made for that purpoſe, broke it in pieces, and conveyed theſe pieces on carriages to the farther end of the mountain, which was at no great diſtance. Having thus ſpent much time to little purpoſe, their reſources failed them, their difficulties increaſed, and they were finally obliged to deſiſt, filled with dejection, confuſion, and deſpair. They were unable to obtain their wiſhes and the end propoſed; and all that they accompliſhed was to deface the pyramid, and betray the weakneſs and impotence of their efforts. This event happened in the year of Chriſt, 593. However, if any one ſhould behold the ſtones that have been taken down, he would think that the pyramid muſt have been entirely deſtroyed; but let him take a view of the pyramid itſelf, and he will ſcarcely believe that it has been at all injured: for a ſmall part only of one of its ſides is demoliſhed. Perceiving the prodigious toil which they underwent in pulling down every ſingle ſtone, I aſked the ſuperintendant of the maſons, whether, if offered a thouſand pieces of gold, on condition that they ſhould replace any one ſtone in its proper and original poſition, they would be able to effect it; he anſwered me, ſwearing by the living God, that, though they were offered double that ſum, the thing would be impoſſible."

Obeliſks and ſphinxes, as well as pyramids, were among their coloſſal works, and which alike demand our admiration and aſtoniſhment at the preſent day. It is alſo remarkable that theſe gigantic embelliſhments in architecture have been erected in no other part of the world beſides Egypt, except thoſe which have been copied from, or brought out of, that country. The ſphinx, which ſtands near the pyramids of Gizeh, is undoubtedly a very great architectural curioſity, and upon the whole is very graceful; the expreſſion of the head is mild and tranquil; the character is African; but the mouth, the lips of which are thick, has a correctneſs of execution truly admirable; it ſeems real life. Art muſt have been at a high pitch when this monument was executed; for, if the head wants what is called *ſtile*, that is to ſay, the ſtraight and bold lines which give expreſſion to the figures under which the Greeks have deſignated their deities, yet ſufficient juſtice has been rendered to the fine ſimplicity and character of nature which is diſplayed in this figure. Among the Egyptians the ſphinx was the ſymbol of religion, by reaſon of the obſcurity of its myſteries; and on the ſame account the Romans afterwards placed a ſphinx in the pronaos or porch of their temples. Sphinxes were uſed by the Egyptians, as a ſymbol of the water's riſing in the Nile: with this view, as it had the head of a woman and body of a lion, it ſignified that the Nile began to ſwell in the months of July and Auguſt, when the ſun paſſes through the ſigns of Leo and Virgo. The coloſſal ſphinx, near the pyramids, according to Thevenot, is twenty-ſix feet high, and fifteen feet from the ear to the chin: but Pliny aſſures us that the head was no leſs than 102 feet in circumference, and ſixty-two feet high from the belly, and that the body was 143 feet long, and was thought to be the ſepulchre of king Amaſis. The French, however, deſirous of aſcertaining whether this ſtatement of Pliny's were true, and very induſtriouſly clearing away the rubbiſh all around it, could find nothing but ſolid unſhapen rock; from which they concluded that it never had a body. The learned Dr. Bryant obſerves, "that this ſphinx ſeems to have been originally a vaſt rock of different ſtrata; which, from a ſhapeleſs maſs, the Egyptians faſhioned into an object of beauty and veneration. The Egyptians uſed this figure in their buildings; from them the Greeks derived it, and afterwards improved it into an ornament uſed in modern architecture."

In the annexed Engraving is given a ſide view of the ſphinx, which exhibits a faithful repreſentation of the decay that it has ſuffered, and the character of this figure in the parts that are ſtill preſerved. The living perſons who are about it will ſerve as a ſcale of compariſon. He that is ſitting down on the top of the head, whom the other is juſt helping up with his hand, is climbing out of a narrow excavation full of rubbiſh at the bottom, which is now only nine feet deep. There are notches cut down the ſides of this aperture at different diſtances, which ſerve as ſtairs to deſcend by, but the uſe of this hole is

beyond the reach of conjecture. The circular figure above, in the same engraving, is a species of patera, which Denon found among the tombs of the kings of Thebes; the ornaments are of exquisite taste, and the execution perfect: the two portraits are those of Osiris and Isis. That of Osiris is generally given under the figure of a hawk, to which the face is here converted; but it has the beak much worn. The ornament beneath is intended for the plant and bud of the lotus, which is used amongst their hieroglyphics as the emblem of death. It is very handsomely bordered with a branch from the vine. The group above was also found among the same tombs. The figure playing upon the harp of twenty-one strings, and which appears evidently the origin of our Welsh harp, is represented in a dress equally uncouth and disagreeable, but the attitude is that of truth and enthusiasm. The second figure is naked to the waist, from whence it is cloathed with a kind of pantaloons. The third figure is attired in a close tunic with large sleeves. The flesh colour of these musicians is dull red; the middle figure has a head-dress composed of the lotus plant; the pantaloons are white; but they sit so close, that the colour becomes of a rosy hue by the tint of the skin which appears through. These figures are finely sculptured and painted; and it is remarkable that they are all women. The birds in the centre of this engraving are supposed to be done for the vulture, eagle, or hawk, and are abundantly used as devices in the Egyptian architecture, and frequent symbols in their hieroglyphies.

Pompey's Pillar, now Diocletian's, is given in the same engraving, as measured very accurately in all its parts, by citizen Norry, which will furnish the reader with an idea of its prodigious dimensions. Cleopatra's Needle, with its hieroglyphies, is also given from a correct admeasurement taken after the base had been dug round, and the rubbish cleared.

COSTUME, CLIMATE, CULTIVATION, AND PRESENT STATE.

Egypt, exclusive of its subjugation by various European powers, being situated in the vast peninsula of Africa, and accessible only on the side next Asia, is the reason why it has in almost every period of its history, been more or less affected by the revolutions and migrations of the Asiatic states; whence arose its present heterogeneous mixture of inhabitants. The only remnant of what is called *ancient* Egyptians, is said to be the Copts; yet neither their written characters, nor their dialect, correspond with any of those which are called Egyptian. There can be little doubt but that these people took their name from the city of Coptos, which flourished before, and after, the commencement of the Christian era; and having early embraced the gospel dispensation, they became celebrious from the stand they made against the persecutions of Diocletian; from which time the name of *Copts* in Egypt, has been synonymous with that of *Christian*. The Copts profess the Monophysite creed; and the Coptic patriarch of Egypt is the head of the church of Abyssinia, whither he sends a bishop, as his deputy, to govern the clergy of that country. They also form the bulk of the inhabitants in Upper Egypt, where they subsist chiefly by husbandry; but are continually plundered by the kiachefs and beys. Numbers of them also inhabit Alexandria, Cairo, and the other principal towns; where, on account of their superior knowledge above any of the other classes in Egypt, they are employed as agents by the principal people of the country. Denon fancied he could distinguish in the Copts evident traces of the ancient Egyptian stock, "a kind of swarthy Nubians, such as are represented on old sculptures, with flat foreheads, eyes half closed, and raised up at the angles, high cheek bones, short flattish nose, large mouth, thick lips, little beard, and without much vivacity or expression in the general contour." However this may be, it is very certain that the original Egyptians were much darker than the Copts, or any other separate or mixed race of people which now inhabit Egypt; *though they were not negroes.*

If there be yet any remain of the mystical ceremonies of the ancient Egytian idolatry, it exists with the sect called *Psylli*, which boasts a very high origin, and pretends to a supernatural power over the instinct and poison of serpents. According to Strabo and Eusebius, they were worshippers of the god Cnuphis, who had a temple at Elephantina in Upper Egypt, where he was adored under the figure of a serpent. "When the Psylli were introduced to us, (says Denon,) we put many questions to them relative to the mystery of their sect, and their supposed command over serpents; which they openly profess. They answering with more assurance than intelligence, we put them to the proof. "Can you tell us whether there are any serpents in this place; and if there are, can you oblige them to come forth from their retreats?" They answered both questions in the affirmative; on which they searched all the rooms, and they presently declared that there was a snake in the house; they then renewed their search to discover where he was hid, made some distortions in passing before a jar placed in a corner of one of the rooms, and declared that the animal was there; where, indeed, we actually found one. This we considered as a true Comus's trick; we looked at each other, and acknowledged that they were very adroit."

These people have an annual festival and religious ceremony, which they call *Sidi Ibrahim*, where priests and proselytes to their doctrine and faith are admitted and made. "Being always curious to observe the means by which men command the opinions of others, (says Denon,) I addressed myself to the chief of the sect, whom I flattered, and he promised to make me a spectator of the exaltation of one of the Psylli, as soon as he should have blown into his spirit, as he expressed it. From my anxious curiosity he thought I bid fair to be a proselyte, and he proposed to initiate me, which I accepted; but when I learned that in the ceremony of initiation the priest spits in the mouth of the neophyte, this circumstance cooled my ardour, and I found that I could not prevail on myself to go through this trial; so I gave my money to the high priest, and he promised to let me be present at the ceremony. They had brought with them their serpents, which they let loose from a large leather sack in which they were kept, and made them erect their bodies and hiss, by irritating them. I thought it was the light which principally caused their anger; for, as soon as they were returned into the sack, their passion ceased, and they no longer endeavoured to bite. It was curious to observe, that, when angry, the neck, for six inches below the head, was dilated to the size of one's hand. (See *colubur naja*, under the head COLUBER, vol. iv. p. 803.) I soon conceived that even I could manage the serpents, without fear of their fangs; for, having well remarked that the Psylli, while they were threatening the animal with one hand, seized it on the back of the head with the other, I did the same with one of the serpents with equal success, though apparently to the indignation of the performers themselves. After this, they proceeded to the grand mystery: one of the performers took a snake, which he had previously disabled by breaking the under jaw, and by rubbing away the gums till the whole of the palate was destroyed; he then grasped it with the appearance of passion, and approached the chief-priest, who with great gravity gave him the spirit, that is to say, after uttering some mysterious words, blew into his mouth; and, at the instant, the other was seized with a sacred convulsion, his arms and legs distorted, his eyes seeming to start from his head, and he began to tear the animal with his teeth; whilst the attendants, appearing to commiserate his sufferings, restrained his struggles with difficulty, and snatched from his hand the serpent, which he was unwilling

willing to let go. As ſoon as the ſnake was removed, he remained as if ſtupid; but the chief approached him, muttered ſome words to him, retook from him the ſpirit by aſpiration, and he returned to his former quieſcent ſtate. Now, however, he that had ſeized the ſnake beginning to be tormented with the ſame ardour to conſummate the myſtery, came up to the chief-prieſt to demand the ſpirit; and as he was ſtronger and more active than the firſt, his cries and convulſions were ſtill more violent and ridiculous.

In ſpeaking of this antique Egyptian ſect, Mr. Bruce obſerves as follows: "Notwithſtanding that the incantation of ſerpents has been generally treated as a fable, there is certainly no doubt of its reality. Even the ſcriptures are full of it. All who have been in Egypt have ſeen as many different inſtances as they choſe. Some have doubted that it was a trick; and that the animals thus handled had been firſt trained, and then deprived of their power of hurting; and, fond of the diſcovery, they have reſted themſelves upon it, without experiment, in the face of all antiquity. But I will not heſitate to aver, that I have ſeen at Cairo (and this may be ſeen daily without any trouble or expence) a man who came from the catacombs, where the pits of the mummy-birds are kept, who has taken a ceraſtes with his naked hand from a number of others lying at the bottom of a tub, has put it upon his bare head, covered it with the common red cap he wears, then taken it out, put it in his breaſt, and tied it about his neck like a necklace; after which it has been applied to a hen, and bit it, which died in a few minutes; and, to complete the experiment, the man has taken it by the neck, and beginning at his tail, has eaten it as one would do a carrot, without any ſeeming repugnance." (See a correct figure of the ceraſtes, vol. iv. p. 799.)

M. Savary alſo tells us, that he ſaw at the feaſt of Sidi Ibrahim, a troop of people, ſeemingly poſſeſſed, with naked arms and a fierce look, holding in their hands enormous ſerpents, which twined round their body, and endeavoured to eſcape. Theſe Pſylli, graſping them ſtrongly by the neck, avoided the bite; and, notwithſtanding their hiſſing, tore them with their teeth, and ate them alive, while the blood ſtreamed from their mouth." A further deſcription of the feats of theſe people is likewiſe given by Haſſelquiſt: "They take the moſt poiſonous vipers with their bare hands, play with them, put them in their boſoms, and uſe a great many more tricks with them, as I have often ſeen. I have frequently ſeen them handle thoſe that were three or four feet long, and of the moſt horrid ſort. The power of doing this is not poſſeſſed by the Arabs, Turks, or any other ſect in Egypt. I enquired and examined whether they had cut out the vipers poiſonous teeth; but I have with my own eyes ſeen they do not. We may therefore conclude, that the art they uſe is not known. Some people are very ſuperſtitious, and the generality believe this to be done by ſome ſupernatural means which they obtain from inviſible beings. It is, however, worthy the endeavours of all naturaliſts, and the attention of every traveller, to learn ſomething deciſive as to this affair. How ancient this art is among the Africans, may be concluded from the ancient Marii and Pſylli, who were from Africa, and daily ſhewed proofs of it at Rome. It is very remarkable that this artifice ſhould have been kept a ſecret for more than two thouſand years, when we have ſeen how many other ſecrets have within that time been revealed." The ſnakemen of Hindooſtan are probably derived from this ſame ſect.

The ſupremacy of Egypt being in the hands of the Turks and mamalukes, the Mahomedan faith is in conſequence the eſtabliſhed religion of the country; though all perſuaſions are now freely tolerated. From hence it alſo follows, that the Turks, who are numerous, and the mamalukes, are conſidered as the principal people. The Turks in Egypt are moſtly of dignified manners; and though their complexion is ſwarthy, yet the ſolemnity of their gait, and ſedateneſs of their character, rather inſpire awe, and command reſpect.

The mamalukes, being now ſelected from all countries where fine young men can be obtained, form an intereſting variety of different complexions and countenances; yet the principal part being ſtill Georgians and Circaſſians, and all trained for the army, and elegantly attired, they are of courſe the faireſt and handſomeſt men in Egypt. After having ſerved their chiefs or maſters with fidelity, they are made free; and as their proſperity or means occur, they have then a right to purchaſe ſlaves for themſelves. A mamaluke, while a ſlave, is not permitted to wear a beard; the whiſker being always an indiſputable proof of their freedom. The revenues of the twenty-four beys or chiefs of the mamalukes, conſiſt in thoſe fertile diſtricts which were originally allotted to them by Solyman the Legiſlator, and in the immenſe extorſions and fines they are prone to exact from the bulk of the inhabitants; and from which there is no appeal. No one can ever be made a chief or a bey, who has not previouſly been a ſlave. The general character of the mamalukes is, that they are brave and generous, though ſometimes cruel and revengeful: but they are moſt abominably addicted to the deteſtable crime againſt nature, which is extremely prevalent in all parts of the Turkiſh dominions. The arms and accoutrements of the mamalukes are as follow: a caſe or quiver containing three javelins, which the mamalukes generally throw before they come to the ſabre, which is their favourite weapon. They are very dexterous at throwing the lance; and they have young attendant mamalukes, called *piétons*, to carry part of their arms, who follow on foot, and run up among the combatants, pick up the javelin when the ſtroke has miſſed, and bring it back to their maſters. The point of this weapon is of hammered iron, the ſhaft of wood, and the ornaments in ſilver, of modern workmanſhip, done in a good taſte, and wrought at Cairo. The caſe is covered with velvet. They have a buckler of rhinoceros' leather, ſabre-proof, and of exquiſite workmanſhip; from the varniſh which covers the leather, and the gilding of the ornaments, it has a very rich effect. Another piece of defenſive armour is an arm-piece, worn on their left arm, with which they hold the horſe's bridle; the right is only protected by a glove of buffalo hide, in the form of thoſe of our dragoons. Under their belt they carry a battle-axe of iron, damaſked with gold, bearing a Perſian inſcription, which ſhews the country in which it is wrought. The handle, made of ſilver and leather, is of Cairo manufacture. They have ſometimes a whalebone bow of perfect workmanſhip; with very long ſharp arrows; the cord of the bow is a bundle of untwiſted ſilk, which has more ſtrength than the thickeſt and beſt twiſted gut. When the bow is uſed, they have a handpiece with a groove, along which the arrow runs; it fits the wriſt that holds the bow, and ſerves to direct the arrow at the moment of its departure from the bow. They wear a ſabre by the ſide, and a dirk in the belt, the hilts and ſcabbards of which are richly ornamented. Under the girdle are alſo a pair of large piſtols ſuperbly mounted; and ſome parties of them are armed with a fuſil or firelock, like the Bedouin Arabs. The annexed engraving exhibits the coſtume of the mamalukes; who, if once brought under European diſcipline, would doubtleſs become the moſt invincible cavalry in the world.

The following particulars of the initiation of the young mamalukes, are given by Browne. "The name, from *maleh*, to poſſeſs, implies merely a perſon who is the property of another. None are choſen but ſuch as are diſtinguiſhed by the grace and manlineſs of their perſons. After having been properly educated as a *piéton*, or attendant on foot, the young mamaluke receives a preſent of a horſe and arms from his maſter; together with a ſuit of accoutrements, which is renewed every year. The generoſity of their maſters, and rewards or extortions from

from others, afford them ſupplies of money either for avarice or debauchery. Some of them, admitted to peculiar favour by the beys, are elected kiachefs, and afterwards beys: but this preferment generally ariſes from political adherence to ſome powerful leader. They are characteriſtically gay, thoughtleſs, and improvident; fond of ſhow, and unprincipled in their means of acquiring it. They ſeldom marry, which accounts for the infamous habit to which they are addicted. It is alſo extremely remarkable that thoſe few who do marry, ſeldom have children. As the ſon even of a bey is not honoured with any particular conſideration, the women perhaps procure abortions. However this be, of eighteen beys whoſe hiſtory I particularly knew, only two of them had any children. The only ſtudy of the mamalukes is to be hardy, capable of every fatigue, of undaunted courage, of eminent ſkill in horſemanſhip, and of unrivalled dexterity in the uſe of the ſabre. Their horſes are of the fineſt Arabian breeds, and are often purchaſed at three or four purſes, 150l. to 200l. ſterling. The gratitude of the young *piéton* is equal to the favour of their maſters, whom they never quit in the hour of danger." The young *piéton*, or mamaluke who attends on foot, is attired very light: his turban is a ſhawl; his veſt or jacket is of fine cloth, of various colours, but moſt commonly yellow or purple, ſometimes ſtriped; his pantaloons are of an enormous ſize; his buſkins are of yellow leather, and his ſandals or ſlippers are of the ſame colour. He is alſo equipped with a ſhawl, by way of girdle, a ſabre, a dagger, a pair of piſtols, and on the left ſide he uſually carries a kind of horn, which contains relics, taliſmans, and oil for wounds. The figure of a young Georgian foot mamaluke is exhibited in the ſame engraving, and a ſoldier of the Bedouin Arabs, with his firelock and cartouch-box. Theſe are the individuals which form the mamaluke armies.

The race of people next in conſideration in modern Egypt, are the Greeks, who muſt be claſſed among the foreigners by whom ſocieties diſtinct from thoſe of the indigenous inhabitants are formed. The fine delineations of their form, their arch and penetrating eyes, and the delicacy and flexibility of their traits, bring to remembrance all that the imagination has figured relative to their anceſtors, and all that their monuments have tranſmitted to us to atteſt their elegance and their taſte. The degraded ſtate to which they have been reduced, through a dread which the ſuperiority of their intellectual faculties ſtill inſpires, has rendered many of them deceitful and treacherous. Were they, however, left to themſelves, they would perhaps become in a little time what they formerly were, ſubtle and ambitious.

Next come the Jews, who are in Egypt what they are every where;—hated, without being dreaded; deſpiſed and perſecuted inceſſantly, without ever being expelled; plundering conſtantly without being very rich; and rendering themſelves uſeful to all the world, at the ſame time that their only incentive is ſelf-intereſt. We cannot decide whether it is owing to their being nearer to their own country that their phyſical character is better preſerved here than elſewhere: but it is a fact which ſtrikes the obſerver very forcibly. Thoſe among them who are ugly reſemble our Jews; while the handſome ones, and more particularly thoſe who are young, bear a ſtrong reſemblance, in point of character, to the intereſting figures pourtrayed by the beſt painters of the diſciples of our Saviour. In the great cities of Egypt the Jews contend with the Copts for the places in the cuſtom-houſes, ſtewardſhips of eſtates, and, in general, for whatever requires calculation, and ſupplies the means of amaſſing and concealing a fortune well or ill acquired, but which is alike expoſed to the rapacity of the kiachefs, ſheiks, and beys.

The characteriſtic traits of another race of men, who are very numerous, are ſtrongly delineated. Theſe are the Barabras, or people from the upper countries, inhabitants of Nubia, and of the frontiers of Abyſſinia. In theſe fervid climates nature has, in an economical mood, denied them every ſuperfluity. They have neither fleſh nor fat, but ſimply nerves, muſcles, and tendons, of greater elaſticity than vigour. They perform by activity and addreſs what others effect by ſtrength. It would ſeem as if the barrenneſs of their ſoil had exhauſted the ſmall portion of ſubſtance which nature has beſtowed on them. Their ſkin is of a ſhining black, exactly ſimilar to that of antique bronzes; yet they have not the ſmalleſt reſemblance to the negroes of the weſtern parts of Africa. Their eyes are deep ſet and ſparkling, with the brows hanging over; the noſe pointed; the noſtrils large; the mouth wide; the lips of moderate dimenſions; and the hair and beard in ſmall quantity, and hanging in little locks. Being wrinkled betimes, and retaining their agility till the laſt, the only indication of old age among them is the whiteneſs of the beard, every part of the body remaining ſlender and muſcular as in their youth. Their phyſiognomy is cheerful; and they are lively and well diſpoſed. They are moſt commonly employed in ſubordinate offices of truſt, to guard the magazines, timber-yards, and other property of the merchants. They are clad in a piece of white woollen cloth, gain but little, and ſubſiſt on almoſt nothing. They are faithful to their maſters, to whom they are ſtrongly attached. During the pilgrimage of Mecca, all the nations which are ranged under the denomination of Maugrabians, or weſtern people, paſs through Egypt, and occaſionally mix with and obtain permanent ſettlements among the other inhabitants of the country.

But the moſt numerous, as well as the moſt ſingular, of the inhabitants of modern Egypt, are the Arabs. Without poſſeſſing an influence proportioned to their numbers, they ſeem to be placed there to ſupply the great depopulation of the country, to cultivate the lands, to tend the flocks, or to be themſelves in the degraded ſtate of animals. They are, however, lively, and have a penetrating phyſiognomy. Their eyes, which are ſunk in and overarched, are replete with vivacity and character; all their proportions are angular; their beard is ſhort, and hanging in filaments; their lips thin and open, diſplaying fine teeth; their arms are fleſhy; and in other reſpects they are more active than handſome, and more muſcular than well ſhaped. Theſe characteriſtic traits are moſt common in the ſmall villages and ſolitary habitations, and more particularly among the inhabitants of the deſert. Three claſſes of theſe people, altogether different from each other, are, however, to be diſtinguiſhed. Firſt, the Arab ſhepherd, who ſeems to belong to the original ſtock, and who moſt reſembles the above deſcription. Next, the Bedouin Arab, on whom a more exalted independence, and the ſtate of warfare in which he lives, have beſtowed a character of ſavage ferocity, leanneſs, and poverty. Laſtly, the Arab cultivator, the moſt civilized, the moſt corrupted, the moſt degraded, in conſequence of the ſtate of bondage in which he is held, and the moſt varied in perſon and in character; as may be remarked in moſt of the villages; in the fellahs or peaſants, who are the chief labourers in huſbandry; in thoſe of the boufackirs or beggars; and, finally, in thoſe of the artiſans, who conſtitute the moſt abject claſs. Theſe two claſſes of Bedouins and artiſans or labourers, are ſprung from the preceding one, that of the Arab ſhepherds.

On inveſtigating the oppreſſed condition of the Fellahs, it is impoſſible to urge as ſo many reproaches againſt theſe cultivators of the land, that they are ſullen, miſtruſtful, avaricious, improvident, and careleſs about the future, when it is conſidered that, independently of the exactions of the proprietor of the land which they till, and thoſe of the covetous ſheik and bey, a wandering enemy in arms, the Bedouin, watches unceaſingly the favourable opportunity to ſnatch from him whatever ſuperfluities he may venture to diſplay. The money which he can hide, and which is a repreſentative of every enjoyment, is therefore all that he can truly conſider as belonging to him. Accordingly the art of burying it in the earth is

his

Denon del. J. Chapman sc.

A Mamaluke on Horseback, with a Piéton, or Foot Mamaluke, and a Bedouin Arab Soldier.

London Published as the Act directs July 7th 1804 by J. Wilkes.

his principal ſtudy; by which conſiderable ſums diſappear, which never again return into circulation. By appearing in rags and tatters, and with a ſtudied diſplay of wretchedneſs, he can alone hope to ſecure from the graſp of tyranny what he has hoarded together. It behoves him to inſpire pity; and not to commiſerate his lot would be to denounce him. Anxious to amaſs his dangerous wealth, and unhappy when in the poſſeſſion of it, his life is ſpent between the diſappointment which reſults from not having procured it, and the ſubſequent dread of ſeeing it ſnatched from him.

It is nevertheleſs true, that the Bedouin Arab, badly armed, and incapable of ſerious reſiſtance, having no other ramparts than the ſhifting ſands, no other lines than the wide expanſe, and no other retreat than the immenſity of the deſerts, is a more pitiable object. Sloth and independence are the baſes of his character; and to indulge the one, and protect the other, he is unceaſingly in an agitated ſtate, allowing himſelf to be haraſſed and pinched by want. Envy, that torment from which the abode of want itſelf is not exempt, hovers alſo over the burning ſands of his retreat. The Bedouins, in waging war againſt all the nations of the univerſe, confine their hatred and their envy to thoſe Bedouins alone who do not belong to their tribe. To them all wars are alike; and as ſoon as the tranquillity of Egypt is diſturbed, either by an inteſtine quarrel, or by a foreign enemy, they take the field. Without attaching themſelves to either party, they take advantage of the conteſt to plunder both. Wherever the booty is, there the tribe of Bedouins is to be found. Never backward to treat, becauſe all the ſtipulations made with them are accompanied by preſents, they are true to no other engagement than the one which neceſſity impoſes. They are, however, neither cruel nor vindictive. The French, whom they have made priſoners, in deſcribing the hardſhips they ſuffered during their captivity, conſidered them rather as the effect of the mode of living adopted by this wandering nation, than as the reſult of their barbarity. Several officers who had fallen into their hands, ſay, that the labour which was required of them was neither cruel, nor exceſſive: they had to attend on the women, and to load and drive the aſſes and camels. It is true that it was neceſſary to encamp and decamp continually, for which purpoſe all the camp equipage was kept conſtantly packed up, and in leſs than a quarter of an hour after notice given, the cavalcade was in motion. This equipage conſiſted of a mill to grind corn and coffee, of a round iron plate on which to bake cakes, of a large coffee-pot, a ſmall one, a few dried goat-ſkins to hold the water, a few ſacks of corn for their horſes, and the tent cloth, in which all the articles are wrapped. A handful of roaſted corn, and a dozen of dates, were the cuſtomary ration on the marching days, accompanied by a ſmall allowance of water, which, on account of its ſcarcity, had been applied to every other purpoſe before it was employed to allay the thirſt. They are for the moſt part well mounted, and always prefer mares, becauſe they can bear more fatigue, and, when going on a predatory excurſion, are not liable to lead to a diſcovery by their neighing. Their dreſs is very light, and their arms either a muſket or a long ſpear, and a ſabre or dagger. Theſe Bedouins, deſtitute of religious prejudices, and without any external form of worſhip, are friends to toleration. Among them a few revered cuſtoms ſupply the place of laws; and their principles bear the reſemblance of virtues which anſwer all the purpoſes of their partial aſſociations, and of their paternal government. We ſhall here cite a trait of their hoſpitality. A French officer had been ſeveral months priſoner to a chief of the Arabs, whoſe camp was ſurpriſed in the night by the French cavalry, and who had barely time to eſcape; and loſing his tents, cattle, and proviſions, he was on the following day fugitive, ſolitary, and without any reſources; yet he drew from his pocket a cake, and, preſenting the half of it to his priſoner, he ſaid to him, "I do not know when we ſhall have any more food; but I ſhall not be accuſed of having refuſed to ſhare my laſt morſel with one whom I eſteem as my friend." Yet the invincible hatred of theſe tribes towards each other is ſometimes aſtoniſhing, particularly where the chief or father of one tribe has been aſſaſſinated or killed by that of another. This calls for what is termed *the price of blood*; then follows reprifals on reprifals, inſatiable vengeance, and ceaſeleſs warfare, until one or other of the tribes is nearly extirpated. The weaker party has then no other reſource than flight to ſave their lives, and theft to ſupport it; men, women, and children, blotted out from all connexion with the other clans, and roving from place to place, become the terror of their neighbours, only appear furtively in their former habitations, which they convert into dens of robbers, alarming thoſe who would ſucceed them in their retreats of miſery. Thus whole villages, when become the aſylum of crime, offer no other view to the paſſenger than deſerted fields, ruins, ſilence, and deſolation.

The Arabs of Egypt who follow huſbandry, and a paſtoral life, are Mahomedans of a very peculiar caſt. Not ſatisfied with the precepts of the koran, and their abſolute devotedneſs to every thing which comes from their prophet; and notwithſtanding the anathemas pronounced againſt every deviation from their law, they have not been able to reſiſt the attractions of idolatry. They have their peculiar ſaints, to whom they do not indeed aſſign a ſeparate place in their paradiſe, where every thing is in common, but to whom they raiſe tombs, and whoſe aſhes they revere; and from an unaccountable ſtupidity, theſe ſaints do not become an object of worſhip till after death, and when alive, are the ſubject of mockery and deriſion. Theſe Arabs attribute to the weak in underſtanding, when dead, certain powers and influences: one is the father of the light, and cures complaints in the eyes; another is the father of generation, and preſides over lying-in women, &c. The greater number of theſe ſaints have paſſed their life in repeating conſtantly the word *allah*, crouched beſide the corner of a wall, or in receiving without thanks what has been neceſſary to their ſubſiſtence; others employ themſelves in beating their heads with a ſtone; others, covered with garlands, in ſinging hymns; others, like the oriental faquirs, in remaining motionleſs and naked, without ever teſtifying the ſlighteſt emotion, and waiting for alms, for which they never aſk, or thank, the donor. Beſides this kind of idolatry, there are others, which are akin to magic; for example, there are certain ſtones and trees which conceal a good or bad genius, and thus became ſacred, and cannot be removed without profanation; and to theſe, domeſtic ſecrets and projects of various kinds are entruſted in confidence, whilſt they are worſhipped with myſterious ſecreſy, and revered in public.

The principal religious feſtival of the muſſulmans in Egypt, is the anniverſary of the birth of Mahomet, when the ſtreets are illuminated, and general joy diffuſed among all the diſciples of their great prophet. Denon has given a deſcription of this feſtival, which he attended with the French generals, at Roſetta. "The ſtreet was the principal aſſembly-room, which was lengthened or contracted according to the number of gueſts. An alcove covered with carpeting, was occupied by the moſt diſtinguiſhed perſonages. Fires, combined with a number of ſmall lamps and large tapers, formed a ſplendid illumination. On one ſide was a band of martial muſic, conſiſting of hautboys, ſmall kettle drums, and large Albaneſe drums. On the other ſide were ſtationed violins and fingers; and, in the middle, Greek dancers; and attendants provided with ſweetmeats, coffee, ſyrups, roſe-water, and pipes, the never-failing accompaniment of all their pleaſures. As ſoon as we were ſeated, the martial muſic commenced. A kind of leader of the band played alternately two different airs, which the other muſicians repeated in chorus. Whether it was owing to the calmneſs of the atmoſphere, or to a wiſh of introducing too many flouriſhes into it, it

ſo happened that the ſecond meaſure was a true cacophony, a diſcordance of harſh ſounds, as diſagreeable to nice ears as it was enchanting to thoſe of the muſſulmans. I noticed particularly, that the leader of the band invariably took up each of the airs with all the importance and enthuſiaſm of an inſpired *improviſatore*, and that, when his nerves appeared to be no longer able to ſupport the energy of expreſſion he tried to beſtow on it, the chorus came to his aid with the ſame unvaried diſſonance. The violins, which were more tolerable, afterwards played an air, in the burden of which a ſmall portion of melody was overcome by ſuperfluous ornaments. The naſal twangs of an inſpired ſinger were ſuperadded to the faſtidious ſoftneſs of the ſemi-tones of the violins, which conſtantly ſhunning the key-note, fell into the ſecond of the key, and invariably terminated by the dieſis, or imperfect ſemi-tone immediately beneath the key-note, as in the Spaniſh ſeguidillas. This may be conſidered as a proof that the reſidence of the Saracens in Spain introduced into that kingdom this ſpecies of muſical compoſition. After this couplet, the violins took up the ſame ſtrain with new variations, which the ſinger diſguiſed by a ſharp movement, until he had entirely loſt ſight of the air, falling into the wild expreſſion of ſounds, without harmony, and without principle. This was what, however, charmed his auditory ſtill more and more. The dance which followed was of the ſame deſcription with the ſinging: it was not the expreſſion of joy, or of gaiety, but of an extravagant pleaſure, which made haſty ſtrides towards laſciviouſneſs; and this was the more diſguſting, as the performers, all of them of the male ſex, preſented, in the moſt indecent way, ſcenes which love has reſerved for the two ſexes in the ſilence and myſtery of the night."—Nothing of the grand muſical inſtruments ſculptured on the walls of their ancient temples, are now to be ſeen in any part of Egypt.

The long reſidence of the French in this country, and the opportunity afforded the principals of being introduced into the moſt reſpectable families, gave Denon an excellent opportunity of obſerving the coſtume of the Egyptian females, who are kept very cloſe in the harem, and never ſuffered to hold converſation with any male but the maſter of the family, nor to appear in company, but during his preſence; ſo ſenſible is he of the ready ſubmiſſion of the moſlem women to the embraces of man: for which reaſon they are never ſuffered to appear in the ſtreet, without being ſo completely muffled up as to expoſe no part to view but the eyes. Yet the coquetry of the elder females, who are the moſt ſcrupulous in public on every point in which honour is concerned, often enables them to elude the moſt watchful care of their huſband or keeper. The young girls who are not yet marriageable, and relative to whom leſs ſtrictneſs is in conſequence obſerved, bear a pretty general reſemblance to the forms of the Egyptian ſtatues of the goddeſs Iſis. The women of the lower claſſes, who take greater pains to conceal the noſe and mouth than any other part, diſcover from time to time, not attractions, but fine ſlender limbs, the ſhape of which diſplays more activity than grace. As ſoon as their breaſts have attained their full growth, they begin to fall, and their gravitation is ſuch, that it would be difficult to ſay how low ſome of them reach. The complexion of theſe women is neither black nor white, but of a duſky brown. They dye of a black colour the eye-brows, eye-lids, and chin; and ſtain the finger-nails of a deep yellow. Few women, however, carry with more elegance a child, a vaſe, or a baſket of fruit; or walk with greater eaſe and ſecurity. Their long drapery would be by no means unbecoming, were it not that a veil, in the ſhape of a ſhip's pendant, caſts a gloom over the whole of their dreſs, ſo as to make it reſemble the diſmal coſtume of a nun of the order of penitents.

"One of the rich natives, (ſays Denon,) who was under ſome obligations to me, by way of teſtifying his graſitude, invited me to his houſe. On account of my advanced age, and of my being a foreigner, he thought that he might allow his wife to be of the breakfaſt party, and thus contribute more to my entertainment. As he was engaged in mercantile purſuits, he ſpoke a little Italian, and acted as interpreter between myſelf and the lady, whoſe beauty was accompanied by a ſoft tinge of melancholy. She was finely formed, and her hands uncommonly delicate and handſome. On my admiring them, ſhe held them out to me. We had very little to ſay to each other; and to make up for this ſilence, I kiſſed her hands, which, as ſhe was perplexed to know what ſhe ſhould afterwards do to intereſt me, ſhe did not offer to withdraw. On my ſide, I dared not let them go, for fear ſhe ſhould imagine that I was tired of them. I am at a loſs to conjecture how this ſcene would have terminated, if refreſhments had not been brought to relieve us from our embarraſſment. They were handed to her, and ſhe preſented them to me in a very particular manner, and with ſome degree of grace. I fancied I could perceive that her negligent and penſive air was merely the affectation of a great lady, who perſuaded herſelf that, by aſſuming it, ſhe ſhould become ſuperior to all the magnificence by which ſhe was ſurrounded and covered. Her engaging manners, in the occaſional abſence of her huſband, attracted other lovers, on whom ſhe contrived to beſtow her favours. The plague breaking out in the city, the lady caught it of her enamorata, beſtowed it very faithfully on her huſband, and they all three died."

Infidelity, in countries where many women are kept as priſoners in the harem for the laſcivious gratification of one man, is certainly more pardonable than under thoſe governments where polygamy is not allowed. Perhaps the ſingle reflection of ſo many women being made ſubſervient to the ſenſual delight of one man, may be a conſtant ſpur to them, from parity of reaſoning, to ſeek a ſimilar gratification from a plurality of males. However this be, it is a well-known fact, that the extreme watchfulneſs of the grand ſeignor himſelf, cannot keep the women chaſte even within the impervious walls of his harem, in the ſeraglio of Conſtantinople; as witneſs the frequent puniſhment of the polluted, by cruelly drowning them in ſacks. See the article CONSTANTINOPLE, vol. v. p. 119, 120.

Denon has furniſhed us with the coſtume of the Egyptian harem, illuſtrated with an elegant engraving, which we ſhall here annex. When the huſband, who is ſupreme, is diſpoſed to give an entertainment in his harem, to pleaſe any of his wives who may be pregnant, or who has juſt given him a ſon, or perhaps one whom he has newly purchaſed, he ſends for the almées, or dancing girls, to perform voluptuous dances, whilſt he is ſmoking his pipe. The favourite wife is here repreſented reclining with her head on his knees; and the almées alternately dance, ſing, and play upon inſtruments, while the other wives are in waiting on the ſofa. In front is a fumigating veſſel of rich perfumes, and to the right a candleſtick after the faſhion of the country; the inſtrument played on by the laſt performer to the right, is a ſmall drum of baked earth, which is ſtruck by the fingers with more or leſs force, and produces a very good effect in keeping time to the muſic; the dancers have generally caſtanets in their hands, which are in the form of ſmall cymbals of the diameter of a crown piece. Two of theſe dancing girls were extremely handſome. Their forms were diſplayed through coloured gauze faſtened by a ſaſh, which they tightened from time to time negligently, and with an air of levity by no means diſagreeable, and ſomewhat *à la Françaiſe*. They had brought with them two inſtruments, a pipe and tabor, and the kind of drum above deſcribed. The two handſomeſt of them began dancing, while the others ſung, with an accompaniment of the caſtanets. The movement they diſplayed in ſtriking them againſt each other, gave infinite grace to their fingers and wriſts. At the commencement the dance was voluptuous: it ſoon after became laſcivious, and expreſſed, in the groſſeſt and moſt

An Egyptian Harem entertained by the Almees, or Dancing Girls.

London Published as the Act directs Oct.r 6.1804 by J. Wilkes

indecent way, the giddy tranſports of the paſſions. Theſe dancers ſwallowed large glaſſes of brandy, as if it had been lemonade. Accordingly, notwithſtanding they were all young and handſome, they looked haggard and jaded, except the two above-mentioned, Joſephina and Hanka, who, though truly graceful, had received no other education than that which is purpoſely beſtowed on this looſe profeſſion, with a view to its profits. When the dance was ended, theſe two girls appeared with all the delicacy of modeſt women, yet poſſeſſing the ſoft voluptuouſneſs which they, no doubt, reſerve for thoſe on whom they laviſh their ſecret favours. Notwithſtanding the licentious life which they lead, they are introduced into the harems of the great, to inſtruct the young perſons of their own ſex in all that may captivate and render them agreeable to their huſband or lord. They give them leſſons of dancing, ſinging, graceful attitude, and, in general, of all voluptuous attainments. It is not ſurpriſing, that with manners which make the principal duty of women to conſiſt in beſtowing pleaſure, thoſe who follow the profeſſion of gallantry ſhould be the teachers of the ſex. They are admitted to moſt of the feſtivals which the grandees give to thoſe of their own rank; and when, from time to time, a huſband wiſhes to entertain his harem in a ſportive mood, they are ſent for to ſing and dance, as ſhewn in the Engraving.

The maſſive Egyptian architecture, has now given place to that of the Mooriſh, which has no fixed principles, nor determined rules; and, as if all human affairs ſhould glory in extremes, lightneſs and airineſs are the only objects that are conſulted; and conſequently there is an infinite variety in theſe productions. The ornaments, though profuſe, are never incoherent, and preſerve a degree of harmony which prevents them from ever paſſing the limits of grace and elegance. The domes and minarets, which are built with great rapidity, are raiſed with much regularity, by maſons who uſe but very few tools, and employ no other material beſides plaſter, ſupported by very ſmall pieces of timber. The uſe of the minaret is only to point out, at a diſtance, the moſque which it ſurmounts, and to ſupport the gallery, in which every four hours the imans call together the faithful muſſulmans, by ſinging hymns to the Deity or to his prophet. In every moſque there is a ciſtern, a baſon for ablutions, and wherever it can be commanded, a ſmall enclоſure planted with trees, that the devotee may pray in the ſhade.

The muſſulmans, who make but little uſe of the light, take no pains to procure it in their buildings; and in general all their cuſtoms ſeem to invite to repoſe. Their divans, where the recumbent poſture is more eaſy than to ſit up, and from which it requires a ſerious effort to riſe; their dreſs, which is a kind of petticoat that confines the legs; their large ſleeves, which ſtretch nearly eight inches over the fingers ends; their turban, which prevents the head from ſtooping; their cuſtom of always holding a pipe in their hands, and intoxicating themſelves with its ſmoke: all theſe conſpire to deſtroy activity and imagination, ſo that they meditate without an object, paſs every day in the ſame taſteleſs manner, and even their whole exiſtence, without ſeeking for any new ſcene to relieve its dull monotony. Even that claſs of ſociety who are obliged to work for their livelihood, are not much different from the higher orders; they have been long taught to expect no other reward from induſtry than a bare ſubſiſtence, and thus they have no motive to depart from their ordinary routine, and to exerciſe their invention. They even diſlike particularly every occupation which keeps them ſtanding; the joiner, blackſmith, carpenter, farrier, all work ſitting, even the maſon raiſes a minaret without ſtanding to his work: like ſavage nations, they do every thing almoſt with a ſingle tool, ſo that one is ſurpriſed at the dexterity with which they manage it, and ſhould almoſt be tempted to allow them inventive ingenuity, if their invariable method of proceeding did not rather lead one to attribute it almoſt to a kind of inſtinct, like the inſect, whoſe workmanſhip we admire, whilſt we know that it has not the power of applying the ſame ſkill to different purpoſes. It is, however, to a deſpotiſm which always commands, and never rewards, that we muſt look for the ſource and permanent cauſe of this ſtagnation of induſtry.

The inhabitants of this country build as little as poſſible, and repair ſtill leſs. If a wall threatens to come down, they prop it up; if notwithſtanding it falls in, it only makes the fewer rooms in the houſe, and they quietly range their carpets by the ſide of the ruins; if at laſt the houſe falls altogether, they either abandon the ſpot, or if they are obliged to clear it out, they carry away the rubbiſh to as ſhort a diſtance as poſſible, which is the cauſe that in almoſt every town of Egypt, and eſpecially in Cairo, the eye of the traveller is conſtantly annoyed by heaps of rubbiſh. In Upper Egypt their manſions are little better than vaſt pigeon-houſes, in which the owner reſerves to himſelf only a room or two for his own uſe, and there he lodges along with poultry of all kinds, and all the vermin that they engender between them, which it is a part of his daily employment to hunt for, but at night the toughneſs of his ſkin defies their bites.

The government of Egypt being now re-aſſumed by the Turks with all their ancient authority, the police has been regulated much in favour of their capitan pacha, and of all their dependents. Ibrahim Bey, who was always well-diſpoſed towards the grand ſeignor, is the ſheik-el-belled, or chief of the mamalukes; and next to him in power is Mohammed Bey Elfi. The courteous manners and dignified appearance of Ibrahim Bey, added to the uniform mildneſs of his character, has conſtantly gained him the reſpect and veneration of all the different tribes in Egypt. Notwithſtanding his advanced age, being in his ſixty-ſixth year, he gained great reputation in the review of the Ottoman army by the grand vizier and general lord Hutchinſon near Cairo, by the dexterity and effect with which he managed the ſabre. He is ſtill robuſt and active, of a fair complexion, with a quick ſparkling eye, aquiline noſe, and ſilvery beard. The kiachefs are the magiſtrates or governors of the towns and villages, who adminiſter juſtice, and regulate the police throughout Egypt; but it is a lamentable reflection that the kiachefs and beys connive with each other in their unbounded extortions on all the ſubordinate orders of the people. The ſheiks are the chiefs of the Mohammedan moſques, as the Coptic prieſts are of the Chriſtian churches. Few of the villages are without a public ſchool, where the children are inſtructed in reading the koran. This is the only book they have; and as the art of printing is ſcarcely known among the moſlems, their copies are always manuſcripts: hence belles lettres and the arts are baniſhed from modern Egypt.

From the above ſtate of things, we cannot wonder that ignorance, filth, indolence, and poverty, pervade the lower ranks of people throughout Egypt. Even in the public ſtreets of Cairo and Alexandria, little is to be ſeen but wretchedneſs and miſery; a moſt melancholy picture, after reflecting on the inexhauſtible reſources of that fertile country. Few of the rich females appear abroad; but the lower claſs are ſeen in groups. All of them are alike careful to hide the face, becauſe this is the only part they are enjoined to conceal. When an Egyptian lady paſſes through the ſtreets, the more full, bulky, and cumberſome, her clothes are, and the more they embarraſs her gait, the higher does ſhe think of her importance: the upper garment commonly falls to the ground, and almoſt conceals the feet: nothing appears of her whole perſon except her eyes; and even before theſe the women often ſuſpend a taliſmanic ring, which has the virtue of driving away enchantment and bad luck. The poorer ſort of women are often employed in fetching water; they appear to be fond and affectionate mothers, and are frequently ſeen carrying their children on their ſhoulders.

For

For theſe coſtumes Denon acknowledges himſelf indebted to the pencil of citizen Rigo, a member of the inſtitute of Cairo.

To the wretched policy of the Egyptian government, aided by internal warfare, plague, peſtilence, &c. muſt be attributed the late wonderful depopulation of the country. From upwards of eight millions of inhabitants, the number is now calculated not to amount to one half. Indeed Browne ſtates the general population at only two millions and a half; but Walſh, the lateſt writer on the ſpot, eſtimates the number at three millions; of which 300,000 are ſuppoſed to inhabit Cairo, which is the metropolis of all Africa; and from ſix to ſeven thouſand in Alexandria.

The common language of Egypt is the Arabic. The Coptic, which has been called the vernacular tongue, is ſaid, by Browne, to be extinct. "Numerous reſearches, (ſays this author,) have enabled me to aſcertain the fact. In Upper Egypt, however, they unknowingly retain ſome Coptic words, ſuch as *Boyuni*, the name of a month. Nevertheleſs, in the Coptic monaſteries, the prayers are read in Arabic, and the epiſtle and goſpel in Coptic; but the prieſt is a mere parrot, repeating a dead letter. Coptic manuſcripts are found in ſome of the convents, and leave to copy them might be obtained from the reſident patriarch."

The current coins in Egypt are thoſe of Turkey, and Spaniſh dollars, at the rate of 150 parats to the dollar. The ignorance of the people in this country, in general is ſo great, that it is with the utmoſt difficulty they can be prevailed on to receive in payment any European coin, either of gold or ſilver, except the Spaniſh dollar, and its ſubdiviſions. A great number of Roman coins were found by the French, in their various reſearches amongſt the ruins; but none of theſe fell into the hands of the Engliſh. The following were all the curioſities ſurrendered by the French to the Britiſh army, which have been ſince brought to London: An Egyptian ſarcophagus, with hieroglyphics, of a ſtone called by the French *breche verte*, from the moſque of St. Athanaſius in Alexandria. Ditto of black granite, from Cairo. Ditto of baſaltes, from Menouf. The fiſt of a coloſſean ſtatue, ſuppoſed to be Vulcan, found in the ruins of Memphis. Five fragments of ſtatues, with lions heads, black granite, brought from the ruins of Thebes. A mutilated figure kneeling, black granite. Two ſtatues, white marble, ſuppoſed to be Septimius Severus and Marcus Aurelius, found in Alexandria. A ſtone of black granite, with three inſcriptions, hieroglyphic, Coptic and Greek, found near Roſetta. A ſtatue of a woman ſitting, with a lion's head, black granite, from Upper Egypt. Two fragments of lions heads, black granite, from Upper Egypt. A ſmall figure kneeling, with hieroglyphics, black granite, from Upper Egypt. Five fragments of ſtatues, with lions heads, black granite, from Upper Egypt. A fragment of a ſarcophagus, black granite, from Upper Egypt. Two ſmall obeliſks, remarkably fine, with hieroglyphics, baſaltes, from Upper Egypt. A coloſſean ram's head, of a ſtone called by the French *rauge grais*, from Upper Egypt. A ſtatue of a woman ſitting on the ground, of black granite; between the feet is a model of a capital of a column of the temple of Iſis at Dendera. A fragment of a ſtatue, with a lion's head, black granite, from Upper Egypt. A cheſt of oriental manuſcripts, amounting to ſixty-two, Coptic, Arabic, and Turkiſh, belonging to the library of the French inſtitute at Cairo.

Several antiquities were found by the Engliſh; the moſt valuable were the figure of a Roman ſoldier, as large as life, and a large tablet, the inſcription of which ſtated, that whatever this belonged to, was erected in honour of Septimius Severus, by the veterans of the eleventh legion. A ſtone was alſo found covered with hieroglyphics, of the ſame unknown kind as the Memnon.

The climate of Egypt is ſuppoſed to be the moſt regular of any in the world. The ſky is almoſt always beautifully ſerene; and, after ſeven or eight in the morning, not a ſingle fleeting cloud can be perceived to intercept the burning rays of the ſun. It ſeldom rains in the interior parts; but, on the ſea-coaſt, and near Alexandria, it rains frequently in what may be called the winter time. The ſhowers, however, are ſhort, though heavy, and are immediately ſucceeded by a fine clear ſky. But the want of rain is ſupplied by the heavy dews which fall during the night. The effect of them is perceived in the morning, when, as ſoon as the ſun appears above the horizon, the ground ſmokes as copiouſly as if a great quantity of rain had fallen. The conſtant ſerenity of the ſky affords the advantage alſo of very clear and bright nights; ſo that the moon is ſcarcely ever overclouded, but ſhines with extreme luſtre. The nights in March, April, and May, are often damp and chilly. "In the evening of the 15th of May (ſays Denon) it thundered; a very rare occurrence in this country, which happens hardly oftener than once in a generation, by a concourſe of circumſtances perhaps not difficult of explanation. The north wind, which is the moſt conſtant of all thoſe that prevail in this part of the world, brings from the ſea the clouds of a colder region, rolls them along through the valley of Egypt, where a burning ſun rareſies them and reduces them to vapour; when this vapour is driven into Abyſſinia, the ſouth wind, which croſſes the lofty and cold mountains of this country, ſometimes brings back a few ſcattered clouds, which, as they experience but little change of temperature when returning over the humid valley of the Nile in flood-time, remain condenſed, and at times produce, without thunder or tempeſt, ſmall haſty ſhowers. But, as the eaſt and weſt winds, which are in general the parents of ſtorms, both croſs burning deſerts, which either abſorb the clouds, or raiſe the vapour to ſuch a height as to be able to paſs over the narrow valley of Upper Egypt, without being able to undergo detonation by the operation of the waters of the river, the phenomenon of thunder becomes ſo rare an occurrence to the inhabitants of this country, that even the thinking people who reſide here do not attempt to aſſign to it a phyſical cauſe. Having queſtioned a perſon in the law on the cauſe of thunder, he replied, with the perfect confidence of conviction: "We know very well that it is an angel, but ſo ſmall in ſtature that he cannot be perceived in the air; he has, however, the power of conducting the clouds of the Mediterranean into Abyſſinia, and when the wickedneſs of men is at its height, he makes his voice to be heard, which is a voice of menace and reproach; and, as a proof that he has alſo the diſpoſal of puniſhment, he opens a little way the gate of heaven, whence darts out the lightning; but as the clemency of God is infinite, never is his wrath carried further in Upper Egypt."

At this ſeaſon of the year the *kamſin*, or deſtroying wind, is uſually experienced. Sometimes, indeed, it rages violently in April; but chiefly in May. It is thus deſcribed by Denon: The kamſin may be termed *the hurricane of Egypt and the deſert*. Its name, *kamſin*, ſignifies *fifty*; becauſe it continues more or leſs for fifty days. It is equally terrible by the frightful ſpectacle which it exhibits when preſent, and by the conſequences which follow its ravages. We had already paſſed with ſecurity one half of the ſeaſon in which it uſually appears; when, in the evening of the 18th of May, I felt myſelf entirely overcome by a ſuffocating heat; it ſeemed as if the fluctuation of the air was ſuddenly ſuſpended. I was ſtruck on my arrival with my companions at the bank of the Nile, with a new appearance of nature all around me; this was a kind of light and colours which I had not before ſeen. The ſun, without being concealed, had loſt its rays; it had even leſs luſtre to the eye than the moon, and gave a pale light without ſhade; the waters of the Nile no longer reflected its rays, but appeared in agitation; every thing had changed its uſual aſpect; it was

now

Denon del. J. Chapman sc.

Portraiture of Ibrahim Beys an Egyptian Lady of Rank; and a female Water-carrier and Child.

London Published as the Act directs July 7th 1804 by J. Wilkes.

now the flat ſhore that ſeemed luminous, and the air dull and opaque; the yellow horizon ſhewed the trees on its ſurface of a dirty blue; flocks of birds were flying off before the cloud; the frighted animals ran looſe in the country, followed by the inhabitants, who vainly attempted to collect them together again. We could now eaſily conceive the dreadful ſituation of thoſe who are ſurpriſed with ſuch a phenomenon of nature, when croſſing the expoſed and naked deſerts; where, as it ſtands upon record, many thouſands have been overwhelmed and loſt in the ſhoals of ſand raiſed by the kamſin winds. The next day, an aſtoniſhing maſs of duſt, attended with ſimilar appearances, travelled along the deſert of Lybia: it followed the chain of the mountains, and, when we flattered ourſelves that we were entirely rid of this peſtilence, the weſt wind brought it back, and once more overwhelmed us with this ſcorching torrent; the light of the ſun could pierce with difficulty through this denſe vapour; all the elements appeared to be in diſorder; rain was mixed with whirlwinds of fire, wind, and duſt; and, in this time of confuſion, the trees, and all the other productions of nature, ſeemed to be again plunged in the horrors of chaos. If the deſert of Lybia had ſent us theſe clouds of duſt, thoſe on the eaſt, on the contrary, had been inundated with water; for the merchants who came from the borders of the Red Sea told us, that in the valleys they had the water up to the middle of their legs. When this deſtructive ſcourge ſets in from the deſert, the inundation of ſand often overwhelms the country, changes its fertility to barrenneſs, drives the labourer from his houſe, whoſe walls it covers up, and leaves no other mark of vegetable life than the tops of a few palm-trees, which adds ſtill more to the dreary aſpect of deſtruction. Thus the deſert is conſtantly encroaching on the fertile land; and, were the water of the Nile to diſcontinue its inundations, the whole vale of Egypt would eventually become a deſert or bed of ſand.

"Two days after this diſaſter, we were told that the plain was covered with birds, which were paſſing on from eaſt to weſt, like the cloſe files of an army; and, indeed, we ſaw at a diſtance the fields appear to move, like a broad torrent flowing through the country. Thinking that they might be ſome foreign birds, we haſtened out to meet them; but inſtead of birds we ſaw a cloud of locuſts, who juſt ſkimmed the ſoil, ſtopping at each blade of graſs to devour it, then flying off to new food. If it had been the ſeaſon in which the corn was young and tender, this would have been a ſerious plague; for theſe children of the deſert are as lean as active, and quickly devour every thing before them. It would be intereſting to know how they live and produce ſuch multitudes in ſo arid a deſert; perhaps it was the rain that had fallen in the valleys which had ſuddenly hatched them, and had produced this emigration, juſt as certain wind bring ſwarms of muſketoes. The wind changing again in a contrary direction to their march, they were once more driven back into the deſert. Theſe locuſts are of a roſe-colour, ſpeckled with black, very ſtrong, ſhy, and difficult to catch." It is during the kamſin, and diſturbance of the waters of the Nile, that the crocodiles moſt abound. Denon ſaw them from eight or ten to thirty feet long: but he ſays they are by no means ſo ferocious as has been pretended.

During the latter days of the kamſin, the current of the Nile becomes ſluggiſh, the waters loſe their uſual ſalubrity and tranſparency, and become green, throwing up flakes of foul mud, which exhale a mephitic odour: in ſhort, it is then no longer the bountiful river, the creator and preſerver of Egypt; but it grows heavy in its motion, and would alarm the inhabitants of the banks, if its periodic reſtoration to its uſual ſtate were not as conſtant a phenomenon for them as it is ſurpriſing to the curious traveller. It keeps falling till the 17th of June, remains in ſtagnation for two days, and on the 19th it begins to riſe. "It is at this period (ſays Denon) that the reſidence in Upper Egypt is almoſt inſupportable; the winds are variable, and are conſtantly changing from the eaſt to the ſouth, or the ſouth-weſt: this latter is terrible, for it troubles the atmoſphere, obſcures the ſun with a burning vapour, parches with thirſt, drics up every thing, inflames the blood, irritates the nerves, and makes life itſelf painful: it alſo oppreſſes the lungs ſo ſeverely, that one involuntarily ſeeks for cooler air to breathe in, feeling as if the mouth was an oven of fire; if one inhales the air by the noſtrils, it affects the head; and in again exhaling it, it feels like a guſh of blood ruſhing over the air-paſſages; every thing we touch is burning; and iron, *even in the night*, acquires as great a heat as it does in France in the dog-days, expoſed to the noon-day beams of the ſun."

During this muddy ſtate of the Nile, the water is purified by ſtanding in jars, which Walſh calls *alkarras*; but which are more commonly known by the name of *balaſſes*, from Balaſſe, the town where they are manufactured, and from whence they are ſent not only throughout Egypt, but alſo into Syria, and the iſles of the Archipelago. They have the uncommon property of allowing water to tranſude through their pores, whereby it ſoon becomes clear and cool; they are made at little expence, and ſold ſo cheap, that they are ſometimes uſed to conſtruct the walls of houſes, and the pooreſt inhabitant may ſupply himſelf with them in abundance. Nature gives the material in the neighbouring deſert, which requires no further preparation; it is a fat, ſoapy, and compact, marl, which only requires moiſtening and working in the hands to be perfectly ductile and tenacious; and any veſſels that are formed of it, when dried in the ſhade and half baked in the ſun, only require burning for a few hours with a little ſtraw-fire, to be completed. The people make raſts of theſe pots, which have been deſcribed by almoſt every traveller in Egypt: they are thus carried down the Nile, part of them are ſold on the way, and the remainder are embarked at Roſetta and Damietta to be ſent abroad. The ſpongy nature of this earth makes the water tranſude, whilſt the ſlimy particles ſuſpended in it are attracted to the ſide of the veſſel, and the outer ſurface being always moiſtened by the tranſudation, when there is the leaſt breath of wind to promote evaporation, the water within the jar becomes as clear and cool as if it were iced. They are ſometimes fumigated with benzoin, or perfumed with orange-flower, or other aromatics, to vary the inſipid taſte of the water, which, however, when drunk from theſe vaſes, is the beſt in the world. It is curious to ſee the immenſe cargoes of theſe jars, which are either piled up on boats, or made into raſts, like the large floats of wood on our rivers, which are borne by the ſtream, and at the ſame time carry their owners, who diſpoſe of them to good advantage. The uſe of theſe vaſes appears to be of great antiquity, for they are repreſented of the ſame form as at preſent, ſtanding on the ſame tripods, and employed for the ſame purpoſe, in hieroglyphic paintings, and on ancient manuſcripts. The poorer ſort of women are continually employed in fetching water in theſe jars.

The violent heats prevail chiefly in June, July, and Auguſt; during which, and the ſeaſon of the kamſin, the paſſage over the deſert is moſt arduous, and often fatal. The French loſt many men in this dreary region, where the heat of the ſands burnt their feet through their ſhoes; and the ſcorching rays of the ſun, cracking the leathern jars which contained their water, expoſed them to the ſevereſt torture of unquenchable thirſt. The Engliſh Indian army, in croſſing from Coſſir, experienced ſimilar loſſes and fatigues; as did the army of the grand vizier, in its march to Salahieh. But their ſufferings were trivial, when compared to thoſe of a party of mamalukes mentioned by Denon, who taking the paſs from the Kittah by the way of Rediſi, nearly all of them periſhed. "This paſs (ſays Denon) is never frequented by

the merchants, and was fatal to the mamalukes, who, by taking this road, loſt their horſes, together with a part of their camels, a conſiderable number of their attendants, and twenty-ſix women out of twenty-eight. Their march was traced by their diſaſters, and by what they left behind them, tents, arms, clothing, the carcaſſes of horſes ſtarved to death, camels which were no longer able to ſupport their burden, attendants, and their women, whom they abandoned to their fate. I figured to myſelf the ſufferings of a poor wretch, panting with fatigue, and expiring with thirſt, his tongue parched, and breathing with difficulty the hot air by which he is conſumed. He hopes that a few minutes repoſe will enable him to recover his ſtrength: he ſtops, and ſees his companions paſs by, calling on them in vain for help. The miſery to which each one is a prey, has baniſhed every compaſſionate feeling: they proceed on their way without caſting a look on him, and follow in ſilence the footſteps of thoſe who precede them. They are no longer in his view: they are fled, and his benumbed limbs, already overpowered by their painful exiſtence, refuſe their office, and cannot be ſtimulated to action either by danger or by terror. The caravan has paſſed: it appears to him like an undulating line in the wide expanſe, and, becoming at length a mere point, diſappears altogether like the laſt glimmer of an expiring taper. He caſts around him his wild and frantic looks, but can ſee nothing: he turns them towards himſelf, and then cloſes his eyes to ſhun the aſpect of the terrible vacuity by which he is ſurrounded. He hears nothing but his own ſighs, and fate hovers over him to cut the final thread of his exiſtence. Alone, and without a companion to do him the laſt offices, he is about to expire without one ſingle ray of hope to adminiſter comfort to his departing ſoul; and his corpſe, conſumed by the parched and burning ſoil, ſoon becomes a bleached ſkeleton, which will ſerve as a guide to the uncertain ſteps of the traveller who ſhall dare to brave the fate that has befallen him."

Such is the picture of the deſolations of the deſert, under circumſtances of unallayed thirſt, fervent heat, and inſupportable fatigue. In theſe wild and dreary waſtes, men alſo often become a prey to thirſt, with the image of a vaſt lake before their eyes. This puniſhment, of a new deſcription, requires explanation, as it reſults from an illuſion peculiar to the deſert. It is produced by the reflection of ſalient objects on the oblique rays of the ſun, refracted by the heat of the burning ſoil; and this phenomenon has ſo truly the appearance of water, that the obſerver is deceived by it over and over again. It provokes a thirſt, which is the more importunate, as the inſtant when it preſents itſelf to the view is the hotteſt time of the day. This optical phenomenon is called *mirage*, in a late paper publiſhed by Monge. In theſe vaſt deſerts, at the diſtance of a hundred miles or more from either ſide the Nile, are ſituated the Oaſes, or iſlands of fertile ſoil, ſurrounded by ſeas of burning ſand, which afford miſerable but central ſettlements for the robbers and banditti of the deſert, the Muggrebin Arabs.

The Natron Lakes, ſo called from their production of that kali which ſupplies the uſe of barilla, are alſo ſituated in the deſert, near that remarkable channel called the *dry river*, or *Bahr Belame*, i. e. river without water: probably an outlet of the lake of Kerun, in remote ages, before the deſerts had become ſo extenſive; and when the mountains were clothed with vegetation, and the Nile a far ſuperior ſtream. On paſſing the deſert towards Coſſir, the rugged and lofty rocks have a grand and terrific appearance, conſiſting chiefly of red granite, and porphyry red and green, the latter being the ophite or ſnake-ſtone of the ancients, by a far more proper appellation, as the word *porphyry* implies red or purple. Here is alſo found the celebrated *verde antico*, or green marble with white and dark ſpots: it ariſes in the neighbourhood of ſerpentine, under a blue ſchiſtus. In theſe rocks are alſo red and other marbles.

If any thing can brighten the gloomy aſpect of the deſert, it is the ſlow but orderly paſſage of the caravans, whoſe numerous attendants give life to this otherwiſe ſolitary empire of death. The large groups of attendant guards, thoſe of the merchants in their different coſtumes, a vaſt retinue of laden camels, with an equal number of Arab guides, the horſes, aſſes, foot travellers, and perhaps a few inſtruments of harſh muſic, give animation to a ſcene moſt ſtriking and pictureſque, even in the wildeſt regions of deſolated nature.

Let us, however, abandon to the mercy of the kamſin theſe wild and barren waſtes, to contemplate the foreground of this ſtriking Egyptian picture, where the rich vale abounds with eternal vegetation—where the cultivator can live for three-half-pence a day—where the moſt abundant crops of rice are produced—and where the fineſt ſugar-canes and plantations of indigo and cotton might be cultivated, under the benign influence of a pure and healthy climate, on the banks of a river of an almoſt miraculous deſcription, the advantages of which cannot be recapitulated. Here the vine-ſtalk continues green through the winter; the leaves only harden, become red, and dry, whilſt the end of the branch perpetually renews its verdure; the creeping peaſe do the ſame, their ſtalk becomes woody, and they will riſe forty feet high, and climb to the tops of the talleſt trees. Here we every where behold the advantages of irrigation, extended by water-carriages, locks, and flood-gates. Theſe Arabian works, made doubtleſs from ancient models, are as uſeful as well contrived; and, in general, it appears that the diſtribution of the waters in Upper Egypt for irrigation, is ordered with more intelligence, and effected with ſimpler means, than even in China. Here are ſtill no leſs than eighty canals, like rivers during the inundation, ſome thirty, ſome forty, leagues in length, receiving and diſtributing the waters over the face of the country. In the elevated tracts or ſpots, which cannot thus receive the benefit of the Nile's increaſe, the want is ſupplied by a great number of wells, ſpiral pumps, and wheels which carry a rope of large earthen pots, and draw water from the canals. In this labour no leſs than two hundred thouſand men are ſaid to be employed every day during the ſeaſon for irrigation, beſides thoſe who draw water in wicker baſkets of ſo fine a texture that not a drop of the liquid runs through.

The Egyptian huſbandmen have not the laborious taſk of ploughing, digging, or breaking the clods; nor have they any occaſion for manure, becauſe the Nile, by bringing with it a profuſion of mud or ſlime, fattens the earth, and makes it exceedingly fruitful. When, therefore, the river has retired, the agriculturiſts have no more to do than to mingle a little ſand with the earth in order to abate its ſtrength, after which they caſt in their ſeed with little trouble, and at an inconſiderable expence. Seed-time differs according to the province, and the height of the ground. Near Syene, wheat and barley are ſown in October, and reaped in January. About Girgeh, the harveſt month is February, and March round Grand Cairo: ſuch is the general progreſs of the harveſt through the Said. There are many exceptions, according as the lands are high or low, more or leſs diſtant from the river. They ſow and reap all the year in Lower Egypt, wherever they can obtain the water of the river. The land is never fallow, and yields three harveſts annually; there the traveller inceſſantly beholds the charming proſpect of flowers, fruits, and corn; and ſpring, ſummer, and autumn, at once preſent their treaſures. Deſcending from the cataracts, at the beginning of January, the wheat is ſeen almoſt ripe; farther on it is in ear; and ſtill farther the fields are green. Lucerne is mowed three times between November and March, and is the only hay of Egypt, ſerving chiefly to fodder the cattle. All the country is more or leſs ſown with wheat, ſainfoin, barley, beans, lentiles, and *doura* or *ſorgo*, which is a kind of millet, cultivated almoſt univerſally in Upper Egypt. Whilſt the grain of this plant is ſtill milky, the peaſants roaſt it like

maize,

maize, they chew the green ſtalk like the ſugar-cane; the leaves are food for cattle; and the medulla or pith, when dry, ſerves for tinder; the cane ſupplies the place of wood for firing and heating the ovens; flour is made of the grain itſelf, and cakes of the flour, but none of all theſe parts are good. Theſe people manage their ovens with great ſkill, and ſhew dexterity in almoſt all their avocations; and as they have a paucity of tools, it is ſurpriſing how much they do with their fingers, the inſtruments to which they are commonly reduced; and with their feet, with which they aſſiſt their hands wonderfully. As workmen, the common people have one great recommendation, which is, that they are patient and unaſſuming, and ready to repeat their work till it is done to your mind. They are eminently ſober, active, laborious, and perſevering; and yet to reflect that a few tyrants exerciſe abſolute empire over many hundred thouſand of ſuch men, poſſeſſing ſuch formidable qualities of body, ſtrongly impreſſes on the mind the fact that ſome perſons are lulled by the habit of obedience, juſt as the force of command acts upon others; and this ſtate continues till one party ſlumber over their abuſe of power, whilſt the others at laſt awake at the noiſe of their chains.

The Egyptian art of hatching chickens has been always peculiar to themſelves. See the article EGG, p. 285 of this volume. Their manner of raiſing bees is not leſs extraordinary, and beſpeaks great ingenuity. Upper Egypt preſerving its verdure only four or five months, the flowers and harveſt being ſeen no longer, the people of Lower Egypt profit by this circumſtance, aſſembling on-board their boats the bees of different villages. Each proprietor confides his hives, with his own mark, to the boatman, who, when loaded, gently proceeds up the river, and ſtops at every place where he finds verdure and flowers. The bees ſwarm from their cells at break of day and collect their nectar, returning ſeveral times loaded with booty, and, in the evening, re-enter their hives, without ever miſtaking their abode.

In Egypt, the camels do all the office of carts, by conveying the proviſions, and carrying away the filth: the ſaddle-horſes and aſſes are chiefly devoted to tranſporting paſſengers from place to place, and they are ſeen in every ſtreet ſaddled, bridled, and always ready to ſtart. The aſs, which in Europe and the northern countries is heavy and dull, appears quite in its natural climate in Egypt; and it here enjoys all its powers in full perfection; it is healthy, active, and cheerful, the mildeſt and ſafeſt animal to mount that one can poſſibly have; his natural pace is an amble or a gallop, and without fatiguing his rider, he carries him rapidly over the plains which lie between the different towns.

The Egyptian horſes are of the true Arabian breed, and are diſtinguiſhed by the excellent qualities they poſſeſs, as well as by the fine ſymmetry of their proportions. None but the Turks and Mamalukes are permitted to ride on horſeback, in order that a ſufficient ſupply of horſes might always be obtained for their cavalry. For ſhort journies, or rides of pleaſure, all other perſons uſe mules or aſſes; but for travelling over the deſert, camels and dromedaries. The women ride aſtride like the men, on a broad and elevated pad, covered with a piece of rich Turkey or Perſian carpet.

The goats in Egypt are remarkably fine, the females giving twice in the courſe of the day more than a quart of milk; to preſerve an ample ſupply of which large herds are kept. The mutton is good, and ſold at a cheap rate; as are alſo the geeſe, fowls, pigeons, eggs, &c. which are in great abundance throughout Egypt. The fleſh of the buffalo ſupplies the table with beef, which, at the time the paſturage is in perfection, ſome time after the retreat of the inundation, is fat and good. The ſmall and delicate cows and oxen are on a variety of accounts too uſeful to be ſlaughtered for food while in vigour. They labour conſtantly at the wheels by which the water is conveyed to the fields and gardens.

The principal fruits throughout Egypt are muſk and water melons, ſmall apricots, grapes, oranges, pomegranates, citrons, a few plantains about Roſetta, and millions of dates. The laſt-mentioned fruit is the potatoe of this country, the poor people living almoſt entirely upon it. The date-tree grows in large woods, thrives almoſt every where, and a ſandy ſoil agrees perfectly well with it. The peninſula of Aboukir, and great part of the ſandy country between Aboukir and Roſetta, are covered with them. Numerous advantages are derived from this tree, every part of which is made to ſerve ſome purpoſe. The fruit is very wholeſome and palatable food, and tolerable brandy is made from it. The leaves are converted into ropes for the germes and other boats; the trunk of the tree makes fuel, and is uſed alſo in the conſtruction of their houſes. Wherever the date-tree is found, it is remarkable that water may be procured by ſinking wells.

The diſeaſes of Egypt are few, but extremely alarming: the moſt common are fever, ophthalmia, dyſentery, and plague. To the exceſſive heat of the ſummer months, the three firſt of theſe maladies have been attributed. But, were heat the only principle of theſe diſeaſes, the Said would not be habitable. Heat certainly diſpoſes the blood to fever, and to which the inhabitants ſeem conſequently more or leſs ſubject; and which they cure by regimen, drinking much water, and bathing in the river; in other reſpects they are ſtrong and healthy. Old men are numerous, and many ride on horſeback at eighty. The food they eat in the hot ſeaſon much contributes to the preſervation of their health; it is chiefly vegetables, pulſe, and milk. They bathe frequently, eat little; ſeldom drink fermented liquors, and mix much lemon juice in their food. This abſtinence preſerves vigour to a very advanced age. The waters of the Nile are lighter, ſofter, and more agreeable to the taſte, than almoſt any other. In Lower Egypt, the neighbourhood of the ſea, the large lakes, and the abundance of the waters, moderate the ſun's heat, and preſerve a delightful temperature. The greateſt torment of the inhabitants are the gnats and muſquitos, which, riſing by millions out of the marſhes, ſwarm in the air and the houſes. The handkerchief muſt be held in the hand all day. It is the firſt thing a viſitor receives, and at night it is neceſſary to ſleep under muſquiteros.

Opthalmia, or diſeaſes of the eyes, are the moſt common of all others in Egypt, where the blind are numerous. Eight thouſand of theſe unfortunate people are decently maintained in the great moſque of Cairo. The ſmall pox is very common in Egypt, but without committing great ravages. As to pulmonary diſeaſes, which in cold countries carry off ſo many in the prime of youth, they are unknown in this more equable climate. The unhealthy ſeaſon in Egypt is from February till the end of May, during which time they eat rice, vegetables, freſh fiſh, and fruits; bathing frequently, and uſing plenty of perfumes and lemon juice, with which regimen they prevent the dangerous effects of that ſickly ſeaſon, and overcome the violence of dyſentery. But the moſt fatal of all their maladies is the plague. Sonnini, Volney, Savary, &c. ſeem erroneouſly to have ſuppoſed that this fever, now properly called epidemical or intermittent, was conſtantly brought from Turkey in the ſhips charged with old clothes, which annually came to Alexandria for a market; "but theſe, and ſimilar reaſons, (ſays Sir Robert Wilſon,) cannot any longer be maintained, ſince the plague has generated annually in Egypt during the laſt four years, although no ſuch communication had been poſſible; and even chiefly commenced in Upper Egypt. The ſource of this diſorder muſt therefore be ſought for in thoſe phenomena with which the appearance is connected. The plague commences in Egypt when the Nile begins to fall, and ceaſes to be fatal, almoſt to a day, (many pretend preciſely ſo,) after the 17th of June, which is the period of the ſummer ſolſtice, and when the Nile is ſuppoſed to receive the firſt increaſe.

increaſe. As the waters of the Nile retire from the ſurface of the country they had inundated, a rich ſlime of conſiderable condenſity is left, which forms a ſoil ſo productive, as to render Egypt the moſt fertile land in the known world: but unfortunately this ſlime, ſubjected to the univerſal laws of matter, is no ſooner ſeparated from its principle of action, than corruption enſues, and continues until all the putrid juices are totally abſorbed by the heat of the ſun, which then leaves the ground perfectly brittle, and full of fiſſures: the atmoſphere at this time ceaſing to be tainted, the plague throughout Egypt diſappears. This theory, however natural to Egypt, cannot be immediately applied to other countries, where the plague annually rages; but an examination into their climate, ſoil, and the cuſtoms of the people, will probably prove the poſition, that the plague is local, occaſioned by a corrupted ſtate of atmoſphere, and never introduced by *contagion*."

Dr. White, an Engliſh phyſician, attached to the army of Egypt, determined to diſcover if this malady, ſo deſtructive to a large portion of the globe, and which filled with apprehenſion the remainder, could not be checked, or rendered leſs virulent, by the introduction of inoculation. Reſolving to become the patient of his own ſpeculation, during the time the plague raged at Roſetta, he inoculated himſelf with matter taken from an infected perſon. The attempt failed twice; the third proved fatal: in three days after the ſymptoms appeared he died, falling a much-to-be-lamented victim to a diſtintereſted zeal, benevolently and intrepidly directed for the benefit and happineſs of the community.—"The fever called plague, (ſays ſir Robert Wilſon,) is not attended with any corporeal pain; torpor tranquillizes all ſenſibility of mind, and the hour of diſſolution is expected with apathy. The criſis is death, or complete recovery.

Dr. Wittman, however, who compiled an Hiſtorical Journal of the Plague, during his continuance with the Turkiſh army in Syria and Egypt, is decidedly of opinion that the plague is extremely *contagious*; but thinks it may be generated by mephitic air—by the ſlime left on the ſhores after the inundations of the Nile—by the ſtench of carrion, or all kinds of dead carcaſes, as well as from the filth, ſtench, and confined hovels, of ſuch multitudes of poor miſerable inhabitants. See the article MEDICINE. So little do the people of the country dread this diſeaſe, that Ibrahim Bey encamped on the very burial-ground at El-Ariſh, where the bodies of ſeveral thouſands of perſons who had fallen victims to the plague during the courſe of the laſt ſix weeks, were interred. "His own tent, (ſays Dr. Wittman,) covered a part of the graves!"

Egypt, in curious ſubjects of Natural Hiſtory, is rather limited. Its mineralogy is not opulent, nor does it ſeem ever to have produced any of the metals. A mountain towards the Red Sea is ſtiled that of emeralds; and even now the beſt emeralds are by the Perſians called thoſe of Said, or Upper Egypt: but the mines are no longer worked, and even the ſpot ſeems unknown. Wad has publiſhed an account of Egyptian foſſils, from ancient fragments in the muſeum of cardinal Borgia at Veletri. They are of red granite; white granite with hornblende; grey felſpar, and black hornblende. The porphyry ſeems petroſilex with ſpots of felſpar. There is alſo a little fragment, with hieroglyphics, of micaceous ſchiſtus, conſiſting of browniſh black mica: other remains are of ſand-ſtone, and ſand-ſtone breſcia, felſpar, ſerpentine, lapis ollaris, white marble with veins of ſilver mica, ſwine-ſtone, what is called green baſalt by the Italians, and jaſper of various kinds; with topaz, or the chryſolite of the ancients, amethyſt, rock cryſtal, calcedony, onyx, carnelian, heliotrope, obſidian, lazulite; but there ſeem to be none of emerald. Many are of baſalt, or the Ethiopic ſtone of Herodotus and Strabo; Pliny adding that the native word means *iron*: the Egyptian is ſometimes a grunſten, being black hornblende with veins of felſpar; and particles of hornblende are viſible in all theſe baſalts. Theſe notices become intereſting, as the Egyptians were the firſt inventors of ſculpture and architecture, and the original materials may juſtly excite curioſity. Beſides the natron lakes, there are ſome mineral ſprings, and one of ſalt water near Cairo, which is ſuppoſed to have medical virtues.

With regard to botanical productions, it is by no means eaſy to diſtinguiſh its native vegetables from thoſe which have been introduced at various periods for profit or pleaſure, and have gradually naturalized themſelves in the ſoil of Egypt. Wherever the annual inundations extend, a number of ſeeds, brought down by the torrent from Ethiopia and Abyſſinia, muſt be depoſited together with the fertilizing mud, which, vegetating regularly every year, are probably miſtaken for truly indigenous plants. We ſhall therefore mention ſuch of the Egyptian vegetables as are of moſt importance, either by their preſent uſe or ancient fame, without being ſolicitous to examine whether they are real natives, or naturalized ſtrangers. The lotus and papyrus have always been the appropriate decorations of the god of the Nile: the former of theſe is a ſpecies of nymphæa or water lily, which at the retreat of the inundation covers all the canals and ſhallow pools with its broad round leaves, among which are its cup-ſhaped bloſſoms of pure white, or cærulean blue, repoſing with inimitable grace on the ſurface of the water. The papyrus, ſacred to literature, after having long vaniſhed from the borders of the Nile, has at length been again recognized in the cyperus papyrus of the Linnæan ſyſtem. (See the article CYPERUS, vol. v. p. 525.) The arum colocaſia of ancient fame is ſtill cultivated in Egypt for its large eſculent roots. The Egyptian ſycamore (ficus ſycomorus), probably introduced from the oppoſite ſhore of Arabia, is of peculiar value from its fruit, its depth of ſhade, and the vigour with which it grows, even on the ſandy frontiers of the deſert. The date palm, the piſtachia, the oriental plane, and the bead-tree, adorn the ſhores, and are cultivated in the vicinity of moſt of the towns. The cypreſs overſhadows the burial grounds, and the caperbuſh roots itſelf in the ruins of Egypt. The ſenna, the mimoſa nilotica, and the henné (Lawſonia inermis), are alſo characteriſtic of Egypt; from the latter of theſe, the women prepare that yellow dye with which they tinge the nails of their fingers. All the moſt exquiſite of the European fruits, ſuch as the almond, the orange, pomegranate, fig, peach, and apricot, are cultivated here with great aſſiduity and ſucceſs; the various kinds of melons and gourds grow to full perfection, and compoſe no unimportant portion of the food of the inhabitants; and mingled with theſe productions of the temperate regions are found the plantain, the ſugar-cane, the cotton, and a few others, that have formerly been imported hither from the tropical climates.

Contemplating the matchleſs fertility of the vale of Egypt, we cannot but notice the two magnificent proſpects which it exhibits at two very different ſeaſons of the year. If the traveller aſcends either of the mountains, or one of the great pyramids near Cairo, in the month of July or Auguſt, he beholds with amazement a ſpacious ſea, ſpotted with innumerable towns and villages, interſected with ſeveral cauſeys, and occaſionally contraſted with groves and orchards; while a magnificent diſplay of ſylvan and mountainous ſcenery bounds the delightful view, and terminates a moſt exquiſite horizon at the utmoſt diſtance the eye can poſſibly reach. On the contrary, if the view be taken in winter, that is, in the months of January and February, the whole country reſembles one extenſive meadow clothed with the fineſt verdure, and enamelled with an infinite variety of flowers; the plains are embelliſhed with numberleſs flocks and herds; the mild zephyrs are impregnated with the ſweet odours that riſe from the orange and lemon groves, and the air is altogether ſo pure and ſalubrious, that a more healthful or agreeable ſpot cannot be found in the univerſe; and, for this reaſon, nature, which in winter ſeems to droop and languiſh in every other climate, appears at this time to triumph in the delights of her Egyptian abode.

EGYP'TIANS, the natives of Egypt: an appellation alſo beſtowed on a ſingular deſcription of wandering vagabonds in England, called *gypſies*. See the article GYPSEY.

EHIN'GEN, a town of Germany, in the circle of Swabia: twelve miles ſouth-weſt of Ulm, and forty-eight weſt of Augſburg. See EBINGEN.

EH'LE, a river of Germany, in the circle of Upper Saxony, which runs into the Elbe, near Magdeburg.

EH'RENBERG, a citadel of Germany, in the county of Tyrol, on the frontiers of Swabia: forty miles north-eaſt of Inſpruck.

EHRENBREIT'STEIN, a fortreſs of Germany, in the Lower electorate, and conſidered as the key of the Rhine and the Moſelle, near Coblentz, on the oppoſite ſide of the Rhine.

EH'RENBURG, a town of Germany, in the circle of Weſtphalia, and county of Hoya: eighteen miles weſt-ſouth-weſt of Hoya.

EH'RENFELS, or EHRNFELS, a lordſhip of Germany, in the circle of Bavaria, and principality of Neuburg, to which it was ceded in 1567. It gives a ſeat in the aſſembly of the circle, and pays thirty-ſix florins for a Roman month. It takes its name from a fortreſs, thirteen miles north-weſt of Ratiſbon.

EHRENFRIE'DERSDORF, or IRBERDORF, a town of Germany, in the circle of Upper Saxony, in the circle of Erzgeburg, founded in 1407; near it are tin mines, formerly very rich: three miles weſt of Wolkenſtein.

EH'RENSTEIN, a town and ancient caſtle of Germany, in the circle of Upper Saxony, and principality of Schwartzburg Rudolſtadt: ten miles north-weſt of Saalfield.

EH'RET (George-Dionyſius), a very excellent botanical painter, ſon to the gardener of the prince of Baden-Durlach, born in that country in 1710. At a very early age, without inſtruction, he took to drawing and painting flowers, and had executed five hundred pieces with wonderful accuracy, when he was made known to Dr. Trew, of Nuremberg, who purchaſed the whole at double the price he ſet upon them. Having, with the thoughtleſſneſs of a young man, diſſipated the ſum which he had thus raiſed, he went to Baſil, where, ſtimulated by neceſſity, he reſumed his labours, and produced many admirable ſpecimens of his ſkill. He then viſited France and England, ſupporting himſelf by the practice and the teaching of his art. In 1736 he was employed in the garden of Mr. Clifford in Holland, where he met with Linnæus, who inſtructed him in his ſyſtem. His fine taſte and botanical accuracy of delineation were publicly diſplayed in the figures of the *Hortus Cliffortianus*, which appeared in 1737. He returned to England about 1740, and ſpent the remainder of his days in this country. He was employed by various lovers of natural hiſtory, whoſe cabinets he enriched with his works. The late ducheſs of Portland poſſeſſed near three hundred paintings of exotics, and five hundred of Engliſh plants, upon vellum, highly finiſhed by his hand. Several of his pieces are in the Britiſh Muſeum, probably from the collections of Sloane and Mead, both of whom employed him; the latter generouſly advanced his price. He was accuſtomed for ſeveral years to paſs ſome of the ſummer months at the ſeat of Ralph Willet, eſq. of Merly, Dorſetſhire, in the library of which is a copious collection of his performances. For his firſt patron, Dr. Trew, he painted a number of figures of rare plants in the Engliſh botanical gardens, of which one hundred have been engraved, and publiſhed under the title of *Plantæ Selectæ, &c.* in ten decads, from 1750 to 1773, with the illuſtrations of Dr. Trew and Dr. Vogel, forming one of the moſt ſplendid works in botany. Ehret drew the figures of Brown's Hiſtory of Jamaica, in forty plates. He both drew and engraved a ſet of fifteen plates of exotics, each containing two or three plants, with a foreign butterfly. He was elected a fellow of the royal ſociety, a diſtinction he deſerved for the ſcientific knowledge which he poſſeſſed, and which greatly contributed to the truth of his pencil. He married a ſiſter of Philip Miller, of Chelſea, and obtained a moderate independence by the practice of his art, which he continued as long as he lived. He died in 1770.

EHRE'TIA, *f.* [ſo named after that ingenious artiſt and botaniſt, *G. D. Ehret.*] In botany, a genus of the claſs pentandria, order monogynia, natural order aſperifoliæ, (borragineæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, bell-ſhaped; half five-cleft, obtuſe, very ſmall, permanent. Corolla: one-petalled; tube longer than the calyx; border five-cleft; diviſions ſomewhat ovate, flat. Stamina: filaments five, ſubulate, patulous, length of the corolla; antheræ roundiſh, incumbent. Piſtillum: germ roundiſh; ſtyle filiform, thicker above, length of the ſtamens; ſtigma obtuſe, emarginate. Pericarpium: berry roundiſh, one-celled. Seeds: four, convex on one ſide, cornered on the other.—*Eſſential Character.* Berry two-celled; ſeeds ſolitary, two-celled; ſtigma emarginate.

Species. 1. Ehretia tinifolia, or tinus-leaved ehretia: leaves oblong-ovate, quite entire, ſmooth; flowers panicled. This is an upright tree, from twenty to thirty feet high, with an oblong thick head. Leaves alternate, veined, blunt, about four inches long, on ſhort petioles. Flowers numerous, white, ſmall. Berry ſpherical, at firſt yellow, then black. Seeds two, hemiſpherical, two-celled. Native of Cuba and Jamaica; flowering there in January and February. In Jamaica, where it is pretty common in the lower lands, and known by the name of *baſtard cherry-tree*, it riſes generally to the height of ſixteen or twenty feet: the berries are ſmall, and ſeldom exceed the largeſt of our European currants in ſize. They ſerve to feed poultry, and are ſometimes eaten by the poorer ſort of people. Mr. Miller received the ſeeds from Jamaica, in 1734. The plants grew here to the height of eight or nine feet, and produced flowers, but not ſeeds. He will not allow that it is Sloane's plant: the leaves in this being ſmoother, longer, and more pointed, and the corymb of flowers much longer than in Sloane's plant.

2. Ehretia ſpinoſa, or thorny ehretia: thorny. This tree has a trunk three or four inches in diameter, dividing almoſt cloſe to the ground uſually in three parts, which run up twenty-five or thirty feet high: theſe having put out a few ſimilar boughs in their progreſs, ſcarcely attain the length of ten feet before they are bowed back to the ground, and require ſupport from the boughs of the neighbouring trees: they have many very ſhort lateral branches ſcatteringly diſpoſed; their bark is aſh-coloured, and ſmooth. Strong, woody, ſhort, very thick, awl-ſhaped, ſpines, are ſcattered over the trunk, principal boughs, and ſecondary branches; the oldeſt of theſe frequently put forth from their middle a perpendicular leafy branchlet of the ſame length with themſelves. Leaves oblong, ſhining, three or four inches long, uncertain in their number, but uſually five or ſix from the ſame tubercle, falling off every year. Flowers very many, ſmall, with yellowiſh corollas. The ſegments of the ſtyle may be regarded as a two-parted ſtigma, whence with a glaſs appears an opening to the germ itſelf. Fruit the ſize of a pea, and red. Native of Carthagena, in New Spain; flowering in Auguſt, and bearing fruit in October. It is called there *cacaracacara*, and differs much in habit from the preceding; they agree, however, in the flower, except in the calyx and ſtyle.

3. Ehretia Bourreria, or oval-leaved ehretia: leaves ovate, quite entire, ſmooth; flowers in a kind of corymb; calyxes ſmooth. This is a ſmall inelegant tree, having an aduſt habit; in Curaçao often above fifteen feet high, in Martinico ſeldom five. Trunk unequal, with a chinky bark. Branches very many, irregular. Leaves alternate, petioled, quite entire, various; obtuſe, acute or emarginate; on rocks ſmooth, elſewhere rugged; differing in ſize, oblong, ovate, &c. Racemes corymbed, terminating.

flowers ſweet. Corollas white, with roundiſh ſegments. Berries ſhining, ſaffron or orange-coloured, pulpy, ſweet, ſucculent, more quadrangular as they are larger; eaten by children, and the natives. This ſpecies is the connecting link between Ehretia and Cordia. Native of the Weſt Indies, growing from the crevices of rocks, where there is no ſoil. According to Dr. P. Browne, it grows in the ſavannas of Jamaica; it is there called *poiſon-berries*: the French name it *bois cabril batard*. It ſeldom riſes above fourteen or fifteen feet; the berries are of a ſaffron colour. Browne named it *Bourreria*, after Mr. Beurer, (or rather Beurer,) an apothecary of Nuremberg, who was a great promoter of natural hiſtory. Cultivated in 1758 by Mr. Miller, who received the ſeeds from Surinam.

4. Ehretia exſucca, or dry-fruited ehretia: leaves wedge-form-lanceolate, with the edge reflex. This is a ſmall tree, fifteen feet in height; ſometimes erect, ſometimes ſupporting itſelf on other trees. Leaves ovate, acute, very ſmooth, alternate, petioled, two inches long. Flowers having a ſlight degree of ſweetneſs, much larger than in the preceding ones; corollas white, with heart-ſhaped ſegments. Frequent about Carthagena, in mountain woods; flowering from May to Auguſt, and ripening the ſeeds in October.

5. Ehretia virgata, or twiggy ehretia: leaves oblong, entire, rugged on the upper ſurface; branches filiform; flowers terminating, ſcattered; calyxes hirſute. Native of Hiſpaniola.

Propagation and Culture. Theſe plants are too tender to thrive abroad in England, where they require a moderate warm ſtove in winter; but when the plants have acquired ſtrength, they may be placed in the open air during the heat of the ſummer, but it ſhould be in a ſheltered ſituation; and when the evenings grow cold in the autumn, they muſt be removed into ſhelter. They are propagated by ſeeds, when theſe can be obtained. Sow them in ſmall pots, plunged into a hot-bed. They may alſo be increaſed by layers, but theſe are long before they put out roots. See LYCIUM.

EHRFEL'DEN, a town of Germany, in the circle of the Upper Rhine, and principality of Heſſe Darmſtadt: eight miles weſt of Darmſtadt.

EHRHAR'TA, *ſ.* [ſo named in honour of *Frederic Ehrhart*, a native of Swiſſerland, a very diligent and acute obſerver. *Linn. Suppl.*] In botany, a genus of the claſs hexandria, order monogynia, or digynia. The generic characters are—Calyx: glume one-flowered, two-valved, ovate, concave, ſhorter than the corolla, patulous; one valve a little larger than the other, and membranaceous. Corolla: double; outer two-valved; valves oblong, complicate, keeled, retuſe, tranſverſely wrinkled, three times as long as the calyx, villoſe on the outſide of the baſe; inner a little ſhorter, keeled, with a ſmooth even ſurface; nectary two-leaved, very ſmall; leaflets jagged and ciliate, involving the genitals. Stamina: filaments ſix, capillary, very ſhort; antheræ upright, linear, emarginate, ſhorter than the corolla. Piſtillum: germ ovate; ſtyle compreſſed, very ſhort, ſmooth; ſtigma ſimple, villoſe. Pericarpium: none. Seed: ſingle, ovate, ſmooth.—*Eſſential Character.* Calyx, a two-valved one-flowered glume; corolla, double, each two-valved; the outer compreſſed.

Species. 1. Ehrharta cartilaginea, or cartilaginous ehrharta: culm undivided; panicle ſimple; outer corolla retuſe, almoſt awnleſs; edge of the leaves cartilaginous, and curled. This is an extremely beautiful ſmooth graſs: root fibrous, perennial; culm erect, jointed, from a foot and a half to two feet high; joints about five; leaves ſheathing, enſiform, the lower ones a hand in length, the upper ones much ſhorter; diſk ſmooth; edge cartilaginous and crenulate, ſcabrous; panicle oblong, conſiſting of fifteen or twenty flowers; peduncles capillary, looſe, flexuoſe, in threes, pairs or ſolitary, ſimple or ſometimes a little branched, growing thicker at the top; flowers drooping; calycine glume coloured at the baſe, outer corolline glume violet, inner becoming pale; bundles of villoſe hairs very white and ſhining; nectary and filaments white; antheræ yellow. Firſt obſerved at the Cape by Thunberg.

2. Ehrharta bulboſa, or bulbous ehrharta: culm undivided; panicle branched, many-flowered; outer corolla retuſe, awned. Lamarck confounds this with the foregoing ſpecies, from which it is very diſtinct.

3. Ehrharta longiflora, or long-flowered ehrharta: culm ſimple; panicle branched, many-flowered; outer corolla mucronate, tubercled, and hiſpid; flowers three-ſtamened. Obſerved at the Cape by Maſſon.

4. Ehrharta panicea, or panicled ehrharta: culm divided; panicle ſomewhat branched; flowers erect, two-ſtyled. Though the ſtyle appears to be ſingle at the baſe, yet it has two ſtigmas, as in the graſſes and oryza (rice), after which it ſhould be placed, ſince it has a great affinity with it. Sonnerat brought it from the Cape in the year 1776.

5. Ehrharta calycina, or calycined ehrharta: culm branched; panicle almoſt ſimple; calyx coloured equalling the corolla. Brought from the Cape by Sparrman.

EH'RICH (Groſs), a town of Germany, in the circle of Upper Saxony, and county of Schwartzburg: four miles weſt of Greuſſen.

EHR'NAU, a town of Germany, in the duchy of Stiria: ſix miles north of Knittelfeld.

EHRN'HAUSEN, a town of Germany, in the duchy of Stiria, at the conflux of the Salm and the Muehr: ten miles north of Mahrburg.

EHRN'SPRUNN, a town of Germany, in the archduchy of Auſtria: eight miles ſouth of Laab.

E'HUD [אחוד Heb. praiſing.] A judge of Iſrael. He was the ſon of Gera, a Benjamite, a man left-handed, who delivered Iſrael from the oppreſſion of Eglon king of Moab. *Judges* iii. 15, &c.

EI'A, a river of Ruſſia, which runs into the Sea of Azoph, at Eiſkoi.

EI'A, or EY, *ſ.* in our old writers, are uſed for an iſland. Hence the names of places ending in *ey*, denotes them to be iſlands. Thus, Ramſey, the iſle of rams; Sheppey, the iſle of ſheep, &c. *Eia* is alſo ſometimes uſed for water; and hence the names of places near waters or lakes terminate in *ey*.

To EJA'CULATE, *v. a.* [*ejaculor*, Lat.] To throw; to ſhoot; to dart out.—Being rooted ſo little way in the ſkin, nothing near ſo deeply as the quills of fowls, they are the more eaſily *ejaculated*. *Grew.*

The mighty magnet from the center darts
This ſtrong, though ſubtile force, through all the parts:
Its active rays, *ejaculated* thence,
Irradiate all the wide circumference. *Blackmore.*

EJACULA'TION, *ſ.* The act of darting or throwing out.—There ſeemeth to be acknowledged, in the act of envy, an *ejaculation* or irradiation of the eye. *Bacon.*—A ſhort prayer darted out occaſionally, without ſolemn retirement.—In your dreſſing let there be *ejaculation* fitted to the ſeveral actions of dreſſing; as at waſhing your hands, pray God to cleanſe your ſoul from ſin. *Taylor.*

EJA'CULATORY, *adj.* Suddenly darted out; uttered in ſhort ſentences.—The continuance of this poſture might incline to eaſe and drowſineſs; they uſed it rather upon ſome ſhort *ejaculatory* prayers, than in their larger devotions. *Duppa.*—Sudden; haſty.—We are not to value ourſelves upon the merit of *ejaculatory* repentances, that take us by fits and ſtarts. *L'Eſtrange.*

EI'BESWALD, a town of Germany, in the duchy of Stiria: ſixteen miles ſouth of Voitſberg.

EI'CETÆ, called alſo HEICETÆ, and HICETÆ, heretics of the ſeventh century, who made profeſſion of the monaſtic life.

EICH'ENBUHL, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: three miles ſouth-eaſt of Miltenberg.

EICH'HOLZ, a town of Germany, in the circle of

Upper

Upper Saxony, and principality of Anhalt Zerbſt: three miles ſouth-weſt of Zerbſt.

EICH'IGT, a town of Germany, in the circle of Upper Saxony, and circle of Erzgeburg: four miles ſouth of Erzgeburg.

EICH'MED, a town of Pruſſia, in the province of Natangen: ſix miles ſouth-ſouth-eaſt of Raſtenburg.

EICHS'FELD, or EISFELD, a country of Germany, in the circle of the Lower Rhine, bounded by Heſſe, Thuringia, Calenberg, and Grubenhagen, divided by mountains into Upper and Lower; the Upper is cold and mountainous, the Lower, flat, warm, and fertile, bearing corn, flax, and tobacco: the inhabitants of the Upper part are principally engaged in manufactures. The whole country belongs to the electorate of Mentz. The principal towns are Heiligenſtadt, Duderſtadt, and Stadtworbis. The contributions amount to 45,000 imperial crowns; the nobility pay 218 to each thouſand, the bailiwicks 500, the clergy 100, and the towns of Heiligenſtadt and Duderſtadt 182.

EICK'EL, a town of Germany, in the circle of Weſtphalia, and county of Mark: two miles ſouth-eaſt of Grimberg.

EI'DE, a town of Norway: thirty-ſix miles eaſt-ſouth-eaſt of Berghen.

EI'DER, a river which, in a great part of its courſe, divides the duchy of Sleſwick from the duchy of Holſtein, and runs into the German ocean twelve miles weſt-ſouth-weſt of Lunden.

EI'DER-DUCK. See ANAS.

EID'WALD, a town of Bohemia, in the circle of Leitmeritz: ſixteen miles weſt-north-weſt of Leitmeritz.

To EJE'CT, *v. a* [*ejicio, ejectum*, Lat.] To throw out; to caſt forth; to avoid.—Tears may ſpoil the eyes, but not waſh away the affliction; ſighs may exhauſt the man, but not *eject* the burthen. *South.*

Infernal lightning ſallies from his throat!
Ejected ſparks upon the billows float!
The heart, as ſaid, from its contracted cave,
On the left ſide *ejects* the bounding wave. *Blackmore.*

To throw out or expel from an office or poſſeſſion:

It was the force of conqueſt; force with force
Is well *ejected*, when the conquer'd can. *Milton.*

To expel; to drive away; to diſmiſs with hatred:

We are peremptory to diſpatch
This viperous traitor; to *eject* him hence. *Shakeſpeare.*

To caſt away; to reject.—Will any man ſay, that if the words whoring and drinking were by parliament *ejected* out of the Engliſh tongue, we ſhould all awake next morning chaſte and temperate. *Swift.*

EJEC'TION, *ſ.* [*ejectio*, Lat.] The act of caſting out; expulſion.—Theſe ſtories are founded on the *ejection* of the fallen angels from heaven. *Broome.*—[In phyſic.] The diſcharge of any thing by vomit, ſtool, or any other emunctory. *Quincy.*

EJEC'TION, *ſ.* in Scots law, the proceſs of turning out the poſſeſſor of any heritable ſubject, by force.

EJECTIO'NE CUSTO'DIÆ, *ſ.* [*ejectment de garde*, Fr.] A writ which lies againſt him that caſteth out the guardian from any land during the minority of the heir. *Reg. Orig.* 162. There are two other writs not unlike this; the one termed *raviſhment de gard*, and the other *droit de gard*. See the article GUARDIAN.

EJECT'MENT, *ſ.* in law, an action by which a perſon ouſted or amoved from the poſſeſſion of an eſtate for years, may recover that poſſeſſion; which action is now uſed as the general mode of trying diſputed titles to lands and tenements. A writ of *ejectione firmæ*, or action of treſpaſs in ejectment, lieth where lands or tenements are let for a term of years, and afterwards the leſſor, reverſioner, remainder-man, or any ſtranger, doth eject or ouſt the leſſee of his term. In this caſe he ſhall have his writ of ejection or ejectment, to call the defendant to anſwer for entering on the lands ſo demiſed to the plaintiff for a term that is not yet expired, and ejecting him. And by this writ the plaintiff ſhall recover back his term, or the remainder of it, with damages.

Since the diſuſe of real actions, this mixt proceeding is become the common method of trying the title to lands or tenements. The writ of covenant, for breach of the contract contained in the leaſe for years, was anciently the only ſpecific remedy for recovering againſt the leſſor a term from which he had ejected his leſſee, together with damages for the ouſter. But if the leſſee was ejected by a ſtranger claiming under a title ſuperior to that of the leſſor, or by a grantor of the reverſion, (who might at any time, by a common recovery, have deſtroyed the term,) though the leſſee might ſtill maintain an action of covenant againſt the leſſor, for non-performance of his contract or leaſe, yet he could not by any means recover the term itſelf. *F. N. B.* 145. If the ouſter was committed by a mere ſtranger, without any title to the land, the leſſor might, indeed, by a real action, recover poſſeſſion of the freehold, but the leſſee had no other remedy againſt the ejector but in damages, by a writ of *ejectione firmæ*, for the treſpaſs committed in ejecting him from his farm. But afterwards, when the courts of equity began to oblige the ejector to make a ſpecific reſtitution of the land to the party immediately injured, the courts of law alſo adopted the ſame method of doing complete juſtice; and, in the proſecution of a writ of ejectment, introduced a ſpecies of remedy not warranted by the original writ, nor prayed by the declaration; viz. a judgment to recover the term, and a writ of poſſeſſion thereupon. This method ſeems to have been ſettled as early as the reign of Edward IV. though it hath been ſaid to have firſt begun under Henry VII. becauſe it probably was then firſt applied to its preſent principal uſe, that of trying the title of the land. *Bro. Ab. F. N. B.* 220.

This remedy by ejectment is, in its origin, an action brought by one who hath a leaſe for years, to repair the injury done him by diſpoſſeſſion. In order, therefore, to convert it into a method of trying titles to the freehold, it is firſt neceſſary that the claimant do take poſſeſſion of the lands, to empower him to conſtitute a leſſee for years, that may be capable of receiving this injury of diſpoſſeſſion. For it would be an offence, called in our law *maintenance*, to convey a title to another, when the grantor is not in poſſeſſion of the land; and, indeed, it was doubted at firſt, whether this occaſional poſſeſſion, taken merely for the purpoſe of conveying the title, excuſed the leſſor from the legal guilt of maintenance. 1 *Ch. Rep. Ap.* 39. When, therefore, a perſon, who hath a right of entry into lands, determines to acquire that poſſeſſion, which is wrongfully withheld by the preſent tenant, he makes (as by law he may) a formal entry on the premiſes, and being ſo in the poſſeſſion of the ſoil, he there, upon the land, ſeals and delivers a leaſe for years to ſome third perſon or leſſee; and, having thus given him entry, leaves him in poſſeſſion of the premiſes. This leſſee is to ſtay upon the land, till the prior tenant, or he who had the previous poſſeſſion, enters thereon a-freſh and ouſts him; or till ſome other perſon (either by accident or by agreement beforehand) comes upon the land, and turns him out, or ejects him. For this injury the leſſee is entitled to his action of ejectment againſt the tenant; or his caſual ejector, whichever it was that ouſted him, to recover back his term and damages. But where this action is brought againſt ſuch a caſual ejector as is before mentioned, and not againſt the very tenant in poſſeſſion, the court will not ſuffer the tenant to loſe his poſſeſſion without an opportunity to defend it. Wherefore it is a ſtanding rule, that no plaintiff ſhall proceed in ejectment to recover lands againſt a caſual ejector, without notice given to the tenant in poſſeſſion, (if any there be,) and making him a defendant if he pleaſes. And, in order to maintain the action, the plaintiff muſt, in caſe of any defence, make out four points before the court; viz. title, leaſe, entry,

and ouſter. Firſt, he muſt ſhew a good title in his leſſor, which brings the matter of right entirely before the court; then, that the leſſor, being feiſed or poſſeſſed by virtue of ſuch title, did make him the leaſe for the preſent term; thirdly, that he, the leſſee, or plaintiff, did enter or take poſſeſſion in conſequence of ſuch leaſe; and, laſtly, that the defendant ouſted or ejected him. Whereupon he ſhall have judgment to recover his term and damages; and ſhall in conſequence have a writ of poſſeſſion, which the ſheriff is to execute, by delivering him the undiſturbed and peaceable poſſeſſion of his term.

This is the regular method of bringing an action of ejectment, in which the title of the leſſor comes collaterally and incidentally before the court, in order to ſhew the injury done to the leſſee by this ouſter. This method muſt be ſtill continued in due form and ſtrictneſs, (ſave only as to the notice to the tenant,) whenever the poſſeſſion is vacant, or there is no actual occupant of the premiſes; and alſo in ſome other caſes. But, as much trouble and formality were found to attend the actual making of the leaſe, entry, and ouſter, a new and more eaſy method of trying titles by writ of ejectment, where there is any actual tenant or occupier of the premiſes in diſpute, was invented by the lord chief juſtice Rolle. *Styl. Pract. Reg.* 108. This new method entirely depends upon a ſtring of legal fictions; no actual leaſe is made, no actual entry by the plaintiff, no actual ouſter by the defendant, but all are merely ideal, for the ſole purpoſe of trying the title. To this end, in the proceedings, a leaſe for a term of years is ſtated to have been made, by him who claims title, to the plaintiff who brings the action; as, by John Rogers to Richard Smith, which plaintiff ought to be ſome real perſon, and not merely an ideal fictitious one who hath no exiſtenee, as is frequently, though unwarrantably, practiſed. *6 Mod.* 309. It is alſo ſtated that Smith the leſſee entered; and that the defendant, William Stiles, who is called the caſual ejector, ouſted him; for which ouſter he brings this action. As ſoon as this action is brought, and the complaint fully ſtated in the declaration, Stiles, the caſual ejector, or defendant, ſends a written notice to the tenant in poſſeſſion of the lands, *e. g.* George Saunders, informing him of the action brought by Smith, and tranſmitting him a copy of the declaration; withal aſſuring him that he, Stiles, the defendant, has no title at all to the premiſes, and ſhall make no defence; and therefore adviſing the tenant to appear in court and defend his own title; otherwiſe he, the caſual ejector, will ſuffer judgment to be had againſt him; and thereby the actual tenant, Saunders, will inevitably be turned out of poſſeſſion. On receipt of this caution, if the tenant in poſſeſſion does not within a limited time apply to the court to be admitted a defendant in the ſtead of Stiles, he is ſuppoſed to have no right at all; and, upon judgment being had againſt Stiles, the caſual ejector, Saunders, the real tenant, will be turned out of poſſeſſion by the ſheriff.

But, if the tenant in poſſeſſion applies to be made a defendant, it is allowed him upon this condition, that he enter into a rule of court to confeſs, at the trial of the cauſe, three of the four requiſites for the maintenance of the plaintiff's action; viz. the leaſe of Rogers the leſſor, the entry of Smith the plaintiff, and his ouſter by Saunders himſelf, now made the defendant inſtead of Stiles; which requiſites being wholly fictitious, ſhould the defendant put the plaintiff to prove them, he muſt of courſe be non-ſuited for want of evidenee; but, by ſuch ſtipulated confeſſion of leaſe, entry, and ouſter, the trial will now ſtand upon the merits of the title only. This done, the declaration is altered by inſerting the name of George Saunders (the tenant) inſtead of William Stiles; and the cauſe goes down to trial under the name of Smith, (the plaintiff,) on the demiſe of Rogers (the leſſor) againſt Saunders the now defendant. And herein the leſſor of the plaintiff is bound to make out a clear title, otherwiſe his fictitious leſſee cannot obtain judgment to have poſſeſſion of the land for the term ſuppoſed to be granted. But, if the leſſor makes out his title in a ſatisfactory manner, then judgment and a writ of poſſeſſion ſhall go for Smith, the nominal plaintiff, who, by this trial, has proved the right of Rogers, his ſuppoſed leſſor.

Yet, to prevent fraudulent recoveries of the poſſeſſion, by colluſion with the tenant of the land, all tenants are obliged by 11 Geo. II. c. 19. on pain of forfeiting three years rent, to give notice to their landlords, when they are ſerved with any declaration in ejectment: and any landlord may, by leave of the court, be made a co-defendant to the action, in caſe the tenant himſelf appears to it, or, if he makes default, though judgment muſt be then ſigned againſt the caſual ejector, yet execution ſhall be ſtayed, in caſe the landlord applies to be made a defendant, and enters into the common rule; a right which indeed the landlord had, long before the proviſion of this ſtatute. (*Salk.* 257. *Burr.* 1301.) in like manner as (previous to the ſtatute of Weſtminſter, 2. c. 3.) if in a real action the tenant of the freehold made default, the remainder-man, or reverſioner, had a right to come in and defend the poſſeſſion, leſt, if judgment were had againſt the tenant, the eſtate of thoſe behind ſhould be turned to a naked right. *Bract. lib.* 5. c. 10. But a tenant to a mortgagor who does not give him notice of an ejectment brought by the mortgagee to enforce an attornment, is not liable to the penalties of 11 Geo. II.

In ejectment for a chapel, the parſon can only defend for a right to enter and perform divine ſervice. *Str.* 914. Notwithſtanding 1 *Salk.* 250, no man is to be admitted tenant or defendant in ejectment by the common rule, unleſs he hath been in poſſeſſion or received rent, and not a mere ſtranger. *Comb.* 209. He who claims title, ſhall be joined as a defendant though the plaintiff oppoſes it. 1 *Salk.* 256. And therefore even the wife of the leſſor. 257. The court permitted an heir who had never been in poſſeſſion, to come in and defend the ejectment. The father under whom he claimed, died juſt after having firſt obtained a ſimilar rule. 4 *Term Rep.* 122. So a mortgagee. *Comberb.* 399.

But if the new defendants, whether landlord, or tenant, or both, after entering into the common rule, fail to appear at the trial, and to confeſs leaſe, entry, and ouſter, the plaintiff Smith muſt indeed be there nonſuited, for want of proving thoſe requiſites; but judgment will in the end be entered againſt the caſual ejector Stiles; for the condition on which Saunders, the tenant, or his landlord, was admitted a defendant, is broken, and therefore the plaintiff is put again in the ſame ſituation as if he never had appeared at all, the conſequence of which would have been that judgment would have been entered for the plaintiff, and the ſheriff, by virtue of a writ for that purpoſe, would have turned out the tenant Saunders, and delivered poſſeſſion to Smith the plaintiff. The ſame proceſs therefore as would have been had, provided no conditional rule had ever been made, muſt now be purſued as ſoon as the condition is broken.

The damages recovered in theſe actions, though formerly their only intent, are now uſually (ſince the title has been conſidered as the principal queſtion) merely nominal, as *one ſhilling*. In order therefore to complete the remedy, when the poſſeſſion has been long detained from him that had the right to it, an action of treſpaſs alſo lies, after a recovery in ejectment, to recover the meſne profits which the tenant in poſſeſſion has wrongfully received. Which action may be brought in the name of either the nominal plaintiff in the ejectment, or his leſſor, againſt the tenant in poſſeſſion: whether he be made party to the ejectment, or ſuffers judgment to go by default. In this caſe the judgment in ejectment is concluſive evidenee againſt the defendant, for all profits which have accrued ſince the date of the demiſe ſtated in the former declaration of the plaintiff; but if the plaintiff ſues for any anteeedent profits, the defendant may make a new defence. 4 *Burr.* 668.

Such

Such is the modern way of obliquely bringing in queſtion the title to lands and tenements, in order to try it in this collateral manner; a method which is now univerſally adopted in almoſt every caſe. It is founded on the ſame principles as the ancient writs of aſſize, being calculated to try the mere poſſeſſory title to an eſtate; and hath ſucceeded to thoſe real actions, as being infinitely more convenient for attaining the ends of juſtice, becauſe the form of the proceeding being entirely fictitious, it is wholly in the power of the court to direct the application of that fiction, ſo as to prevent fraud and chicane, and eviſcerate the very truth of the title. The writ of ejectment and its nominal parties (as was reſolved by all the judges) are judicially to be conſidered as the fictitious form of an action, really brought by the leſſor of the plaintiff againſt the tenant in poſſeſſion, invented, under the controul and power of the court, for the advancement of juſtice in many reſpects, and to force the parties to go to trial on the merits, without being entangled in the nicety of pleadings on either ſide.

But a writ of ejectment is not an adequate means to try the title of all eſtates, for on thoſe things, whereon an entry cannot in fact be made, no entry ſhall be ſuppoſed by any fiction of the parties. Therefore an ejectment will not lie of an advowſon, a rent, a common, or other incorporeal hereditaments. *Brownl.* 129. Except for tithes in the hands of lay appropriators, by the expreſs purview of 32 Hen. VIII. c. 7. which doctrine hath ſince been extended by analogy to tithes in the hands of the clergy. 2 *Ld. Raym.* 789. Nor will it lie in ſuch caſes, where the entry of him that hath right is taken away by deſcent, diſcontinuance, twenty years diſpoſſeſſion, or otherwiſe.

Ejectment ought to be brought for a thing that is certain; and if it be of a manor, the manor of A. with the appurtenances; if of a rectory, the rectory of B. &c. And ſo many meſſuages, cottages, acres of arable land, meadow, with the appurtenances in the pariſh of, &c. Ejectment lies of a church, as of an houſe called the pariſh church of, &c. And a church is a meſſuage, by which name it may be recovered; and the declaration is to be ſerved on the parſon who performs divine ſervice. 11 *Rep.* 25. 1 *Salk.* 256. It lies *de uno meſſuagio ſive burgagio*; but not *de uno meſſuagio ſive tenemento*, unleſs it have a *vocat'* A. &c. to make it good, becauſe of the uncertainty of the word tenement. 1 *Sid.* 295. But for a meſſuage *and* tenement hath been allowed. 1 *Term Rep.* 11. So indeed for a meſſuage *or* tenement. 3 *Wilſ.* 23. It will lie for a moiety, or third part of a manor or meſſuage, &c. And for a chamber or room of a houſe well ſet forth. 3 *Leon.* 210. It lieth *de domo*, which hath convenient certainty for the ſheriff to deliver poſſeſſion, &c. *Cro. Jac.* 654. It lies of a cottage or curtilage; of a coal-mine, &c. but not of a common, piſcary, &c. *Cro. Jac.* 150. For underwood it lies, though a *præcipe* doth not. 2 *Roll. Rep.* 482. But for *uno clauſo*, or *una pecia terræ*, &c. without certainty of the acres, and their nature, it doth not lie. 4 *Mod.* 1. It lieth of a cloſe, containing three acres of paſture, &c. Alſo of ſo many acres of land covered with water; though not *de aquæ curſu*. 1 *Brownl.* 242. It lies for a prebendal ſtall, after collation to it. 1 *Wilſ.* 14.

In this action the law requires, that the thing demanded be ſo particularly ſpecified, that the ſheriff may certainly know what to give the poſſeſſion of, if the plaintiff ſhould recover; for the judgment is in order to execution; and the judgment would be vain, if execution could not be had of the thing ſpecifically demanded; but in this action the judges did not confine themſelves to thoſe rules which govern the *præcipe*, but allowed ſome things to be recovered in this action, which could not be demanded in a *præcipe*; becauſe, ſince the eſtabliſhment of that real action, many things have been added and improved by art, and acquired new appellations that are perfectly underſtood now by the law, which are not found in the ancient law books; and as men began to contract by new names which were not known in the old law, ſo it was reaſonable to ſuffer the remedy to follow the nature of ſuch contracts. 2 *Ld. Raym.* 1470. 1 *Burr.* 629.

An ejectment is a poſſeſſory remedy, and only competent where the leſſor of the plaintiff may enter; therefore it is always neceſſary for the plaintiff to ſhew that his leſſor had a right to enter, by proving a poſſeſſion within twenty years, or accounting for the want of it, under ſome exceptions allowed by the ſtatute; twenty years' adverſe poſſeſſion, is a poſitive title to the defendant; it is not a bar to the action or remedy for the plaintiff only, but takes away his right of poſſeſſion. 1 *Burr.* 119. Every plaintiff muſt ſhew a right of poſſeſſion, as well as of property, and therefore the defendant needs not plead the ſtatute, as in the caſe of actions.

A judgment in ejectment is the recovery of the poſſeſſion, (not of the ſeiſin or freehold;) without prejudice to the right, as it may afterwards appear between the parties. He who enters under it in truth and ſubſtance, can only be poſſeſſed according to right, *prout lex poſtulat.* If the leſſor have a freehold, he is in as a freeholder: if he has a chattel intereſt he is in as a termor; and in reſpect of the freehold, his poſſeſſion enures according to right. If he has no title, he is in as a treſpaſſer; and, without any re-entry by the true owner, is liable to account for the profits. 1 *Burr.* 114.

This action of ejectment is rendered a very eaſy and expeditious remedy to landlords *whoſe tenants are in arrear*, by 4 Geo. II. c. 28, which enacts that every landlord, who hath by his leaſe a right of re-entry in caſe of nonpayment of rent, when half a year's rent is due, and no ſufficient diſtreſs is to be had, may ſerve a declaration in ejectment on his tenant, or fix the ſame upon ſome notorious part of the premiſes, which will be valid, without any formal re-entry or previous demand of rent. And a recovery in ſuch ejectment ſhall be final and concluſive, both in law and equity, unleſs the rent and all coſts be paid or tendered within ſix calendar months afterwards. The true conſtruction upon this act is, to take off the landlord the inconvenience of his continuing always liable to an uncertainty of poſſeſſion; (from its remaining in the power of the tenant to offer him a compenſation at any time, in order to found an application for relief in equity;) and to limit and to confine the tenant to ſix calendar months after execution granted, for his doing this; or elſe that the landlord ſhall from thenceforth hold the demiſed premiſes diſcharged from the leaſe. 1 *Burr.* 619. As to the proviſion of 11 Geo. II. c. 19. in caſes of tenants at rack-rent being one year in arrear and deſerting the premiſes, two juſtices of peace may in this caſe put the landlord in poſſeſſion. See the article RENT.

Where an ejectment is brought againſt a tenant, for the purpoſe of turning him out of his houſe, farm, &c. and the tenant actually holds the premiſes of the leſſor of the plaintiff, it is ſometimes neceſſary to give him notice to quit poſſeſſion, in order to maintain an ejectment. Here we may obſerve, that demiſes, where no certain term is mentioned, are held to be tenancies from year to year, which neither party can determine, without reaſonable notice to the other. This notice is, in moſt counties, ſix months; and it muſt, in all ſuch caſes, expire at that part of the year when the tenancy commenced; and therefore it hath been holden, that half a year's notice to quit poſſeſſion muſt be given to ſuch tenant, before the end of which time the landlord cannot maintain an ejectment; unleſs the tenant has attorned to ſome other perſon, or done ſome act diſclaiming to hold as tenant; in which caſe no notice is neceſſary. And the ſame law will apply to the executor of ſuch a tenant. 3 *Wilſ.* 25. 1 *Term Rep.* 160. But after the expiration of a leaſe for a certain term, the tenant continuing in poſſeſſion is deemed a treſpaſſer; and therefore an ejectment which is an action of treſpaſs may be brought without any notice to quit.

Where there is a tenant in poſſeſſion, in order to proceed againſt him, prepare a declaration, the copy of which,

which, upon ſtamp, you ſerve the tenant with: if there be more than one tenant, each muſt be ſerved with a copy; but if the man is not at home, his wife will do, provided ſhe be ſerved on the premiſes, and ſo ſworn to; this is neceſſary both in town and country cauſes. At the time of ſervice, in all caſes it is requiſite to read over or explain the notice at the foot of the declaration to the perſon ſerved. The tenant's ſon, daughter, or ſervant, he being out of the way, muſt not be ſerved, unleſs it appear to the court, that ſuch declaration and notice came to his hands, in which caſe it has been held a good delivery; but if the tenant purpoſely keep out of the way to avoid being ſerved, the court on affidavit will grant a rule to ſhew cauſe why that ſhould not be deemed good ſervice. The declaration muſt be ſerved before the eſſoign-day of every term, either in town or country, and the notice muſt be made to appear in the next term after delivery: but the delivery on a Sunday, or on the eſſoign-day of that term wherein the defendant is to appear, will not do.

In ejectment, where there are divers defendants, and the freeholds are ſeveral, no defendant may defend for more than is in his own poſſeſſion; and the plaintiff may take judgment againſt his ejector for what remains. 1 *Vent.* 355. If there be two defendants in ejectment, and one of them appears and confeſſes leaſe, entry, and ouſter, but the other does not appear, in that caſe the plaintiff may enter a *non-pros* or *retraxit* againſt him, and go to trial, and have judgment againſt the other defendant. 1 *Lord Raym.* 717. Alſo if an ejectment be brought againſt two perſons, and after iſſue joined, one dies, and a *venire* is awarded as to the two defendants, and a verdict againſt two; here, upon ſuggeſtion of the death of one of them upon the roll, judgment ſhall be given for the plaintiff againſt the other for the whole: for it is ſaid this action is grounded upon torts, which are ſeveral in their nature, and one may be found guilty and the other acquitted.

As the plaintiff in ejectment is a mere nominal perſon, and a truſtee for the leſſor; if he releaſe the action, the court may ſet aſide the releaſe, and he ſhall be committed for a contempt; ſo likewiſe if he releaſe an action brought in his name for the meſne profits. 1 *Salk.* 260. If a man is made plaintiff in ejectment without his knowledge, and the defendant appearing, the plaintiff thereupon becomes nonſuit, after which execution is ſued out againſt him; if it appears by his oath that he was made plaintiff without his knowledge, or order, he ſhall be diſcharged. 1 *Lil.* 500.

If there be a verdict and judgment againſt the plaintiff, he may bring another action of treſpaſs and ejectment for the land, it being only to recover the poſſeſſion, &c. wherein judgment is never final; for it is not like a writ of right, &c. where the title alone is tried. *Wood's Inſt.* 547. The reaſon why an ejectment is not or cannot be *final*, ſeems to be this. That it is impoſſible from the ſtructure of the record in this action, to plead a former, in bar of another, ejectment brought. Becauſe, 1. The plaintiff and defendant are nominal, and exiſt in moſt caſes on record only; and conſequently may be changed in a new action. But the identity both of plaintiff and defendant muſt be averred in pleading a former action in bar. 2. The term demiſed may be laid many different ways. An ejectment however, though in its nature not *final at law*, is capable of being made ſo in *equity*: and the court of chancery will on proper grounds grant a perpetual injunction; and not permit the poſſeſſion of lands to be diſturbed by a vain inceſſant litigation of the ſame queſtion. See 2 *Eq. Ab.* 171. c. 1. 1 *Bro. P. C.* 266. 2 *Stra.* 404.

EIF'FEL, a ſmall country of Germany, ſituated between the duchy of Juliers, the electorate of Treves, the duchy of Luxemburg, and the electorate of Cologne. It belongs to the duke of Arenberg, and ſeveral other princes.

EI'GALACH, a ſmall Ruſſian iſland, in the Erozen Sea. Lat. 78. 25. N. lon. 133. E. Ferro.

EIGH, *interj.* An expreſſion of ſudden delight.

EIGHT, *adj.* [eahta, Sax. *ahta*, Goth. *acht*, Scot.] Twice four. A word of number.—This iſland contains *eight* ſcore and *eight* miles in circuit. *Sandy.*

EIGHT, *ſ.* [more properly EYOTT, which ſee.] A little iſland.—Some do alſo plant oſiers on their *eights*, like quickſetts. *Evelyn.*

EIGHT AL'NEY, a little iſland in Glouceſterſhire, where Edmund king of England, and Canutus king of the Danes, in a ſingle combat tried their right to the kingdom.

EIGHTH, *adj.* Next in order to the ſeventh; the ordinal of eight.—In the *eighth* month ſhould be the reign of Saturn. *Bacon.*

I ſtay reluctant ſeven continued years,
And water her ambroſial couch with tears;
The *eighth* ſhe voluntary moves to part,
Or urg'd by Jove, or her own changeful heart. *Pope.*

EIGHTEE'N, *adj.* Twice nine.—If men naturally lived but twenty years, we ſhould be ſatisfied if they died about *eighteen*; and yet *eighteen* years now are as long as *eighteen* years would be then. *Taylor.*

EIGHTEEN'TH, *adj.* The next in order to the ſeventeenth; twice ninth.—In the *eighteenth* year of Jeroboam died Abijam. 1 *Kings.*

EIGHT'FOLD, *adj.* Eight times the number or quantity.

EIGHTH'LY, *adv.* In the eighth place.—*Eighthly*, living creatures have voluntary motion, which plants have not. *Bacon.*

EIGH'TIETH, *adj.* The next in order to the ſeventy-ninth; eighth tenth.—Some balances are ſo exact as to be ſenſibly turned with the *eightieth* part of a grain. *Wilkins.*

EIGHT'SCORE, *adj.* Eight times twenty; an hundred and ſixty:

What! keep a week away? ſeven days and nights?
Eightſcore eight hours? and lovers' abſent hours,
More tedious than the dial *eightſcore* times?
Oh weary reckoning! *Shakeſpeare.*

EIGH'TY, *adj.* Eight times ten; fourſcore:

Eighty odd years of ſorrow have I ſeen,
And each hour's joy wreck'd with a week of teen. *Shakeſp.*

EIGNE, *adj.* [*aiſne*, Fr.] In law denotes the eldeſt or firſt born. Here it ſignifies unalienable, as being entailed.—It happeneth not ſeldom, that, to avoid the yearly oath, for averment of the continuance of ſome eſtate for life, which is *eigne*, and not ſubject to forfeiture for the alienation that cometh after it, the party will offer to ſue for a pardon uncompelled before the time; in all which, ſome mitigation of the uttermoſt value may well and worthily be offered. *Bacon.*

EILD, *ſ.* [eld, Sax.] Age in its general meaning:

His crown, and me (poor orphan) left alone
My uncle govern'd in my tender *eild*. *Fairfax.*

EILE'MA, *ſ.* [from ειλεω, to involve.] A painful twiſting of the inteſtines, from flatulence. Alſo a membrane or covering.

EI'LENBURG, or EULENBURG, a town of Germany, in the circle of Upper Saxony, and circle of Leipſic: twelve miles north-eaſt of Leipſic; thirty-ſix miles weſt-north-weſt of Meiſſen.

EIME'O, or EIMEEO, one of the Society iſlands, in the South Pacific Ocean; almoſt wholly ſurrounded with rocks: four leagues weſt from the north-weſt part of Otaheita.

EI'MONT, a river of England, which runs into the Eden a little below Penrith.

EI'NABI, a town of Aſiatic Turkey, in the province of Natolia: thirty-ſix miles north of Degnizlu.

EIN'BECK, or EIMBECK, a town of Germany, in the circle of Lower Saxony, and principality of Grubenhagen, on the Ilmen, encloſed with walls, and defended with redoubts,

doubts, towers, &c. and containing 830 houſes. It is the chief manufacturing town in the whole principality: thirty miles ſouth-ſouth-weſt of Hildeſheim, and forty-eight miles ſouth-ſouth-weſt of Brunſwick.

EIN'FIDEL, a town of Bohemia, in the circle of Pilſen: eight miles weſt of Teuſing.

EINIEH', a town of Aſiatic Turkey, in the province of Natolia: forty-four miles ſouth-weſt of Artaki.

EINSID'LEN, a town and abbey of Swiſſerland, in the canton of Schweitz: fifteen miles eaſt of Zug.

EIN'VILLE AU JARD, a town of France, in the department of the Meurte, and chief place of a canton, in the diſtrict of Luneville: four leagues eaſt of Nancy, and one and a half north of Luneville.

EI'SEL, *ſ.* [eoſil, Sax.] Vinegar; verjuice; any acid. *An old word:*

Caſt in thy mind
How thou reſembleſt Chriſt, as with ſowre poiſon,
If thou paine thy taſte; remember therewithall,
How Chriſt for thee taſted *eiſel* and gall. *Sir T. More.*

EI'SENACH, a town of Germany, in the circle of Upper Saxony, and capital of a principality of the ſame name, in the circle of Thuringia, on the Neſſe, where the repreſentatives of the ſtate aſſemble. It has a college, a ſeminary for divinity, and an orphan houſe: forty miles eaſt of Weimar, and twenty-ſix weſt-ſouth-weſt of Erfurt. Lat. 50. 46. N. lon. 27. 57. E. Ferro.

EI'SENACH, a principality of Germany, in Thuringia, and circle of Upper Saxony, ſituated on the confines of Heſſe. It is mountainous, and hardly produces corn enough for the inhabitants. Some wine is made, but of a very indifferent ſort. It has ſome mines of copper, iron, vitriol, and alum, with ſome ſalt ſprings. It gives a vote to the duke of Saxe-Weimar, in the diets and aſſemblies of the circle. The tax is fifty-eight rixdollars and ſeventeen kruitzers. Eiſenach is the capital.

EI'SENBERG, a town of Germany, in the circle of the Upper Rhine, and county of Waldeck, with a caſtle: three miles ſouth-weſt of Corbach.

EI'SENBERG, a town of Germany, in the circle of Upper Saxony, and marggraviate of Meiſſen: eight miles north of Dreſden.

EI'SENBURG, a town of Germany, in the circle of Upper Saxony, and principality of Saxe-Gotha: twenty miles weſt of Altenburg, and thirty ſouth-ſouth-weſt of Leipſic.

EI'SENHARTZ, a town of Germany, in the duchy of Stiria; enriched by iron mines diſcovered in 712: ten miles north of Leoben.

EI'SENSTADT, a town of Bohemia, in the circle of Konigingratz: three miles north-north-eaſt of Gitſchin.

EI'SENSTADT, a town of Hungary: eight miles north of Edenburg, and ſixteen ſouth of Vienna.

EIS'FELD, a town of Germany, in the circle of Upper Saxony, and principality of Cobourg, on the Werra: eight miles eaſt of Hildburghauſen.

EIS'GARN, a town of Germany, in the archduchy of Auſtria: eight miles weſt-north-weſt of Bohmiſch Waidhofen.

EI'SKOI, a town of Ruſſia, in the government of Caucaſus, ſituated at the mouth of the river Eia, on the eaſt coaſt of the Sea of Azoph: fifty miles ſouth-weſt of Azoph. Lat. 46. 30. N. lon. 56. E. Ferro.

EI'SLEBEN, a town of Germany, in the electorate of Saxony, and county of Mansfeld; once the capital of a county of the ſame name. It contains three churches, and about 700 houſes. Martin Luther, the celebrated reformer, was born and died in this town: twelve miles eaſt of Mansfeld, and twelve weſt of Hall.

EISS, a village and barony of Germany, in the circle of Weſtphalia: ſix miles eaſt-north-eaſt of Aix-la-Chapelle.

EISS'DORF, or EYSZDORF, a town of Germany, in the circle of Upper Saxony, belonging to the biſhopric of Merſeburg: four miles eaſt-ſouth-eaſt of Lutzen.

EI'THER, *pron.* [æg'ðer, Sax. *auther*, Scott.] Which ſoever of the two; whether one or the other:

So like in arms thoſe champions were,
As they had been a very pair;
So that a man would almoſt ſwear,
That *either* had been *either*. *Drayton.*

Each; both.—In the proceſs of natural beings, there ſeem ſome to be creatures placed, as it were, on the confines of ſeveral provinces, and participating ſomething of *either*. *Hale.*

Sev'n times the ſun has *either* tropic view'd,
The Winter baniſh'd, and the Spring renew'd. *Dryden.*

It is uſed ſometimes of more than two; any one of a certain number. Any of an indeterminate number, as in the following paſſage.—Henry VIII. Francis I. and Charles V. were ſo provident, as ſcarce a palm of ground could be gotten by *either* of the three, but that the other two would ſet the balance of Europe upright again. *Bacon.*

EI'THER, *adv.* A diſtributive adverb, anſwered by *or*; either the one *or*.—*Either* your brethren have miſerably deceived us, *or* power confers virtue. *Swift to Pope.*

What perils ſhall we find,
If *either* place, *or* time, *or* other courſe,
Cauſe us to alter th' order now aſſign'd? *Daniel.*

EI'THON, or YTHON, a river of Scotland, which runs into the German Sea: twenty-ſix miles north of Aberdeen.

EI'TIAT, a town of Africa, in the empire of Morocco, and province of Tedla, defended with walls, and containing about 3000 inhabitants.

EJULA'TION, *ſ.* [*ejulatio*, Lat.] Outcry; lamentation; moaning: wailing.—Inſtead of hymns and praiſes, he breaks out into *ejulations* and effeminate wailings. *Government of the Tongue.*

With diſmal groans
And *ejulation*, in the pangs of death,
Some call for aid. *Philips.*

EJURA'TION, *ſ.* [Lat.] Renouncing or reſigning one's place. *Bailey.*

E'KA, a town of Sweden, in the province of Smaland: eleven miles north of Wexio.

EKANFANO'KA. See OUAQUAPHENOGAW.

EKAN'GA, a river of Ruſſia, which runs into th Frozen Sea, 140 miles eaſt of Kola.

EKAR'MA, one of the ſmaller Kurule iſlands, in the North Pacific Ocean. Lat. 49. 30. N. lon. 172. 15. E. Ferro.

EKAS'TROV, a town of Ruſſia, in the government of Archangel: eighty miles ſouth of Kola.

EKA'TERINGBURG, a town of Ruſſia, and capital of a province of the ſame name, in the government of Perm: 148 miles ſouth-eaſt of Perm, and 960 eaſt-ſouth-eaſt of Peterſburg. Lat. 56. 45. N. lon. 78. E. Ferro.

EKA'TERINGBURG, a province of Ruſſia, in the government of Perm, about 360 miles long, and from 100 to 160 broad: the capital is of the ſame name.

EKATERININSKAI'A, a bay of the North Sea, in Ruſſian Lapland, near Kola. Lat. 68. 50. N. lon. 50. 10. E. Ferro.

EKATERINOGRAD', a town of Ruſſia, in the government of Caucaſus, on the Malva: 260 miles ſouth-eaſt of Azoph, and 1080 ſouth-ſouth-eaſt of Peterſburg. Lat. 44. 15. N. lon. 61. 24. E. Ferro.

EKATERINOSLAV', a city of Ruſſia, and capital of a government of the ſame name: 164 miles north-eaſt of Otchakov, and 728 ſouth-ſouth-eaſt of Peterſburg. Lat. 48. 15. N. lon. 52. 60. E. Ferro.

EKATERINOSLAV', a government of Ruſſia, bounded on the weſt by the dominions of Turkey, on the north-weſt by the government of Kiov, on the north by the government of Charkov, on the eaſt by the country of the

Cofacs, and on the fouth by the Black Sea; divided into two provinces, Ekaterinoflavfkoi and Taurida. This government contains the greateft part of that territory which was wreſted by the late empreſs from the Turks, and compriſes New Ruſſia, the former government of Azoph, and Crim Tartary.

EKATERINOSLAV'SKOI, a province of Ruſſia, in the government of Ekaterinoſlav, comprehending what has formerly been called *Budziac Tartary*, and the *Ukraine*, now a part of the government of Ekaterinoſlav.

EKE, *adv.* [eac, Sax. *ook*, Dut.] Alſo; likewiſe; beſide; moreover:

If any ſtrength we have, it is to ill;
But all the good is God's, both power and *eke* will. *Spenſer.*

To EKE, *v. a.* [eacan, Sax.] To increaſe:

The little ſtrength that I have, I would it were with you.
—And mine to *eke* out her's. *Shakeſpeare.*

To ſupply; to fill up deficiencies:

Your ornaments hung all,
On ſome parch'd dog-hole *ek'd* with ends of wall. *Pope.*

To protract; to lengthen:

I ſpeak too long; but 'tis to piece the time,
To *eke* it, and to draw it out in length,
To ſtay you from election. *Shakeſpeare.*

To ſpin out by uſeleſs additions. [In this ſenſe it ſeems borrowed from the uſe of our old poets, who put *eke* into their lines when they wanted a ſyllable.]—Euſden *ekes* out Blackmore's endleſs line. *Pope.*

EKEBER'GIA, *ſ.* in botany, a genus of the claſs decandria, order monogynia, (monadelphia, *Retz.*) natural order of trihilatæ, (meliæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, bell-ſhaped, tomentoſe, four-parted; diviſions ovate, obtuſe. Corolla: petals four, oblong, obtuſe, tomentoſe on the outſide, a little longer than the calyx; nectary, a ring ſurrounding the baſe of the germ. Stamina: filaments ten, very ſhort, pubeſcent; antheræ ovate, acute, upright. Piſtillum: germ ſuperior; ſtyle cylindric, very ſhort; ſtigma capitate. Pericarpium: a globular berry. Seeds: five, oblong.—*Eſſential Character.* Calyx, four-parted; petals, four; nectary, like a garland ſurrounding the germ; berry containing five oblong ſeeds.

Ekebergia capenſis, a ſingle ſpecies; it is a tree, with abruptly or unequally pinnate leaves, the common petiole flatted; the flowers panicled and axillary.

EKEL'SBEKE, a town of France, in the department of the North, and chief place of a canton, in the diſtrict of Bergues: three leagues ſouth of Dunkirk.

EKE'NAS, a ſea-port town of Sweden, in the province of Nyland, on the north coaſt of the Gulf of Finland; the harbour is not good: fifty miles ſouth-eaſt of Abo.

EKER'DER, a town of Aſiatic Turkey, in the province of Natolia: ſixteen miles eaſt of Iſbarteh.

EKE'SIO, a town of Sweden, in the province of Smaland: ſixty miles north-weſt of Calmar.

E'KIE, a town of Aſia, in Thibet: fifty-five miles ſouth of Toſon Hotun.

EK'KI TEK'KI, a town of Africa, in the country of Commendo.

EK'MIN. See ACHMIM.

EK'RAD, a town of Egypt: ten miles ſouth-eaſt of Monfalout.

E'KREBEL, the name of a place ſaid to be ſituated near Chuſi, upon the brook Mochmuz; where, in the days of Judith, part of the combined armies of the Edomites and Ammonites encamped. *Judith*, vii. 18.

E'KRON, [Heb. barrenneſs.] A province of the land of the Philiſtines, and one of the five lordſhips of that nation; *Joſh.* xiii. 3. alſo the name of its principal city. We find, by comparing Judges, i. 18. Joſhua, xv. 45. and xix. 43. that this province, together with its towns and villages, were conquered by, and reckoned with, the tribe of Judah, and the city of Ekron aſſigned to the tribe of Dan. Yet, notwithſtanding, in the days of Samuel, we again find it in the hands of the Philiſtines, and ſoon afterwards again ceded to the Iſraelites, 1 *Sam.* vii. 13. Here the ark of God, taken from the Iſraelites, was brought previous to its departure for Iſrael; and here alſo was the oracle of Baal-zebub, to which Ahaziah king of Iſrael ſent to enquire concerning his recovery. 2 *Kings*, i. In the valley of Ekron the children of Iſrael and the men of Judah took up arms, and purſued the Philiſtines to the gates of the city.

E'KRONITE, a native or an inhabitant of Ekron.

E'KSAS, a town of Egypt: twenty-one miles ſouth of Cairo.

E'KSENIDE, a town of Aſiatic Turkey, in the province of Natolia: eighty-four miles ſouth of Degnizlu. Lat. 36. 27. N. lon. 46. 45. E. Ferro.

EL-A'RISH, a town of Syria, on the coaſt of the Mediterranean, ſituated about two miles from the ſea It was taken by the French army under Bonaparte, in 1799, who gave orders for it to be deſtroyed; and it is now in ruins. Dr. Wittman, who viſited this place in 1801, obſerved that the French had alſo cut down nearly the whole plantation of date-trees, which at once ornamented and enriched the ſpot, and produced food to the inhabitants. The Turkiſh ſhips of war, with an army deſtined for Egypt, were anchored off the port.

EL-BETH'EL, [Heb. the God of Bethel.] A name given by the patriarch Jacob to an altar erected by him in Bethel, on his ſecond viſit to that place. *Gen.* xxxv. 7.

EL-ELO'HE-ISRAEL, [Heb. God the God of Iſrael.] The name of an altar erected by the patriarch Jacob, at his firſt ſettlement in Canaan. *Gen.* xxxiii. 20.

EL-PA'RAN, or plain of Paran, ſituated in Arabia Petræa, near the wilderneſs of Paran. *Gen.* xiv. 6.

E'LA CAI'LI, *ſ.* in botany. See EUPHORBIA.

EL'ABACH, a river of Germany, which runs into the Elbe, near Konigſtein, in the marggraviate of Meiſſen.

To ELA'BORATE, *v. a.* [*elaboro*, Lat.] To produce with labour.—They in full joy *elaborate* a ſigh. *Young.*—To heighten and improve by ſucceſſive endeavours or operations.—The ſap is diverſified, and ſtill more *elaborated* and exalted, as it circulates through the veſſels of the plant. *Arbuthnot.*

ELA'BORATE, *adj.* [*elaboratus*, Lat.] Finiſhed with great diligence; performed with great labour.—Formalities of extraordinary zeal and piety are never more ſtudied and *elaborate* than when politicians moſt agitate deſperate deſigns. *King Charles.*

ELA'BORATELY, *adv.* Laboriouſly; diligently; with great ſtudy or labour.—Some coloured powders, which painters uſe, may have their colours a little changed by being very *elaborately* and finely ground. *Newton.*

ELABORA'TION, *ſ.* Improvement by ſucceſſive operations.—To what purpoſe is there ſuch an apparatus of veſſels for the *elaboration* of the ſperm and eggs; ſuch a tedious proceſs of generation and nutrition? *Ray.*

ELABU'GA, a town of Ruſſia, in the government of Viatka, on the Biclaia: 156 miles ſouth of Viatka.

To ELA'CERATE, *v. a.* [*elacerare*, Lat.] To tear in pieces. *Bailey.*

ELÆACH'NUS BURM. See ELÆAGNUS.

ELÆAG'NUS, *ſ.* [ελαιαγνος of Theophraſtus; from ελαια, the olive, and αγνος, chaſte; or a ſhrub ſo called from its ſuppoſed quality of preſerving chaſtity.] The OLEASTER; in botany, a genus of the claſs tetrandria, order monogynia, natural order elæagni, *Juſſ.* The generic characters are—Calyx: perianthium one-leafed, four-cleft, ſuperior, ſtraight, bell-form, outwardly ſcabrous, inwardly coloured, deciduous. Corolla: none. Stamina: filaments four, very ſhort, inſerted into the calyx below the diviſions; antheræ oblong, incumbent. Piſtillum: germ roundiſh, inferior; ſtyle ſimple, a little

ſhorter than the calyx: ſtigma ſimple. Pericarpium: drupe ovate, obtuſe, ſmooth, with a dotted tip. Seed: not oblong, obtuſe.—*Eſſential Character.* Corolla, none; calyx, four-cleft, bell-form, ſuperior; drupe below the calyx.

Species. 1. Elæagnus auguſtifolia, or narrow-leaved oleaſter: leaves lanceolate.- A tree branching from the bottom, growing ſometimes to the height of three fathoms, with a trunk the thickneſs of a man's arm or thigh, elegant in its appearance, eſpecially from the ſilvery brightneſs of the leaves. Bark ſmooth, brown; wood pale, prettily veined with grey and brown, but not hard; branches and branchlets ſlender, frequent, alternate, ſmooth, unarmed, or having thorns, eſpecially in young trees; leaves petioled, in the more northern parts lanceolate, in the more ſouthern broader, rather obtuſe, and larger; ſilvery white underneath, on their upper ſurface hoary-greniſh, and ſhining very much. The flowers come out at the middle leaves of the ſmaller branches, uſually ſolitary or two together, ſometimes, but very ſeldom, three from each axil, in which caſe one or two are on ſhorter peduncles and barren, having no germ, though they have a ſtyle and antheræ. The diviſions of the calyx (or corolla) are four, very ſeldom five, never more in the wild plant, (others ſay from four to eight:) the antheræ are placed at the baſe of theſe, on very ſhort filaments; ſtyle the length of the calyx; drupe always ſolitary, oblong, hoary-white when young, thicker and yellowiſh when ripe, incloſing within a ſweet pulp a woody, grey, furrowed, nut. In the deſerts, near the Volga, the fruit is hardly bigger than the berries of the barberry; whereas, in the more ſouthern parts, it is the ſize of the cornelian cherry. Native of the ſouth of Europe, the Levant, near the Caſpian ſea, in the deſerts near the Volga, and the farther Tartarian deſert, and other parts of the Ruſſian empire in Aſia. It flowers there in May. It was cultivated by Parkinſon in 1633.

Mr. Miller diſtinguiſhes ſpecifically the thorny and unarmed narrow-leaved oleaſter. The latter, he ſays, is that which is moſt commonly preſerved in the Engliſh gardens. The leaves are more than four inches long, and not half an inch broad; they are very ſoft, and have a ſhining appearance like ſatin. The flowers come out at the footſtalks of the leaves, ſingly, or two, and frequently three, at the ſame place; the outſide of the calyx is ſilvery and ſtudded, the inſide of a pale yellow; it has a very ſtrong ſcent. The flowers appear in July, and ſometimes are ſucceeded by fruit. The *eſpinoſa*, or thorny elæagnus, he takes to be the common ſort, which grows naturally in Bohemia, and of which he ſaw ſome trees in the curious garden of the famous Boerhaave, near Leyden. The leaves of this are not more than two inches long, and about three quarters of an inch broad in the middle; they are white, and have a ſoft cottony down on their ſurface; at the footſtalk of every leaf comes out a pretty long ſharp thorn, the leaves being alternate, the ſpines come out on each ſide of the branches. The flowers are ſmall, and have a ſtrong ſcent when fully open. They were both obſerved by Tournefort in the Levant.

2. Elæagnus orientalis, or oriental oleaſter: leaves oblong, ovate, opake. This has the appearance of the foregoing, but the leaves are twice as broad, ovate-oblongiſh, ſoft to the touch on both ſides, pale underneath, but neither ſurface ſhining or ſilvery. In ſtature and manner of growth this tree reſembles a middle-ſized willow, as it does alſo in the hoarineſs of its leaves and the diviſion of its branches. In the wild ſpecimens from Perſia, ſharp ſtraight thorns are ſcattered variouſly over the branches; on the ſmaller twigs they are hoary all over and bear leaves; whereas the cultivated trees have no thorns. Flowers alternate, peduncled, ſolitary, extremely fragrant; calyx funnel-form, hoary on the outſide, the diviſions become reflex by age, and are obſcurely yellowiſh within. This and the ſpinoſa of Linnæus do no ſeem to differ any otherwiſe than a garden tree does from a wild one or the thorny variety of the foregoing ſpecies from the unarmed. Native of the mountains of Perſia from Caucaſus to Derbent, about the Caſpian ſea abundantly, and of the Levant.

3. Elæagnus latifolia, or broad-leaved oleaſter: leaves ovate. This riſes with a woody ſtem to the height of eight or nine feet, dividing into many branches. Leaves ſilvery, with ſeveral irregular dark-coloured ſpots; they are alternate, and continue all the year. Native of the Eaſt Indies and China. Mr. Miller ſays, that it is rare at preſent in the Engliſh gardens; but that there were ſeveral large plants of it in the royal garden at Hampton-court, ſome of which produced flowers.

4. Elæagnus criſpa, or curled-leaved oleaſter: leaves lanceolate-oblong, obtuſe, waved; flowers ſolitary. 5. Elæagnus multiflora, or many-flowered oleaſter: leaves obovate, obtuſe; flowers axillary, aggregate; peduncles longer than the flower. 6. Elæagnus umbellata, or umbelled oleaſter: leaves obovate, obtuſe; flowers axillary, aggregate; peduncles ſhorter than the flower. 7. Elæagnus glabra, or ſmooth-leaved oleaſter: leaves ovate-oblong, acuminate; flowers axillary, ſubſolitary. 8. Elæagnus macrophylla, or ſilver-leaved oleaſter: leaves rounded-ovate, ſilvery. 9. Elæagnus pungens, or prickly oleaſter: branchlets becoming thorns; leaves oblong, waved; flowers axillary, in pairs. Theſe ſix ſpecies are natives of Japan.

Propagation and Culture. The firſt ſort is extremely hardy, and is not injured by froſt; it is not, however, of very long duration; young plants, therefore, ſhould be raiſed once in three or four years, by ſeeds or layers. The ſecond requires the protection of a greenhouſe. The third ſort requires a warm ſtove to preſerve it in this country; for it is too tender to live in the open air, except for a ſhort time in the warmeſt part of the ſummer. It may be raiſed from ſeeds. The other ſpecies have not yet been introduced into cultivation in Europe.

ELÆ'GRUS. See ELÆAGNUS.

ELÆ'IS, *ſ.* [ſo named by Jacquin, from ελαια, the olive, on account of the oilineſs of the nuts.] In botany, a genus of palmæ; dioecia hexandria, (*Thunb.*) of the natural order of palms. The generic characters are—I. Male. Calyx: perianthium ſix-leaved; leaflets concave, upright. Corolla: one-petalled, ſix-cleft, upright, ſharp, length of the calyx. Stamina: filaments ſix, ſubulate, length of the corolla; antheræ oblong, ſharp. II. Female. Calyx: as in the male, (nine-leaved, with the inner leaflets longer, *Gærtner.*) Corolla: ſix-petalled, (none, unleſs a part of the calyx be conſidered as ſuch, *G.*) Piſtillum: germ ovate, (three-celled, *G.*) ſtyle thickiſh, (three-cornered, *G.*) ſtigmas three, reflex. Pericarpium: drupe fibrous, ovate, ſomewhat angulated, oily, (ſuperior, berried, one-celled, *G.*) Seed: nut ovate, obſcurely three-ſided with three holes, three-valved, (valveleſs, *G.*) one-celled.—*Eſſential Character.* Male. Calyx, ſix-leaved; corolla ſix-cleft; ſtamina, ſix. Female. Calyx, ſix-leaved, (nine-leaved, with the inner leaflets longer, *G.*) Corolla, ſix-petalled, (none, *G.*) ſtigmas three; drupe fibrous; nut one to three-valved, (valveleſs, *G.*)

Elæis guineenſis, a ſingle ſpecies. It is the palma oleoſa of Miller. Trunk erect, irregular from the ſtipes of the fronds, which continue a long time, and are longer the nearer they are to the frond. Fronds pinnate, with a rigid rib (or rachis) fifteen feet in length, for four feet below the leaflets armed at the edge on both ſides with awl-ſhaped ſpines, the uppermoſt hooked and bowed back, the middle ones ſtraight, the loweſt patulous, and twice as long as the reſt; leaflets ſword-ſhaped, acute, unarmed, folded back at the baſe, a foot and a half long, and an inch broad. After theſe have fallen, the rigid rib remains ſome time, and reſembles a ſpine. Spadix axillary, a foot long, much compreſſed, erect, divided into about fifty branchlets, five inches long, erect, the thickneſs of a finger, compactly ſpiked, imbricate, and irregularly diſpoſed, with triangular acuminate tips. The

branchlets, except the tip, are wholly covered with ſmall flowers, each having a ſmall roundiſh bracte at the baſe, the loweſt on each branchlet being much larger than the others with a lanceolate point. The flowers have a ſingular and very ſtrong ſmell, like aniſe-ſeeds mixed with chervil-leaves. Fruit larger than a pigeon's egg; the pericarpium variegated with yellow, black, and red, and ſo full of oil as to run out on being very ſlightly preſſed. Nut black, with longitudinal interrupted whitiſh ſtreaks. Mr. Miller ſays, that the leaflets are long, narrow, and not ſo ſtiff as moſt of the palms; that the foot-ſtalks of their leaves are broad at the baſe, where they embrace the ſtem, diminiſh gradually upwards, and are armed with ſtrong, blunt, yellowiſh, thorns, which are largeſt at their baſe. The flowers come out at the top of the ſtem among the leaves; ſome bunches have only male flowers, others female; the latter are ſucceeded by oval berries, bigger than the largeſt Spaniſh olives, but of the ſame ſhape; they grow in very large bunches, and when ripe are of a yellowiſh colour. From this fruit the inhabitants of the Weſt-India iſlands draw an oil, in the ſame manner as it is extracted from olives. They alſo extract a liquor from the body of the tree, which when fermented has a vinous quality, and will inebriate. The leaves are wrought by the negroes into mats, on which they repoſe. It is called in the Weſt Indies the *oily palm*, and by ſome *negroes oil*; the fruit of this tree having been firſt carried from Africa to America by the negroes. It grows in great plenty on the coaſt of Guinea, and alſo in the Cape de Verd iſlands, but was not in any of our American colonies, till it was carried there by the negroes, who now propagate it in great plenty. Jacquin alſo ſays that he has never ſeen this tree wild in America, and that the French call it *palmier*.

Gærtner has ſet down another elæis, which he names *melanococca*, from the blackneſs of the nuts. He thinks it may poſſibly be no more than a variety: the ſhell, however, is much ſmaller, and not ſo much bellied, but rather oblong, and ſuddenly contracted at the tip into an oblique dagger-point; it is alſo thinner, and elegantly variegated on the outſide with teſtaceous ſtreaks, irregularly confluent, with other alternate ſtreaks like the others, but of a coal black; when broken it appears of a ſooty black colour. The ſeed is ovate-oblong, and brown.

Jacquin alſo mentions another very thorny palm, which has ſomewhat of the ſame habit with elæis guineenſis, and is called in Martinico *grigri*. The fruit is eatable, of an acid flavour, globular, ſlightly depreſſed, acuminate by means of the ſtyle, ſcarlet and ſhining. The pulp is ſmall, red, ſoft, and not fibrous, ſurrounded by a very thin pellicle. Nut brown, with three obſcure holes, from which run lines in a ſtellate order like veins over the whole ſurface. Kernel cartilaginous, and hollow.

Another palm occurs about Carthagena, called by the natives *corozo*. They make both an oil and a butter of the fruit for domeſtic uſes. The pericarpium is ſhining, and yellow on the outſide, ſupported by a three-leaved calyx and a three-petalled corolla, permanent and ſhining; it is but little fibroſe, not thick, and contains a pleaſant oil. Its form is ovate, obſcurely three-cornered. Nut black, and ſhining, of the ſame form, with three obſcure holes at the baſe. Kernel roundiſh, cartilaginous, very hard, ſolid, with the center ſlightly cloven. Linnæus (in Mant.) refers to the third palm of Miller, which is the macaw-tree of the Weſt Indies. See BACTRIS and COCOS.

Propagation and Culture. It muſt conſtantly be kept in the bark ſtove, otherwiſe it will not make any great progreſs. In about twenty years it will be too tall for moſt of our ſtoves. It is propagated by ſeeds; for the ſowing and management of which, ſee PALMS and PHŒNIX.

ELÆOCAR'PUS, *ſ.* [from ελαια, olive, and καρπος, fruit.] In botany, a genus of the claſs polyandria, order monogynia, natural order of guttiferæ. The generic characters are—Calyx: perianthium one-leafed, ſpreading, permanent, five-parted; leaflets linear-lanceolate, concave, ſharp. Corolla: petals five, with claws; multifid-laciniate, the extreme jags capillary, equal, ſcarcely longer than the calyx, inſerted at the baſe of the nectary. Stamina: filaments twenty to thirty, capillary, very ſlender, ſhort, inſerted into the nectary; antheræ ſhorter than the corolla, upright, linear, ſcabrous, two-valved at the tip; valves ſpreading, with about five ciliate hairs, very ſlender, from reflex expanding, unequal. Piſtillum: germ ſomewhat globular, villoſe, ſitting on the nectary; ſtyle filiform, longer than the ſtamens; ſtigma ſharp. Pericarpium: drupe oblong, of a ſmooth even ſurface. Seed: nut oblong, grooved and tubercled; ſhell ſubtrivalvular; kernel ſubtrigonal.—*Eſſential Character.* Calyx, five-leaved (or one-leafed, five-parted); corolla, five-petalled, jagged; antheræ two-valved at the tip; drupe with a curled ſhell.

Species. 1. Elæocarpus ſerratus, or ſerrate-leaved elæocarpus: leaves alternate, lanceolate-elliptic, ſerrate; racemes axillary. Branches round, warted, ſmooth; leaves petioled, three inches long, bluntly-ſerrate, ſmooth, nerved, and veined; flowers diſtant. Linnæus obſerves, that they are ſimple, looſe, ſolitary, the length of the leaves, which have a double gland at their baſe. According to Retzius, the calyx has three, four, or five, ſharp-keeled diviſions; and the corolla has three petals, cut in tripartite diviſions; the ſtamens twenty-five, with anthers terminating in cirrhoſe threads, and the germ very tomentoſe. Linnæus affirms, that there are twenty ſtamens in the Ceyloneſe plant, eight in that from Java, and ſixteen in Burman's; who ſays, however, that there are ſixteen when there are four diviſions of the calyx, and twenty when there are five. The deſcription under *Dicera dentata* belongs to this ſpecies. Native of the Eaſt Indies.

2. Elæocarpus dentatus, or tooth-leaved elæocarpus: leaves alternate, oblong, tooth-ſerrate at top; racemes axillary; flowers one-ſtyled. Native of the iſlands of the South Seas. Theſe two ſpecies have been confounded.

3. Elæocarpus dicera, or dicera elæocarpus: leaves oppoſite, ovate, doubly-ſerrate; racemes compound; flowers four-ſtyled. According to Linnæus's Supplement, it correſponds with the preceding in the ſtructure of the flower; but it differs in having four ſtyles, a berried four-celled fruit, and two ſeeds in each cell. See DICERA SERRATA.

4. Elæocarpus copalliferus, or copal elæocarpus: leaves quite entire; panicle terminating. It yields the copal reſin, but of this there are ſeveral ſorts. It is thus deſcribed by Vahl: This is a lofty tree, with round branches, mealy-tomentoſe at the top, and ferruginous. Leaves petioled, alternate, half a foot long and more, lanceolate, acuminate, rounded at the baſe, almoſt three inches broad, ſubcoriaceous, ſmooth on both ſides, above very finely marked with lines along the nerves, and with more obſcure oblique lines between the nerves, beneath having protuberant alternate nerves. Vahl obſerves, that vateria of Linnæus agrees with elæocarpus in the calyx, corolla, anthers, and fruit; and that they are the ſame, appears from the ſpecimen in Herman's Herbarium. He does not find that the calyx is ſuperior, as Retzius affirms it to be. Native of the Eaſt Indies.

5. Elæocarpus integerrimus, or entire-leaved elæocarpus: leaves lanceolate, quite entire; flowers heaped, axillary. This is a middle-ſized tree, with ſpreading branches. Leaves ſmooth, petioled, alternate. Flowers many, golden, ſweet-ſmelling. Native of Cochin-china, where it is alſo cultivated on account of the ſweetneſs and beauty of the flowers.

6. Elæocarpus oblongus, or oblong elæocarpus. Native of the Eaſt Indies.

ELÆODEN'DRUM, *ſ.* [from ελαια, olive, and δενδρον, a tree.] The OLIVE-WOOD; in botany, a genus of the claſs pentandria, order monogynia. The generic characters are—Calyx: perianthium five-leaved; leaflets roundiſh, blunt, concave, ſpreading very much, ſmall, permanent. Corolla: petals five, roundiſh, blunt, concave, ſpreading

ſpreading very much, twice as long as the calyx. Stamina: filaments five, ſubulate, bent back, ariſing from a gland beneath the germ; antheræ roundiſh, erect. Piſtillum: germ roundiſh, conical, placed on a gland; ſtyle conical; ſtigma obtuſe, bifid. Pericarpium: drupe ovate, obtuſe. Seed: nut ovate; ſhell thick, and very hard; two-celled; kernels oblong, compreſſed.—*Eſſential Character.* Corolla, five-petalled; drupe ovate, with a two-celled nut.

Species. 1. Elæodendrum orientale: a moderate ſized twiggy ſhrub or tree, a native of the oriental regions; with the leaves ovate-lanceolate, ſmooth, ſometimes ſlightly waved, and ſometimes even a little inclining to a ſubſerrated appearance on the upper parts of the ſhoots. Flowers borne towards the ends of the branches, ſtanding by twos and threes; of a pale green colour, ſupported on ſhortiſh pedicels, each of which ſprings from a ſomewhat longer common pedicel. The lower ſhoots, or thoſe neareſt the ground, appear to be ſomewhat procumbent, and have narrower and longer leaves in proportion than the upper ones; the nerves or midribs of theſe leaves are alſo of a reddiſh colour.

2. Elæodendrum argan: branches ſpiny; leaves ovate, obtuſe. This is a middle-ſized tree, with ſhort thickiſh ſpines at the ends of the branches. It is called *argan* by the Moors, who expreſs an oil from the fruit, which the Europeans uſe in a variety of works, and the Moors for the table. Native of the woods of Morocco, whence it was ſent to Retzius by profeſſor Schulten.

ELÆOM'ELI, *ſ.* with ancient phyſicians, a kind of ſweet oil of the conſiſtence of honey, ſaid to flow from the trunk of a tree in Syria, and to be very efficacious in bilious complaints.

ELÆOSAC'CHARUM, *ſ.* in pharmacy, a compoſition of oil and ſugar.

ELÆOTHE'SIUM, *ſ.* in antiquity, a room or place where the athletæ were wont to bathe and anoint themſelves.

E'LAH, [Heb. an oak.] A valley of Paleſtine, in the land of Judah, remarkable for a battle fought between the Iſraelites under king Saul, and the Philiſtines, in which the latter were vanquiſhed; and where David ſlew Goliah. 1 *Sam.* xviii. 19. xxi. 9.

ELAHA'JAN, a town of Arabia, in the country of Yemen: 100 miles ſouth-eaſt of Amanzirifdin.

ELAIOCAR'POS. See ELÆOCARPUS and DICERA.

ELA'IS, *ſ.* in botany. See ELÆIS.

E'LAM, [עלם Heb. a young man.] The ancient name of Perſia, ſo named from Elam, eldeſt ſon of Shem, whoſe deſcendants, probably, firſt ſettled there. Chedorlaomer, king of this country, together with his confederates, were vanquiſhed by the patriarch Abraham, when they invaded Canaan. *Gen.* xiv. *Jer.* xlix. 34.

E'LAN, a town of Ruſſia, in the country of the Coſacs, on the Don: ſixty-eight miles ſouth-weſt of Archadinſkaia.

E'LAN, a town of South Wales, in the county of Brecknock.

To ELAN'CE, *v. a.* [*elancer*, Fr.] To throw out; to dart; to caſt as a dart:

Harſh words, that once *elanc'd*, muſt ever fly
Irrevocable. *Prior.*

ELAPHEBO'LIA, *ſ.* in Grecian antiquity, a feſtival in honour of Diana the huntreſs. In the celebration a cake was made in the form of a deer (ελαφος), and offered to the goddeſs. It owed its inſtitution to the following circumſtance: When the Phocians had been ſeverely beaten by the Theſſalians, they reſolved, by the perſuaſion of one Deiphantus, to raiſe a pile of combuſtible materials, and burn their wives, children, and effects, rather than ſubmit to the enemy. This reſolution was unanimouſly approved by the women, who decreed Deiphantus a crown for his magnanimity. When every thing was prepared, before they fired the pile, they engaged their enemies, and fought with ſuch deſperate fury, that they totally routed them, and obtained a complete victory. In commemoration of this unexpected ſucceſs, this feſtival was inſtituted to Diana, and obſerved with the greateſt ſolemnity.

ELAPHEBO'LIUM, *ſ.* in Grecian antiquity, the ninth month of the Athenian year, anſwering to the latter part of February and beginning of March. It conſiſted of thirty days; and took its name from the feſtival claphebolia, kept in this month, in honour of Diana the huntreſs, as mentioned in the preceding article.

ELA'PHRIUM, *ſ.* in botany. See FAGARA.

To ELAPIDATE, *v. a.* [*elapidare*, Lat.] To clear a place of ſtone.

ELAPIDA'TION, *ſ.* A clearing of ſtones.

To ELAP'SE, *v. n.* [*elapſus*, Lat.] To paſs away; to glide away; to run out without notice.—There is a docible ſeaſon, a learning-time in youth, which, ſuffered to *elapſe*, and no foundation laid, ſeldom returns. *Clariſſa.*

ELAP'SION, *ſ.* The act of ſliding away; the act of paſſing away without notice. *Scott.*

To ELA'QUEATE, *v. a.* [*e*, from, and *laqueus*, Lat. a trap.] To diſentangle; to ſet free from a ſnare.

ELAQUEA'TION, *ſ.* The act of diſentangling; the act of ſetting free.

ELARAHAL', or EL HARAHAL, a town of Spain, in the province of Seville: twenty miles north-weſt of Seville.

ELARGA'TION, *ſ.* [*e*, from, and *largior*, Lat. to beſtow.] The act of freely beſtowing.

ELASE'RE, a town of Arabia, in the country of Yemen: twenty-eight miles north of Chamir.

ELAS'MIS, *ſ.* A trivial name for a genus of talcs, compoſed of ſmall plates in form of ſpangles; and either ſingle, and not farther fiſſile; or, if complex, only fiſſile to a certain degree, and in ſomewhat thick laminæ. Of theſe talcs there are ſeveral varieties, ſome with large and others with ſmall ſpangles, which differ alſo in colour and other peculiarities.

ELAS'TIC, or ELASTICAL, *adj.* [ελαω, Gr.] Having the power of returning to the form from which it is diſtorted or withheld; ſpringy; having the power of a ſpring.—A fermentation muſt be excited in ſome aſſignable place, which may expand itſelf by its *elaſtical* power, and break through, where it meets with the weakeſt reſiſtance. *Bentley.*

By what *elaſtic* engines did ſhe rear,
The ſtarry roof, and roll the orbs in air. *Blackmore.*

All bodies partake, more or leſs, of the properties of elaſticity; though perhaps none are perfectly elaſtic, as none are found to reſtore themſelves with a force equal to that with which they are compreſſed. The principal phenomena obſervable in elaſtic bodies are, 1. That an elaſtic body, (*i. e.* a body perfectly elaſtic, if any ſuch there be) endeavours to reſtore itſelf with the ſame force with which it is preſſed or bent. 2. An elaſtic body exerts its force equally towards all ſides; though the effect is chiefly found on that ſide where the reſiſtance is weakeſt; as is evident in the caſe of a gun exploding a ball, a bow ſhooting out an arrow, &c. 3. Elaſtic bodies, in what manner ſoever ſtruck, or impelled, are inflected and rebound after the ſame manner: thus a bell yields the ſame muſical ſound, in what manner or on what ſide ſoever it be ſtruck; the ſame of a tenſe or muſical chord; and a body rebounds from a plane in the ſame angle in which it meets or ſtrikes it, making the angle of incidence equal to the angle of reflection, whether the intenſity of the ſtroke be greater or leſs. 4. A body perfectly fluid, if any ſuch there be, cannot be elaſtic, if it be allowed that its parts cannot be compreſſed. 5. A body perfectly ſolid, if any ſuch there be, cannot be elaſtic; becauſe, having no pores, it is incapable of being compreſſed. 6. The elaſtic properties of bodies ſeem to differ, according to their greater or leſs denſity or compactneſs, though not in an equal degree: thus, metals are rendered more

compact

compact and elaſtic by being hammered: tempered ſteel is much more elaſtic than ſoft ſteel; and the denſity of the former is to that of the latter as 7809 to 7738: cold condenſes ſolid bodies, and renders them more elaſtic; whilſt heat, that relaxes them, has the oppoſite effect: but, on the contrary, air, and other elaſtic fluids, are expanded by heat, and rendered more elaſtic.

ELASTIC FLUIDS, or VAPOURS, are ſuch as may be compreſſed mechanically into a leſs ſpace, and which reſume their former ſtate when the compreſſing force is withdrawn. Such as atmoſpherical air, and all the aerial fluids, with all kinds of fumes or gaſes raiſed by means of heat, whether from ſolid or fluid bodies. Of theſe, ſome remain elaſtic only while a conſiderable degree of heat is applied to them, or to the ſubſtance which produces them; while others continue elaſtic in every degree of cold that has yet been obſerved. The elaſtic force with which any one of theſe fluids is endowed, has not yet been calculated, as being ultimately greater than any obſtacle we can put in its way. Thus, on compreſſing the atmoſpherical air, we find that for ſome little time at firſt it eaſily yields to any force applied; but at every ſucceeding moment the reſiſtance becomes always the ſtronger, and a greater and greater force muſt be applied to compreſs it farther. As the compreſſion goes on, the veſſel containing the air becomes hot; but no power whatever has yet been able in any degree to deſtroy the elaſticity of the contained fluid; for, upon removing the preſſure, it is always found to occupy the very ſame ſpace that it did before. The caſe is the ſame with the ſteam of water, to which a ſufficient heat is applied to keep it from condenſing into water. See all theſe facts exemplified under the heads of the different *Gaſes*, and under *Atmoſpherical Air*, in the article CHEMISTRY, vol. iv. p. 196, &c.

ELAS'TIC STONE, *ſ.* See BRASILIAN STONE.

ELAS'TIC GUM, or RESIN, *ſ.* commonly called *India-rubber*. See the article CAOUTCHOUC, vol. iii. p. 744; and the article CHEMISTRY, vol. iv. p. 340.

ELASTI'CITY, *ſ.* Force in bodies, by which they endeavour to reſtore themſelves to the poſture from whence they were diſplaced by any external force. *Quincy.*—A lute-ſtring will bear an hundred weight without rupture; but at the ſame time cannot exert its *elaſticity*: take away fifty, and immediately it raiſeth the weight. *Arbuthnot.*

Mc emptineſs and dullneſs could inſpire,
And were my *elaſticity* and fire. *Pope.*

The cauſe or principle of this important property, *elaſticity*, is variouſly accounted for. The Carteſians aſcribe it to their ſubtile matter making an effort to paſs through pores that are too narrow for it. Thus, ſay they, in bending or compreſſing a hard elaſtic body, as a bow, for inſtance, its parts recede from each other on the convex ſide, and approach on the concave one: conſequently the pores are contracted or ſtraitened on the concave ſide; and, if they were before round, are now perhaps oval: ſo that the *materia ſubtilis*, or matter of the ſecond element, endeavouring to paſs out of the pores thus ſtraightened, muſt make an effort, at the ſame time, to reſtore the body to the ſtate it was in when the pores were rounder, i. e. before the bow was bent: and in this conſiſts its *elaſticity*. Some later philoſophers account for elaſticity much after the ſame manner as the Carteſians, with this only difference, that inſtead of the ſubtile matter of the Carteſians, theſe ſubſtitute ether, or a fine ethereal medium that pervades all bodies.

Others, ſetting aſide the precarious notion of a materia ſubtilis, account for elaſticity from the great law of nature, attraction, or the cauſe of the coheſion of the parts of ſolid and firm bodies. Thus, ſay they, when a hard body is ſtruck or bent, ſo that the component parts are moved a little from each other, but not quite diſjointed or broken off, or ſeparated ſo far as to be out of the power of that attracting force by which they cohere; they muſt, on removing the external violence, ſpring back to their former natural ſtate. Others again reſolve elaſticity into the preſſure of the atmoſphere: for a violent tenſion, or compreſſion, though not ſo great as to ſeparate the conſtituent particles of bodies far enough to let in any foreign matter, muſt yet occaſion many little vacuola between the ſeparated ſurfaces; ſo that on the removal of the force they will cloſe again by the preſſure of the aerial fluid upon the external parts. There are others who attribute the elaſticity of all hard bodies to the power of reſilition in the air included within them; and ſo make the elaſtic force of the air the principle of elaſticity in all other bodies.

Among the modern philoſophers, Barruel and Libes ſeem to have made the moſt intereſting reſearches reſpecting the cauſe of elaſticity. Barruel aſcribes the cauſe to two principles: 1. "Every body in nature," ſays he, "is porous, and theſe pores are proportioned to the denſity of the ſubſtance. 2. Theſe pores are filled with different fluids, and principally with caloric. But caloric poſſeſſes a ſtrong repulſive force; from which it follows, that, when an elaſtic body is compreſſed, the caloric in its pores drives back by its repulſive power the diſplaced parts, and brings them to their former ſtate." Libes, who has examined the ſame ſubject with ſimilar attention, makes elaſticity to depend on caloric interpoſed either between the moleculæ of the bodies, or combined with them, and at the ſame time on the attractive force of theſe moleculæ. "This being premiſed," ſays he, "I ſay, that the reſtoration of ſolid bodies after compreſſion is a combined effect, which depends in part on the repulſive force which their integral moleculæ have received from caloric, and in part from the attractive force of theſe moleculæ." He then applies elegant formulæ of calculation to theſe phenomena.

The ſuppoſition that repulſion is a primary cauſe, independent of all others, has given riſe to many erroneous theories, and very much embarraſſed philoſophers in accounting for the phenomena of elaſticity.

ELA'TE, *adj.* [*elatus*, Lat.] Fluſhed with ſucceſs; elevated with proſperity; lofty; haughty:

Oh, thoughtleſs mortals! ever blind to fate!
Too ſoon dejected, and too ſoon *elate!*
I, of mind *elate*, and ſcorning fear,
Thus with new taunts inſult the monſter's ear. *Pope.*

To ELA'TE, *v. a.* To elevate with ſucceſs; to puff up with proſperity. To exult; to heighten. *An unuſual ſenſe:*

Or truth, divinely breaking on his mind,
Elates his being, and unfolds his power. *Thomſon.*

EL'ATE, *ſ.* [ſo named παρα το ελαν, from its great height; ελατη ουρανομηκης, *Homer.*] In botany, a genus of palmæ, (monoecia triandria, *Thunb.*) The generic characters are—I. Male flowers. Calyx: ſpathe two-valved; ſpadix branching. Corolla: petals three, roundiſh. Stamina: filaments three, ſimple; antheræ adnate. II. Female flowers in the ſame ſpadix with the males. Calyx: ſpathe common with the males. Corolla: petals three, roundiſh, permanent. Piſtillum: germ roundiſh; ſtyle ſubulate; ſtigma ſharp. Pericarpium: drupe ovate, acuminate. Seed: nut ovate, grooved.—*Eſſential Character.* Male: calyx, three-toothed; corolla, three-petalled; antheræ, ſix, ſeſſile. Female: calyx, one-leafed; corolla, three-petalled; piſtillum, one; ſtigmas, three; drupe, one-ſeeded.

Elate ſylveſtris, or prickly-leaved elate, a ſingle ſpecies: fronds pinnate; leaflets oppoſite. This palm grows to the height of about fourteen feet, the trunk being covered with an aſh-coloured cruſt, cloſely united with a very hard whitiſh wood; pinnate leaves break out from the top of the trunk only, in a decuſſated order, the old ones dropping off as the young ones break forth; the flowers are concealed in ſtiff, green, coriaceous ſpathes;

they are ſmall, ſeveral on the ſame peduncle; petals whitiſh-green; ſtamens whitiſh, lanuginoſe. They have no ſmell, but a rough taſte; fruits oblong-round, ſmall, like a wild plum, with a hard woody point at top, covered with the calyx at bottom, firſt green, then red, but when ripe of a reddiſh brown, or blackiſh and ſhining, covered with a thin rind that is eaſily broken, and having a whitiſh ſweet farinaceous pulp within; the nut or ſtone is oblong, rufous, marked longitudinally with a deep furrow, and containing a whitiſh bitter kernel; the fruits grow on green, ſmooth, ſhining, branches, near a yard long, and two fingers broad, flat, ſtiff, and woody; whence a clear auſtere liquor flows when they are cut or wounded. The poorer ſort of people chew the nut in the ſame manner with the areca-nut, with the leaf of the betel and quick-lime. The elephants are very fond of the fruit branches, which are very ſweet. The leaves, fruit, &c. are very aſtringent, and are looked upon as powerful in ſtopping fluxes. Native of the Eaſt Indies. Introduced about 1763, by John Blackburne, eſq. For the *Propagation and Culture*, ſee PALMS.

EL'ATER, *ſ.* [ελαυνω, to agitate.] The SKIPPER; in entomology, a genus of inſects belonging to the order of coleoptera. The antennæ of ſome elateres are ſetaceous, others filiform, pectinated, or ſerrated. Their larvæ live in decayed trunks of trees, where they undergo their metamorphoſes. Many of the coleopterous inſects have a great difficulty in reſtoring themſelves when laid on the back; the apparatus with which the inſects of this genus are provided for that purpoſe, is ſingular and curious. An elaſtic ſpring, or ſpine, projects from the hinder extremity of the breaſt, and there is a groove or cavity in the anterior part of the abdomen. When laid on its back, the inſect raiſes and ſuſtains itſelf on the anterior part of the head and the extremity of the body, by which means the ſpine is removed from the groove where it is lodged, when in its natural poſition; then ſuddenly bending its body, the ſpine is ſtruck with force, acroſs a ſmall ridge or elevation, into the cavity from whence it was withdrawn; by which ſhock, the parts of the body before ſuſtained in the air, are ſo forcibly beat againſt whatever the inſect is laid on, as to cauſe it to ſpring or rebound to a conſiderable diſtance. The antennæ are lodged in a cavity ſcooped out of the under ſide of the head and thorax, probably to preſerve them, when the inſect falls, after its ſingular leap.

There are no leſs than one hundred and eighty-three ſpecies of this genus of inſects now aſcertained; of which twenty-ſix are found in England. They are all eaſily diſtinguiſhed from every other genus by the ſpine at the extremity of the thorax; a character which ſcarcely any other inſect poſſeſſes. The phoſphoreus, noctilucus, and ſeveral other ſpecies of this inſect, give out a ſtrong phoſphoric light in the night time, the ſtreams of which are ſo luminous, that a perſon may ſee to read the ſmalleſt print, by placing them on the leaf of a book. The elegant ſpecies delineated on the annexed engraving, are as follow: Fig. 1. Elater Flabellicornis, with fan-ſhaped antennæ; the largeſt of the genus yet known; meaſuring about two inches and a half from the head to the anus. The head is ſmall, and of a ſquariſh form, ſurrounded with a ſmall black margin, having four palpi, two of them very ſhort; the eyes are brown and ſhining; the antennæ are the length of the thorax, and black; thoſe of the male are pectinated, or rather laminated, having not leſs than eight diſtinct plates or laminæ lying cloſe to each other, which, when cloſed together, appear to be of equal thickneſs. The general colour of the inſect is a dark ſhining bronze: the thorax has a black margin, terminating on the ſides in two ſharp ſpines; the eſcutcheon is ſmall; the wing-caſes or ſhells are ſmooth and gloſſy, without any margin, and rounding at their extremities, without any ſpines; the elaſtic ſpring is black, and ſmall for the ſize of the inſect. All the under part of the inſect is the ſame colour as the upper; the bearers or feet conſiſt of five articulations, beſides the hooks or claws. It is a native of India; that which is figured in the engraving was found at Sierra Leona, on the coaſt of Africa.

Fig. 2. The Porcatus: a beautiful ſpecies, and large, meaſuring an inch and three quarters. The head is a dark braſſy green; the eyes brown and ſhining; the antennæ black, conſiſting of ten articulations; the thorax on the ſides is yellow, having a broad bar of a green colour running longitudinally from the head to the hinder part, being marginated with black; the wing-caſes are deeply furrowed with green and yellowiſh lines, the ſides having a broad yellow ſtripe all round them, and are marginated with black; the extremities rounded, and not ending in a ſpine; the breaſt, abdomen, and legs, are entirely dark green; the elaſtic ſpring is black and large; the bearers conſiſt of five articulations beſides the hooks. It inhabits South America: the one figured in the engraving was brought from the Bay of Honduras.

Fig. 3. The Auratus, ranked among the moſt elegant of the elateres, is alſo large, meaſuring near an inch and three-fourths. The head is green; the eyes black; the antennæ are black, and ſhorter than the thorax, having at each joint ſome ſhort hairs, plainly to be diſcovered when viewed through a microſcope; the thorax is green, and margined, appearing as if finely poliſhed; the hinder corners being pointed, and forming obtuſe angles; the eſcutcheon is round, and ſhining; the wing caſes are likewiſe green, variegated with ſhades of yellow and gold, ſhining, and margined; their extremities terminating in two ſharp points: all the under part of the inſect is of the ſame ſhining green as the upper, except the bearers, which are black, and conſiſt of five articulations beſides the claws. In this inſect the elaſtic ſpring is very large and ſtrong, ſo that it can jump to a conſiderable height. This was brought from China.

Fig. 4. The Serraticornis: meaſures near an inch and a quarter. The head is reddiſh brown; the eyes ſmall and black; the antennæ black, ſerrated, and ſhorter than the thorax; the thorax is red-brown, with a dark longitudinal dagger-ſhaped ſtreak running along the middle from the head to the eſcutcheon; the ſides terminating in two angular points; the eſcutcheon is ſmall and brown; the wing-caſes are reddiſh, brown, marginated, and ending in two ſpines: they are a little ſtriated, with three longitudinal ſtreaks of a dark brown colour; the principal one in the middle along the future, the others on each ſide; the breaſt and fore-part of the abdomen is the ſame red-brown colour as on the upper ſide; the hinder part of the abdomen is darker, having two remarkable oval ſpots of a lightiſh colour near the anus; the bearers conſiſt of no more than four articulations beſides the hooks. This came from Rio Janeiro in the Braſils: it is alſo found in Italy.

Fig. 5. The Angulatus: a degree larger than the preceding. The head and eyes are black, the former being furniſhed with two remarkable thick and ſhort horns or ſpines; the antennæ are black, and ſtrongly pectinated, conſiſting of not leſs than ten articulations; the thorax is orange coloured, with a broad black ſtreak down the middle. Two remarkable black lozenge-ſhaped ſpots are placed near the middle of the thorax, and are united to the longitudinal black ſtreak. Cloſe to theſe are two ſingular ſwellings, like protuberances, on the ſides of the thorax. The eſcutcheon is black; the wing caſes pale-orange, the ſides and middle having three black ſtripes running along them, the extremities ending in two ſharp ſpines; the breaſt is orange, with two long black ſpots on the ſides; the abdomen is of a dark cream colour, with two black ſtripes running along the ſides from the breaſt, and joining at the anus; all the legs are orange; the bearers conſiſting of five articulations, beſides the hooks. Native of the Braſils.

Fig. 6. The Faſciatus: about three quarters of an inch in length. The head is grey; the eyes black; the antennæ ſerrated and black, much ſhorter than the thorax, which is grey, with two ſmall round black ſpots on the middle, and two ſquare ones next the eſcutcheon; the eſcutcheon itſelf is black, ſurrounded by a patch of the ſame colour; the wing caſes are grey, with two waved irregular bands croſſing them, one near the middle, the other near the anus: all the under part of the inſect is black; and, when viewed through a microſcope, appears to be powdered, as it were, with grey. The legs are entirely black. Native of Africa and Europe; and is found likewiſe in England.

Fig. 7. The Pictus: nearly the ſize of the preceding. The head is yellow-brown; the eyes ſmall and black; the antennæ deeply ſerrated and black, being ſhorter than the thorax; the thorax is yellow-brown, with ſeveral black longitudinal ſtreaks; the eſcutcheon is very ſmall and yellow-brown; the wing-caſes the ſame colour, with ſeveral faint black marks thereon, particularly two ſituated near the middle, of a triangular ſhape, and reaching to the ſides: they are a little ſtriated, and terminate at the anus in four blunt ſpines, two to each. All the under part of this inſect is of a grey colour. The elaſtic ſpring in this inſect is remarkably large. Native of Africa.

Fig. 8. The Teſſellatus: a native of Europe, and an inhabitant of England; the ſhells adorned with teſſelated whitiſh ſpots on a chocolate-coloured ground. Fig. 9. The Purpureus: thorax black, with a thin purple down; wing-caſes or ſhells purple, with raiſed lines: native of Auſtria. Fig. 10. The Pulchellus: head and thorax black and bronze; ſhells variegated with black, yellow, and reddiſh brown: inhabits England, and is found in gardens. Fig. 11. The Rufipes, moſtly black and poliſhed: a native of Saxony. Fig. 12. The Ignitus: a curious and beautiful ſpecies, from Cayenne. Fig. 13. The Phoſphoreus: dark bronze, with two tranſparent yellow ſpots on the thorax, which appear to give out a phoſphoric light: it is a native of South America. Fig. 14. The Fuſcipes: a large ſpecies, moſtly black; wing-caſes ſtriate: native of the Eaſt Indies. Fig. 15. The Sanguinolentus: thorax and body black; wing-caſes blood-red, with an ovate black ſpot in the center: inhabits Germany. Fig. 16. The Bipuſtulatus; a ſmall ſpecies, found in the woods of Germany: it is quite black, with two flame-coloured puſtules on the wing-caſes. Fig. 17. The Pulverulentus: head and body black, very minutely ſpeckled with greeniſh gold; on the wing-caſes a divaricated ſtripe of red: native of America.

ELA'TERIST, *ſ.* One who holds the doctrine of the elaſticity of the air.

ELAT'ERIUM, *ſ.* [ελατηριον, Gr.] The elaſticity of the air.

ELATE'RIUM, *ſ.* [ελατηριον, from ελαυνω; whatever purges the belly; troches made of the juice of the wild cucumber; and a name for that cucumber itſelf.] In botany, a genus of the claſs monoecia, order monandria, natural order cucurbitaceæ. The generic characters are—I. Male flowers. Calyx: none. Corolla: one-petalled, ſalver-ſhaped; tube cylindric; border five-cleft; diviſions lanceolate, channelled on the back, the inciſures furniſhed with a toothlet. Stamina: filament ſingle, columnar; anther linear. II. Female flowers. Calyx and corolla as in male. Piſtillum: germ inferior, echinate; ſtyle columnar, thickening; ſtigma capitate. Pericarpium: capſule inferior, echinate, leathery, filled with pulp, uniform, one-celled, two-valved, elaſtic. Seeds: ſeveral.—*Eſſential Character.* Male: calyx, none; corolla, ſalver-ſhaped. Female: calyx, none; corolla, ſalver-ſhaped; capſule, inferior, one-celled, two-valved.

Species. 1. Elaterium Carthagenenſe: leaves cordate, angular. This is probably an annual plant; ſtems round, ſmooth, herbaceous, diffuſed, ſcandent, with tendrils biſid and lateral; leaves very finely ſerrate, ſmooth underneath, ſomewhat rugged above, petioled, alternate, numerous; peduncles of the male flowers axillary, ſolitary, many-flowered, ſpreading, almoſt the length of the leaves, racemed or ſubumbelled: female peduncle from the ſame axil, ſolitary, one-flowered, ſhort: corolla white, without ſcent in the day, but ſmelling ſweet at night; fruit green, an inch and half long, having but little watery pulp, ſmelling like cucumber; when ripe, it opens elaſtically with a very gentle touch, and diſperſes its ſeeds; or, when approaching to maturity, if it be held ſome time in the hand cloſed, it will do the ſame; one valve is compoſed of the whole ſides and the anterior part of the fruit, and is roundiſh two-lobed on one ſide, or like the figure 8; the back of the capſule forms the other, which is therefore oblong: this on the inſide at the tip is furniſhed with a lanceolate appendix, highly elaſtic, furniſhed with about eighteen toothlets, to which as many browniſh ſeeds adhere. Native of Carthagena in New Spain, covering entire ſhrubs with its ſtalks, and flowering in October and November.

2. Elaterium trifoliatum: leaves ternate, gaſhed. Capſule kidney-ſhaped, rough with hairs, two-valved, opening with a ſpring; and therefore of this genus. Native of Virginia. See MOMORDICA.

E'LATH, or ELOTH, [Heb. a hind.] A city of Edom, ſituated near the Red Sea. It was in being in the days of Moſes, *Deut.* ii. 8. and during the ſubjection of the Edomites to Judah, was one of Solomon's principal ſeaports. 2 *Chron.* viii. 17. It was taken from Judah, and deſtroyed; but was rebuilt by Uzzah king of Judah, who reſtored it to his kingdom: it was again taken from Judah in the reign of Ahaz, by Rezin king of Syria, through the aſſiſtance of Pekah king of Iſrael, and was never afterwards regained by the Jews. 2 *Kings*, xiv. 22. xvi. 6.

ELA'TINE, *ſ.* [ελατινος, made of fir.] In botany, a genus of the claſs octandria, order tetragynia, natural order inundatæ, (caryophylleæ, *Juſſ.*) The generic characters are—Calyx: perianthium four-leaved; leaflets roundiſh, flat, ſize of the corolla, permanent. Corolla: petals four, ovate, obtuſe, ſeſſile, ſpreading. Stamina: filaments eight, length of the corolla; antheræ ſimple. Piſtillum: germ orbicular, globoſe-depreſſed, large; ſtyles four, upright, parallel, length of the ſtamens; ſtigmas ſimple. Pericarpium: capſule orbicular, globoſe-depreſſed, large, four-celled, four-valved. Seeds: ſeveral, mooned, upright, ſurrounding the receptacle in the manner of a wheel.—*Eſſential Character.* Calyx, four-leaved; petals, four; capſule, four-celled, four-valved, flatted.

Species. 1. Elatine hydropiper, or oppoſite-leaved water-wort: leaves oppoſite. A very ſmall annual aquatic plant, hardly a ſpan in length; ſtems very tender, creeping; the ſhoots erect, and leafy; leaves ovate-lanceolate, quite entire, ſeſſile at the joints; flowers ſolitary, much ſmaller than in the ſecond ſpecies, alternate, on very ſhort peduncles at the axils of the leaves on the branches, and cloſe to them on the ſtem; petals white, purpliſh, or roſe-coloured; ſtyles none, ſtigmas very ſmall; anthers globular: capſules ſmaller than in the ſecond. Native of Denmark, Sweden, Switzerland, Sileſia, and France; in ditches and wet places: flowering in ſummer.

2. Elatine alſinaſtrum, or whorl-leaved water-wort: leaves in whorls. Native of Aboa, Leipſic, Sileſia, Switzerland, near Paris and Montpellier, England; in ditches. Found by Mr. James Sherard on the bogs upon the common, by the road from Eltham to Chiſſelhurſt: it flowers in June and July. See ANTIRRHINUM, LATHYRUS, APHACA, and VERONICA.

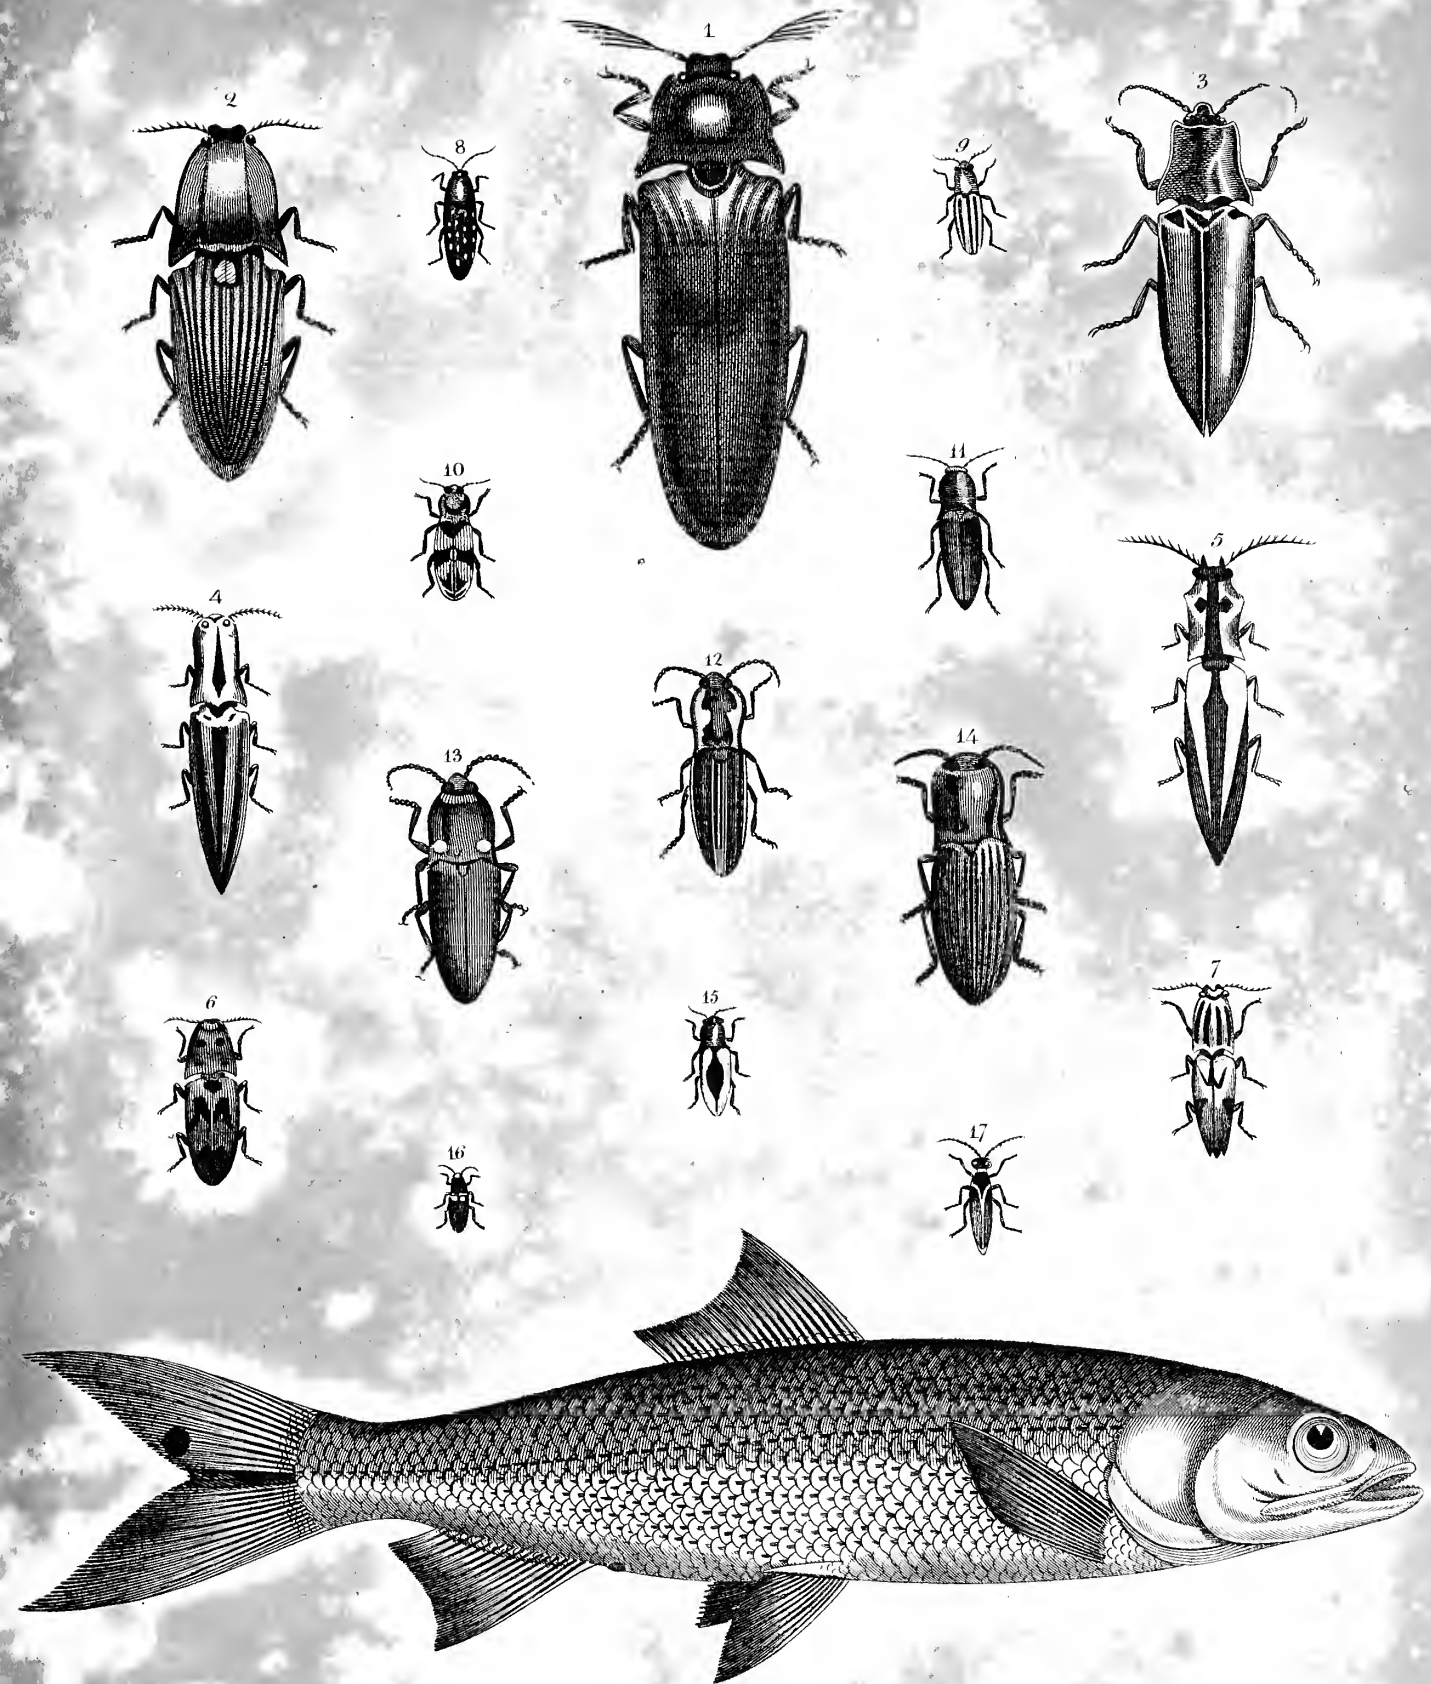
ELA'TION, *ſ.* Haughtineſs proceeding from ſucceſs; pride of proſperity.—God began to puniſh this vain *elation* of mind, by withdrawing his favours. *Atterbury.*

ELATI'TES, *ſ.* in natural hiſtory, a kind of blood-ſtone.

ELATOS'TEMA, *ſ.* in botany; ſee DORSTENIA.

ELAT'MA,

ELATER AND ELOPS.



H. Bloch del.

J. Pass sculp.

Seventeen species of Elater or Skipper, & the Elops or Saur-fish.

London Published as the Act directs Sep.r 6. 1803 by J. Wilkes

ELAT'MA, a town of Ruſſia, in the government of Tambov, on the Oka: 132 miles north of Tambov. Lat. 55. 2. N. lon. 59. 28. E. Ferro.

To ELAX'ATE, *v. a.* [*elaxare*, Lat.] To unlooſe or make wider.

ELAY', a river of Wales, in the county of Glamorgan, which runs into the ſea, near Pennarth Point.

EL'BA (iſle of), in Latin *Ilva*, anciently *Oethalia*, in the Tuſcan ſea, and middle diviſion of Italy, oppoſite to Piombino, being ſeparated from the main land by a channel of the latter name, about 10 miles broad. The iſland is forty miles in circuit, reckoning its gulfs, capes, &c. and has two ports; the one to the north weſt, called Porto Ferraio, belonged to the grand-duke of Tuſcany before the late revolutionary war; the other is to the ſouth-eaſt, called Porto Longone, was ſubject to Spain, and indeed the whole iſland was generally conſidered as under the protection of that crown, and moſtly belonged to the duke of Piombino. By the treaty of Luneville, Dec. 1800, it was expreſsly ſtipulated that Elba ſhould be attached to the duchy of Tuſcany; but in Auguſt 1801, the dominions of the grand duke were given in ſovereignty to the infant of Spain, by the title of Louis I. king of Etruria; by which means the French obtained this iſland for themſelves at the peace of March 1802, in direct contradiction to the treaty of Luneville. The place is mountainous, and has mines of iron, marble, ſulphur, and ſome lead-ſtone. It lies fourteen miles ſouth-weſt of Piombino. Lat. 42. 26. N. lon. 11. 18. E.

ELBE, a river of Germany, which riſes in the ſouth-eaſt part of the principality of Jauer, in Sileſia, takes a ſoutherly courſe through part of Bohemia, paſſing by Arnau, Koninghoff, Konigingratz, &c. to Pardubitz, where, turning towards the weſt and north-weſt, it paſſes by Nimburg, Koſteletz, Melnik, Raudnitz, Leitmeritz, Tetſchen, &c. after which it enters Saxony, paſſes by Konigſtein, Pirnau, Dreſden, Meiſſen, Belgern, Torgaw, Wittenburg, Coſwick, Deſſau, Barley, Magdeburg, Tangermunde, Sandau, Domitſch, Boitzenburg, Lauenburg, Hamburg, Gluckſtadt, &c. and runs into the German Sea, about lat. 54. 3. N. lon. 25. 50. E. Ferro. Pruſſia having allowed the French troops under Bonaparte, to blockade its banks, with a view to injure our commerce in that quarter, the king of England took the ſpirited reſolution of completely blockading the entrance of it, which was notified to the neutral powers in June 1803.

ELBE, a river of Germany, in the circle of the Upper Rhine, which runs into the Eder, two miles ſouth-ſouth-eaſt of Fritzlar, in the county of Waldeck.

ELBEDOU'I, a town of Arabia, in the country of Yemen: fourteen miles ſouth of Abu Ariſch.

EL'BERT, a county of the American States, in the upper diſtrict of Georgia, on the tract of land between Tugulo and Broad rivers. The ſouth-eaſt corner of the county is at their confluence, at the town of Peterſburg. On the north-weſt it is bounded by Franklin county. Elberton, the ſeat of juſtice in this county, is twenty-three miles north-weſt of Peterſburg, and thirty ſouth-eaſt of Franklin court-houſe.

EL'BERTON, a poſt-town of the American States, in Effingham county, Georgia, on the north-eaſt bank of Ogeechee river, nineteen miles weſt of Ebenezer, forty-eight north-weſt of Savannah, and fifty-five ſouth-eaſt of Louiſville. Lat. 32. 18. 45. N. lon. 80. 30. W.

ELBEUF', a town of France, in the department of the Lower Seine, and chief place of a canton, in the diſtrict of Rouen; with a manufacture of cloth, on the Seine: ten miles ſouth of Rouen.

EL'BING, or ELBLANG, a ſea-port town of Pruſſia, ſituated on a river of the ſame name, near the Friſche Haffe, built in 1239; ſeven years after its foundation it enjoyed the privilege of coining money. It is a place of conſiderable trade, and was till very lately Hanſeatic. The Roman Catholics make uſe of the largeſt church, the Lutherans have eight others, the Calviniſts have places of worſhip, and other ſects are tolerated: thirty miles ſouth-eaſt of Dantzick.

ELBO'IC, *ſ.* A rude kind of compoſition in proſe or verſe; a rough line or verſe.

EL'BOW, *ſ.* [elboga, Sax.] The next joint or curvature of the arm below the ſhoulder:

In ſome fair evening, on your *elbow* laid,
You dream of triumphs in the rural ſhade. *Pope.*

Any flexure or angle.—Fruit trees, or vines, ſet upon a wall between *elbows* or buttreſſes of ſtone, ripen more than upon a plain wall. *Bacon.*

To be at the ELBOW. To be near; to be at hand:

Strait will he come;
Wear thy good rapier bare, and put it home:
Quick, quick; fear nothing, I'll *be at thy elbow*. *Shakeſp.*

To EL'BOW, *v. a.* To puſh with the elbow.—One *elbows* him, one joſtles in the ſhole. *Dryden.*—To puſh; to drive to a diſtance; to encroach upon:

It thruſts and ſtretches out,
And *elbows* all the kingdoms round about. *Dryden.*

To EL'BOW, *v. n.* To jut out in angles.

ELBOWCHA'IR, *ſ.* A chair with arms to ſupport the elbows.—Swans and *elbowchairs*, in the opera of Diocleſian, have danced upon the Engliſh ſtage with good ſucceſs. *Gay.*

EL'BOWING, *part. act.* Puſhing with the elbows; encroaching upon; bending out like an elbow.

EL'BOWROOM, *ſ.* Room to ſtretch out the elbows on each ſide; perfect freedom from confinement.—A politician muſt put himſelf into a ſtate of liberty to provide *elbowroom* for conſcience to have its full play in. *South.*

Now my foul hath *elbowroom*;
It would not out at windows nor at doors. *Shakeſpeare.*

ELBU'GA, a river of Ruſſia, in the government of Caucaſus, which runs into the Kagalinſk, twelve miles eaſt of Azoph.

EL'BURG, or ELBURCH, a town of the United Dutch States, in Guelderland, ſituated on the eaſtern ſhore of the Zuyder Sea: thirty-four miles north-north-eaſt of Utrecht. Lat. 52. 28. N. lon. 23. 13. E. Ferro.

ELCE'SAITES, in church hiſtory, ancient heretics, who appeared in the reign of the emperor Trajan, and took their name from their leader Elceſai. They held a mean between the Jews, Chriſtians, and Pagans; they worſhipped one God, obſerved the Jewiſh ſabbath, circumciſion, and other ceremonies of the law. They rejected the Pentateuch, and the prophets; nor had they much reſpect for the writings of the apoſtles, particularly thoſe of St. Paul.

EL'CHE, a town of Spain, in the province of Valencia, ſituated in a foreſt of palms and olive-trees; the environs produce a great quantity of wine, and feed a number of cattle; the water is ſalt, and not good; that which the inhabitants drink is brought from a diſtance. Several magnificent remains of its ancient ſplendour make it ſuppoſed to be the ancient *Ilici*: eight miles ſouth-weſt of Alicant.

EL'CHE, a town of Spain, in New Caſtile: twenty-ſeven miles ſouth-eaſt of Alcaraz.

ELCHIN'GEN, an abby of Germany, in the circle of Swabia, the abbot of which is a prince, and pays fifty florins for a Roman month, and is taxed 162 rix-dollars and twenty-nine kruitzers to the imperial chamber: its territory includes about fifteen villages near Ulm.

ELCO'SIS, *ſ.* [ελκος, Gr. an ulcer.] A diſeaſe attended with fœtid carious ulcers.

ELD, *ſ.* [ealb, Sax. *eld*, Scottiſh.] Old age; decrepitude:

Thy blazed youth
Becomes aſſuaged, and doth beg the alms
Of palſied *eld*. *Shakeſpeare.*

Old people; persons worn out with years.—They count him of the green-hair'd *eld*. *Chapman*.

EL'DA, a town of Spain, in the province of Valencia: twenty miles west-north-west of Alicant.

EL'DAD, [Heb. the love of God.] A man's name.

ELDAG'SEN, or ELDAGSHAUSEN, a town of Germany, in the circle of Lower Saxony, and principality of Calenburg: sixteen miles east-north-east of Hameln.

EL'DEN HOLE, in Derbyshire. See PEAK.

ELDE'NA, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania: three miles east of Griefswalda.

EL'DER, *s.* in botany. See SAMBUCUS and VIBURNUM.

EL'DER, *adj.* the comparative of *eld*, now corrupted to *old*; [ealo, ealdon, Sax.] Surpassing another in years; survivor; having the privileges of primogeniture: opposed to *younger*.—They bring the comparison of younger daughters conforming themselves in attire to their *elder* sisters. *Hooker*.

Fame's high temple stands;
Stupendous pile; not rear'd by mortal hands!
Whate'er proud Rome, or artful Greece beheld,
Or *elder* Babylon, its frame excell'd. *Pope*.

EL'DER-GUN, *s.* A pop-gun made of elder:

Who disinherited one son
For firing off an *elder-gun*. *Churchill*.

EL'DERS, *s.* Persons whose age gives them a claim to credit and reverence.—Rebuke not an *elder*, but intreat him as a father, and the younger men as brethren. 1 *Tim.* v. 1.

The blushing youth their virtuous awe discloses,
And from their seats the reverend *elders* rose. *Sandys*.

Ancestors.—Says the goose, If it will be no better, e'en carry your head as your *elders* have done before you. *L'Estrange*.

I lose my patience, and I own it too,
Where works are censur'd, not as bad, but new;
While, if our *elders* break all reason's laws,
Those fools demand not pardon, but applause. *Pope*.

Those who are older than others.—At the board, and in private, it very well becometh children's innocency to pray, and their *elders* to say, Amen. *Hooker*.

ELDERS, in the Jewish history, were persons the most considerable for age, experience, and wisdom. Of this sort were the *Seventy* men whom Moses associated to himself in the government of his people; such, likewise, afterwards were those who held the first mark in the synagogue, as presidents. In the first assemblies of the primitive Christians, those who held the first places were called *elders*. The word *presbyter*, often used in the New Testament, is of the same signification: hence the first councils of Christians were called *presbyteria*, or councils of elders. The same denomination is still retained in the presbyterian discipline in Scotland. The elders are officers, who, in conjunction with the pastors, or ministers, and deacons, compose the consistories or kirk-sessions, meeting to consider, inspect, and regulate, matters of religion and discipline. They are chosen from among the people, and are received publicly with some degree of ceremony.

EL'DERLY, *adj.* Inclining to old age.

EL'DERSHIP, *s.* Seniority; primogeniture.—The world, while it had scarcity of people, underwent no other dominion than paternity and *eldership*. *Raleigh*.

Nor were the *eldership*
Of Artaxerxes worth our least of fears,
If Memnon's interest did not prop his cause. *Rowe*.

Presbytery; ecclesiastical senate; kirk-session.—That controversy sprang up between Beza and Erastus, about the matter of excommunications; whether there ought to be in all churches an *eldership*, having power to excommunicate, and a part of that *eldership* to be of necessity certain chosen out from amongst the laity. *Hooker*.

EL'DEST, *adj.* The superlative of *eld*, now changed to *old*; [ealo, ealdon, ealdrte, Sax.] The oldest; that has the right of primogeniture:

We will establish our estate upon
Our *eldest* Malcolm, whom we name hereafter
The prince of Cumberland. *Shakespeare*.

The person that has lived most years.—*Eldest* parents signifies either the oldest men and women that have had children, or those who have longest had issue. *Locke*.

ELDITZ'KA, a fortress of Russia, in the government of Upha, on the river Upha: fifty miles north of Upha.

ELD'PACH, a town of Germany, in the archduchy of Austria: six miles south of Ips.

EL'DRED, a man's name.

ELE'A, in ancient geography, a district of Peloponnesus, situated between Achaia and Messenia, reaching from Arcadia to the Ionian sea.

ELEA'LEH, [Heb. the ascension of God.] A city of Palestine, situated in the land of the Amorites, east of Jordan. This city was destroyed by the Israelites in their contest with Sihon, during the journey to Canaan, and was afterwards assigned to the Reubenites, who rebuilt it. *Num.* xxxii. 37.

ELEA'SA, the place where Judas Maccabeus encamped previous to the battle in which he lost his life. 1 *Macc.* ix. 5.

EL'EANOR, [Camden supposes it to be a corruption of *Helena*; others derive it from æl eamen, Sax. all fruitful.] A name of women.

ELEA'TIC, *adj.* Belonging to Elea; belonging to the sect founded by Parmenides, a native of Elea.

ELEA'TIC PHILOSOPHY, among the ancients, a name given to that of the Stoics, because taught at Ελεα, in Latin *Velia*, a town of the Lucani. The founder of the Eleatic sect is supposed to have been Xenophanes, who lived about the 56th olympiad, almost 600 years before Christ. This sect was divided into two parties, the one rejecting, and the other approving, the appeal to fact and experiment. Of the former kind were Xenophanes, Parmenides, Melissus, and Zeno, of Elea. They are supposed to have maintained principles not unlike those of Spinoza; they held the eternity and immutability of the world; that whatever existed was only one being; that this one being was immoveable and immutable, and was the true God; and whatever changes seemed to happen in the universe, they considered as mere illusions of sense. The other branch of the Eleatic sect were the atomic philosophers, who formed their system from an attention to the phenomena of nature; of these the most considerable were Leucippus, Democritus, and Protagoras.

ELEA'ZAR, [אלעזר Heb. of אל God, and עזר help, *i. e.* the help of God.] A man's name.

ELEA'ZAR, high-priest of the Hebrew nation, was the third son of Aaron, and his successor in that office. His elder brethren, Nadab and Abihu, were struck dead during their father's life-time for presuming to burn incense in the tabernacle with strange fire, contrary to the divine command. On the death of Aaron on mount Hor, about the year before Christ 1452, Eleazar was invested by Moses with the robes belonging to his father's dignity. We have little information concerning him, excepting that he continued to discharge the duties of the high-priesthood during the remainder of the life of Moses, and the whole of the administration of Joshua; and that he survived the latter but a short time, dying most probably about the year before Christ 1427.

ELEA'ZAR, high-priest of the Jews, was raised to that office on the death of his brother, Simon the Just, about 292 years before Christ. It was during his pontificate, according to the testimony of Aristæas, which was implicitly received by Josephus, and after him by Justin Martyr, Irenæus, Cyril, Chrysostom, Epiphanius, and others

others of the Chriſtian fathers, that Ptolemy Philadelphus, king of Egypt, ſent an embaſſy to Jeruſalem, with rich preſents, in order to obtain a copy of the ſacred books of the Hebrews, which he placed in the library at Alexandria. Eleazar died after he had filled the ſtation of high-prieſt about thirty-two years.

ELECAMPA'NE, *ſ.* [*helenium*, Lat.] A plant, named alſo ſtarwort. See INULA.—The Germans have a method of candying *elecampane* root like ginger, to which they prefer it, and call it German ſpice. *Hill.*

To ELE'CT, *v. a.* [*electus*, Lat.] To chooſe for any office or uſe; to take in preference to others:

Henry his ſon is choſen king, though young;
And Louis of France, *elected* firſt, beguil'd. *Daniel.*

[In theology.] To ſelect as an object of eternal mercy.

ELE'CT, *adj.* Choſen; taken by preference from among others:

You have here, lady,
And of your choice, theſe reverend fathers,
Yea, the *elect* of the land, who are aſſembled
To plead your cauſe. *Shakeſpeare.*

Choſen to an office not yet in poſſeſſion.—The biſhop *elect* takes the oaths of ſupremacy, canonical obedience, and againſt ſimony; and then the dean of the arches reads and ſubſcribes the ſentences. *Ayliffe.*—[In theology.] Choſen as an object of eternal mercy:

Some I have choſen of peculiar grace,
Elect above the reſt: ſo is my will. *Milton.*

ELEC'TION, *ſ.* [*electio*, Lat.] The act of chooſing; the act of ſelecting one or more from a greater number for any uſe or office; choice.—If the *election* of the miniſter ſhould be committed to every ſeveral pariſh, do you think that they would chooſe the meeteſt? *Whitgift.*—The power of choice:

For what is man without a moving mind,
Which hath a judging wit, and chuſing will!
Now if God's pow'r ſhould her *election* bind,
Her motions then would ceaſe, and ſtand all ſtill. *Davies.*

Voluntary preference.—He calls upon the ſinners to turn themſelves and live; he tells us, that he has ſet before us life and death, and referred it to our own *election* which we will chooſe.—Diſcernment; diſtinction; diſcrimination.—In favour, to uſe men with much difference and *election* is good: for it maketh thoſe preferred more thankful, and the reſt more officious. *Bacon.*—[In theology.] The predetermination of God by which any were ſelected for eternal life.—The conceit about abſolute *election* to eternal life, ſome enthuſiaſts entertaining, have been made remiſs in the practice of virtue. *Atterbury.*—The ceremony of a public choice.—I was ſorry to hear with what partiality, and popular heat, *elections* were carried in many places. *King Charles.*

ELEC'TION, *ſ.* in law, is when a man is left to his own free will, to take or do one thing or another, which he pleaſes. And if it be given of ſeveral things, he who is the firſt agent, and ought to do the firſt act, ſhall have the election: as if a perſon make a leaſe, rendering rent, or a garment, &c. the leſſee ſhall have the election, as being the firſt agent, by the payment of the one, or delivery of the other. *Co. Litt.* 144. And if A. covenant to pay B. a pound of pepper or ſugar, before Eaſter; it is at the election of A. at all times before Eaſter, which of them he will pay: but if he pays it not before the ſaid feaſt, then afterwards it is at the election of B. to demand and have which he pleaſeth. *Dyer*, 18. 5 *Rep.* 59. If I give to you one of my horſes in my ſtable, there you ſhall have the election; for you ſhall be the firſt agent, by taking or ſeizure of one of them. *Co. Litt.* 145. If things granted are annual, and to have continuance, the election (where the law gives it him) remains to the grantor, as well after the day as before: but it is otherwiſe when to be performed at once. When nothing paſſes to the feoffee or grantee before election to have the one thing or the other, the election ought to be made in the life of the parties; and the heir or executor cannot make the election: but where an eſtate or intereſt paſſes immediately to the feoffee, donee, &c. there election may be made by them, or their heirs or executors. 2 *Rep.* 36. And when one and the ſame thing paſſeth to the donee or grantee, and ſuch donee or grantee hath election in what manner he will take it, there the intereſt paſſeth immediately, and the party, his heirs, &c. may make election when they will. *Co. Litt.* 145.

Where the election creates the intereſt, nothing paſſes till election; and if no election can be made, no intereſt will ariſe. *Hob.* 174. If the election is given to ſeveral perſons, there the firſt election made by any of the perſons ſhall ſtand: as if a man leaſes two acres to A. for life, remainder of one acre to B. and of the other acre to C. now B. or C. may elect which of the acres he will have, and the firſt election by one binds the other. *Co. Litt.* 145. If a man leaſes two acres for life, the remainder of one in fee to the ſame perſon; and after licenſes the leſſee to cut trees in one acre, this is an election that he ſhall have the fee in the other acre. 2 *Danv.* 762. A real election concerning lands is deſcendible; and election of a tenant in tail may prejudice his iſſue. He in remainder may make an election, after the death of tenant for life; but if the tenant for life do make election, the remainder-man is concluded. *Moor, Ca.* 247.

A perſon grants a manor, except one cloſe called N. and there are two cloſes called by that name, one containing nine acres, and the other but three acres; the grantee ſhall not in this caſe chooſe which of the ſaid cloſes he will have, but the grantor ſhall have election which cloſe ſhall paſs. 1 *Leon.* 268. But if one grants an acre of land out of a waſte or common, and doth not ſay in what part, or how to be bounded, the grantee may make his election where he will. 1 *Leon.* 30. Where there are three coparceners of lands, upon partition the eldeſt ſiſter ſhall have the election: though if ſhe herſelf make the partition, ſhe loſes it, and ſhall take laſt of all. *Co. Litt.* 166.

A condition of a bond is, that the obligor ſhall pay thirty pounds, or twenty kine, at the obligee's election, within ſuch a time; the obligee at his peril is to make his election within the time limited. 1 *Leon.* 69. Though in debt upon bond to pay ten pounds on ſuch a day, or four cows, at the then election of the obligee, it was adjudged, that it was not enough for the defendant to plead that he was always ready, &c. if the obligee had made his election; for he ought to tender both at the day, by reaſon the word *then* relates to the day of payment. 1 *Nelſ.* 694, 695. If a man hath an election to do one of two things, and he cannot by any default of a ſtranger, or of himſelf, or the obligee, or by the act of God, do the one, he muſt at his peril do the other. 1 *Lil. Abr.* 506.

Where the law allows a man two actions to recover his right, it is at his election to bring which he pleaſeth: and when a man's act may work two ways, both ariſing out of his intereſt, he hath election given him to uſe it either way. *Dyer*, 20. Action of treſpaſs upon the caſe, or action of treſpaſs *vi & armis*, may be brought againſt one that reſcues a priſoner, at the election of the party damnified by the reſcous. And an action on the caſe, or an aſſiſe, lies againſt him that ſurcharges a common, at the election of him that is injured thereby. 1 *Lil.* 504. Alſo for a rent-charge out of lands, there may be a writ of annuity or diſtreſs, at the election of the grantee: but after the death of the grantor, if the heir be not charged, the election to bring annuity ceaſeth. *Dyer*, 344.

A man was indicted of felony for entering a houſe and taking away money, and found guilty, and burnt in the hand; after which the perſon who loſt the money brought an action of treſpaſs againſt the other for breaking his houſe, and taking away his money; and it was held that the action would lie; for though it was at his election at firſt, either to prefer an indictment or bring an action, yet

by the indictment he had made no election, becauſe that was not the proſecution of the party, but of the crown. *Style*, 347.

If a bargain and ſale be made of lands, which is inrolled, and at the ſame time the bargainor levies a fine thereof to the bargainee, he hath his election to take by one or the other. 4 *Rep.* 72. A wife hath her election which to take, of a jointure made after marriage, or her dower, on the death of the huſband, and not before. *Dyer*, 358. When a leſſor hath election to charge the leſſee, or his aſſignee, for rent; if he accepts the rent of the aſſignee, he hath determined his election. 3 *Rep.* 24. If a perſon hath election to pay or perform one of two things at a day, and he do neither of them at that day, his election is gone: and where a grant is made of two acres of land, the one for life, the other in fee, or in tail, and before any election the feoffee makes a feoffment of both; in this caſe the election will be gone, and the feoffor may enter upon which he will for the forfeiture. 2 *Rep.* 37. If money on a mortgage be to be paid to a man, his heirs, or executors, the mortgagor hath election to pay it to either: and if in a feoffment it be to pay to the feoffee, his heirs or aſſigns, and he enfeoff another, the feoffor may pay the money to the firſt or ſecond feoffee, &c. *Co. Litt.* 210. In ſome caſes, where one hath cauſe of ſuit, he may ſue one perſon or another at his election; for there is an election of perſons, as well as of things. *Dyer*, 204. A man by deed binds himſelf and his heirs to pay money, and dies; the obligee may chooſe to ſue the heir, or the executors, although both of them have aſſets. *Poph.* 151. One may have election, when he hath recovered a debt, to have his execution by *elegit; fieri facias*, or *capias ad ſatisfaciendum*; but where he takes an *elegit*, and hath no fruit of it, he may reſort to another writ, though the election be entered on record. *Hob.* 57. But there is no election againſt the king in his grants, &c. 1 *Leon.* 30.

ELECTION OF A CLERK OF STATUTES-MERCHANT. A writ that lies for the choice of a clerk aſſigned to take bonds called *ſtatutes-merchant*; and is granted out of the chancery, upon ſuggeſtion that the clerk formerly aſſigned is gone to dwell at another place, or is under ſome impediment to attend the duty of his office, or hath not lands ſufficient to anſwer his tranſgreſſions, if he ſhould act amiſs, &c.

ELECTION OF ECCLESIASTICAL PERSONS. There is to be a free election for the dignities of the church. 9 *Edw.* II. c. 14. And none ſhall diſturb any perſon from making free election, on pain of great forfeiture. If any perſons that have a voice in elections, take any reward for an election in any church, college, ſchool, &c. the election ſhall be void: and if any of ſuch ſocieties reſign their places to others for reward, they incur a forfeiture of double the ſum; and the party giving it, and the party taking it, is incapable of ſuch place. 31 *Eliz.* c. 6.

ELECTION OF MEMBERS OF PARLIAMENT. See the article PARLIAMENT.

ELECTION OF A VERDEROR OF THE FOREST. A writ which lies for the choice of a verderor, where any of the verderors of the foreſt are dead, or removed from their offices, &c. It is directed to the ſheriff; and, as appears by the ancient writs of this kind, the verderor is to be elected by the freeholders of the county, in the ſame manner as coroners.

ELECTIONEER'ING, *ſ.* Concern in parliamentary elections.—Adieu, ſay I, to all *electioneering*. *Soame Jenyns.*

ELEC'TIONS, or CHOICE, *ſ.* in algebra, a calculation of the ſeveral different ways of taking any number of things propoſed, either ſeparately, or as combined in pairs, in threes, in fours, &c. not as to the order, but only as to the number and variety of them. Thus, of the things *a*, *b*, *c*, *d*, *e*, &c. the elections of
one thing are (*a*,) $1 = 2^1 - 1$,
two things are (*a*, *b*, *ab*) $3 = 2^2 - 1$,
three things are (*a*, *b*, *c*, *ab*, *ac*, *bc*, *abc*) $7 = 2^3 - 1$, &c.
and of any number, *n*, all the elections are $2^n - 1$; that is, one leſs than the power of 2 whoſe exponent is *n*, the number of ſingle things to be choſen, either ſeparately or in combination.

ELEC'TIVE, *adj.* Regulated or beſtowed by election or choice.—I will ſay poſitively and reſolutely, that it is impoſſible an *elective* monarchy ſhould be ſo free and abſolute as an hereditary. *Bacon.*—Exerting the power of choice.—To talk of compelling a man to be good, is a contradiction; for where there is force, there can be no choice: whereas all moral goodneſs conſiſteth in the *elective* act of the underſtanding will. *Grew.*

ELEC'TIVE ATTRAC'TION. See the article CHEMISTRY, vol. iv p. 174, &c.

ELEC'TIVELY, *adv.* By choice; with preference of one to another.—How or why that ſhould have ſuch an influence upon the ſpirits, as to drive them into thoſe muſcles *electively*, I am not ſubtle enough to diſcern. *Ray.*

ELEC'TOR, *ſ.* He that has a vote in the choice of any officer:

From the new world her ſilver and her gold
Came, like a tempeſt, to confound the old;
Feeding with theſe the brib'd *electors'* hopes,
Alone ſhe gave us emperors and popes. *Waller.*

A prince who has a voice in the election or choice of the German emperor.—See the article GERMANY.

ELEC'TORAL, *adj.* Having the dignity of an elector. Belonging to an elector, or to the body of electors of Germany.—The emperor gave the ſolemn inveſtiture of the *electoral* dignity to the plenipotentiary of Erneſt Auguſtus. *Collins.*—Of the three colleges of the empire, the firſt is the *electoral*. *Guthrie.*

ELEC'TORATE, *ſ.* The territory of an elector. It is uſed as well to ſignify the dignity of, as the territories belonging to, any of the electors of Germany; ſuch are Bavaria, Saxony, Hanover, &c.

ELEC'TRA, one of the Oceanides, wife of Atlas, and mother of Dardanus, by Jupiter. *Ovid. Faſt.* 4.—A daughter of Agamemnon king of Argos. She firſt incited her brother Oreſtes to revenge his father's death by aſſaſſinating his mother Clytemneſtra. Oreſtes gave her in marriage to his friend Pylades, and ſhe became mother of two ſons, Strophius and Medon. Her adventures and misfortunes form one of the intereſting tragedies of the poet Sophocles. *Elian.*—A ſiſter of Cadmus. *Pauſ.* 9, c. 8.—A city and river of Meſſenia in Peloponneſus. *Pauſ.* 4, c. 33.—One of Helen's female attendants. *Id.* 10, c. 25.

ELEC'TRAL, *adj.* for *electric* or *electrical*, occurs in a poem of Shenſtone's, publiſhed after his death, but is an unneceſſary and a misformed word. *Maſon's Supplement.*—Upon which we have the following remarks in the Monthly Magazine: The adjectives *electric*, *electral*, and *electrical*, have all been uſed by writers of education: are they in purity, as in meaning, equivalent? The termination *ic* derives from the Greek ικος, as μοναρχης, monarch, μοναρχικος, monarchic; κωμος, fun, κωμικος, comic: the termination *al* derives from the Latin *alis*, as *æquare*, to level; *æqualis*, equal; *navis*, a ſhip; *navalis*, naval: but the termination *ical* is a hybrid coaleſcence of the Greek and Latin formative ſyllables, a mongrel affix peculiar to Engliſh language. If then the ſpirit of our language does not favour the breed of mule words, it would follow, that, where the radical ſubſtantive or etymon is Greek, the inflection of the derived adjective ſhould be in *ic*; and where the etymon is Latin, in *al*: but that, to words of low and ludicrous ſignification, an affix *ical*, ſomewhat barbarous and illiterate in its very compoſition, would beſt be adapted: as *whimſical*, *finical*, *pedantical*, *ſatirical*. As the old word *electre*, amber, may come from the Greek, or from the Latin, the adjectives *electric* or *electral* are alike proper. *Monthly Mag.* vol. xii. p. 300.

ELEC'TRE, *ſ.* [*electrum*, Lat.] Amber; which, having the quality when warmed by friction, of attracting bodies, gave to one ſpecies of attraction the name of *electricity*, and to the bodies that ſo attract, the epithet

electric.

electric. A mixed metal.—Change ſilver plate or veſſels into the compound ſtuff, being a kind of ſilver *electre*, and turn the reſt into coin. *Bacon.*

ELEC'TRESS, *ſ.* The wife or widow of a German elector.—The *electreſs* Palatine has ſent me ſix wild boars' heads. *Cheſterfield.*—The act of parliament ſettled the crown on the *electreſs* Sophia and her deſcendants, being proteſtants. *Burke.*

ELEC'TRIC, or ELECTRICAL, *adj.* [*electrum*, Lat.] Attractive by a peculiar property, ſuppoſed once to belong chiefly to amber.—An *electric* body can by friction emit an exhalation ſo ſubtle, and yet ſo potent, as by its emiſſion to cauſe no ſenſible diminution of the weight of the *electric* body, and to be expanded through a ſphere, whoſe diameter is above two feet, and yet to be able to carry up lead, copper, or leaf-gold, at the diſtance of above a foot from the *electric* body. *Newton.*—Produced by an electric body.—If that attraction were not rather *electrical* than magnetical, it was wonderous what Helmont delivereth concerning a glaſs, wherein the magiſtery of loadſtone was prepared, which retained an attractive quality. *Brown.*

ELEC'TRIC, *ſ.* the globe, cylinder, or barrel, of an electrical machine. This term is alſo applied to all ſubſtances in which the electric fluid can be excited and accumulated, without tranſmitting it; and which are therefore called *non-conductors*. They are alſo called *original electrics*, and *electrics per ſe*. To the claſs of non-conductors belong glaſs, and all vitrifications, even of metals; all gems, of which the moſt tranſparent are the beſt; all reſins, and reſinous compoſitions; alſo ſulphur, baked wood, all bituminous ſubſtances, wax, ſilk, cotton, all dry animal ſubſtances, as feathers, wool, hair, &c.; alſo paper, white ſugar, and ſugar-candy; likewiſe air, oils, chocolate, calces of metals, the aſhes of animal and vegetable ſubſtances, the ruſt of metals, all dry vegetable ſubſtances, and ſtones, of which the hardeſt are the beſt.

ELEC'TRICA, *ſ.* with phyſicians. Medicines which have the quality of drawing.

ELEC'TRICALNESS, *ſ.* The quality of being electrical. *Scott.*

ELECTRICITY, *ſ.* [from ηλεκτρον, *amber*, as having the power to *excite*, or *attract*.] The ſcience which inveſtigates and explains the nature and properties of that active and ſubtile matter, which philoſophers have agreed to call *electric fluid*; or that exceedingly elaſtic principle, which when excited by friction, is found to reſide more or leſs in all bodies or ſubſtances with which we are acquainted. No one branch of natural philoſophy, perhaps, hath attracted more attention than the doctrine of electricity; and indeed there are few which ſeem more worthy of inveſtigation. When we conſider the diſtinguiſhed part which electricity apparently performs in the grand operations of nature; the aſtoniſhing, and, on the firſt view, the inexplicable effects produced by its power, ſo different from thoſe of any other; and its ſecret and concealed mode of action, which the moſt acute obſervers have not hitherto been able fully to penetrate; it will not appear ſurpriſing that both the learned and the unlearned ſhould, with unabated zeal, have employed their attention on this phenomenon, as important to ſpeculative philoſophy, as by its medical influence it is intereſting to ſociety.

The property of excitation which amber poſſeſſes, certainly furniſhed the firſt idea of electricity. Thales, ſix hundred years before Chriſt, and Theophraſtus, three hundred years before the ſame era, recorded this electrical property in amber. See the article AMBER, vol. i. p. 398. It was afterwards noticed by Pliny, and other later naturaliſts, particularly Gaſſendus, Kenelm Digby, and ſir Thomas Brown. But it was generally imagined that this quality was peculiar to amber and jet, and perhaps agate, till W. Gilbert, a native of Colcheſter, and a phyſician in London, publiſhed his treatiſe *De Magnete*, in the year 1600. Dr. Gilbert made many conſiderable experiments and diſcoveries, conſidering the then infant ſtate of the ſcience. He greatly enlarged the liſt of electrics, and of the bodies on which they act: he remarked, that a dry air was moſt favourable to electrical phenomena, whilſt a moiſt air almoſt annihilates the electric principle: he alſo obſerved the conical figure aſſumed by electrified drops of water: he conſidered electrical attraction ſeparately from repulſion, which he thought had no place in electricity, as a phenomenon ſimilar to the attraction of coheſion; and, he imagined, that electrics were brought into contact with the bodies on which they act by their effluvia, excited by friction.

The ingenious Mr. Boyle alſo added to the catalogue of electric ſubſtances; but he thought that glaſs poſſeſſed this power in a very low degree: he found, that the electricity of all bodies, in which it might be excited, was increaſed by wiping and warming them; that an excited electric was acted upon by other bodies as ſtrongly as it acted upon them; that diamonds rubbed againſt any kind of ſtuff, emitted light in the dark; and that feathers would cling to the fingers, and to other ſubſtances, after they had been attracted by electrics. He accounted for electrical attraction, by ſuppoſing a glutinous effluvia emitted from electrics, which laid hold of ſmall bodies, in its way, and carried them back to the body from which it proceeded.

Otto Guericke, the celebrated inventor of the air-pump, lived about the ſame time. This ingenious philoſopher diſcovered, by means of a globe of ſulphur, that a body once attracted by an electric, was next repelled, and continued in this ſtate of repulſion till it ſhould be touched by ſome other body: he alſo obſerved the ſound and light produced by the excitation of the tube; and that bodies immerged in electrical atmoſpheres are themſelves electrified with an electricity oppoſite to that of the atmoſphere.

The light emitted by electrical bodies was, not long after, obſerved to much greater advantage by Dr. Wall, who aſcribes to light the electrical property which they poſſeſs; and he ſuggeſted a ſimilarity between the effects of electricity and lightning. Sir Iſaac Newton was not inattentive to this ſubject: he obſerved that glaſs attracts light bodies on the ſide oppoſite to that on which it is rubbed; and he aſcribes the action of electric bodies to an elaſtic fluid, which freely penetrates glaſs, and the emiſſion of it to the vibratory motions of the parts of excited bodies.

Mr. Hawkſbee wrote copiouſly on this ſubject in 1709, when a new era commenced in the hiſtory of electricity. He firſt took notice of the great electrical power of glaſs, and light proceeding form it; though others had before obſerved the light proceeding from other electrified ſubſtances: he alſo noted the noiſe occaſioned by it, with a variety of phenomena relating to electrical attraction and repulſion. He firſt introduced a glaſs globe into the electrical machine, to which circumſtance it was that many of his important diſcoveries were owing. After his time there was an interval of near twenty years in the progreſs of this ſcience, until the experiments and writings of Mr. Stephen Grey gave new vigour to this intereſting inquiry. To him we owe the capital diſcovery of communicating the power of native electrics to other bodies, in which it cannot be excited, by ſupporting them on ſilken lines, hair lines, cakes of reſin or glaſs; and a more accurate diſtinction than had hitherto been obtained between electrics and non-electrics: he alſo ſhewed the effect of electricity on water much more obviouſly than Gilbert had done in the infancy of the ſcience.

The experiments of Mr. Grey were repeated by M. du Faye, member of the academy of ſciences at Paris, to which he added many new experiments and diſcoveries of his own. He obſerved, that electrical operations are obſtructed by great heat, as well as by a moiſt air; that all bodies, both ſolid and fluid, would receive electricity, when placed on warm or dry glaſs, or ſealing-wax; that

thoſe bodies which are naturally the leaſt electric, have the greateſt degree of electricity communicated to them by the approach of the excited tube. He tranſmitted the electric virtue through a diſtance of 1256 feet; and firſt obſerved the electric ſpark from a living body, ſuſpended on ſilken lines, and noted ſeveral circumſtances attending it. M. du Faye alſo eſtabliſhed a principle, firſt ſuggeſted by Otto Guericke, that electric bodies attract all thoſe that are not ſo, and repel them as ſoon as they are become electric, by the vicinity or contact of the electric body. He likewiſe ſuppoſed, from other experiments, that there were two kinds of electricity, one of which he called the *vitreous*, belonging to glaſs, rock cryſtal, &c. and the other *reſinous*, as that of amber, gumlac, &c. diſtinguiſhed by their repelling thoſe of the ſame kind, and attracting each other. He farther obſerved, that communicated electricity had the ſame property as the excited; and that electrical ſubſtances attract the dew more than conductors.

Mr. Grey, reſuming his experiments in 1734, ſuſpended ſeveral pieces of metal on ſilken lines, and found that by electrifying them they gave ſparks; which was the origin of metallic conductors: and on this occaſion he diſcovered a cone or pencil of electric light, ſuch as is now known to iſſue from an electrified point. From other experiments he concluded, that the electric power was of the ſame nature with that of thunder and lightning.

Dr. Deſaguliers ſucceeded Mr. Grey in the proſecution of this ſcience. The account of his firſt experiments is dated in 1739. To him we owe thoſe technical terms of *conductors* or *non-electrics* and *electrics per ſe*; and he firſt ranked pure air among the electrics per ſe, and ſuppoſed its electricity to be of the vitreous kind. After the year 1742, in which Dr. Deſaguliers concluded his experiments, the ſubject was taken up and purſued in Germany: the globe was ſubſtituted for the tube, which had been uſed ever ſince the time of Hawkſbee, and a cuſhion was ſoon after uſed as a rubber, inſtead of the hand. About this time too, ſome uſed cylinders inſtead of the globes; and ſome of the German electricians made uſe of more globes than one at the ſame time. By thus increaſing the electrical power, they were the firſt who ſucceeded in ſetting fire to inflammable ſubſtances: this was firſt done by Dr. Ludolf, in 1744; who, with ſparks excited by the friction of a glaſs tube, kindled the ethereal ſpirit of Frobenius. Winkler did the ſame by a ſpark from his own finger, by which he kindled French brandy, and other ſpirits, after previouſly heating them. Mr. Gralath fired the ſmoke of a candle juſt blown out, and ſo lighted it again; and Mr. Boze fired gunpowder, by means of its inflammable gas. About this time Ludolf the younger demonſtrated, that the luminous barometer was made perfectly electrical by the motion of the quickſilver. The electrical ſtar and electrical bells were alſo of German invention.

In England, Dr. Watſon made a diſtinguiſhed figure from this period in the ſcience of electricity: he fired a variety of ſubſtances by the electrical ſpark, and firſt diſcovered that they are capable of being fired by the repulſive power of electricity. In 1745, the accumulation of the electrical power in glaſs, by means of the Leyden phial, was firſt diſcovered. Dr. Watſon obſerved that glaſs tubes and globes do not contain the electric matter in themſelves, but only ſerve as *firſt-movers* or *determiners*, as he expreſſes it, of that power; which was alſo confirmed towards the end of 1746, by Mr. Benjamin Wilſon, who made the ſame diſcovery, that the electric fluid does not come from the globe, but from the earth, and other non-electric bodies about the apparatus. Dr. Watſon alſo diſcovered what Dr. Franklin obſerved about the ſame time in America, called the *plus* and *minus* in electricity. He likewiſe ſhewed that the electric matter paſſed *through* the ſubſtance of the metal of communication, and not merely over the *ſurface*. The notion of medical electricity commenced in 1747. We muſt not omit to notice other experiments and concluſions drawn from them, by Mr. Wilſon, Mr. Smeaton, and Dr. Miles, in England, and by the abbé Nollet, with regard to the effect of electricity on the evaporation of fluids, on ſolids, and on animal and other organized bodies, in France.

Whilſt the philoſophers of Europe were thus buſily employed in electrical experiments and purſuits, thoſe of America, and Dr. Franklin in particular, were equally induſtrious, and no leſs ſucceſsful. His diſcoveries and obſervations in electricity were communicated in a Series of Letters to a Friend; the firſt of which is dated in 1747, and the laſt in 1754. The ſimilarity between electricity and lightning had been ſuggeſted by ſeveral writers: but Dr. Franklin firſt propoſed a method of bringing the matter to the teſt of experiment, by raiſing an electrical kite; and he ſucceeded in collecting the electric fluid by this means from the clouds, in 1752, one month after the very ſame theory had been verified in France, and without knowing what had been done there: and to him we owe the practical application of this diſcovery, in ſecuring buildings from the damage of lightning, by the erection of metallic conductors.

In the ſubſequent period of the hiſtory of this ſcience, Mr. Canton in England, and ſignior Beccaria in Italy, acquired diſtinguiſhed reputation. They both diſcovered, independently of each other, that air is capable of receiving electricity by communication, and of retaining it when received. Mr. Canton alſo, towards the end of the year 1753, purſued a ſeries of experiments, which prove that the appearances of poſitive and negative electricity, which had hitherto been deemed eſſential and unchangeable properties of different ſubſtances, as of glaſs and ſealing-wax for inſtance, depend upon the ſurface of the electrics, and that of the rubber. This hypotheſis, verified by numerous experiments, occaſioned a controverſy between Mr. Canton and Mr. Delaval, who ſtill maintained that theſe different powers depended entirely on the ſubſtances themſelves. About this time too, ſome curious experiments were performed by four of the principal electricians of that period, viz. Dr. Franklin, and Meſſrs. Canton, Wilcke, and Æpinus, with a view to aſcertain the nature of electric atmoſpheres.

The theory of *two* electric fluids, always co-exiſtent and counteracting each other, though not abſolutely independent, was maintained by a courſe of experiments on ſilk ſtockings of different colours, communicated to the royal ſociety of London by Mr. Symmer, in 1759, which was farther purſued by Mr. Cigna of Turin, who publiſhed his account in the Memoirs of the Academy of Turin for the year 1765.

Many inſtances occur in the hiſtory of the ſcience about this period, of the aſtoniſhing force of the electric ſhock, in melting wires, and producing other ſimilar effects: but the moſt remarkable is an experiment of S. Beccaria, in which he thus revivified metals. Several experiments were alſo made by Dr. Watſon, Mr. Smeaton, Mr. Canton, and others, on the paſſage of the electric fluid through a vacuum, and its luminous appearance, and on the power poſſeſſed by certain ſubſtances of retaining the light communicated to them by an electric exploſion. Mr. Canton, S. Beccaria, and others, made many experiments to identify electricity and lightning, to aſcertain the ſtate of the atmoſphere at different times, and to explain the various phenomena of the aurora borealis, water-ſpouts, &c. on the principles of this ſcience.

Thoſe who are deſirous of farther information with reſpect to the hiſtory of electrical experiments and diſcoveries, may conſult Dr. Prieſtley's Hiſtory and Preſent State of Electricity. This author, however, is not merely an hiſtorian: his work contains many original experiments and diſcoveries made by himſelf. He aſcertained the conducting power of charcoal, and of hot glaſs; the electricity of fixed and inflammable air, and of oil; the difference between new and old glaſs, with reſpect to the diffuſion of electricity over its ſurface; the lateral exploſion

in

in electrical diſcharges; a new method of fixing circular-coloured ſpots on the ſurfaces of metals, and the moſt probable difference between electrics and conductors, &c. The ſcience is alſo greatly indebted to many other perſons, either for their experiments and improvements of it, or for treatiſes and other writings upon it; as Mr. Henley, to whom we owe ſeveral curious experiments and obſervations on the electrical and conducting quality of different ſubſtances, as chocolate, vapour, &c. with the reaſon of the difference between them; the fuſion of platina; the nature of the electric fluid, and its courſe in a diſcharge; the method of eſtimating the quantity of it in electrical bodies by an electrometer; the influence of points, &c. Alſo Meſſrs. van Marum, van Swinden, Ferguſon, Cavallo, lord Mahon, Nairne, &c. for their ſeveral treatiſes on the ſubject of electricity, any of which may be conſulted with advantage for the experiments and principles of the ſcience.

It is natural to imagine that a power of ſuch efficacy as that of electricity would eventually be applied to medical purpoſes; eſpecially, ſince it has been found invariably to increaſe the ſenſible perſpiration, to quicken the circulation of the blood, and to promote the glandular ſecretion: accordingly, many inſtances occur in the latter period of the hiſtory of this ſcience, in which it has been applied with conſiderable advantage and ſucceſs. And among the variety of caſes in which it has been tried, there are none in which it has been found prejudicial, except pregnancy and the venereal diſeaſe. In moſt diſorders, in which it has been uſed with perſeverance, it has given at leaſt a temporary and partial relief, and in many it has effected a total cure. Of which numerous inſtances may be ſeen in the Philoſ. Tranſ. and the writings on this ſcience by Meſſrs. Lovet, Weſtley, Ferguſon, Cavallo, Wilkinſon, &c.

It is hardly neceſſary to recite the ancient hypotheſes on this ſubject, or the numerous controverſies or exploded notions relative to electricity; ſuch as that of the ſympathetic powder of the Peripatetics; that of unctuous effluvia emitted by excited bodies, and returning to them again, adopted by Gilbert, Gaſſendus, ſir Kenelm Digby, and others; or that of the Carteſians, who aſcribed electricity to the globules of the firſt elements, diſcharged through the pores of the rubbed ſubſtance, and in their return carrying with them thoſe light bodies, in whoſe pores they were entangled: theſe hypotheſes were framed in the infancy of the ſcience, and of philoſophy in general, and have been wiſely given up. In the more advanced ſtate of electricity there have been ſuggeſted two principal theories, each of which has had its advocates. The one, is that of *two* diſtinct *electric fluids*, repulſive with reſpect to themſelves, and attractive of one another, adopted by M. du Faye, on diſcovering the two oppoſite ſpecies of electricity, viz. the *vitreous* and *reſinous*, and ſince new-modelled by Mr. Symmer. It was ſuppoſed by him that theſe two fluids are equally attracted by all bodies, and exiſt in intimate union in their pores; and that in this ſtate they exhibit no mark of their exiſtence. But that the friction of an electric by a rubber ſeparates theſe fluids, and cauſes the vitreous electricity of the rubber to paſs to the electric, and then to the prime conductor of a machine, while the reſinous electricity of the conductor and electric is conveyed to the rubber: and thus the quality of the electric fluid, poſſeſſed by the conductor and the rubber, is changed, while the quantity remains the ſame in each. In this ſtate of ſeparation, he contends that the two electric fluids will exert their reſpective powers; and any number of bodies charged with either of them will repel each other, attract thoſe bodies that have leſs of each particular fluid than themſelves, and be ſtill more attracted by bodies that are wholly deſtitute of it, or that are loaded with the contrary. According to this theory, the electric ſpark is ſuppoſed to make a double current; one fluid paſſing to an electrified conductor from any ſubſtance preſented to it, whilſt the ſame quantity of the other fluid paſſes from it; and when each body receives its natural quantity of both fluids, the balance of the two powers is reſtored, and both bodies are unelectrified. For a further account of this theory, ſee Dr. Prieſtley's Hiſtory, vol. ii. ſect. 3.

The other theory, now generally received, is diſtinguiſhed under the denomination of *poſitive and negative electricity*, being firſt ſuggeſted by Dr. Watſon, but digeſted, illuſtrated, and confirmed, by Dr. Franklin; and ſince that it has been known by the appellation of the Franklinian hypotheſis. It is here ſuppoſed that all the phenomena of electricity depend on one fluid, *ſui generis*, extremely ſubtile and elaſtic, diſperſed through the pores of all bodies, by which the particles of it are as ſtrongly attracted as they are repelled by one another. When bodies poſſeſs their natural ſhare of this fluid, or ſuch a quantity as they can retain by their non-attraction, it is then ſaid they are in an unelectrified ſtate; but when the equilibrium is diſturbed, and they either acquire an additional quantity *from* other bodies, or loſe part of their own natural ſhare by communication *to* other bodies, they exhibit electrical appearances. In the former caſe it is ſaid they are electrified poſitively, or *plus*; and in the other negatively, or *minus*. This electric fluid, it is ſuppoſed, moves with great eaſe in thoſe bodies that are called conductors, but with extreme difficulty and ſlowneſs in the pores of electrics; whence it comes to paſs, that all electrics are impermeable to it. It is farther ſuppoſed that electries contain always an equal quantity of this fluid, ſo that there can be no ſurcharge or increaſe on one ſide without a proportionable decreaſe or loſs on the other, and *vice verſa*; and as the electric does not admit the paſſage of the fluid through its pores, there will be an accumulation on one ſide, and a correſponding deficiency on the other. Then when both ſides are connected together by proper conductors, the equilibrium will be reſtored by the ruſhing of the redundant fluid from the overcharged ſurface to the exhauſted one. Thus alſo, if an electric be rubbed by a conducting ſubſtance, the electricity is only conveyed from one to the other, the one giving what the other receives; and if one be electrified poſitively, the other will be electrified negatively, unleſs the loſs be ſupplied by other bodies connected with it, as in the caſe of the electric and inſulated rubber of a machine. This theory ſerves likewiſe to illuſtrate the other phenomena and operations in the ſcience of electricity. Thus, bodies differently electrified will naturally attract each other, till they mutually give and receive an equal quantity of the electric fluid, and the equilibrium is reſtored between them. Beccaria ſuppoſes, that this effect is produced by the electric matter making a vacuum in its paſſage, and the contiguous air afterwards collapſing, and ſo puſhing the bodies together.

The influence of points, in drawing or throwing off the electric fluid, a moſt curious phenomenon, is ſuppoſed to depend on the leſs reſiſtance it finds to enter or paſs off through fewer particles than through a greater number, whoſe reſiſtance is united in flat or round ſurfaces. The electric light is ſuppoſed to be part of the electric fluid, which appears when it is properly agitated; and the ſound of an exploſion is produced by vibrations, occaſioned by the air's being diſplaced by the electric fluid, and again ſuddenly collapſing.

Mr. Cavendiſh has publiſhed an attempt to deduce and explain ſome of the principal phenomena of electricity in a mathematical and ſyſtematic manner, from the nature of the electric fluid, conſidered as compoſed of particles that repel each other, and attract the particles of all other matter, with a force inverſely as ſome leſs power of the diſtance than the cube, whilſt the particles of all other matter repel each other, and attract thoſe of the electric fluid, according to the ſame law. *Philoſ. Tranſ.* vol. lxi. p. 584–677.—And a ſimilar hypotheſis and method of reaſoning has been propoſed by M. Æpinus, in his *Tentamen Theoriæ Electricitatis & Magnetiſmi.*

Of the ELECTRICAL APPARATUS.

The *electrical machine* is the *primum mobile* of the electrical apparatus. It conſiſts of the electric or barrel, the moving engine or wheel, the rubber, and the prime conductor. In the early ſtate of the ſcience, for the electric, was uſed ſealing-wax, ſulphur, or rough glaſs; but, ſince the method of inſulating the rubber, and ſo producing negative electricity, was introduced, ſmooth glaſs has been uſed. The form is commonly either that of a globe, or of a cylinder. Each figure has its advantages, and its inconveniences. Dr. van Marum, a late German writer, has conſtructed a machine, in which gum-lac, in the form of a diſc, is uſed as an electric inſtead of glaſs; which has the effect of depending very little on the temperature of the air; deſcribed in his Treatiſe concerning the method of electrifying. Groningen, 1776. But he has ſince procured others to be made by Mr. Cuthbertſon of London, conſtructed of large diſcs, or round plates of glaſs: one of theſe is now placed in Teyler's muſeum at Harlem, having two of theſe glaſs plates, of ſixty-five inches diameter, excited, on both ſides of them, by rubbers of waxed taffaty; with which effects are produced that are truly aſtoniſhing and tremendous.

There have been various contrivances for giving *motion* to the electric of a machine. The common method is by a wheel turned by a winch or handle; a cord going round a groove in the periphery of the wheel, and over a pulley in the neck of the globe or cylinder. Others have uſed multiplying wheels, which are eaſily turned by a winch; and others again make uſe of a wheel and pinion, or a wheel and endleſs ſcrew. But Van Marum's machine is ſaid to have the completeſt movement, its operation being very uniform, and eaſily worked; it is kept in motion by a weight, which, after being wound up to the height of twelve feet, continues the motion uniformly for ſix hours; yielding alſo a negative power, as well as the poſitive; and the conductors annexed to it ſerving eaſily to convey the electrical fluid wherever it is required, without the addition of any chain, or wires, &c.

The *rubber* is the next material part of a machine. Theſe were formerly made of red baſil ſkins, ſtuffed with hair, wool, flax, or bran: Dr. Nooth introduced ſilk cuſhions ſtuffed with hair, over which is laid a piece of leather, rubbed with amalgam, which are better than the others. The rubber may be inſulated in any way that beſt ſuits the conſtruction of the machine: and a chain or wire may eaſily be ſuſpended from it, to communicate with the floor, whenever the inſulation is not neceſſary; and thus poſitive and negative electricity may be produced at pleaſure.

The *prime conductor* is another neceſſary appendage to the electrical machine: it is inſulated, and ſo connected with the electrical machine, as to receive the electric fluid immediately from the excited electric. In the preſent advanced ſtate of the ſcience, this part of the electrical apparatus has been conſiderably improved. The prime conductor is commonly made of hollow braſs, of a cylindrical form, perfectly ſmooth and round, without points or ſharp edges. The ends of the conductor are ſpherical; and it is neceſſary, that the part moſt remote from the electric ſhould be made round and much larger than the reſt, the better to prevent the electric fluid from eſcaping, which it always endeavours moſt to do at the greateſt diſtance from the electric or barrel: and the other end ſhould be furniſhed with ſeveral pointed wires or needles, either ſuſpended from, or fixed to, an open metallic ring, and pointing to the globe or cylinder, or plate, to collect the electric fluid. It is beſt ſupported by pillars of ſolid glaſs, covered with ſealing-wax or good varniſh. Prime conductors of a large ſize are uſually made of paſteboard, covered with tin-foil or imboſſed paper; theſe being uſeful for throwing off a longer and denſer ſpark than thoſe of a ſmaller ſize: they ſhould terminate in a ſmaller knob or obtuſe edge, at which the ſparks ſhould be ſolicited. Mr. Nairne prepared a conductor ſix feet in length, and one foot in diameter, from which he drew electrical ſparks at the diſtance of ſixteen, ſeventeen, or eighteen, inches; and Dr. Van Marum ſtill far exceeded this, with a conductor of eight inches diameter, and upwards of twenty feet long, formed of different pieces, and applied to the large electrical machine in Teyler's muſeum at Harlem, the moſt powerful machine of the kind yet conſtructed. But the ſize of the conductor muſt always be limited by that of the electric or barrel, there being a maximum which the ſize of the former ſhould not exceed; for it may be ſo large, that the diſſipation of the electric fluid from its ſurface may be greater than that which the electric is capable of ſupplying.

Dr. Prieſtley recommends a prime conductor of poliſhed copper, in the form of a pear, ſupported by a pillar and a firm baſis of baked wood: this receives the electric fluid by a long arched wire of ſoft braſs, which may be eaſily bent, and raiſed or lowered to the globe or cylinder; it is terminated by an open ring, in which ſome ſharp-pointed wires are hung. In the body of this conductor are holes for the inſertion of metalline rods. This, he ſays, collects the electric fluid perfectly well, and retains it equally every where. *Hiſt. Elect.* vol. ii. ſect. 2.

Mr. Henley (Philoſ. Tranſ. vol. lxiv. p. 403.) contrived a new kind of prime conductor, which, from its uſe, is called the *luminous* conductor. It conſiſts of a glaſs tube eighteen inches long, and two inches diameter. The tube is furniſhed at both ends with braſs caps and ferules about two inches long, cemented and made air-tight, and terminated by braſs balls. In one of theſe caps is drilled a ſmall hole, which is covered by a ſtrong valve, and ſerves for exhauſting the tube of its air. Within the tube at each end there is a knobbed wire, projecting to the diſtance of two inches and a half from the braſs caps. To one of the balls is annexed a fine-pointed wire for receiving and collecting the electric fluid, and to the other a wire with a knob or ball for diſcharging it. The conductor, thus prepared, is ſupported on pillars of ſealing-wax or glaſs. Beſide the common purpoſes of a prime conductor to an electrical machine, this apparatus ſerves to exhibit and aſcertain the direction of the electric fluid in its paſſage through it.

The moſt approved electrical machines are exhibited in the Electricity Plate I. Fig. 1, repreſents the very ingenious electrical machine invented by Mr. Read, and improved by Mr. Lane. The glaſs cylinder A, is moved vertically by means of the pulley at the lower end of the axis, the pulley being turned by the large wheel B, parallel to the table: there are ſeveral pulleys, of different ſizes, either of which may be uſed, according as the motion is required to be quicker or ſlower. The prime conductor C is furniſhed with points to collect the electric fluid, and is ſcrewed to the wire of a coated jar D. The figure ſhews alſo the manner of applying Mr. Lane's electrometer, which is ſcrewed on to the prime conductor at K, as will be hereafter explained.

Fig. 2, repreſents Dr. Prieſtley's machine, deſcribed in his Hiſtory of Electricity; in which *g* is the globe, or electric; *f* the rubber; in the two pillars *d*, *d*, of baked wood, are ſeveral holes to receive the ſpindles of different globes or cylinders, ſeveral of which may be put on together, to increaſe the electricity: *klm* is the prime conductor, being a copper tube, ſupported on a ſtand of glaſs or baked wood.

Fig. 3, is a portable electrical machine for common uſes. C repreſents the electric, or glaſs cylinder, about one foot in diameter, and twenty inches long, which is turned by means of a wheel; the rubber or cuſhion is ſupported behind the cylinder by two upright ſprings that appear beneath, and are faſtened to two croſs bars of glaſs. B, is a metallic prime conductor, ſupported on two pillars of glaſs: from the end neareſt to the cylinder iſſue ſeveral points, and at the other end the ball E

London. Published as the Act directs Jan.y 30. 1804. by J. Wilkes.

projects by means of a wire. The chain D, connects the rubber with the earth, or ground.

Fig. 4, shews Mr. Nairne's patent machine for medical purposes. Its glass cylinder is about seven inches in diameter, and twelve long, with two prime conductors parallel to it. The rubber is fastened to the conductor R; and consists of a cushion of leather stuffed, having a piece of silk glewed to its under part. These conductors are of tin covered with black lacker, each of them containing a large coated glass jar, and likewise a smaller one, or a coated tube, which are visible when the caps N N are removed. To each conductor is fixed a knob O, for the occasional suspension of a chain to produce positive or negative electricity. That part of the winch C, which acts as a lever in turning the cylinder, is of glass. Thus every part of the machine is insulated, the cylinder itself and its brass caps not excepted; by which means very little of the electric fluid is dissipated, and hence of course the effects are the more powerful. To this machine the inventor has adapted flexible conducting joints, and a discharging electrometer, for the more appropriate practice of medical electricity.

Fig. 5, represents the very powerful electrical machine invented by the late Mr. George Adams, of Fleet-street, London, and improved by Messrs. W. and S. Jones, in Holborn. The cylinder or barrel A B, is supported by two strong perpendicular pieces, C D. The axis of one cap of the cylinder moves in a small hole at the upper part of one of the supports. The opposite axis passes through the upper part of the other support. To this axis the winch or handle is fitted. The cushion, or rubber, is supported and insulated by a glass pillar; the lower part of this pillar is fitted into a wooden socket, to which a regulating screw is adapted, to increase or diminish the pressure of the cushion against the cylinder. A piece of silk comes from the under edge of the cushion, and lies on the cylinder, passing between it and the cushion, and proceeding till it nearly meets the collecting points of the conductor. The more strongly this silk is made to adhere to the cylinder, the stronger is the degree of excitation. Before the cylinder, or opposite to the cushion, is a metallic tube E F, supported by a glass pillar G H. This is the prime conductor, now more frequently called only the conductor.

The large electrical machine placed in Teyler's museum at Haerlem, partly described above, has, for the electric, two glass plates of sixty-five inches diameter, made of French glass, as this is found to produce the most electricity next to English flint glass, which could not be made of a sufficient size: these plates are set on the same horizontal axis, at the distance of seven inches and a half, and are excited by eight rubbers, each fifteen inches and a half long; and both sides of the plates are covered with a resinous substance to the distance of sixteen inches and a half from the centre, both to strengthen the plates, and to prevent any electricity from being carried off by the axis. Its battery of jars contains 225 square feet of coated surface, and its effects are astonishingly great, and, without proper care, very dangerous.

The next principal article of the electrical apparatus, is the *Leyden phial*. This is nothing more than a glass bottle or jar, coated both within and without with tin foil, or some other conducting substance, that it may be charged and employed in a variety of useful and interesting experiments. Or even flat glass, or any other form, so coated and used, has received the same denomination. Also a vacuum produced in such a jar, &c. has been named the *Leyden vacuum*. The Leyden phial was so called, because it is said that M. Cunæus, a native of Leyden, first contrived, about the close of the year 1745, to accumulate the electric fluid in glass. But Dr. Priestley asserts that this discovery was first made by Von Kleist, dean of the cathedral in Camin; who, on the 4th of November 1745, sent an account of it to Dr. Lieberkuhn at Berlin: however, those to whom Kleist's account was communicated, could not succeed in performing his experiments. The chief circumstances of this discovery are stated by Dr. Priestley in the following manner:

Professor Musschenbroek and his friends, observing that electrified bodies, when exposed to the common atmosphere, which is always replete with conducting particles of various kinds, soon lost the most part of their electricity, imagined, that if the electrified bodies could be terminated on all sides by original electrics, they might be capable of receiving a stronger power, and retaining it a longer time. Glass being the most convenient electric for this purpose, and water the most convenient non-electric, they at first made these experiments with water in common glass bottles: but no considerable discovery was made, till M. Cunæus, happening to hold his glass vessel in one hand, containing water, which had a communication with the prime conductor by means of a wire; and with the other hand disengaging it from the conductor, when he supposed the water had received as much electricity as the machine could give it, was surprised by a sudden and unexpected shock in his arms and breast. This experiment was repeated with the same effect; and the first accounts of it were published in Holland by Messrs. Allamand and Musschenbroek; by the abbé Nollet and M. Monnier, in France; and by Messrs. Gralath and Rugger, in Germany. M. Gralath contrived to increase the strength of the shock, by altering the shape and size of the phial, and also by charging several phials at the same time, so as to form what is now called the *electrical battery*. He likewise made the shock to pass through a number of persons connected in a circuit from the outside to the inside of the phial. He also observed that a cracked phial would not receive a charge: and he discovered what is now called the *residuum of a charge*.

Dr. Watson, about this time, observed a circumstance attending the operation of charging the phial, which, if pursued, might have led him to the discovery which was afterwards made by Dr. Franklin. He says, that when the phial is well electrified, and the hand applied to it, the electric fluid will flash from the outside of the glass, wherever touched, and will crackle in the hand. He also observed, that when a single wire only was fastened about a phial, properly filled with warm water, and charged; upon the instant of its explosion, the electrical corruscations were seen to dart from the wire, and to illuminate the water contained in the phial. He likewise found that the stroke, in the discharge of the phial, was, *cæteris paribus*, as the points of contact of the non-electrics of the outside of the glass; which lead to the method of coating glass: in consequence of which he made experiments, from whence he concluded, that the effect of the Leyden phial was greatly increased by, if not chiefly owing to, the number of points of non-electrics in contact with the glass, and the density of the matter of which these points consisted; provided the matter was, in its own nature, a ready conductor of electricity. He farther observed, that the explosion was greater from hot water inclosed in glasses, than from cold, and from his coated jars warmed, than when cold.

Mr. Wilson, in 1746, discovered a method of giving the shock, by the Leyden phial, to any particular part of the body, without affecting the rest. He also increased the strength of the shock by plunging the phial in water, which gave it a coat of water on the outside as high as it was filled within. He likewise found that the law of accumulation of the electric fluid in the Leyden phial, was always in proportion to the thinness of the glass, the surface of the glass, and that of the non-electrics in contact with its outside and inside.

Mr. Canton found, that when a charged phial was placed upon electrics, the wire and coating would give a spark or two alternately, and that by a continuance of the operation the phial would be discharged; though he did not observe that these alternate sparks proceeded from the two contrary electricities discovered by Dr. Franklin.

lin. The abbé Nollet alſo made ſeveral experiments with this phial. He received a ſhock from one, out of which the air had been exhauſted, and into which the end of his conductor had been inſerted. He aſcribed the force of the glaſs, in giving a ſhock, to that property of it, by which it retains it more ſtrongly than conductors do, and is not ſo eaſily diveſted of it as they are. It was he alſo who firſt tried the effect of the electric ſhock on brute animals: and he enlarged the circuit of its conveyance.

M. Monnier, it has been ſaid, was the firſt who diſcovered that the Leyden phial would retain its electricity for a conſiderable time after it was charged; and that in time of froſt he found it continued for thirty-ſix hours. It is remarkable too, that both the French and Engliſh philoſophers made ſeveral experiments, which, with a ſmall degree of attention, would have led them to the diſcovery of the different qualities of the electricity on the contrary ſides of the glaſs. But this diſcovery was reſerved for the ingenious Dr. Franklin: who, in explaining the method of charging the Leyden phial, obſerved, that when one ſide of the glaſs is electrified *plus*, or poſitively, the other ſide is electrified *minus*, or negatively. Dr. Franklin having alſo found that glaſs was impervious to electricity, and that as the equilibrium could not be reſtored to the charged phial by any internal communication, it muſt neceſſarily be done by conductors externally joining the inſide and the outſide. Theſe capital diſcoveries he made by obſerving, that when a phial was charged, a cork ball ſuſpended by ſilk, was attracted by the outſide coating, when it was repelled by a wire communicating with the inſide, and *vice verſâ*. But the truth of this principle appeared more evident, when he brought the knob of the wire, communicating with the outſide coating, within a few inches of the wire communicating with the inſide coating, and ſuſpended a cork ball between them; for then the ball was attracted by them alternately, till the phial was diſcharged.

Dr. Franklin alſo ſhewed, that when the phial was charged, one ſide loſt exactly as much as the other gained, in reſtoring the equilibrium. Hanging a fine linen thread near the coating of an electrical phial, he obſerved that whenever he brought his finger near the wire, the thread was attracted by the coating; for as the electric fluid was drawn from the inſide by touching the wire, the outſide drew in an equal quantity by the thread. He likewiſe proved, that the coating on one ſide of a phial received juſt as much electricity, as was emitted from the diſcharge of the other, and that in the following manner:—He inſulated his rubber, and then hanging a phial to his conductor, he found it could not be charged, even when his hand was held conſtantly to it; becauſe, though the electric fluid might leave the outſide of the phial, there was none collected by the rubber to be conveyed to the inſide. He then took away his hand from the phial, and forming a communication by a wire from the outſide coating to the inſulated rubber, he found that it was charged with eaſe. In this caſe it was plain, that the electric fluid which left the outſide coating, was conveyed to the inſide by the way of the rubber, the globe, the conductor, and the wire of the phial. This new theory of charging the Leyden phial, led Dr. Franklin to obſerve a greater variety of facts, relating both to the charging and diſcharging it, than other philoſophers had attended to. And this maxim, that it takes in at one ſurface what it loſes at the other, led Dr. Franklin to think of charging ſeveral phials together with the ſame trouble, by connecting the outſide of one with the inſide of another; by which the electric fluid that was driven out of the firſt would be received by the ſecond, &c. By this means he found, that a number of jars might be charged with the ſame labour as one only; and on this principle he firſt conſtructed an electrical battery.

When Dr. Franklin firſt began his experiments on the Leyden phial, he imagined that the electric fluid was all crowded into the ſubſtance of the non-electric, in contact with the glaſs. But he afterwards found, that its power of giving a ſhock lay in the glaſs itſelf, and not in the coating, by the following ingenious analyſis of the phial. To find where the ſtrength of the charged bottle lay, having placed it upon a glaſs, he firſt took out the cork and the wire; but not finding the electricity in them, he touched the outſide coating with one hand, and put a finger of the other into the mouth of the bottle; when the ſhock was felt quite as ſtrong as if the cork and wire had been in it. He then charged the phial again, and pouring out the water into an empty bottle which was inſulated, he expected that if the force reſided in the water, it would give the ſhock; but he found it gave none. He therefore concluded that the electric fluid muſt either have been loſt in decanting, or muſt remain in the bottle; and the latter he found to be true; for, upon filling the charged bottle with freſh water, he found the ſhock, and was ſatisfied that the power of giving it reſided in the glaſs itſelf. The ſame experiment was made with panes of glaſs, laying the coating on lightly, and charging it, as the water had been before charged in the bottle, when the reſult was preciſely the ſame.

From this account of Dr. Franklin's method of analyſing the Leyden phial, the manner of charging and diſcharging it will be eaſily underſtood. Fig. 6, in the Electricity Plate I. repreſents a Leyden jar, coated with tinfoil on the inſide and outſide, within three inches of the top, having a wire with a round braſs knob at its upper extremity. This wire paſſes through the cork D, that ſtops the mouth of the jar, and, at its lower end, is bended and branched ſo as to touch the inſide coating in ſeveral places. Thus it is ready to be charged with the electric fluid, and then diſcharged at pleaſure, by applying a diſcharger.

Fig. 7, in the ſame engraving, exhibits the form of the diſcharging rod; which conſiſts of a glaſs handle, and two curved wires, which move by a joint C, fixed to the braſs cap of the glaſs handle. The wires B B are pointed, and the points enter the knobs D D, to which they are ſcrewed, and may be unſcrewed from them at pleaſure. By this conſtruction, the balls, or the points, may be uſed as occaſion requires. The wires being moveable at the joint C, may be adapted to ſmaller or larger jars at pleaſure. The method of charging and diſcharging is as follows: place the Leyden jar, prepared as above, near to the prime conductor of the electrical machine, ſo that the knob of the wire in the jar may be in contact with it; then, upon turning the winch of the machine, the index of Henley's electrometer, which may be previouſly affixed to the conductor, will gradually riſe as far as ninety degrees nearly, and there reſt; which ſhews that the phial has received its *full charge*; then, holding the diſcharger by its glaſs handle, and applying one of its knobs to the outſide coating of the phial, the other being brought near the knob of the wire, or near the prime conductor which communicates with it, a report will be heard, and luminous ſparks will be ſeen, between the diſcharger and the conducting ſubſtances communicating with the ſides of the phial; and by this operation the phial will be *diſcharged*: But, inſtead of uſing the diſcharger, if a perſon touch the outſide of the phial with one hand, and bring the other hand near the wire of the phial, the ſame ſpark and report will take place, and a ſhock will be felt, affecting the wriſts and elbows, and the breaſt too when the ſhock is ſtrong: a ſhock may alſo be given to any ſingle part of the body, if that part alone be brought in contact. If a number of perſons join hands, and the firſt of them touch the outſide of the phial, while the laſt touches the wire communicating with the inſide, they will all feel the ſhock at the ſame time. If the coated phial be held by the wire, and the outſide coating be preſented to the prime conductor, it will be charged as readily; but with this difference, that in this caſe the outſide will be poſitive, and the inſide negative; alſo if the prime conductor, by being connected with the rubber of the machine, be electrified

trified negatively, the phial will be charged in the same manner; but the side that touches the conductor will be electrified negatively, and the opposite side will be electrified positively. But, by insulating the phial, and repeating the same process, the index of the electrometer will soon rise to ninety degrees, yet the phial will remain uncharged; because the outside, having no communication with the earth, &c. cannot part with its own electricity, and therefore the inside cannot acquire an additional quantity: but when a chain, or any other conducting medium, connects the outside of the phial with the table, the phial may be charged as before. Moreover, if a phial be insulated, and one side of it, instead of being connected with the earth, be connected with the insulated rubber, whilst the other side communicates with the prime conductor, the phial will be expeditiously charged; because that, whilst the rubber exhausts one side, the other side is supplied by the prime conductor; and thus the phial is charged with its own electricity; or the electric fluid of one of its sides is thus thrown upon the other side. This last experiment may be diversified by insulating the phial, and placing it with its wire at the distance of about half an inch from the prime conductor, and holding the knob of another wire at the same distance from its outside coating; then, upon turning the machine, a spark will be observed to proceed from the prime conductor to the wire of the phial, and another spark will pass at the time from the outside coating to the knob of the wire presented towards it: and thus it appears, that as a quantity of the electric fluid is entering the inside of the phial, an equal quantity of it is leaving the outside. If the wire presented to the outside of the phial be pointed, it will be seen illuminated with a star; but if the pointed wire be connected with the coating of the phial, it will appear illuminated with a pencil or brush of rays.

Mr. Cavallo has described the construction of a phial which, being charged by an electrical kite, in examining the state of the clouds, or in any other way, may be put into the pocket, and which will retain its charge for a considerable time. A phial of this kind has been kept in a charged state for six weeks. See his Electricity, p. 340. Mr. Cavallo also describes a method of repairing coated phials that have cracked by accident. He first removes the outside coating from the fractured part, and then makes it moderately hot, by holding it to the flame of a candle; and whilst it remains hot, he applies burning sealing-wax to the part, so as to cover the fracture entirely; observing that the thickness of this wax coating may be greater than that of the glass. Lastly, he covers all the sealing-wax, and also part of the surface of the glass beyond it, with a composition made with four parts of bees-wax, one of resin, one of turpentine, and a very little oil of olives; this being spread upon a piece of oiled silk, he applies it in the manner of a plaster. In this way several phials have been so effectually repaired, that after being frequently charged, they were again broken by a spontaneous discharge, but in a different part of the glass.

Fig. 8. in the Engraving, exhibits another Leyden phial, which is called the *spotted bottle*, because it is only coated with small pieces of tin-foil, placed at a little distance from each other. If this bottle be charged in the usual manner, strong sparks of electricity will fly from one spot of tin-foil to the other, making the passage of the fluid on the outside very visible. Discharge this bottle, by bringing a pointed wire gradually near the knob, and the uncoated part of the glass between the spots will be pleasingly illuminated, and the noise will resemble that of small fired crackers. If the jar be discharged suddenly, the outside surface will appear illuminated. To produce these appearances, the glass must be very free from moisture. If a phial uncoated on the outside be held in the hand, and its knob presented towards an electrified conductor; the electric fluid, while it is charging, will pass from the outside to the hand, in a pleasing manner; on the discharge, beautiful ramifications will be seen upon the uncoated part of the bottle.

This experiment may be still farther pursued by suspending two sets of bells from a Leyden bottle placed horizontally; one set connected with the inside, the other with the outside, as represented by fig. 9. Hook up the chain from the bells communicating with the inside, that they may have no connection with the table; charge the bottle in the usual manner; during the charge, the set suspended from the outside will continue to ring. After the bottle is charged, unhook the wire of the bells suspended from the inside. Touch now the wire A, and the bells will cease ringing, but the other set will begin to act; take the finger from A, and apply it to B, and the bells at B will be quiet, while those at A will be set ringing; and so on alternately, till the bottle is discharged of the electrical fluid.

The most formidable charge that can be given to the electrical apparatus, is by means of the electrical battery, which consists of a number of Leyden jars connected together in a box. The bottom of the box is covered with tin-foil; from these a hook projects on the outside of the box, by which any substance may be connected with the outside of the jars; their insides are all connected by wire or some metallic communication; by means of which a great number of very interesting experiments in electricity are performed; and though it be a formidable appendage to an electrical machine, yet it cannot be said that the apparatus is complete without it. Its effects in exploding various bodies, in firing gunpowder, in melting wires, and in imitating all the effects of lightning, are highly curious and interesting.

In an electrical battery, the jars are so arranged that the whole may be charged at the same time, and discharged in an instant; so that the whole power of the electric fluid accumulated in them, may be at once exerted upon the substance exposed to the shock. The electrical battery represented at fig. 10, in the preceding engraving, consists of nine jars connected together by the wires *a*, *b*, *c*, *d*, *e*, *f*, *g*, *h*, *i*; all of which are fastened into the stoppers of the bottles, and meet at top in the brass ball. Thus a communication is made between all the inside coating of the jars, while their outside coatings are connected by the bottom of the box in which they stand. In one side of the box, near the bottom, is an hole through which a brass hook passes, and which communicates with the metallic lining of the box, and consequently with the outside coatings of the jars. To this hook a wire or chain is occasionally connected when a discharge is made; and, for the more convenient making of this discharge, a ball and wire B, proceed to a convenient length from the center ball A. When the whole force of the battery is not required, one, two, or three, jars may be rendered neutral, by pressing down the wires belonging to them, until their extremities can slip out of their respective holes in the brass ball, and then turning them into such a posture that they cannot have any communication with the battery. The number of jars represented in this figure is rather small for some purposes; but it may be enlarged at pleasure.

The *electrical kite*, was contrived by Dr. Franklin, as before-mentioned, to verify his hypothesis of the identity of electricity and lightning. It consisted of a large thin silk handkerchief, extended and fastened at the four corners to two slender strips of cedar, and accommodated with a tail, loop, and string, so as to rise in the air like a common paper kite. To the top of the upright stick of the cross was fixed a very sharp-pointed wire, rising a foot or more above the wood; and to the end of the twine, next the hand, a silk ribband was tied. From a key suspended at the junction of the twine and silk, when the kite is raised during a thunder-storm, a phial may be charged, and electric fluid collected, as is usually done by means of a cylinder or globe in the electrical machine. Kites made of paper, covered with varnish, or with well-boiled linseed oil, to

preſerve them from the rain, with a ſtick and cane bow, like the common ones uſed by boys, will anſwer the purpoſe extremely well, and are very uſeful in determining the electricity of the atmoſphere.

The next article of conſideration in the electrical apparatus, is the *electrometer*; an inſtrument that meaſures the quantity, and determines the quality, of electricity in any electrified body. Previous to the invention of inſtruments of this kind, Mr. Canton eſtimated the quantity of electricity in a charged phial, by preſenting the phial with one hand to an inſulated conductor, and giving it a ſpark, which he took off with the other; proceeding in this manner till the phial was diſcharged, when he determined the ſtrength of the charge by the number of ſparks. The moſt ſimple electrometer, is a flaxen thread, called by Dr. Deſaguliers, the *thread of trial*; which, being brought near an electrified body, is attracted by it: but this does little more than determine whether the body is in any degree electrified or not; without determining its quantity, much leſs the quality of it. The abbé Nollet uſed two threads, thus ingeniouſly ſhewing the degree of electricity by the angle of their divergency, exhibited in their ſhadow on a board placed behind them. But electrometers have, of late years, been greatly improved.

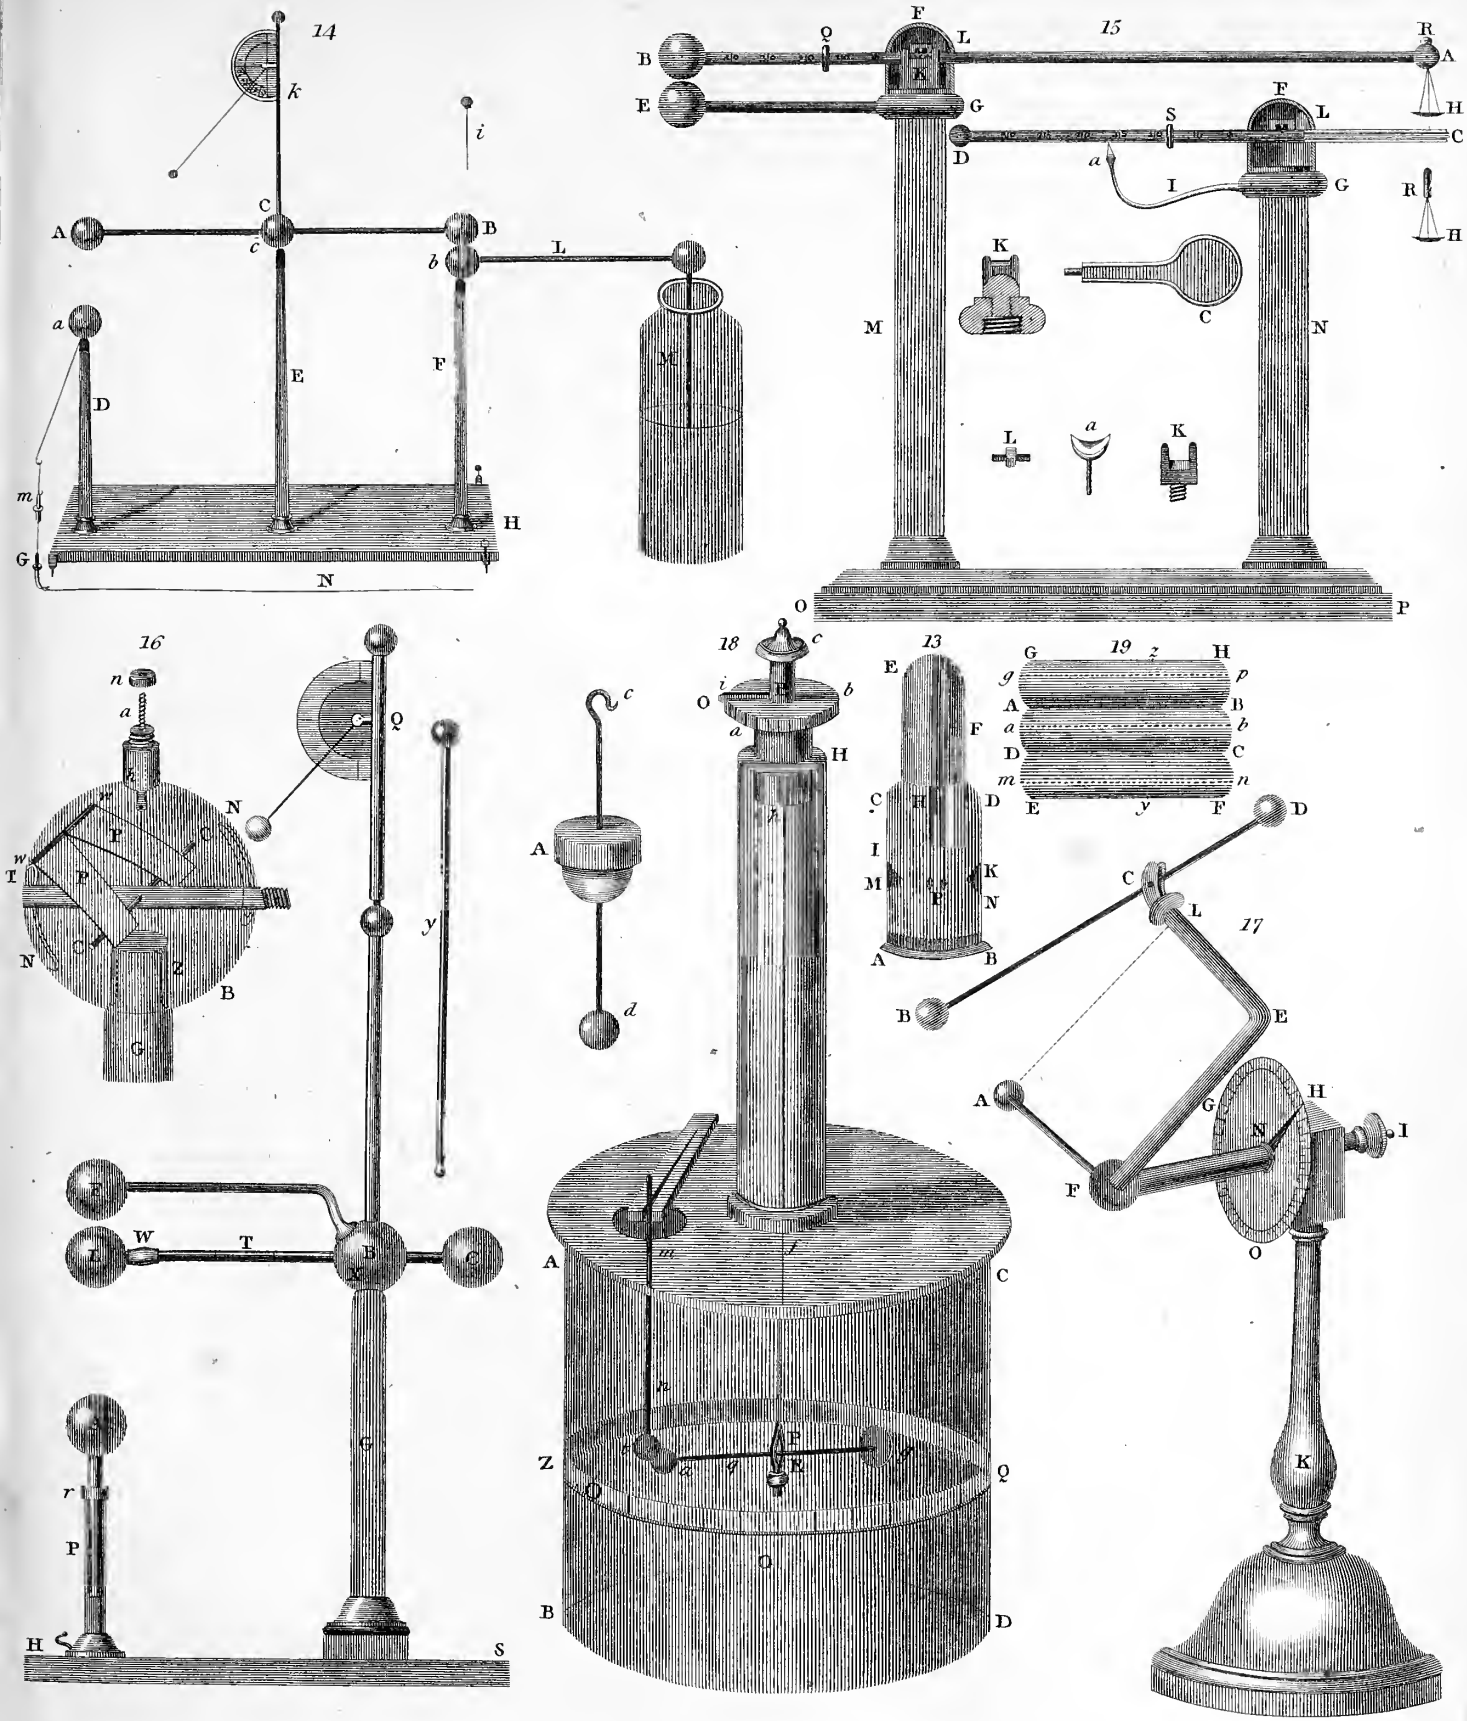
Mr. Canton's electrometer, repreſented in the preceding engraving at fig. 11, conſiſts of two balls of cork, or pith of elder, about the ſize of a ſmall pea, ſuſpended by fine flaxen threads, about ſix inches long, wetted in a weak ſolution of ſalt. If the box containing theſe balls be inſulated, by placing it on a drinking-glaſs, or rummer, and an excited ſmooth glaſs tube be brought near them, they will firſt be attracted by it, and then be repelled both from the glaſs, and from each other; but on the approach of excited wax, they will gradually approach and come together; and *vice verſa*. This alſo ſerves to determine the electricity of the clouds and air, by holding them at a ſufficient diſtance from buildings, trees, &c. for if the electricity of the clouds or air be poſitive, their mutual repulſion will increaſe by the approach of excited glaſs or decreaſe by the approach of amber or ſealing-wax; on the contrary, if it be negative, their repulſion will be diminiſhed by the former, and increaſed by the latter. See Philoſ. Tranſ. vol. 48. If two balls of this kind be annexed to a prime conductor, they will ſerve to determine both the degree and quality of the electricity, by their mutual repulſion and divergency.

The diſcharging electrometer of Mr. Lane, is repreſented as fixed to the prime conductor of the electrical machine, fig. 1, in the preceding engraving. It conſiſts of braſs work, the lower part of which is incloſed in the pillar F, made of baked wood, and boiled in linſeed oil, and bored cylindrically about two-thirds of its length; the braſs work is fixed to the pillar by the ſcrew H, moveable in the groove I; and through the ſame is made to paſs a ſteel ſcrew L, to the end of which, and oppoſite to K, a poliſhed hemiſpherical piece of braſs, attached to the prime conductor, is fixed a ball of braſs M, well poliſhed. To this ſcrew is annexed a circular plate O, divided into twelve equal parts. The uſe of this electrometer is to diſchage the jar D, or any battery connected with the conductor, *without a diſcharging rod*, and to give ſhocks ſucceſſively of the ſame degree of ſtrength; on which account it is very fit for medical purpoſes. Then, if a perſon holds a wire faſtened to the ſcrew H in one hand, and another wire fixed to E, a loop of braſs wire paſſing from the frame of the machine to a tin plate, on which the phial D ſtands, he will perceive no ſhock, when K and M are in contact; and the degree of the exploſion, as well as the quantity of electricity accumulated in the phial, will be regulated by the diſtance between K and M. Mr. Henley has much improved Mr. Lane's electrometer, by taking away the ſcrew, the double milled nut, and the ſharp-edged graduated plate, and adding other contrivances in their ſtead. Mr. Henley's diſcharger of this kind has two tubes, one ſliding within the other, to lengthen and accommodate it occaſionally to a larger apparatus.

The quadrant electrometer of Mr. Henley, delineated in the ſame engraving at fig. 12, conſiſts of a ſtem, terminating at its lower end with a braſs ferrule and ſcrew, for faſtening it upon any occaſion; and its upper part ends in a ball. Near the top is fixed a graduated ſemicircle of ivory, on the centre of which the index, being a very light rod with a cork ball at its extremity, reaching to the braſs ferrule of the ſtem, is made to turn on a pin in the braſs piece, ſo as to keep near the graduated limb of the ſemicircle. When the electrometer is not electrified, the index hangs parallel to the ſtem; but as ſoon as it begins to be electrified, the index, repelled by the ſtem, will begin to move along the graduated edge of the ſemicircle, and ſo mark the degree to which the conductor is electrified, or the ſtrength or height to which the *charge* of any jar or battery is advanced.

Mr. Cavallo has invented a very ſenſible electrometer, well adapted for the obſervation of the preſence and quality of natural and artificial electricity. It is delineated at fig. 13, in the Electricity Plate II. A glaſs tube, CDNM, is cemented into the piece AB. The upper part of the tube is ſhaped tapering to a ſmall extremity, which is entirely covered with ſealing-wax. Into this tapering part, a ſmall tube of glaſs is cemented, the lower extremity being alſo covered with ſealing-wax, projects a ſmall way within the tube CDNM. Into this ſmaller tube, a wire is cemented, which, with its under extremity, touches a flat piece of ivory H, faſtened to the tube by means of a cork. The upper extremity of the wire projects about a quarter of an inch above the tube, and ſcrews into the braſs cap EF, which cap is open at the bottom, and ſerves to defend the waxed part of the inſtrument from the rain. From H are ſuſpended two fine ſilver wires, having very ſmall corks at the lower ends, which, by their repulſion, ſhew the electricity. IM, and KN, are two ſlips of tin-foil ſtuck to the inſide of the glaſs, and communicating with the braſs bottom AB. They ſerve to convey away that electricity, which, when the corks touch the glaſs, is communicated to it, and might diſturb their free motion. When this inſtrument is uſed to obſerve artificial electricity, it is ſet on a table, and electrified by touching the braſs cap EF with an electrified body; in this ſtate, if any electrified ſubſtance is brought near the cap, the corks of the electrometer, by their converging, or diverging more, will ſhew the ſpecies of electricity. When it is to be uſed to try the electricity of the atmoſphere, fogs, &c. it muſt be held a little above the head by the bottom AB, ſo that the obſerver may conveniently ſee the corks, which will immediately diverge if there be any ſufficient quantity of electricity in the air, the nature of which may be aſcertained by bringing an excited piece of ſealing-wax towards the braſs cap EF. This inſtrument is uſually kept in a braſs caſe.

A very ingenious electrometer has been lately invented by Mr. Cuthbertſon, for meaſuring the electricity of large jars and batteries. It is repreſented in the annexed engraving, at fig. 14. GH is an oblong piece of wood, ſerving as a ſtand for the inſtrument, in which are fixed three glaſs ſupporters, D, E, F, mounted with braſs balls, *a*, *c*, *b*. Of theſe ſupporters E and F are exactly of the ſame length; but D is four inches ſhorter. Under the braſs ball *a* is a long braſs hook; the ball *c* is made of two hemiſpheres, the under one being fixed to the braſs mounting, and the upper turned with a groove to ſhut upon it, ſo that it can be taken off at pleaſure. The ball *b* has a braſs tube fixed to it, about three inches long, cemented on the top of F, and the ſame ball has a hole at the top, of about one-half inch diameter, correſponding with the inſide of the tube. AB is a ſtraight braſs wire, with a knife-edged center in the middle, placed a little



Electrical Apparatus.—N.o 2.

London. Published as the Act directs. February 5. 1804. by J. Wilkes.

little below the center of gravity, and equally balanced with a hollow brafs ball at each end, the center, or axis, refting upon a proper fhaped piece of brafs fixed in the infide of the ball *c*; that fide of the hemifphere towards *c* is cut open, to permit the end *c* A of the balance to defcend till it touches the ball *a*, and the upper hemifphere C is alfo cut open to permit the end *c* B to afcend; *i* is a weight, weighing a certain number of grains, and made in the form of a pin with a broad head; the ball B has two holes, one at the top, and the other at the bottom; the upper hole is fo wide, as to let the head of the pin pafs through it, but to ftop at the under one, with its fhank hanging freely in *b*; *k* is a common Henley's quadrant electrometer; and when in ufe it is fcrewed upon the top of *c*. It is evident, from the conftruction, that if the foot ftand horizontal, and the ball B be made to touch *b*, it will remain in that pofition without the help of the weight *i*; and if it fhould by any means receive a very low charge of electric fluid, the two balls *b*, B, will repel each other; B will begin to afcend, and, on account of the center of gravity being above the center of motion, the afcenfion will continue till A reft upon *a*. If the balance be fet again horizontal, and the pin *i* be put into its place in B, it will caufe B to reft upon *b*, with a preffure equal to that weight, fo that more electric fluid muft be communicated than formerly before the balls will feparate; and as the weight in B is increafed or diminifhed, a greater or lefs quantity of electric fluid will be required to effect a feparation.

When this inftrument is to be applied to a jar, or battery, one end of a wire L muft be inferted into a hole in *b*, and the other end into a hole of any ball proceeding from the infide of a battery, or jar, as M. A chain, or wire, or any body through which the charge is to pafs, muft be hung to the hook at *m*, and carried from thence to the outfide of the battery, as is reprefented by the line N; *k* muft be fcrewed upon *c*, with its index towards A. The reafon of this inftrument being added, is to fhew, by the index continuing to rife, that the charge of the battery is increafing, becaufe the other part of the inftrument does not act till the battery has received its required charge. It may be here obferved, that this inftrument confifts of three electrometers, viz. Henley's electrometer, Lane's difcharging electrometer conficerably improved, and Brookes's fteelyard electrometer improved likewife. By this combination and thefe improvements, we poffefs all that can be required in an electrometer for batteries and large jars; for, by *k*, we fee the progrefs of the charge; by the feparation of B *b*, we have the repulfive power in weight; and by the ball A, the difcharge is made whenever the charge has acquired the ftrength propofed. Example: Prepare the electrometer in the manner fhewn in the figure, with the jar M annexed, which contains about 168 fquare inches of coating. Take out the pin in B, and obferve whether the ball B will remain at reft upon *b*; if not, turn the adjufting fcrew at C till it juft remains upon A. Put into B the pin, marked *i*, weighing 15 grains; take two inches of watch-pendulum wire, fix to each end a pair of fpring tongs, reprefented at G *m*, hook one end to *m*, and the other to the wire N, communicating with the outfide of the jar; let the prime conductor of an electrical machine, or a wire proceeding from it, touch the wire L; then, if the machine be put in motion, the jar and electrometer will charge, as will be feen by the rifing of the index *k*; and when charged high enough, B will be repelled by *b*, and A will defcend and difcharge the jar through the wire which was confined in the tongs, and the wire will be fufed and run into balls. The ingenious inventor, by breathing through a glafs pipe into the jar, damped it a little in the infide. Then loading B with a pin of thirty grains, he obtained fuch a charge as fufed eight inches of watch-pendulum wire, difpofed exactly as the two inches were difpofed in the former experiment. And by repeating and varying his experiments, he found that double quantities of electrical fluid, in the form of a difcharge, will melt four times the length of wire of a certain diameter.

A very ingenious *difcharging balance electrometer* has been lately invented by A. W. Von Hauch, of the royal fociety of Copenhagen; which is reprefented in the fame engraving, at fig. 15. O P is a board of dry mahogany, which ferves as a ftand for the inftrument. In this board are faftened two glafs pillars, M and N, which fupport the two brafs caps or rings G G, with the two forks of tempered fteel K K fcrewed into them. The two rings G G are well covered with varnifh. In the ring G is faftened a brafs rod, which terminates in a ball E of the fame metal, and an inch in diameter. The length of the rod and ball together is four inches and a half. A very delicate beam, A B, the arms of which are of unequal length, moves on a fharp triangular axis (a knife edge) of well tempered fteel on the fork K of the pillar M. It is feventeen inches in length, and fo conftructed that the fhort arm forms a third, and the long one two-thirds, of the whole beam. The fhort arm of brafs furnifhed with the ball B, exactly of the fame fize as the ball E, is divided into forty-five parts equivalent to grains. The long arm A is of glafs covered with copal varnifh, and ends in an ivory ball A, into which is fitted an ivory hook R, deftined to fupport the ivory fcale H. In order to render the infulation more complete, this fcale is fufpended by three hairs. A very delicate beam, C D, eleven inches in length, moves on an axis, like the former, on the pillar N. This beam is proportioned in the fame manner, one arm being a third and the other two-third of the whole length. The long arm of brafs is furnifhed at the end with a ball D, and divided into thirty parts correfponding to grains. The fhort arm of glafs terminates in a long roundifh plate C, covered with copal varnifh. The fteel forks are fhewn by the fections of the two brafs caps F F, as are alfo the two knife edges L L. By thefe caps the efcape of the electric fluid is partly prevented. A brafs ring Q capable of being moved along the fhort arm of the upper beam A B, fhews, by means of marks determined by trial and cut out on the beam, the number of grains which muft be placed in the fmall fcale to reftore the equilibrium of the beam at each diftance of the ring Q from the point of fufpenfion. On the long arm C D of the lower beam there is alfo a moveable ring S, which, like the ring Q fhews in grains, by its diftance from the point of fufpenfion, the power requifite to overcome the preponderance of L D in regard to L C. The power neceffary for this purpofe will be found if the fcale or fhell H, which weighs exactly fourteen grains, be fuffered to fink down on the glafs plate C, and the ring S be pufhed forwards till both the arms of the beam are in equilibrium. The part of the beam on which the ring S has moved is divided into fourteen parts, fo that 0 marks the place where the ring S muft ftand when the beam, in its free ftate, is in equilibrium; and 14 ftands at the place where the ring S again reftores a perfect equilibrium when the fhell H is laid on the glafs plate C. Each of thefe parts, which are divided into quarters, indicates a grain. The lower divifions of the fcale will be found with more accuracy if quarters of a grain be put, in fucceffion, into the fhell H (after it has been laid on the plate C), and the ring S be moved between each quarter of a grain until the perfect equilibrium be reftored. This place on the beam is then to be marked, and traced in this manner, until the 30th part of a grain be given. Both fcales, for the fake of diftinctnefs, are divided only fo low as quarters of a grain; though the inftrument is fo delicate, and muft abfolutely be fo, that 1-20th of a grain is fufficient to deftroy the equilibrium.

The two glafs pillars M and N, together with the fteel forks affixed to them, are fo fitted into the ftand, that both the beams lie parallel to each other as well as to the rod G E. In this pofition of the beams A B, the balls B and E are juft in contact. The fmalleft glafs pillar N is of fuch a height, that the ball of the beam C D ftands at

the diſtance of exactly four lines from the ring G, and cannot move without touching the latter. The ſmall ſhell H is ſuſpended in ſuch a manner that there is a diſtance of exactly two lines between it and the ſhell C. In each of the braſs rings G G is a ſmall hole, that the inſtrument may be connected with the two ſides of an electric jar. I is a braſs wire, with a hollow bit of ivory *a* deſtined to ſupport the beam C D, which is neceſſarily preponderant at D, in order to prevent oſcillation between the diſcharges to be examined by the inſtrument.

It may be readily comprehended that, when the beam A B has moved, A muſt paſs over twice the ſpace that B does; and that, in the beam C D, the caſe is the ſame in regard to C and D. If A B therefore be connected with the external ſide, and C D with the internal ſide, of a battery, but in ſuch a manner that the inſtrument is at a ſufficient diſtance beyond the electric atmoſphere; and if the battery be charged, the repulſive effect of the electric power will oblige the ball B to ſeparate from the ball E; the ſhell H muſt therefore naturally ſink down with double velocity, ſo that when the ball B riſes a line, the ſhell H muſt ſink two: when it reaches this depth it will touch the ſhell C, and the latter, by the power excited in it, will be obliged to ſink, by which D muſt naturally again aſcend in a double proportion to the ſinking of C; ſo that when C has fallen two lines, D muſt have aſcended four, and D that moment touches the ring by which the two ſides of the battery are connected with each other, and diſcharges the battery.

But, as the attractive electric power between unlike atmoſpheres, under like circumſtances, is at leaſt as ſtrong as its repulſive power between like atmoſpheres, it would thence follow that the electric power, inſtead of repelling the ball B from the ball E would rather attract D, and, by its contact with G, promote the diſcharging; by which the inſtrument would fail of its object, and be ſubjected to the temperature of the atmoſphere; and beſides this, the electric power could no longer be determined by weight. To obviate this inconvenience, the inſtrument, in all electrical experiments, muſt be applied in ſuch a manner that the power with which the ball D is attracted by A B may exceed in ſtrength the power required to repel the ball B from the ball E. For this purpoſe the ring S muſt always be removed two diviſions farther on C D towards D, than the ring Q is ſhifted on A B towards B. If, for example, an electric force were required equal to eight grains, according to this electrometer, the ring Q muſt be removed to the place where 8 ſtands, and the ring S to the place marked 10. The repulſive power will then naturally repel the balls B and E before G is in a condition to attract the ball D, as a power of two grains would be neceſſary for this purpoſe, beſides that of the eight already in action. The ſhell H, with its weight of fourteen grains, will eaſily overcome the preponderance of L D over L C, as it amounts only to ten grains, and therefore nothing exiſts that can impede the diſcharging.

When the ring S, according to the required power, is removed ſo far towards D that the ſhell H is not able by its weight to deſtroy the preponderance of L D in regard to L C, the active power of the ſhell H muſt be ſo far increaſed by the addition of weights, that it can act with a preponderance of four grains, on the plate C. If, for example, an electric power of fourteen grains be required, the ring S muſt be removed to 16, by which L D reſts upon *a*, with a preponderance of ſixteen grains in regard to L C. Now to make H act on the plate C with a preponderance of four grains, it muſt be increaſed to twenty grains, that is, ſix grains weight more muſt be added, as it weighs only fourteen; which ſix grains are again laid upon L B; and therefore the ring Q is ſhifted to 20, as the ſtrength of the repulſive power is pointed out by fourteen grains. If an electric power of twenty-five grains be required, the ring S muſt be removed to 27, and the weight of ſeventeen grains be put into the ſhell H in order to produce a preponderance of four grains in regard to S. Theſe ſeventeen grains are added to the required power of twenty-five grains, and the ring Q is puſhed to 42, &c. In this manner the repulſive power always acts before the attractive power can begin to operate.

It may be readily perceived that the faults and inconveniences common to moſt electrometers hitherto employed, cannot take place here; becauſe the diſcharging is performed by immediate connection between the poſitive and negative electricity in the inſtrument itſelf, without any external means being employed. One of the moſt eſſential advantages of this inſtrument is, the certainty with which the ſame reſult may be expected when the experiment is repeated. For the ſame degree of electric power, whatever be the temperature of the atmoſphere, will always be neceſſary to commence the ſeparation of the two balls B and E from each other, the quantity of coated glaſs and the diſtance of the ring Q from the axis L being the ſame. Another no leſs important advantage of this inſtrument is, that in an experiment where the ſame electric power, often repeated, is neceſſary to aſcertain the reſult with accuracy; ſuch, for example, as the charging a battery through acids, water, &c.; the ſame degree of precaution is not neceſſary as is indiſpenſibly ſo in the common electrometers, as the perſon who puts the machine in motion has nothing to do but to count how often the electrometer diſcharges itſelf; and the inſtrument may be incloſed in a glaſs caſe, or prevented in any other manner from external contact, or any other circumſtances which might render the experiment uncertain.

Another more recent *diſcharging electrometer* has been invented by Henry Lawſon, eſq. We ſhall give the deſcription of it in his own words: "Some time ago it ſtruck me that ſome additions to Brookes's electrometer might be made ſo as to fit it for a good diſcharging electrometer to meaſure the repulſion between two balls (of a certain ſize) in grains, and alſo effect the diſcharge of a battery at the ſame time. The inſtrument known by the name of *Cuthbertſon's diſcharging electrometer*, was at that time the beſt, and indeed the only inſtrument for diſcharging batteries or jars by its own action, then made; but I think this will be found in the eſſentials, and in the theory and uſe, a more perfect inſtrument. It is repreſented in the Electricity Plate II. fig. 16. On the baſe S, is fixed the glaſs pillar G, ſupporting the hollow braſs ball B. T, is a light gradnated braſs tube divided (from the weight W towards the ball B) into thirty parts, repreſenting grains. W, is a ſliding weight. L, a light braſs ball ſcrewed to the end of the tube T, on the other end of which tube adjuſts the heavy counter-balance-ball C, the tube T and its two balls being ſuſpended at their common center of gravity by a ſilk line in the center of the ball B, the mechaniſm of which is ſhewn in the plan or ſection at the ſide. The braſs ball F is ſtationary, and of the ſame ſize as the ball L, and is fixed by a braſs arm to the ball B. The adjuſting ball A is alſo of the ſame ſize, and adjuſts cloſe to the ball L, or at any lower ſtation between that and the ring *r*. The braſs tube to which the ball A is fixed is divided into inches, halves, and quarters: a more minute diviſion is unneceſſary and improper. The diviſions begin, or the o line is marked, on the ſaid tube at the ring *r*, when the three balls A L F are cloſe together. The ring *r* ſerves as an index, as the diviſions paſs in ſucceſſion into the glaſs tube P, on lowering the ball A. The hook H is ſcrewed into the baſe of P. The quadrant, or Henley's electrometer Q is ſupported on a long braſs ſtem to keep it out of the atmoſphere of the lower part of the inſtrument. The ſide-plan or ſection ſhews the internal conſtruction of the ball B. In the firſt place, the ball ſcrews in half, horizontally. The light tube T paſſes through the ball, and is ſuſpended nearly in the center of it by ſome ſilk twiſt *s*, which ſmall ſilk twiſt is fixed into the eye of the adjuſting wire *a*, part of which wire is filed ſquare and goes through

through the square hole *h*. The nut *n* screws on *a*, and serves to adjust the light tube T vertically. The light plates P P are of copper, and move freely on the wire *w w* somewhat like a hinge, and rest on the copper wires C C, serving to make the direct communication between the inside and out of the battery or jar. N N are notches serving to let the tube T descend when the discharge is made. Into the tube Z the glass pillar is ground. At the bottom of the notch N is a piece of brass filed with a Y, and so placed as to keep the centers of the balls L and F under each other when they come close together.

When the instrument is adjusted, which is done by placing the weight W at o on the line of grains, and then screwing or unscrewing the counterbalance-ball C, till the tube T rises slowly into its horizontal position; then set the ball A at the distance from the ball L that you choose, and the weight W placed at the division or number of grains that you wish the repulsive power of the electricity to arrive at before the discharge is made: this being done, connect the battery or jar with the ball B by means of the wire *y*, the end of which goes into B at the hole X, and should stand at right angles to B, the ball of *y* resting on the battery: then connect the outside of the battery or jar with the hook H; as the battery charges, the electrometer Q continues to rise; and when it is so highly charged that the repulsive power between the balls L and F is equal to the number of grains at which the weight W was placed, the ball L will descend, and deliver the charge of the battery to the ball A. The substance or thing through which the shock is intended to be passed, must form part of the communication between the hook H and the outside of the battery or jar. It is evident, from considering the instrument, that it is attended with these excellencies; that, the whole being compact, the electric atmosphere must be so also; that it has but one insulation to depend upon: that the equilibrium of the divided arm and ball may always be adjusted, consequently the weight used known to a certainty; and the hook for communicating with the outside of the battery being placed on the foot of the instrument, the communication may be made by wires lying on the table; which are by far the best mode of conducting shocks; as chains, by the imperfect connection of their links, (especially if long,) very often, and without being suspected, hinder the success of many very well-concerted experiments." The electrometers of Bennett, Brookes, M. de Luc, and some others, have been superseded in their use and application by these later improvements.

An electrometer has been recently invented, capable of exhibiting absolute measures, and susceptible of comparison with others: whence it is denominated the *comparable electrometer*. This instrument is shewn at fig. 17, in the annexed engraving; where A represents a polished brass ball, one-fourth of an inch in diameter. It is fixed on the point of a needle three inches long, as slender as can be had of that length. The other end of the needle passes through a ball of amber or glass, or other firm non-conducting substance, about half or three-fourths of an inch in diameter; but the end does not reach quite to the surface, although the ball is completely perforated. From this ball rises a glass rod F E L, three inches long from F to E, where it bends at right angles, and is continued on to L, immediately over the center of the ball A. At L is fixed a piece of amber C, formed into two parallel cheeks, between which hangs the stalk D C B of the electrometer. This is formed by dipping a strong and dry silk thread, or fine cord, in melted sealing-wax, and holding it perpendicular till it remain covered with a thin coating, and be fully penetrated by it. This stalk is fastened into a small cube of amber, perforated on purpose, and having fine holes drilled in two of its opposite sides. The cheeks of the piece C are wide enough to allow this cube to move freely between them, round two fine pins, which are thrust through the holes in the cheeks, and reach about half way to the stalk. The lower part of the stalk is about three inches long, and terminates in a gilt and burnished cork ball, (or may be made of thin metal,) a quarter of an inch in diameter. The upper part C D is of the same length, and passes through (with some friction) a small cork ball. This part of the instrument is so proportioned, that when F E is perpendicular to the horizon, and D C B hangs freely, the balls B and A just touch each other. The ball F is fixed on the end of the glass rod F I, which passes perpendicularly through the centre of a graduated circle G H O, and has a knob handle of boxwood on the farther end at I. This glass rod turns stiffly, but smoothly, in the head of the pillar H K, &c. and has an index N H, which turns round it. This index is set parallel to the line L A, drawn through the centre of the fixed ball of the electrometer. The circle is divided into 360 degrees, and o is placed uppermost, and 90 on the right hand. Thus the index will point out the angle which L A makes with the vertical. It will be convenient to have another index, turning stiffly on the same axis, and extending a good way beyond the circle.

This instrument is used in the following manner: A connection is made with the body whose electricity is to be examined, by sticking the point of the connecting wire into the hole at F; till it touch the end of the needle; or, if we would merely electrify the balls A and B, and then leave them insulated, we have only to touch one of them with an electrified body. Now, take hold of the handle I, and turn it to the right till the index reach 90. In this position, the line L A is horizontal, and so is C B; and the moveable ball B is resting on A, and is carried by it. Now electrify the balls, and gently turn the handle backwards, bringing the index back toward o, &c. noticing carefully the two balls. It will happen that, in some particular position of the index, they will be observed to separate. Bring them together again, and again cause them to separate, till the exact position at separation is ascertained. This will shew their repulsive force in contact, or at the distance of their centers, equal to the sum of their radii. Having determined this point, turn the instrument still more toward the vertical position. The balls will now separate more and more. Let an assistant turn the long index so as to make it parallel to the stalk of the electrometer, by making the one hide the other from his view. Thus it will give absolute measures: for, by poising the stalk, by laying some grains weight on the cork-ball D, till it becomes horizontal and perfectly balanced, and computing for the proportional lengths of B C and D C, we know exactly the number of grains with which the balls must repel each other (when the stalk is in an horizontal position), in order *merely to separate*. Then a very simple computation will ascertain the grains of repulsion when they separate in any oblique position of the stalk; and another computation, by the resolution of forces, will shew us the repulsion exerted between them when A L is oblique, and B C makes any given angle with it. This is sufficiently obvious to need no farther explanation. The reason for giving the connection between A and C such a circuitous form, was to avoid all action between the fixed and the moveable part of the electrometer, except what is exerted between the two balls A and B. This instrument will also measure the *attractions* of the oppositely electrified bodies; for instead of making the ball B *above* A, by inclining the instrument to the right hand, we may incline it to the left; and then, by electrifying one of the balls positively, and the other negatively, when at a great distance from each other, their mutual attraction will cause them to approach; C B will deviate from the vertical toward A; and we can compute the force by means of this deviation. But this instrument must be secured against dissipation as much as possible, by varnishing all its parts, by having all angles, points, and roughnesses, removed, and by choosing a dry state of the air, and a warm room; and, because it is impossible to prevent dis-

 sipation

ſipation altogether, we ſhould make a previous courſe of experiments, in a variety of circumſtances, in order to determine the diminution per minute correſponding to the circumſtances of the experiments that are to be made with further views.

A moſt valuable electrometer has been invented by Mr. Coulomb, of the royal academy of ſciences at Paris, deſcribed in their Memoirs for 1785. It is conſtructed as repreſented in the engraving at fig. 18. ABDC repreſents a glaſs cylinder, twelve inches in diameter and in height. This is covered by a glaſs plate fitted to it by a projecting fillet on the under ſurface. This cover is pierced with two round holes of one inch three-fourths in diameter. One of them, *f*, is in the center, and it receives the lower end of the glaſs tube *fh*, of twenty-four inches height, which is fixed in the hole with a cement made of ſealing wax, or other electric ſubſtance. The top of this tube receives the braſs collar H, bored truly cylindrical, and having a ſmall ſhoulder, which reſts on the top of the tube. This collar is faſtened with cement, and receives the hollow cylinder P, to which is joined the circular plate *ab*, divided on the edge into 360 degrees. It is alſo pierced with a round hole in the center, which receives the cylindrical pin *i*, having a milled head, and an index o, whoſe point is bent down, ſo as to mark the diviſions on the circle *ab*. This pin turns ſtiffly in the cylinder P, which turns ſteadily in the collar H. To the lower end of the center pin is faſtened a little pincer, formed like the end of a port-crayon, and tightened by a ring, ſo as to hold faſt the ſuſpenſion-wire *kf*, the lower end of which is graſped by a ſimilar pincer P. The lower end o, is cylindrical, and it is of ſuch weight as to ſtrain the wire perfectly ſtraight, but without any riſk of breaking it. It may be made half of the weight that will juſt break it.

This pincer is enlarged at E, and pierced with a hole, which receives tightly the arm *gq*, of the electrometer. This is eight inches long, and conſiſts of a dry ſilk thread, or ſlender ſtraw of ſome graſs completely dried, and dipped in melted gum lac or fine ſealing-wax, and held upright before a clear fire, till it form a ſlender cylinder of about 1-30th of an inch in diameter. This occupies ſix of the eight inches, from *g* to *q*: the remaining two inches is a fine thread of the lac or ſealing-wax, as it drains off in forming the arm. At *a* is a ball of pith of elder or fine cork, one-fourth or one-half of an inch in diameter, made very ſmooth, and gilded. It is balanced by a vertical circle *g*, of paper ſtiffened with varniſh. The whole is ſeen in its place in the engraving, where the arm hangs horizontally about the middle of the height of the great cylinder. In its oſcillations the ball *a* moves round in a circle, whoſe center is in the axis of the whole inſtrument. Its ſituation is indicated by a graduated circle ZOQ drawn on a ſlip of paper, and adhering to the glaſs with varniſh. The electrified body, whoſe action is to be obſerved, is another ſmall ball of cork *t*, alſo gilt, or a braſs ball well poliſhed. This is carried by a ſtalk of gum lac *mn*, incloſing a dry ſilk thread. This ſtalk is graſped by a clamp of cleft deal, or any ſimilar contrivance, which lies firm on the glaſs cover. When this ball is let down through the hole *m*, it ſtands ſo as to touch the ball *a* on the arm, when that ball is oppoſite o on the graduated circle.

To electrify the ball *t*, we employ a ſlender ſtick of ſealing-wax or lac, holding a metal wire that carries a ſmall poliſhed metal ball. We touch with it ſome electrified body, ſuch as the prime conductor of a machine, the knob of a jar, &c. Introduce this electrified ball cautiouſly into the hole *m*, and touch the ball *t* with it. The ball *a* is immediately repelled, and goes to a diſtance, twiſting the ſuſpenſion-wire, till the force of twiſt exerted by the wire balances the mutual repulſion of the balls *t* and *a*.

Such is the proceſs for examining the law of electric action. But when we would examine the action of different bodies in different ſtates, another apparatus is wanted. This is repreſented by the piece *c*A*d*, conſiſting of a plug of ſealing-wax A, which fits tight into the hole *m*, and is pierced by the wire *cd*, hooked at *c*, to receive a wire connecting it occaſionally with an electrified body, and having below a poliſhed metal ball *d*, which fits into the ſame poſition as the ball *t*.

The inſtrument is fitted for uſe in the following manner: Turn the milled button *c*, at top, till the twiſt-index *i*, is on the mark o, of the twiſt circle. Then turn the whole in the collar H, till the ball *a* ſtands oppoſite to the mark o of the paper circle ZOQ and at the ſame time touches the ball *t* or *d*.

The obſervation is made thus: the ball *t* or *d*, is electrified, and *a* is repelled, and retires, twiſting the wire; and, after a few oſcillations, ſettles at a diſtance correſponding to the repulſion. Now turn the twiſt-index, ſo as to force the ball *a* nearer to *t* or *d*, as occaſion may require. We eſtimate the force of this new repulſion by adding the motion of the twiſt-index to the angle at which the ball firſt reſted. By turning the twiſt index ſtill more, we bring the balls ſtill nearer, and have a meaſure of another repulſion. And thus we may obtain as many meaſures as we pleaſe.

In this way Monſ. Coulomb aſcertained the relation between the repulſion and the diſtance to be the inverſe duplicate ratio of the diſtances. He diſcovered the law of diſſipation by air in contact, and the relation which this bears to the primitive repulſion, by obſerving the gradual approach of *a* to *t* as the electricity diſſipates from both, and by ſlackening the twiſt-index till the ball *a* retires to it its primitive diſtance. He aſcertained the diſſipation along imperfect conductors, and the length neceſſary for inſulation, by completely inſulating the ball *t*, and obſerving the loſs by air in contact with it, and then ſliding a metal rod down the inſulating ſtalk, till the diſſipation began to exceed what took place by the air alone. He examined the proportion of redundant fluid in communicating bodies, by connecting them alternately with the ball *d*; as alſo by electrifying one ball, and obſerving its repulſive force, and then ſharing its electricity with another, and obſerving the diminution. An example of one or two of thoſe trials will give a clearer conception of the concluſions deduced from theſe obſervations.

The ball *t* was introduced and electrified; *a* was repelled, and ſettled at 40°; the index was twiſted 140°, which brought *a* to 20; and the time was noted. The electricity gradually diſſipated, and *a* came nearer to *t*. The index was untwiſted 30°, and *a* retired a little beyond 20°; but, on waiting a few ſeconds, it ſtood exactly at 20°. The time was again noted. The interval was exactly three minutes. The concluſion from the experiment was as follows: When the ball was brought to 20°, the repulſion was evidently 140 + 20, or 160. Three minutes afterwards it was 110 + 20, or 130; and 30° were loſt in three minutes, or 10° per minute. The mean force was 145. Therefore the mean loſs per minute was $\frac{10}{145}$. Obſerve alſo, that the primitive force correſponding to the diſtance was 40; and the force correſponding to 20 was 160, or inverſely, as 20² to 40². But obſerve, that the diſtances were not meaſured by the angles, but by the chord of the angles. The obliquity of action muſt alſo be accounted for; and the real lever is leſs than the arm, in the proportion of radius to the coſine of half the angle.

The wire uſed by Coulomb in his firſt experiments on the law of action was of ſuch ſtrength, that $\frac{1}{360}$ of a French grain, applied at the point *a*, held it faſt till the twiſt-index was turned 360°; ſo that one degree correſponded to $\frac{1}{129600}$ of a grain. A foot of this wire weighed $\frac{1}{16}$th of a grain. Experience having ſhewn that this was a ſenſibility far exceeding what was neceſſary for the meaſures that he had in view, and made the inſtrument too delicate for common uſes, he ſubſtituted much ſtronger and ſhorter wires, and recommends much ſmaller dimenſions

ſions for the whole inſtrument. It is far more ſenſible than Bennet's gold-leaf electrometer. The ſame inſtrument, with a ſilver wire ſuſpenſion, and a thread of lac projecting from the end g, as an index to coincide more cloſely with the ſcale, is ſufficiently nice for all experiments of meaſurement. It is always proper to have the diameter of the cylinder double the length of the arm, that the action of the glaſs may not diſturb the poſition of the arm. It is greatly improved by having a round hole in the bottom of the inſtrument, in which the cylinder EO of the lower pincer may hang freely: this prevents much tedious oſcillation. For ordinary experiments, for meaſuring charges of batteries, and the like, a much leſs delicate inſtrument, with a ſuſpenſion-wire ſtrained at both ends, is abundantly delicate, and vaſtly more manageable. The wire ſhould extend as far below the arm as above it, and ſhould be graſped below, by a pincer turning by a milled head in a hole at the end of a ſlender ſpring. This enables us to adjuſt the inſtrument ſpeedily. Having placed the twiſt-index at o, turn this lower button gently till the ball a points exactly to o on the paper circle. Coulomb's electrometer has the great advantage of waſting very little electricity; whereas Henley's, or Brookes's, or de Luc's, waſte it very faſt when it is intenſe.

This electrometer, as hitherto applied, meaſures only repulſions. It is not ſo eaſy to meaſure attractions with it; for even Mr. Coulomb was obliged to take a very circuitous method, during which a great deal of electricity was diſſipated. In this reſpect, the *comparable* electrometer above deſcribed has the advantage; but, in every other reſpect, Mr. Coulomb's is the fineſt electrometer that has yet been publiſhed, giving *abſolute* meaſures, and this with great accuracy. The honourable Mr. Cavendiſh has employed the conſtruction in his moſt valuable experiments on the force of gravity, (Phil. Tranſ. 1798, part ii.) an experiment which Newton would have been delighted with obſerving.

The next inſtrument to be noticed is the *electrophor*, or *electrophorus*; this conſiſts of three diſtinct parts, as ſhewn in the engraving, at fig. 19. The chief part is a cake ABCD, made of ſome electric; ſuch as gum-lac, ſealing-wax, pitch, or other reſinous compoſition. This is melted on a conducting plate, DCFE, and allowed to congeal; in which ſtate it is found to be negatively electric. Another conducting plate, GHBA, is laid at top, and may be raiſed up by ſilk lines, or any inſulating handle. Hence we ſhall call ABCD the *cake*, DCFE the *ſole*, and GHBA the *cover*. It is proper to make all the three parts of conſiderable thickneſs, and of no great breadth. Although this diminiſhes greatly the moſt remarkable of the actions, it leaves them ſufficiently vivid, and it greatly increaſes the ſmaller changes which are inſtructive in the compariſon. The general facts are,

If the ſole has been inſulated during the congelation of the electric, till all is cold and hard, the whole is found negatively electric, and the finger draws a ſpark from any part of it, eſpecially from the ſole. If allowed to remain in this ſituation, its electricity grows gradually weaker, and at laſt diſappears: but it may be excited again by rubbing the cake with dry warm flannel, or, which is better, with dry and warm cat or hare fur. If the cover be now ſet on the cake by its inſulating handle, but without touching the cover, and again ſeparated from the cake, no electricity whatever is obſerved in the cover. But if it be touched while on the cake, a ſharp pungent ſpark is obtained from it; and if, at the ſame time, the ſole be touched with the thumb, a very ſenſible ſhock is felt in the finger and thumb.

After this, the electrophorus appears quite inactive, and is ſaid to be *dead*; neither ſole nor cover giving any ſign of electricity. But, when the cover is raiſed to ſome diſtance from the cake (keeping it parallel therewith), if it be touched while in this ſituation, a ſmart ſpark flies, to ſome diſtance, between it and the finger, more remarkably from the upper ſide, and ſtill more from its edge, which will even throw off ſparks into the air, if it be not rounded off. As this diminiſhes the deſired effects, it is proper to have the edge ſo rounded. This ſpark is not ſo ſharp as the former, and reſembles that from any electrified conductor. The electricity of the cover, while thus raiſed, is of the oppoſite kind to that of the cake, or is *poſitive*. The electricity of the cover while lying on the cake is the ſame with that of the cake, or *negative*. Theſe appearances may be repeated for a very long time, without any ſenſible diminution of their vivacity. The inſtrument has been known to retain its power undiminiſhed even for months. This makes it a ſort of magazine of electricity, and we can take off the electricity of the cake and of the cover as charges for ſeparate jars, the cover, when raiſed, charging like the prime conductor of an ordinary electrical machine; and, when ſet on the cake, charging it like the rubber. This cauſed its inventor, Mr. Volta, to give it the name *electrophorus*.

If the ſole be inſulated before putting on the cover, the ſpark obtained from the cover is not ſo active as it was before: but the ſame ſhock will be felt if both cake and cover be touched together. If the cover be again raiſed to a conſiderable height, the ſole will be found electrical, and its electricity is that of the cake, and oppoſite to that of the cover. After touching both cover and ſole, if the cover be raiſed and again ſet down, without touching it while aloft, the whole is again inactive. If both cover and ſole be made inactive when joined, they ſhew oppoſite electricities when ſeparated, the ſole having the electricity of the cake. If both cover and ſole be made inactive when ſeparate, they both ſhew the oppoſite to the electricity of the cake when joined.

Let us now attend to the diſpoſition of the electrical fluid in the different parts of the inſtrument in their various ſituations, and to the forces which operate mutually between them. Experiments for examining this inſtrument are beſt made by ſetting the three plates vertically, ſupported on glaſs ſtalks, with leaden feet, to ſteady them. A very ſmall electrometer may be attached to the outer ſurfaces of the cover and ſole.

If the extent of the plates were incomparably greater than their thickneſs, we may infer that the redundant fluid and matter would be diſpoſed in parallel ſtrata, and that the actions would be the ſame at all diſtances. But ſince this is not the caſe, the diſpoſition of the fluid will be ſomewhat different; and whatever it is, the action of any ſtratum will be diminiſhed by an increaſe of diſtance. The following deſcription cannot be very different from the truth:

1. The cake grows negative by cooling; and if it were alone, it would have a negative ſuperficial ſtratum on both ſides, of greater thickneſs near the edges; and the fluid would probably grow denſer by degrees to the middle, where it would have its natural denſity. But it cools in conjunction with the ſole, and the attraction of the redundant matter in the cake for the moveable fluid in the ſole diſturbs its uniform diffuſion in the ſole, and cauſes it to approach the cake. And becauſe this, in all probability, happens while the cake is ſtill a conductor, the diſpoſition of its fluid will be different from that deſcribed above. But becauſe we do not know preciſely the gradation of denſity, and aim only at general notions at preſent, it will be ſufficient to conſider the cake and ſole as divided into two ſtrata only; one redundant in fluid, and the other deficient, neglecting the neutral ſtratum that is interpoſed between them in each. The cake, then, conſiſts of a ſtratum AB$b$$a$A containing redundant matter, and a ſtratum $a$$b$CD containing redundant fluid; and the ſole has a ſtratum DCnm containing redundant fluid, namely, all that belongs naturally to the ſpace DCFE, and a ſtratum mnFE containing redundant matter. This may be called the *primitive ſtate* of the cake and

and ſole; and if once changed by communication with unelectrified bodies, it can never be recovered again without ſome new excitement.

2. If the ſole be touched by any body communicating with the ground, fluid will come in, till the repulſion of the redundant fluid in the ſole for a ſuperficial particle *y* is equal to the attraction of the redundant matter in the cake for the ſame particle. The under ſurface will be neutral, and the fluid will increaſe in denſity toward the ſurface D C. The ſole contains more than its natural quantity of fluid, but is neutral by the balance of oppoſite forces. Let it now be inſulated. This diſpoſition of fluid may be called the *common ſtate* of the electrophorus.

3. Let the cover G H B A be laid on it. The particle *z*, at the upper ſurface of the cover, muſt be more attracted by the redundant matter in the ſtratum A B *b a*, than it is repelled by the redundant fluid in the remoter ſtrata; for the fluid in the cake is leſs than what belongs to it in its natural ſtate, and therefore *z* is attracted by the cake. The redundant fluid which has come into the remote ſide of the ſole is leſs than what would ſaturate the redundant matter of the cake, becauſe it only balances the exceſs of the remote action of this matter above the nearer action of the compreſſed fluid in the ſole; and this ſmaller quantity of redundant fluid acts on *z* at a greater diſtance than that of the redundant matter in the cake. On the whole, therefore, the particle *z*, lying immediately within the ſurface G H, is attracted; therefore ſome will move toward the cake, and its natural ſtate of uniform diffuſion through the cover will be changed into a violent ſtate, in which it will be compreſſed on the ſurface A B, being abſtracted from the ſurface G H. It will now have a ſtratum G *g p* H, containing redundant matter, and another *g p* B A, containing redundant fluid. But this will diſturb the arrangement which had taken place in the ſole, and had rendered it neutral on the under ſurface. We do not attend to the fluid in the cake, but conſider it as immoveable, for any motion which it can get will be ſo ſmall, that the variations of its action will be altogether inſignificant. The particle *y*, ſituated in that ſurface, will be more repelled by the compreſſed fluid in the ſtratum *g p* C A than it is attracted by the equivalent but more remote redundant matter in G H *p g*. Fluid is therefore diſpoſed to quit the ſurface E F, and the ſole appears poſitively electric; very little indeed, if the cover be thin. All this may be obſerved by attaching a ſmall Canton's electrometer to the lower ſurface of the ſole.

4. A particle of fluid *z*, placed immediately without the ſurface G H, will be more attracted by the deficient ſtratum G H *p g* and by A B *b a*, than it is repelled by the redundant ſtrata beyond them, and the cover muſt be ſenſibly negative. This is the common ſtate of the whole inſtrument after ſetting on the cover. It is ſlightly poſitive on the lower ſurface of the ſole, and much more ſenſibly negative on the upper ſurface of the cover. A ſmart ſpark will therefore be ſeen between it and the finger, fluid will enter, till the attraction of the redundant matter in A B *b a* is balanced by the repulſion of the redundant fluid in D C F E.

5. A ſpark will now be obtained from the ſole, becauſe it was faintly poſitive before, and there has been added the action of the fluid which has entered into the cover. The fluid in the ſole is therefore diſpoſed to fly to any body preſented to it. But when this has happened, the equilibrium at the ſurface G H is deſtroyed, and that ſurface again becomes negative, and will attract fluid, although the cover already contains more than its natural quantity. A ſmall ſpark will therefore be ſeen between the cover and any conducting body preſented to it. By touching it, the neutrality or equilibrium is reſtored at G H; but it is deſtroyed again at E F, which will again give a poſitive ſpark, which, in its turn, again leaves G H negative. This will go on for ever, in a ſeries of communications continually diminiſhing, ſo as ſoon to become inſenſible, if the three parts of the electrophorus be thin. This makes it proper to make them otherwiſe, if the inſtrument be intended for illuſtrating the theory.

At laſt the equilibrium is completed at the ſurfaces G H and E F, and both are neutral in relation to ſurrounding bodies, although both the cover and ſole contain more than their natural ſhare of electric fluid. We may call this the *neutral* or *dead* ſtate of the electrophorus. This ſtate may be produced at once, inſtead of doing it by theſe alternate touches of G H and E F. If we touch at once both theſe ſurfaces, we have a bright pungent ſpark, and a ſmall ſhock. If this be the object of the experiment, the ſtate N°. 4, which gives occaſion to it, may be called the *charged* ſtate of the electrophorus.

When the inſtrument has thus been rendered neutral in relation to ſurrounding bodies, it is plain that it may continue in this ſtate for any length of time without any diminution of its capability of producing the other phenomena, provided only that no fluid paſs from the cover to the cake. We do not *fully* underſtand what prevents this communication, nor indeed what prevents the rapid eſcape from an overcharged body into the air. This cauſe, whatever it be, operates here; and the beſt way of preventing the diſſipation, or the abſorption by the cake, is to keep the electrophorus with its cover on. It will come into this neutral ſtate by diſſipation from the ſole, and abſorption by the cover, in no very long time; and after this, will remain neutral, retaining its power with great obſtinacy, eſpecially if the cake and plates are very thin.

6. If the cover be now removed to a diſtance, both parts of the apparatus will ſhew ſtrong marks of electricity. The cover contains much redundant fluid, and muſt appear ſtrongly poſitive, and will give a bright ſpark, which may be employed for any purpoſe. It may be employed for charging a jar poſitively by the knob, if we juſt touch the cover with the knob. The ſole will attract fluid, or be negative, although it contain more than its natural quantity of fluid, and it will take a ſpark. The ſole, therefore, in the abſence of the cover, may be employed to charge a jar negatively by the knob. By touching it with the finger, or with the knob of a jar held in the hand, it is reduced to the common ſtate deſcribed in N°. 2; and now all the former experiments may be repeated again in the ſame order. We may call this the *active* or the *charging* ſtate.

Volta, its undoubted inventor, called it *electroforo perpetuo*; for it *appears*, as has been already obſerved, to contain a magazine of electricity. The cover, when removed, will charge a jar held in the hand poſitively; and having done this ſervice, it will charge a jar negatively when again ſet on the cake. The ſole, in the abſence of the cover, will charge a third jar negatively; and then when the cover, after being touched, is ſet down again, it will charge a fourth jar poſitively. It may not be difficult to contrive a ſimple mechaniſm, connected with the motion of the cover, which ſhall connect the joined parts with two jars, and ſhall connect them, when ſeparated, with two others; and thus charge all the four with great expedition. This can be done without any new excitation of the electrophorus. But it is by no means a *magazine* of electricity, which it gradually expends: it is a *collector* of electricity from the ſurrounding bodies, which it afterwards imparts to others, and may be employed to diſcharge jars in the ſame gradual manner as to charge them.

7. If the electrophorus be not inſulated, a ſhock may ſtill be obtained, by firſt touching the ſole, and then, without removing the finger, touching the cover: but this will not be ſo ſmart as when the negative cover is touched at the ſame time that we touch the ſole, more highly poſitive, than when it communicates with the ground. The difference, muſt, however, be almoſt imperceptible when the pieces are thin.

8. If the electrophorus is not insulated, the cover, when put on, will give a spark in the manner already mentioned, and it will be somewhat stronger than when it is insulated; because the fluid is allowed to escape from the sole, and does not obstruct the entry into the cover. If we then, without removing the finger from the cover, touch the sole, nothing is felt; but if we first touch the sole, and, without removing the finger from it, touch the cover, we obtain a shock. This is evident from the theory. By this series of alternate touches, the period of the electrophorus is completed. The electrophorus is charged, or rendered neutral, by touching the plates when joined; then, by touching both when separated, the whole is reduced to the common state. When separated, from being in the neutral state, they have opposite electricities, the sole shewing that of the cake. When brought together, each in the common state, they have opposite electricities, the cover shewing that of the cake.

9. When, by long exposure to the air without its cover, the electrophorus has lost its virtue, it may be brought again into an active state in a variety of ways. Its surface may be rendered negative by friction with dry cat or hare skin, or warm flannel. It may be rendered negative by setting on it a jar charged negatively on the inside, and then touching the knob with any thing communicating with the ground. This is the most expeditious method, and will give it a high degree of excitation, if the jar be of size, and if the electrophorus be covered with a plate of tin-foil which comes into contact all over its surface. This however requires the previous charging of the jar; therefore it will be as expeditious and effectual to connect this surface with the rubber of an electrical machine.

The electrophorus has been compared to a charged plate of coated glass. It is true that it *may be brought* into an external state which very much resembles a charged pane; namely, when the cover, in its natural state, is set on the electrophorus in its natural state; and accordingly it gives a shock, and the two exterior surfaces become neutral; but the internal constitution, and the acting forces, are totally and *essentially* different. The two coatings of the pane would not, when separated, exhibit the appearances of the electrophorus; nor, when touched in their disjoined state, will they produce the same effects when joined. In the operation of coated glass, the constant or invariable part, the glass is not the *agent*, it is merely the *occasion* of the action, by *allowing* the accumulation. In the electrophorus, the electric, which is the constant invariable part, is the *agent producing* the accumulation. The electrophorus is an original, and a very ingenious and curious, electrical machine. Nothing has so much contributed to spread some general, though slight, acquaintance with the mechanical principles of electricity. The numerous dabblers in natural knowledge had been diverted from scientific pursuit by the variety of the singular and amusing effects of electricity, and had really attained very little connected knowledge. The effects of the electrophorus *forced* this knowledge upon them; because no use can be made of it without a pretty clear conception of the disposition of the electricity, and the kind and intensity of its action. It is therefore most ungrateful in the experimenters who have attained better views, to attempt to rob Mr. Volta of the real merit of discovery, by shewing that its effects are similar to those of Mr. Symmer's stockings, or of Cigna's plates, or of Franklin's charged or discharged glass panes. And the attempt destroys itself: for it shews the ignorance or inattention of its author; for the similarity is not real, as cannot but appear clear to any person who will examine things minutely, and scientifically.

The electricians are no less obliged to Mr. Volta for another machine, or instrument, from which the study of nature's operations has derived, or may derive, immense advantages. We mean the CONDENSER, or *collector of electricity*. This instrument consists of a smooth metal plate, furnished with an insulating handle, and a semi-conducting, or imperfectly insulating, plane. To examine a weak electricity with this apparatus, as that of the air in calm and hot weather, which is not generally sensible to an electrometer, the above-mentioned plate is to be placed upon the semi-conducting plane; and a wire, or some other conducting substance, must be connected with the metal plate, and extended in the open air, so as to absorb its electricity. The general effect is to render sensible an accumulation or deficiency of electric fluid so slight that it will not affect the most delicate electrometer; and it produces (at least in the opinion of Mr. Volta) this effect, by employing for the sole, a body which is an imperfect conductor, such as a plate of well dried marble, or well dried, but not baked, wood; or even a conducting body, covered with a piece of dry taffety or other silk. Mr. Volta, Cavallo, and others, who have written a great deal on the subject, have attempted to shew how these substances are preferable (and they certainly are preferable in a high degree) to more perfect insulators; but, not having taken pains to form precise notions of the disposition and action of the electric fluid in the situations afforded by the instrument, their reasonings have not been very clear. We think that an adequate conception of the essentials of an *electrical condensator*, may be acquired by means of the following considerations:

Furnish the cover of an electrophorus with a graduated electrometer, which indicates the proportional *degrees of electricity*; electrify it positively to any degree, suppose six, while held in the hand, at some distance over a metal plate placed on a wine-glass as an insulating stand, but communicating with the ground by a wire. Bring it gradually down toward the plate. Theory teaches, and we know it by experiment, that the electrometer will gradually subside, and perhaps will reach to 2° before the electricity is communicated in a spark. Stop it before this happens. In this state the attraction of the plate produces a compensation of four degrees of the mutual repulsion of the parts of the cover, by constipating the fluid on its under surface, and forming a deficient stratum above. Now we can suppose that the escape of the fluid from this body into the air begins as soon as electrified to the degree 6, and that it will fly to the plate with the degree 2, if brought nearer. If we can prevent this communication to the plate, by interposing an electric, we may electrify the cover again, while so near the metal plate, to the degree 6, before it will stream off into the air. If it be now removed from the plate, the fluid would raise the electrometer to 10, did it not immediately stream off; and an electric excitement of any kind which could only raise this body to the degree 6 by its intensity, will, by this apparatus, raise it to the degree 10, if only copious enough in extent. If we do the same thing when the wire is taken away which connects the plate with the ground, we know that the same diminution of the electricity of the cover cannot be produced by bringing it down into the neighbourhood of the plate below.

Here we see the whole theory of Mr. Volta's condenser. He seems to have obscured his conceptions of it by having his thoughts bent upon the electrophorus; and is led into fruitless attempts to explain the advantages of the imperfect conductor above the perfect insulator. But the apparatus is altogether different from an electrophorus, and is more analogous in its operations to a coated plate not charged nor insulated on the opposite side; and such a coated plate lying on a table is a complete condenser, if the upper coating be of the same size with the plate of the condenser. All the directions given by Mr. Volta for the preparation of the imperfect conductor shew, that the effect produced is to make them as perfect conductors as possible for any degree of electricity that exceeds a certain small intensity, but such as shall not

not ſuffer this very weak electricity to clear the firſt ſtep of the conduit. The marble muſt be thoroughly dried, and even heated in an oven, and either uſed in this warm ſtate, or varniſhed, ſo as to prevent the re-abſorption of moiſture. We know that marble of ſlender dimenſions, ſo as to be completely dried throughout, will not conduct till it has again become moiſt. A thick piece of marble is rendered ſo, ſuperficially only, and ſtill conducts internally. It is then in the beſt poſſible ſtate. The ſame may be ſaid of dry unbaked wood. Varniſhing the upper ſurface of a piece of marble or wood, is equivalent to laying a thin glaſs plate on it. Now this method, or covering the top of the marble, or of a book, or even the table, with a piece of clean dry ſilk, makes them all the moſt perfect condenſators. This juſt view of the matter has great advantages. It takes away the myſterious indiſtinctneſs and obſcurity which kept the inſtrument from improvement. We can now make one incomparably better and more ſimple than any propoſed by Volta. We need only the ſimple moveable plate. Let this be varniſhed on the under ſide with a moderately thick coat of the pureſt and hardeſt *vernis de Martin*, or coach-painters varniſh; and we have a complete condenſator by laying it on a table. If it be connected by a wire with the ſubſtance in which the weak and imperceptible electricity is excited, it will be raiſed (provided there be enough of it of that ſmall intenſity) in the proportion of the thickneſs of the varniſh to the fourth part of the diameter of the plate. This degree of condenſation will be procured by detaching the connecting wire from the inſulating handle of the condenſer, and then raiſing the condenſer from the table. It will then give ſparks, though the original electricity could not ſenſibly affect a flaxen fibre.

It muſt be particularly noted, that it can produce this condenſation only when there is electric fluid to condenſe; that is, only when the weak electricity is diffuſed over a greater ſpace than the plate of the condenſer. In this way it is a moſt excellent collector of the weak atmoſperic electricity, and of all diffuſed electricity. But to derive the ſame advantage from it *in many very intereſting caſes*, ſuch as the enquiry into the electricity excited in many operations of nature on ſmall quantities of matter, we muſt have condenſers of various ſizes, ſome not larger than a ſilver penny. To conſtruct theſe in perfection, we muſt uſe the pureſt and hardeſt varniſh, of a kind not apt to crack, and highly coercive. This requires experiment to diſcover it. Spirit varniſhes are the moſt coercive; but, by their difference of contraction by cold from that of metals, they ſoon appear froſty, and when viewed through a lens, they appear ſhivered; and are then uſeleſs. Oil varniſhes have the requiſite toughneſs, but are much inferior in coercion. We have found amber varniſh inferior to copal varniſh in this reſpect, as was previouſly noticed by Von Hauch. On the whole, we ſhould prefer the fineſt coach-painters varniſh, new from the ſhop, into which a pencil has never been dipped: and we muſt be particularly careful to clear our pencils of moiſture and all conducting matter, which never fails to taint the varniſh. We ſcarcely need remark, that the coat of varniſh on theſe ſmall condenſers ſhould be very thin, otherwiſe we loſe all the advantage of their ſmallneſs. Mr. Cavallo has ingeniouſly improved Volta's condenſer by connecting the moveable plate, after removal, with a ſmaller condenſer.

It will readily occur to the reader, that this inſtrument is not inſtantaneous in its operation, and that the application muſt be continued for ſome time, in order to collect the minute electricity which may be excited in the operations of nature. He will alſo be careful that the experiment be ſo conducted that no uſeleſs accumulation is made any where elſe. When we expect electricity from any chemical mixture, it never ſhould be made in a glaſs veſſel, for this will take a charge, and thus may abſorb the whole excited electricity, accumulating it in a neutral or inſenſible ſtate. Let the mixture be made in veſſels of a conducting ſubſtance, inſulated with as little contact as poſſible with the inſulating ſupport; for here will alſo be ſomething like a charge. Suſpend it by ſilk threads, or let it reſt on the tops of three glaſs rods, &c.

Whoever conſiders this apparatus, will perceive that its office is not to manifeſt a ſmall quantity of electricity, but to condenſe an expanded quantity of electricity into a ſmall ſpace: hence, if by means of this apparatus one expected to render more manifeſt than it generally is, when communicated immediately to an electrometer, the electricity of a ſmall tourmalin, or of a hair when rubbed, he would find himſelf miſtaken. It is Mr. Bennet's *doubler* that was intended to anſwer that end; viz. to multiply, by repeated *doubling*, a ſmall, and otherwiſe unperceivable, quantity of electricity, till it became ſufficient to affect an electrometer, to give ſparks, &c. The merit of this invention is certainly conſiderable; but the uſe of it is far from preciſe and certain; and for this principal reaſon, viz. becauſe it multiplies not only the electricity which is communicated to it from the ſubſtance in queſtion; but it multiplies alſo that electricity which in the courſe of the operation is almoſt unavoidably produced by accidental friction; or that quantity of electricity, however ſmall it may be, which adheres to the plates in ſpite of every care and precaution. Mr. Cavallo has, however, with great induſtry, ſearched out all its imperfections, and has endeavoured to remove them by ſeveral ingenious conſtructions. But Mr. Bennet's original inſtrument, or *doubler of electricity*, has received its greateſt improvement from the hand of Mr. Nicholſon, whereby the machine becomes leſs liable to the objections above-mentioned. In its improved ſtate, it conſiſts of two inſulated and immoveable plates about two inches in diameter, and a moveable plate alſo inſulated, which revolves in a vertical plane parallel to the two immoveable plates, paſſing them alternately. A correct view of the inſtrument is given at fig. 20, in the Electricity Plate III. of which the following is an explanation: The plate marked A, is conſtantly inſulated, and receives the communicated electricity. The plate B revolves; and, when it is oppoſite the plate A, the connecting wires at the end of the croſs piece D, touch the pins of A and C at E F, and a wire proceeding from the plate B, alſo touch the middle piece G, which is ſupported by a braſs, wooden, or other conducting pillar in connection with the earth. In this poſition, if electricity be communicated to the plate A, the plate B will acquire a contrary ſtate; and, paſſing forwards, the wires alſo moving with it by means of the ſame inſulating axis, the plates are again inſulated till the plate B is oppoſite to C, and then the wire at H touches the pin in C, connecting it with the earth, and communicating the contrary ſtate of electricity to that of B, but of the ſame kind with that of A. By moving the handle ſtill farther, B is again brought oppoſite to A; and, the connecting wires joining A and C, they both act upon B, which is connected with the earth as before, and nearly double its intenſity, whilſt the electricity of C is abſorbed into A; becauſe of the increaſed capacity of A, whilſt oppoſed to B, capable by its connection with the earth of acquiring a contrary ſtate, ſufficient to balance the influence of both the other plates. Thus by continuing to revolve the plate B, the proceſs is performed in a very expeditious manner. The ball I is made heavier on one ſide than the other, and ſcrewed upon the axis oppoſite to the handle, to counterbalance the plate B, which may therefore be ſtopped in any part of its revolution.

Mr. Nicholſon's beautiful mechaniſm for thus expediting the multiplication, has, however, the inconvenience of bringing the plates towards each other *edgewiſe*, which will bring on a ſpark or communication ſooner than may be deſired: but this is no inconvenience whatever in any philoſophical reſearch; becauſe, before this happens, the electricity has become very diſtinguiſhable

as to its kind, and the degree of multiplication is little more than an amuſement. The ſpark may even ſerve to give an indication of the original intenſity, by means of the number of turns neceſſary for producing it. If the fine wires, which form the alternate connections in ſo ingenious a manner, were tipped with little balls to prevent the diſſipation, it would be a great improvement. An alternate motion, like that of a pump-handle, might alſo be adopted with advantage. This would allow the plates to approach each other *face to face*, and admit a greater multiplication, if thought neceſſary.

There remains nothing more to notice of the apparatus, except that minutiæ which will occur to every perſon diſpoſed to engage in electrical experiments. Among ſuch we may notice ſome glaſs tubes about three feet long, and an inch and a half in diameter, one of which ſhould be cloſed at one end with a braſs cap and ſtop-cock, to rarefy or condenſe the incloſed air; ſome ſticks of ſealing-wax, or tubes of rough glaſs, or glaſs tubes covered with ſealing-wax, or cylinders of baked wood for producing the negative electricity; with proper rubbers, as black oiled ſilk, with amalgam upon it for the former, and ſoft new flannel, or hare-ſkins or cat-ſkins tanned with the hair on, for the latter; coated plates of glaſs for ſimilar uſes as the Leyden jar; metal rods as diſchargers; ſmall glaſs ſpheres or globes; inſulating ſtools, ſupported by pillars of glaſs covered with ſealing-wax, or of baked wood, to keep the electric fluid from paſſing to the earth; a pot of amalgam, &c. The beſt kind of amalgam is that of Dr. Higgins compoſed of zinc and quickſilver. If a little of the latter be added to melted zinc, it renders it eaſily pulverable, and more quickſilver muſt be added in due proportion for a very ſoft amalgam.

PRINCIPLES OR LAWS OF ELECTRICITY.

Modern electricians, with almoſt one conſent, appear to believe in the exiſtence of a fluid *ſui generis*, and to have adopted the Franklinian hypotheſis of the action of that fluid, by *attraction* and *repulſion*. There are ſome, however, whoſe diffident and ſcrupulous minds, not being as yet ſatisfied with the chemical theory of phlogiſton, fire, heat, or caloric, ſtill reject the doctrine of an electric fluid, and attempt to deduce the laws of the electrical phenomena, not from the preſence of any peculiar *ſubſtance*, but from peculiar *modes*; on the principle that ſound, and ſome concomitant motions, and other mechanical appearances, are the reſults of the elaſtic undulations of air; juſt as lord Bacon and others have explained the effects of fire by elaſtic undulations of the integrant particles of tangible matter. There ſeems nothing, however, of this kind, that can give any explanation of the motions, preſſures, and other mechanical appearances, of electricity. This requires, that every doctrine which claims the name of an explanation, ſhall be perfectly conſiſtent with the acknowledged laws of mechaniſm; and that the explanation ſhall conſiſt in pointing out thoſe mechanical laws, of which the facts in electricity are particular inſtances. It may not be difficult to preſent an intricate or complex phenomenon to our view, in ſuch a form, that it ſhall have ſome reſemblance to ſome other complex phyſical fact, more familiar, perhaps, though not better underſtood. But this will not ſtand againſt the eſtabliſhed law of electricity by *attraction* and *repulſion*; a circumſtance which admits of the moſt accurate examination and compariſon with any explanation that is attempted.

Many philoſophers, and among them ſome reſpectable mathematicians, have ſupported the doctrine of Du Faye, Symmer, Cigna, &c. who employ two fluids as agents in all electrical operations. It muſt be confeſſed that there are ſome appearances where the explanation by means of two fluids ſeems, at firſt ſight, more palpable and eaſier conceived. But whenever we attempt to obtain *meaſures*, and to ſay what will be the preciſe kind and degree of the electricity, we find ourſelves obliged to aſſign to the particles of thoſe fluids actuating mechanical forces preciſely equivalent to thoſe of the ſingle fluid only.

Mr. Profeſſor Ruſſel, of the univerſity of Edinburgh, in his theory, conſiders the electrical phenomena as the reſults of the action of a ſubſtance which may be called an *electrical fluid*, connected with bodies by attractive and repulſive forces acting at a diſtance, and diminiſhing as the diſtance increaſes. Mr. Ruſſel ſpeaks of the electric fluid as a compound of ſeveral others; and, particularly, as containing elementary fire, and deriving from it a great elaſticity, or mutual repulſion of its particles. This, however, is different from the elaſticity or mutual repulſion of the particles of air, becauſe it acts at a diſtance; whereas the particles of air act only on the adjoining particles. By this conſtitution, bodies containing more electric fluid than the ſpaces around them repel each other; and the particles of this electric fluid attract the particles of other bodies with a force which diminiſhes by diſtance. The characteriſtic ingredient of this fluid is ELECTRICITY *properly ſo called*. This is united with the elaſtic fluid by chemical affinity, which Mr. Ruſſel calls *elective attraction*, a term lately introduced into chemiſtry. This he ſuppoſes to extend to all diſtances, but not preciſely by the ſame law as the mutual repulſion of the particles of the other fluid, and in general, it repreſſes the repulſions of that fluid while in this ſtate of compoſition. This *electricity*, moreover, attracts the particles of other bodies, but with certain elections. Non-electric or conducting bodies are attracted by it at all diſtances; but electrics act on it only at very ſmall and inſenſible diſtances. At ſuch diſtances its particles alſo attract each other. The phenomena of light and heat are conſidered as marks of partial decompoſition, and as proofs of the preſence of elementary fire in the compound: the ſmell peculiar to electricity, and the effect on the organ of taſte, are proofs of decompoſition and of the complex nature of the fluid. Bodies or conductors containing electric fluid, repel each other at conſiderable diſtances, but, if forced very near, attract each other. Electrics can contain it only in conſequence of the *electricity* in the compound. Part of this electricity muſt be attached to the ſurface in a non-elaſtic ſtate; becauſe when it is brought ſo near as to be attracted, its particles are within the ſpheres of each other's action, and this redoubled attraction overcomes the repulſion occaſioned by its union with the other ingredient; and the electric fluid is partly decompoſed, and the *electricity*, properly ſo called, adheres to the ſurface of the electric, *as the water of damp air adheres to a cold pane of glaſs in our windows*. Alſo, by this conſtitution, electric fluid may appear in two ſtates; elaſtic, like air, when entire; and unelaſtic, like water, when partly decompoſed by the attraction of electrics. But the attentive reader will eaſily ſee, that all this intricate combination of different kinds of attraction and repulſion is nothing but mere accommodations of hypothetical forces to the phenomena. This, and the more recent though ſimilar theory of M. de Luc, have, for theſe reaſons, fallen to the ground.

The laws of electrical phenomena, founded on the principles of attraction and repulſion, are accommodated to the fact, that bodies in their natural ſtate, having their natural quantity of electric fluid, are altogether inactive on each other, by making this natural quantity ſuch, that its mutual repulſion exactly balances its attraction for the common matter. Hence it follows, that the electric phenomena muſt be deduced from a *redundancy* or *deficiency* of electric fluid. This is the Franklinian doctrine. The redundant ſtate of a body is called by Dr. Franklin POSITIVE OR PLUS ELECTRICITY, and the deficient ſtate is called NEGATIVE OR MINUS ELECTRICITY. When a body contains more than its natural quantity, or leſs, it will be redundant in the one caſe, and deficient in the other. Theſe different conditions exhibit different appearances, which conſtitute the action of the electric fluid. And hence, in the firſt caſe, wherever the electric fluid

fluid is redundant, there will be an efflux of the contained fluid; and on the other hand, if the body contains leſs than its natural quantity of fluid, there will be an influx from without. But this efflux or influx may be prevented, either by ſurrounding the body with ſubſtances, through the pores of which the fluid cannot move at all, or by the body itſelf being of this conſtitution. And thus we ſee, that the very circumſtance of being impervious to the fluid, or completely permeable, renders the body capable or incapable of exhibiting electrical phenomena, if ſurrounded by permeable bodies. This circumſtance is alone ſufficient to conſtitute the difference between *electrics per ſe*, and *non-electrics*; and here a numerous claſs of phenomena receive an explanation by this hypothetical conſtitution of the electric fluid. All electrics *per ſe* are bodies fit for confining electricity in bodies which are rendered capable, (by whatever means) of producing electrical phenomena; and no conductor, or ſubſtance which allows the electricity to paſs through it, can be made electric by any of the means which produce that effect in *inſulators*. And it is well known, that the electricity of electrics is vaſtly more durable than that of non-electrics in ſimilar ſituations. When the tendency to efflux or influx is induced, as hereafter ſhewn, by a due proportion of the redundancy and deficiency of electric fluid, the part of the body where this obtains is by no means in its natural ſtate, and may contain either more or leſs than its natural quantity. But it neither acts like an over-charged nor like an under-charged body, and is therefore called *neutral*. Such, for example, is noticed in the plates and covers of the electrophorus.

It may be proper to point out ſome of the habitudes that indicate which end of the conductor is electrical by the redundancy of electric fluid. It is generally believed, that the remote end of a conductor which is electrified by glaſs, excited by rubbing it with flannel or amalgamated leather, is electrical by redundancy. No difference has been obſerved in the attractions and repulſions; but there are other marks of diſtinction which are conſtant, and undoubtedly ariſe from a difference in the mode of action of thoſe mechanical forces. If a glaſs mirror, covered with tin-foil, be made to touch the remote end of the conductor, and ſlowly drawn tranſverſely, ſo that the conductor draws a line as it were acroſs it: this mirror being laid down with the foiled ſide undermoſt, the duſt, which ſettles on it in the courſe of a day or two, will be chiefly collected along this line, ſomewhat in the form of the fibres of a feather. But if the conductor was rendered electrical by the globe covered with ſealing-wax, the duſt will be collected along this line in little ſpots like a row of beads. The appearances will be reverſed if the mirror has been paſſed acroſs the end of the conductor which is neareſt to the excited electric. In ſhort, in whatever way the drawing point has been electrified, if it repel a ball which has touched excited glaſs, the line will be feathered; but if it attract ſuch a ball, the line will be ſpotted. There are many ways of making this appearance much more remarkable; but we mention this, becauſe the circumſtances which occaſion the difference, whatever it be, are the moſt ſimple poſſible. Nothing is communicated; and therefore the effect muſt ariſe from a ſubſtance or power reſiding in the body. If it be a ſubſtance *ſui generis*, the electric action muſt ariſe from a different diſtribution of this ſubſtance; from a redundancy and deficiency of it in the different portions of the conductor. Without pretending to ſay which is redundant, we ſhall ſuppoſe, with Dr. Franklin, that the electricity of excited glaſs is ſo; and hence the words *redundant*, and *poſitive*, are uſed alike to diſtinguiſh this ſtate of electricity.

When an inſulated body is brought very near to an electrified body, a ſpark is obſerved to paſs between them, accompanied with a noiſe which is called the *ſnap*; from whence is inferred a *transference* of electrical matter. When a body has imparted electricity to another, it conſtantly repels it, unleſs that other has afterwards imparted all its electricity to other bodies. This fact, from which there is no exception, is an immediate conſequence of the theory. Before the transference ſuppoſed by it, one of the bodies was in its natural ſtate; after the transference, both bodies contain redundant fluid, or redundant matter; therefore they muſt mutually repel.

All the phenomena of communicated electricity muſt be more remarkable or forcible, in proportion to the conducting power of the bodies. A very imperfect conductor, ſuch as glaſs or ſealing-wax, will impart or receive fluid only between the very neareſt parts; whereas a metalline body is inſtantly affected through its whole extent. This deduction is perfectly agreeable to the whole train of electric experiments. The finger receives a ſtrong ſpark from a large metalline electrified body, which diſcharges *every part of it* of a portion of its electricity. But an excited globe, which ſhews, by its action on a diſtant body, as great a degree of electricity, will give only a very ſmall ſpark; and it is found not to be affected at any conſiderable diſtance from the point of its ſurface from which the transference was made. The whole electricity of a perfect conductor is diſcharged by touching it; but a non conductor will ſucceſſively give ſparks, if touched in many different parts; and it may be ſeen by a nice electrometer, that each contact takes away the electricity only from a very ſmall ſpace round it: and it is farther highly deſerving of notice, that ſome time after a ſpark has been obtained from a particular ſpot of the electric, a ſecond ſpark may be obtained from it, the electricity of the neighbouring parts having been gradually diffuſed over it.

If an electrified conducting body touch any thing communicating with the ground by perfect conductors, all its electricity muſt diſappear, and none can appear in the body touched by it; for the maſs of the earth bears ſuch an unmeaſurable proportion to that of the greateſt body that we can electrify, that when the redundancy or deficiency is divided between them, it muſt be imperceptible in both. Hence the deſcent of all lightning into the earth; and hence the neceſſity of *inſulation*, as it is called, or the ſurrounding by non-conductors every body which we would have exhibit electric appearances.

Any unelectrified body will be firſt attracted by an electrified body, will touch it, and will then be repelled. The *neutral* body is rendered electrical by induction. It is, *in conſequence of this*, attracted, comes near enough to receive a ſpark, or even touches it, and is then electrified by communication; and, *in conſequence of this*, it is repelled. This has been confirmed by an endleſs train of experiments. It was firſt taken notice of by ſir Iſaac Newton. Otho Guericke mentions many inſtances of the repulſion, but did not obſerve that it was an univerſal law. Newton was ſo ſtruck with it as to engage in a conſiderable train of experiments in the early part of his life, while meditating on the power of gravity; but even his ſagacious mind did not obſerve the whole proceſs of nature in his experiments. He obſerved, that the light bodies which roſe and adhered to the rubbed plate of glaſs were ſoon after repelled by it; but did not obſerve, that the ſame piece would again riſe to the glaſs after it had touched the table. This fact is now the foundation of many experiments, which the itinerant electricians vie with each other in rendering amuſing. There is frequently a ſeeming capriciouſneſs in thoſe attractions and repulſions. A pith ball, or a down feather, hung by ſilk, will cling to the conductor, or otherwiſe electrified body, and will not fly off again, at leaſt for a long while. This happens when thoſe bodies are ſo dry as to be almoſt non-conductors. They acquire a poſitive and negative pole, like an iron nail adhering to a magnet, and are not repelled till they become almoſt wholly poſitive or negative. This never happens with conducting light bodies.

We

We have ſeen, that the transference of electricity is deſultory, and that the change made in the electric ſtate of the communicating bodies is always conſiderable. It appears to keep ſome ſettled ratio to the whole electric power of the body. When the form of the parts where the communication takes place, and other circumſtances, remain the ſame, the transference increaſes with the ſize of the bodies; and all the phenomena are more vivid in proportion. When the conductor is large, the ſpark is very bright, and the ſnap very loud. This ſnap alone ſeems to indicate ſome material agent. It is occaſioned by a ſonorous undulation of the air, or of ſome elaſtic fluid, which ſuddenly expands, and as ſuddenly collapſes again. But ſuch is the rapidity of the undulations, that when it is made in cloſe veſſels it does not exiſt long enough, in a very expanded ſtate, to affect the column of water, ſupported in a tube by the elaſticity of the air, for the purpoſe of a delicate thermometer or barometer; juſt as a muſket-ball will paſs through a looſe hanging ſheet of paper without cauſing any ſenſible agitation.

The ſpark is accompanied by intenſe heat, which will kindle inflammable bodies, will melt, explode, and calcine, metals. It alſo produces ſome very remarkable chemical effects. It calcines metals even under water or oil; it renders Bolognan phoſphorus luminous; it decompoſes water, and makes new compoſitions and decompoſitions of many gaſiform fluids; it affects vegetable colours; it blackens the calces of biſmuth, lead, tin, luna cornea; it communicates a very peculiar ſmell to the air of a room, which is diſtinct from all others; and in the calcination of metals, it changes remarkably the ſmells with which this operation is uſually accompanied; it affects the tongue with an acidulous taſte; it agitates the nervous ſyſtem. When we compare theſe appearances with ſimilar chemical and phyſiological phenomena, which naturaliſts never heſitate in aſcribing to the action of material ſubſtances, tranſferable from one body, or one ſtate of combination, to another, we can ſee no greater reaſon for heſitating in aſcribing the electric phenomena to the action of a material ſubſtance; which we may call *a fluid*, on account of its connected mobility, and *electric fluid*, on account of its diſtinguiſhing effects.

Having taken this comprehenſive view of the ancient and preſent ſtate of the ſcience of electricity, it would be abſurd to traverſe the wild and barren waſtes of thoſe authors who have ſet up unfounded theories and fanciful hypotheſes; or to bewilder and perplex the reader with the unintereſting and deſultory controverſies which have been the conſequence, merely to arrive by circumlocution at thoſe legitimate facts which are now eſtabliſhed by the teſt of experiment and rational demonſtration. Thoſe who delight in the clear and convincing language of mathematical diſcuſſion, may ſee the Franklinian theory ſifted through all the moſt ſtriking features of electrical phenomena, in the work of M. Æpinus, of the imperial academy of St. Peterſburgh; as well as in thoſe of our illuſtrious countrymen, the Hon. Mr. Cavendiſh, and earl Stanhope. We are convinced that the *reſults* of their labours, clearly and methodically arranged, cannot but be moſt ſatisfactory and pleaſing to the bulk of our readers, becauſe they will thereby obtain an ample knowledge of all the phenomena, without the coſt of that labour and time which it is not always convenient to beſtow: and theſe phenomena having been moſt accurately and neatly claſſed in the Inſtitutes of Natural Philoſophy, recently publiſhed by the Rev. Dr. Enfield, we ſhall avail ourſelves of that mode, and ſtate them as follows: From what has been premiſed, we are warranted to conclude, 1. That the earth, and all bodies with which we are acquainted, contain a certain quantity of that exceedingly elaſtic fluid, which is called the *electric fluid*.—This certain quantity, ſuppoſed to belong to all bodies, may be called their natural ſhare or ſtate; and ſo long as each body contains neither *more*, nor *leſs*, than this quantity of the electric fluid, it lies dormant, and produces no effect. 2. When a body becomes poſſeſſed of more, or leſs, than this natural quantity, it is inſtantly *electrified*, and is capable of exhibiting appearances which are aſcribed to the action of *electricity*.—This equilibrium could never be diſturbed, or, if it were diſturbed, would be immediately reſtored, and therefore be inſenſible; but that ſome bodies do not admit the paſſage of the electric fluid through their pores, or along their ſurfaces, though others do. 3. When therefore a body has acquired an additional quantity of electric matter; or loſt a part of what naturally belonged to it, and is at the ſame time ſurrounded by bodies through which it *cannot* paſs, it muſt remain in that ſtate, and is thence ſaid to be *inſulated*.—The doctrine which reſults from theſe definitions, and from the facts previouſly ſtated, will be found exemplified in the following propoſitions:

I. The electric fluid, being excited, becomes perceptible to the ſenſes.—Let a glaſs tube be rubbed with the hand, or with a leathern cuſhion; the electric fluid being thus excited, will attract light ſubſtances, and give a lucid ſpark to the finger, or any metallic ſubſtance, brought near it. The glaſs tube is the *electric*, and all thoſe bodies which are capable, by any means, to produce ſuch effects, are alſo *electrics*. The hand, or any other body that rubs an electric, is called the *rubber*.

Reſpecting the theory of electricity, there are two different hypotheſes, one that there is only *one* fluid, and the other that there are *two*. Dr. Franklin's hypotheſis is the former, and depends on the following principles: 1. That all terreſtrial bodies are full of the electric fluid. 2. That the electric fluid violently repels itſelf, and attracts all other matter. 3. By exciting an electric, the equilibrium of the electric fluid contained in it is deſtroyed, and one part contains more than its natural quantity, and the other leſs. 4. Conducting bodies, connected with that part which contains more electric fluid than its natural quantity, receive it, and are *charged* with more than their natural quantity; this is called *poſitive* electricity: if they be connected with that part which has leſs than its natural quantity, they part with ſome of their own, and contain leſs than their natural quantity; this is called *negative* electricity. 5. When one body poſitively and another negatively electrified are connected by any conducting ſubſtance, the fluid in the body which is poſitively electrified ruſhes to that which is negatively electrified, and the equilibrium is reſtored. Theſe are the principles of *poſitive* and *negative* electricity. The other hypotheſis is, that there are *two* diſtinct fluids, ſuggeſted by M. Du Faye, upon his diſcovery of the different properties of excited glaſs, and excited reſins, ſealing-wax, &c. The following are the principles of this theory: 1. That the two powers ariſe from two different fluids which exiſt together in all bodies. 2. That theſe fluids are ſeparated in non-electrics, by the excitation of electrics, and from thence they become evident to the ſenſes, they deſtroying each others effects when united. 3. When ſeparated they ruſh together again with great violence, in conſequence of their ſtrong mutual attraction as ſoon as they are connected by any conducting ſubſtance. Theſe are the principles of *vitreous* and *reſinous* electricity.—*But the theory is unfounded.*

II. The electric fluid paſſes eaſily along the ſurfaces of ſome bodies; whilſt other bodies do not convey it: the former are called *conductors*, the latter *non-conductors*, or *electrics*.—The metallic cylinder being fixed upon glaſs ſupporters, and placed near the electric machine, will, by means of pointed wires, receive the electric fluid from the glaſs cylinder, and the fluid will be diffuſed over the whole ſurface of the metallic cylinder, from whence it cannot paſs through the glaſs ſupporters which are electric, but may be conveyed away by any metallic or other *conducting* ſubſtances, brought near, or into contact with it. This metallic cylinder is the *prime conductor*.

III. Some conductors are more perfect than others; and the electric fluid will always pass through that which is most perfect. Hence the fluid will pass through a wire held in the hand.—The following bodies are conductors and electrics, put down in the order of their degrees of perfection: *Conductors*; gold, silver, copper, brass, iron, tin, quicksilver, lead, the other metals, ores, charcoals, water, ice, snow, salts, soft stones, smoke, steam: *Non-conductors*, or *electrics*; glass, and all vitrifications, even those of metals; precious stones, resins, gums, amber, sulphur, baked wood, bituminous substances, wax, silk, cotton, feathers, wool, hair, paper, air, oil, hard stones. Many electrics become conductors when heated, and *all*, when moistened.

An exhausted glass vessel, on being rubbed, shews no signs of electricity upon its external surface. But the electric power of a glass cylinder is the strongest when the air within is a little rarefied. If the air be condensed, or the cylinder be filled with some conducting substance, it is incapable of being excited. Nevertheless, a solid stick of glass, sealing-wax, sulphur, &c. may be excited. The same substance, by different preparations, is sometimes a conductor, and at others an electric. A piece of wood just cut from a tree is a good conductor; let it be baked, and it becomes an electric; burn it to charcoal, and it is a good conductor again; lastly, let this coal be reduced to ashes, and these will be *impervious* to electricity. Such changes are also observable in many other bodies; and very likely in all substances there is a gradation from the best conductors to the best non-conductors of electricity.

IV. Non-conductors retain the fluid on a small part of their surface where the friction has acted; conductors diffuse it over all their surface, and therefore cannot confine it, unless they be surrounded entirely by non-conductors, that is, be *insulated*. This is constantly seen from the partial distribution of the fluid on an excited electric, and its universal diffusion over a conductor. If a finger, or any other conductor, be presented to an excited glass, cylinder, tube, &c. it will receive a spark, and in that spark, a small part only of the electricity of the electric; because the excited electric, being a non-conductor, cannot convey the electricity of all its surface to that point to which the conductor has been presented. But if any conducting substance be brought to a charged metallic conductor, it will receive in one spark nearly the whole of the electricity accumulated upon it. The small part which remains is very trifling in comparison of the first spark, and is called the *residuum*.—It was stated above that a body is said to be *positively electrified*, when it has excited or thrown upon it a greater quantity of the electric fluid than its natural share; and that a body is *negatively electrified*, when it has a less quantity of the electric matter than is natural to it.

V. The electric fluid may be excited by rubbing, by pouring a melted electric into another substance, by heating and cooling, and by evaporation.—In working the electrical machine, the fluid is excited by friction. Rubbing is the general mean by which all electric substances that are at all excitable may be excited. Whether they be rubbed with electrics of a different sort, or conductors, they always shew signs of electricity, and in general stronger when rubbed with conductors, and weaker when rubbed with electrics.—When sulphur is melted into an earthen vessel, if the vessel be supported by a conducting substance, the sulphur, when cold and separated from the vessel, is strongly electrical, and will attract light bodies.—If sulphur be melted into glass vessels, when cold, the glass, whether supported by electrics or not, will be positively electrical, and the sulphur negative.—Melted sealing-wax, when poured into sulphur, becomes positively electrified, and the sulphur negative.—Melted sealing-wax poured into glass cups acquires a negative electricity; upon being separated, the glass is positive.—Sulphur melted into metal cups, shews no signs of electricity till it is separated from the cup; then the cup is negative, and the sulphur is positive.—If a stick of sealing-wax be broken into two pieces, the extremities that were contiguous will be found electrified, one positively, and the other negatively.

The tourmalin, a stone which is generally of a deep red, or purple colour, about the size of a walnut, and found in the East Indies, while kept in the same degree of heat, shews no signs of electricity, but will become electrical by increasing or diminishing its heat, and stronger in the latter than in the former case. Its electricity does not appear all over its surface, but only on two opposite sides, which may be called its *poles*, and they are always in one right line with the center of the stone, and in the direction of the strata; in which direction the stone is absolutely opaque, though on the other side it is semi-transparent. Whilst the tourmalin is heating, one of its sides, (which we will call A,) is electrified plus; the other, (called B,) minus. But when it is cooling A is minus, and B is plus. If this stone be excited by friction, then both its sides at once may be made positive. If a tourmalin be cut into several parts, each piece will have its positive and negative poles, corresponding to the positive and negative sides of the stone from which it was cut.—These properties are now found to belong to several hard and precious stones as well as to the tourmalin.

Electricity may be produced by the evaporation of water in this manner: upon an insulating stand, as a wine glass, place an earthen vessel, as a crucible, a basin, &c. and put into it three or four lighted coals. Let a wire be put with one end among the coals, and with the other let it touch a very sensible pith-ball or Canton's electrometer. Then pour in a spoonful of water at once upon the coals, which will occasion a quick evaporation; and at the same time the electrometer will diverge.

VI. The electric fluid may be lodged in electrics, or in insulated conductors, in a greater quantity than naturally belongs to them; that is, they may be *positively* electrified.—In working the electrical machine, the cylinder acquires more than its natural quantity of fluid by excitation; the conductor, by communication: for, while there is a free conveyance of electric fluid from the earth to the rubber, by means of a conducting supporter, the conductor will be highly electrified. The electric matter with which the prime conductor is loaded, is not *produced* by the friction of the cylinder against the rubber. It is only *collected* by that operation from the rubber, and all the bodies that are contiguous to it. If, therefore, the rubber be well insulated, the friction of the cylinder will produce but little electricity; for in that case the rubber can only part with its own share, which is very inconsiderable. In this situation, if the finger be presented to the rubber, sparks will be seen to dart from it to the rubber, to supply the place of that electric matter which had passed from it to the cylinder: if the conductor be also insulated, these sparks will cease as soon as it is fully loaded.

VII. The electric fluid being accumulated on any body, will pass to any conductor brought near to that body: if it pass from, or be received by, *pointed* wires, it will be conveyed in a continued stream; if it pass from, or be received by, a surface which has no sharp points, it will be discharged with an instantaneous explosion or spark.—Let the fluid be received from the conductor upon a pointed wire, and upon a brass ball, and this result appears. The electric fluid will also be diffused through the surrounding atmosphere, by wires placed upon the conductor. Hence arises the necessity of keeping the whole surface of the conductor free from points. When a conductor is electrified by communication, its whole electric power is discharged at once, on the near approach of a conductor communicating with the earth; whereas an excited electric, in the same circumstances, loses its electric power only in the parts near to the conductor.

VIII. If conductors be insulated, they will retain a greate

greater or leſs quantity of the electric fluid, (the power of the machine being given,) proportional to the extent of ſurface in the conductor.—This reſult appears by obſerving the difference in the magnitude and diſtance of ſparks taken from a ſmall conductor, and of thoſe taken from a large one. There is a limit, however, beyond which this propoſition will not hold true, but which, experiment has not yet ſufficiently aſcertained. For it is certain, that if the conductor be very long, it will diſcharge itſelf over the cylinder back to the rubber long before it is fully charged. The late Mr. G. C. Morgan aſſerts, that by the moſt powerful excitation of a cylinder fourteen inches in diameter, the ſpark afforded by a conductor eight inches in diameter, and twelve feet long, did not equal half the length of that procured from the ſame cylinder with a conductor of equal diameter, but ſhortened to ſix feet. And he ſuggeſts that a conductor of half that length even, and about ſixteen inches in diameter, would have yielded a longer ſpark than either of the preceding. See *Morgan's Lect. on Elect.* vol. i. p. 54, &c.

IX. A body may be deprived of part of its natural portion of electric fluid; that is, be *negatively* electrified.—If the rubber which communicates the fluid to the glaſs cylinder, and from thence to the conductor, be inſulated, becauſe by working the machine a quantity of its fluid is conveyed away, and it cannot receive a freſh ſupply through its ſupporter, it will be in an *exhauſted* or *negative* ſtate. If negative electricity be required, then the chain which connects the rubber with ſurrounding objects, and conſequently with the earth, the great reſervoir of the electric fluid, muſt be removed from the inſulated rubber, and hung to the prime conductor; for in this caſe the electricity of the conductor will be communicated to the ground, and the rubber will appear ſtrongly negative. Another conductor may be connected with the inſulated rubber, and then as ſtrong negative electricity may be obtained from this as poſitive can be in the caſe before-mentioned.—The patent machine of Mr. Nairne is admirably adapted for the purpoſes both of poſitive and negative electricity.

X. When bodies are negatively electrified, they receive the electric fluid from other bodies brought near them.—Let two inſulated conductors, one of which is connected with the glaſs cylinder, the other with the rubber, be electrified; whilſt they are in this ſtate let them be brought near each other; a ſpark will paſs from that which (by Prop. VI.) is poſitively, to that which (by Prop. IX.) is negatively, electrified.—Let two perſons ſtanding on glaſs feet be electrified, firſt both poſitively, or both negatively, they will not, on contact, communicate the fluid to each other; but let them be electrified, the one poſitively and the other negatively, by making a communication from one to the conductor, and from the other to the rubber, on contact, the former will give, and the latter receive, a ſpark.

XI. From a *pointed* body poſitively electrified, the fluid will be ſeen to ſtream out, towards any electrified body brought near it, in a conical pencil of rays; whereas in paſſing from the unelectrified body to a pointed body negatively electrified, it will form a globular flame, or ſtar, about its point.—This reſult is made obvious by obſerving, in a dark room, the different appearances of the electric fluid at the extremity of a pointed wire, when the point is preſented to an inſulated conductor poſitively, and when it is preſented to one negatively, electrified; or when ſuch a wire is fixed upon a conductor poſitively or negatively electrified. Within a *luminous conductor* electrified poſitively, (viewed in a dark room,) the electric fluid will be ſeen paſſing in the form of a pencil from one wire, and received in the form of a ſtar upon the other; and the reverſe, if it be electrified negatively.

XII. If two bodies be electrified, both poſitively, or both negatively, they repel each other; but if one be electrified poſitively, and the other be negatively or not at all electrified, they attract each other.—Thus, light feathers, or hair, connected with the conductor, appear repellent, but are attracted by bringing any non-electrified body near them. The hair of a perſon electrified becomes repellent. In the graduated or Henley's electrometer, the ball is repelled according to the degree in which the conductor is electrified. Downy feathers, paper figures, threads of flax, thiſtle down, gold leaf, braſs duſt, or other light bodies, brought near to the conductor, are alternately attracted and repelled. But this will not take place if the bodies be laid on a plate of glaſs.

Two bells being ſuſpended by wires from a braſs rod connected with the conductor, and a third by a ſilk cord, and two ſmall balls of braſs ſuſpended by a ſilken thread between the bells, the electric fluid will be communicated from the conductor to the outer bells, and by the balls to the middle bell, and from thence conveyed by a chain to the earth: the balls in receiving and communicating the fluid are attracted and repelled ſucceſſively, and produce ringing: exactly on the ſame principle as the experiment made with the Leyden phial and ſix bells, as ſhewn in the Electricity Plate I. fig. 9.

Let water flow from a capillary tube, from which, before it is electrified, it paſſes in drops; upon being electrified, the particles of fluid will be ſeparated, and their motion accelerated. Theſe appearances will be preſented, whether the conductor be poſitively or negatively electrified.

Mr. Symmer's electricity of ſilk ſtockings illuſtrates this propoſition. He had been accuſtomed to wear two pair of ſilk ſtockings, a white pair under black ones. When theſe were pulled off together, no ſigns of electricity appeared, but on pulling off the black ones from the white, he heard a ſnapping noiſe, and in the dark perceived luminous ſparks. On this ſubject he has related a number of very curious experiments on the attraction and repulſion of the ſtockings, and upon their different ſtates of electricity.

Since it is found that rubbed glaſs electrifies any inſulated conductor poſitively, it may be determined whether any body is electrified poſitively or negatively, by bringing it near to a pith-ball, or down-feather, poſitively electrified, and obſerving whether the ball or feather be *attracted*, or *repelled*, by the body. Bring a pith-ball or down-feather, ſuſpended by a ſilken thread and poſitively electrified by any rubbed glaſs ſurface, near to another pith-ball or feather ſuſpended by a flaxen thread from a conductor connected with the cylinder; then bring the ſame near to a conductor connected with the rubber, and the kind or meaſure of the electricity will be ſeen. Thus was the invention and utility of the *electrometer* ſuggeſted.

XIII. From the ſharp points of electrified bodies there proceeds a current of air.—A wire, with ſharp points bent in oppoſite directions, and ſuſpended on the point of a perpendicular wire inſerted in the conductor, will be carried round by the current of air proceeding from the points. Let ſeveral pieces of imboſſed or gilt paper be ſtuck like vanes into the ſide of a cork, through the center of which a needle paſſes; ſuſpend the whole by a magnet, and preſent one of the vanes to the point of a wire inſerted in the conductor; they will be put into motion.

The rapid diſſipation of the electric fluid by ſharp points, and the impoſſibility of making any conſiderable accumulation in a body which has any ſuch points projecting beyond other parts of its ſurface, is one of the moſt abſtruſe phenomena in electricity. The diſſipation is attended with many remarkable circumſtances, which have greatly the appearance of the actual eſcape of ſome material ſubſtance. A ſtream of wind blows from ſuch a point, and quickly electrifies the air of a room to ſuch a degree, that an electrometer in the fartheſt corner of the room is affected by it. This diſſipation in a dark place is, in many inſtances, accompanied by a bright train of light diverging from the point like a firework. Dr. Franklin is therefore very anxious to reconcile this appearance

pearance with his theory of plus and minus electricity, but does not expreſs himſelf well ſatisfied with any explanation which had occurred to him. From the beginning, he ſaw that he could not conſider the ſtream of wind as a proof of the eſcape of the electric fluid, becauſe the ſame ſtream is obſerved to iſſue from a ſharp negative point; which, according to his theory, is not diſperſing, but abſorbing it. The Hon. Mr. Cavendiſh ſeems to have given the firſt ſatisfactory account of this phenomenon. To ſee it in its full force, the phenomenon itſelf muſt be carefully obſerved. The ſtream of wind is plainly produced by the eſcape of ſomething from the point itſelf, which hurries the air along with it; and this alſo draws a great deal of the ſurrounding air, eſpecially from behind, in the ſame manner as the very ſlender thread of air from a blow-pipe hurries along with it the ſurrounding air and flame from a conſiderable ſurface on all ſides. It is in this manner that it gathers the whole of a large flame into one maſs, and, at laſt, into a very point. If the ſmoke of a little roſin thrown on a live coal be made to riſe quietly round a point projecting from an electrified body, continually ſupplied from an electrical machine, the vortices of this ſmoke may be obſerved to curl in from all ſides, along the wire, forming a current of which the wire is the axis, and it goes off completely by the point. But if the wire be made to paſs through a cork fixed in the bottom of a wide glaſs tube, and if its point project not beyond the mouth of the tube, the afflux of the air from behind is prevented, and we have no ſtream; but if the cork be removed, and the wire ſtill occupy the axis of the tube, but without touching the ſides, we have the ſtream very diſtinctly; and ſmoke which riſes round the far end of the tube is drawn into it, and goes off at the point of the wire. Now it is of importance to obſerve, that whatever prevents the formation of this ſtream of wind prevents the diſſipation of electricity from the point. If the point project a quarter of an inch beyond the tube, or if the tube be open behind, the ſtream is ſtrong, and the diſſipation ſo rapid, that even a very good machine is not able to raiſe a Henley's electrometer, ſtanding on a conductor, a very few degrees. If the tube be ſlipped forward, ſo that the point is juſt even with its mouth, the diſſipation of electricity is next to nothing, and does not exceed what might be produced by ſuch air as can be collected by a ſuperficial point. If the tube be made to advance half an inch beyond the point which it ſurrounds, the diſſipation becomes inſenſible. All theſe facts put it beyond a doubt that the air is the cauſe, or, at leaſt, the occaſion of the diſſipation, and carries the electricity off with it, in this manner rendering electrical the whole air of a room.

It has been demonſtrated that two ſpheres, connected by an infinitely extended, but ſlender, conducting canal, are in electrical equilibrium, if their ſurfaces contain fluid in the proportion of their diameters. In this caſe, the ſuperficial denſity of the fluid and its tendency to eſcape are inverſely as the diameters. Now if, in imagination, we gradually diminiſh the diameter of one of the ſpheres, the tendency to eſcape will increaſe in a greater proportion than any that we can name. We know, that when the prime conductor of a powerful table-machine has a wire of a few inches in length projecting from its end, and terminating in a ball of half an inch in diameter, we cannot electrify it beyond a certain degree; for when arrived at this degree, the electricity flies off in ſucceſſive burſts from this ball. Being much more overcharged than any other part of the body, the air ſurrounding the ball becomes more overcharged by communication, and is repelled, and its place ſupplied by other air, not ſo much overcharged, which ſurrounded the other parts of the body, and is preſſed forwards into this ſpace by the general repulſion of the conductor and the confining preſſure of the atmoſphere; otherwiſe, being alſo overcharged, it would have no tendency to come to this place. Half a turn of the cylinder is ſufficient to accumulate to a degree ſufficient for producing one of theſe exploſions, and we have two of them for every turn of the cylinder. A point may be compared to an incomparably ſmaller ball. The conſtipation of the fluid, and its tendency to eſcape, muſt be greater in the ſame unmeaſurable proportion. This denſity and mutual repulſion cannot be diminiſhed, and muſt even be increaſed, by the matter of the wire forming a cone, of which the point is the apex; therefore, if there were no other cauſe, we muſt ſee that it is almoſt impoſſible to confine a collection of particles, mutually repelling, and conſtipated, as theſe are, in a fine point.

But the chief cauſe ſeems to be a certain chemical union which takes place between the electric fluid and a correſponding ingredient of the air. In this ſtate of conſtipation, almoſt completely ſurrounded by the air, the little maſs of fluid muſt attract and be attracted with very great force, and more readily overcome the force which keeps the electric fluid attached to the laſt ſerics of particles of the wire. It unites with the air, rendering it electric in the higheſt degree of redundancy. It is therefore ſtrongly repelled by the maſs of conſtipated fluid which ſucceeds it within the point. Thus is the electrified air continually thrown off, in a ſtate of electrification, that muſt rapidly diminiſh the electricity of the conductor. Hence the uninterrupted flow, without noiſe or much light, when the point is made very fine. When the point is blunt, a little accumulation is neceſſary before it attains the degree requiſite for even this minute exploſion; but this is ſoon done, and theſe little exploſions ſucceed each other rapidly, accompanied by a ſputtering noiſe, and trains of bright ſparks. The noiſe is undoubtedly owing to the atoms of the highly electrified fluid. Theſe are, in all probability, rarefied of a ſudden, in the act of electrification, and immediately collapſe again in the act of chemical union, which cauſes a ſonorous agitation of the air. This electrified air is thus thrown off, and its place is immediately ſupplied by air from behind, not yet electrified, and therefore ſtrongly drawn forward to the point, from which they are thrown off in their turn. This rapid expanſion and ſubſequent collapſing of the air is verified by the experiments of Mr. Kinnerſly, related by Dr. Franklin, and is ſeen in numberleſs experiments made with other views in later times, and not attended to. Perhaps it is produced by the great heat which accompanies, or is generated in, the transference of electricity, and it is of the ſame kind with what occaſions the burſting of ſtones, ſplitting of trees, exploding of metals, &c. by electricity. The expanſion is either inconſiderable, or it is ſucceſſively produced in very ſmall portions of the ſubſtance expanded; for when metal is exploded in cloſe veſſels, or under water, there is but a minute portion of gaſeous matter produced; and in the diſſipation by a very fine point, ſufficiently great to give full employment to a powerful machine, the ſtream of wind is but very faint, and nine-tenths of this has been dragged along by the really-electrified thread of wind in the middle.

From a collation of all the appearances of electricity, we muſt form the ſame conception of the forces which operate round a point that is negatively electrified, not diſperſing, but drawing in, electric fluid. It is more completely under-charged than any other part of a body, and attracts the fluid in the ſurrounding air, and the air in which it is retained, with incomparably greater force, It therefore deprives the contiguous air of its fluid, then repels it, and produces a ſtream like the over-charged point.

If a conducting body be brought near to any part of an overcharged body, the fronting part of the firſt is rendered undercharged; and this increaſes the charge of the oppoſite part of the overcharged body. It becomes more overcharged in that part, and ſooner attains that degree of conſtipation that enables the fluid to quit the ſuperficial ſeries of particles, and to electrify ſtrongly the

contiguous air. The explosion is, therefore, made in this part in preference to any other; and the air thus exploded is strongly attracted by the fronting part of the other body, and must fly thither in preference to any other point. If, moreover, the fronting part be prominent or pointed, this effect will be produced in a superior degree; and the current of electrified air, which will begin very early, will increase this disposition to transference in this way by rarefying the air; a change which the whole course of electric phenomena shews to be highly favourable to this transference, although we cannot perhaps form any very adequate notion how it contributes to this effect. This seems to be the reason why a great explosion and snap, with a copious transference of electricity, is generally preceded by a hissing noise like the rushing of wind, which swells to a maximum in the loud snap itself.

XIV. Some bodies upon being rubbed, are electrified positively, and others negatively; and the same bodies are capable of being electrified positively, or negatively, as they are rubbed with different substances.—Thus smooth glass becomes positively electrified by being rubbed with any substance hitherto tried, except the back of a living cat; rough glass becomes positively electrified by being rubbed with dry oiled silk, sulphur, and metals; negatively, with woollen cloth, sealing-wax, paper, the human hand. White silk becomes positively electrified by being rubbed with black silk, metals, black cloth; negatively, with paper, hairs, the hand. Black silk will be positively electrified with red sealing-wax; negatively, with hare's skin, metals, the hand. Sealing-wax will be positively electrified with the hand, leather, woollen cloth, paper, hare's skin. Baked wood will be positively electrified with silk; negatively, with flannel. If these and other substances, being electrified, be brought near to a pith-ball or down-feather, as described Prop. XII. it will appear whether they are electrified positively or negatively.

XV. Bodies insulated, if placed within the influence of an electrified body, will be electrified, at the part adjacent to that body, in the manner *contrary* to that of the electrified body.—Bring a conductor (without pointed wires) near to the glass cylinder, whilst the machine is working; if the conductor be not insulated, it will be negatively electrified till it is brought so near as to receive sparks from the cylinder: if the conductor be insulated, it will, in the same situation, be electrified negatively, in the parts nearest the cylinder, and positively in the parts more remote; as may be seen by bringing an excited glass tube (which is positively electrified) near to a ball suspended from the conductor. Let two pith-balls be so suspended by flaxen threads as to be in contact when unelectrified; on being brought near to a body electrified positively, they will repel each other, being electrified negatively: if the balls be suspended in the same manner by silken threads, they will, in the same situation, be positively electrified.

Let P C, fig. 21, in the Electricity Plate III. be an electrified prime conductor, and A B a metallic body placed within its atmosphere, but beyond the striking distance. Now, from the principles already explained, it is evident that the electrical atmosphere of the prime conductor must be *positive* or *negative*. If it be *positive*, then the adjacent part A of the metallic body A B, will be found to be electrified negatively; the remote part B, will be electrified positively; and there will be a certain point D, in its natural state, or not electrified at all.—If the prime conductor be charged with *negative* electricity, then A will be positive, B negative, and still some point, as D, will be found unelectrified, which is called the *neutral* point.

Earl Stanhope has demonstrated, by a considerable number of experiments, that the neutral point D, is the fourth point of an harmonical division of the line C A B. Consequently, the points C, A, and B, being given, the neutral point D, may be always found. For, by the proportion assumed by his lordship, as the whole line B C is to the part C A, so is the remote end B D to the middle term D A; therefore, by composition, B C + C A (B A + 2 A C) : C A :: B D + D A (B A) :: A D. Thus, if B A be 40 inches, and C A 36, then A D is equal to 12½ inches.—From the nature of this proportion, it is evident, that the neutral point D can never be farther from A than half the distance between A and B, supposing the electrified conductor P C to be removed to an infinite distance. It is likewise evident, that the evanescent position of the neutral point D must be A, when the end A of the metallic body A B comes into contact with the charged body, P C.

From the above considerations, lord Stanhope has, with great ingenuity, proved by an elaborate mathematical demonstration, illustrated and confirmed by a great variety of experiments, that the denfity of an electrical atmosphere superinduced upon any body must be inverfely as the fquare of the diftance from the charged body.

Let a circular plate compofed of rofin and fulphur, or of fealing-wax, be negatively electrified by rubbing it with flannel; whilft it is in this ftate, let a metallic plate of the fame form and fize, having a glafs handle faftened to its center, be placed, by means of the handle, on the electrified plate; then receive a fpark from the metallic plate with the finger: after which the metallic plate, being removed by the glafs handle, will be found to be pofitively electrified. This is the origin and action of the electrophorus.

Let one fide of a plate of glafs be electrified pofitively, the other fide will attract light bodies, being negatively electrified.—Let a plate of glafs be placed between two metallic plates about two inches in diameter fmaller than the plate of glafs, and let the plates be fupported by a conductor; upon pofitively electrifying the upper metallic plate, by means of a wire connected with the prime conductor, the fluid, not being able to pafs along the glafs, will be accumulated upon the part contiguous to the upper metallic plate; whilft the lower metallic plate, being within the electric influence of the upper, will be negatively electrified.

XVI. When any electric fubftance is electrified, it will continue in that ftate till fome conductor conveys away the accumulated, or reftores the deficient, fluid; which will be done more or lefs rapidly, according to the degree of conducting power in the conductor, and the number of points in which it touches the electric.—When the metallic plate in an electrophorus is electrified, (as fuggefted Prop. XV.) by fetting it upon the electric plate, touching it with the finger, and feparating it fucceffively, many fparks may be obtained, without again exciting the electric plate; for this plate being negatively electrified, the metallic plate, on being touched with the hand, becomes pofitively electrified, and the electric plate remains long in its negative ftate, becaufe, not being a conductor, its deficiency will be flowly fupplied from the air where its furface is not covered. See this fully exemplified in the explanation and figure of the electrophorus, p. 419.

If a glafs veffel, a common drinking-glafs, for inftance, held in the hand, receive the electric fluid on the infide from a wire, or chain, fixed on the conductor, pith-balls, placed under the veffel upon a conducting fupporter, will continue long in motion.—Let a plate of glafs be electrified in the manner defcribed in Prop. XV. Becaufe one fide of the plate is pofitively electrified, and the other negatively, if a communication is made from one metallic plate to the other by means of fome conductor, part of the accumulated fluid will fuddenly pafs to the fide which is deficient; upon a fecond application of the plates of metal to the glafs, there will be a fecond explofion.

XVII. If a glafs plane, or cylindrical veffel, *coated* on both fides with tin-foil, or any other conducting fubftance, be *charged*, that is, pofitively electrified on one fide, and confequently negatively electrified on the other;

a communication being made from one ſide to the other by ſome conductor, the plane, or veſſel, will be ſuddenly *diſcharged*, with an exploſion.—There is a ſtrong attraction (compare Prop. XII. and XV.) between the fluids on oppoſite ſides of the glaſs, or the fluid which is accumulated on one ſide makes a powerful effort towards the other ſide where the fluid is deficient; but the ſubſtance of the glaſs itſelf being *impervious* to the electric fluid, the accumulated fluid cannot paſs to the deficient ſide till a communication is made between them by ſome conducting ſubſtance. When ſuch a communication is made, becauſe the metallic coating touches the whole ſurface of the electrified glaſs, the whole quantity of redundant fluid eaſily paſſes from the ſide which was poſitively electrified to the other.

Let a plate of glaſs, coated with tin-foil (except about one inch and a half from the edge), be charged, as deſcribed Prop. XV. Upon making a communication from one ſide to the other by the diſcharging-rod, there will be a ſudden diſcharge. The ſame may be done with the *Leyden phial*. Charge a jar coated on the inſide with water, ſhot, or braſs duſt, and held on the outſide by the hand, then diſcharge it in a dark room.

If two equal circular braſs plates, one of which is ſuſpended by a long metallic rod from the conductor parallel to the horizon, and the other, ſupported by a conductor, is placed parallel and oppoſite to the firſt, be electrified; the plate of air between them will be charged by the braſs plates.

Let one coated jar be ſuſpended by a wire under another; let the upper jar be charged by taking ſparks from the conductor; the lower uninſulated jar will be charged with the electric fluid which paſſes from the ſide negatively electrified of the upper jar.—A coated jar cannot be charged unleſs its outer ſurface be connected with ſome conductor. For without ſuch a conductor, the electric fluid cannot paſs from or to the outer ſurface, which is neceſſary in order to charge the jar.

When a coated glaſs veſſel is charged, the charge of electric fluid is in the glaſs, and not in the coating.—Lay a plate of glaſs between two metallic plates, as deſcribed Prop. XV. Having charged the plate of glaſs, remove the upper plate of metal by a glaſs handle, with ſome non-conducting ſubſtance, as ſilk; remove the electrified glaſs plate, and place it between two other plates of metal unelectrified and inſulated; the plate of glaſs thus coated afreſh will ſtill be charged.

The diſcharge of a plate of glaſs, Leyden phial, &c. is made by reſtoring the equilibrium which was deſtroyed by the charging; and it is effected by forming a communication between the overloaded and the exhauſted ſide; and if the communication be made by metal, or other good conductors, the equilibrium will be reſtored with violence, the redundant electricity on one ſide will ruſh with great rapidity through the metallic communication to the exhauſted ſide, and a large exploſion will be made, that is, the flaſh of electric light will be very viſible, and the report will be very loud.

XVIII. If the conductor be electrified poſitively, that ſide of the jar with which it has a communication will be electrified poſitively, the other, negatively.—Charge one Leyden jar on the inſide poſitively, and another negatively, and obſerve, in a dark room, the different appearances of the electric fluid upon the point of a wire brought near to the ball which is connected with the inner ſide of each jar: when the point is preſented to the jar poſitively electrified on the inner ſide, it will exhibit the appearance of a ſtar; when preſented to the other, that of a pencil.—Obſerve the different appearances, in a dark room, when with the ſame charged jar the point is preſented towards the ſide poſitively, and towards the ſide negatively, electrified.

Between two jars, charged one negatively and the other poſitively, ſuſpend by a ſilken ſtring a cork ball, from which ſhort threads hang freely; the ball will paſs with a rapid motion from one to the other, and, being firſt attracted towards the jar poſitively electrified, then towards the other, it will receive the fluid from the former, and communicate it to the latter, till both are diſcharged. If both be charged in the ſame manner, the cork will remain at reſt.—If, after a jar is charged, the uncoated part of the jar be moiſtened by the breath, or by ſteam, the jar placed upon a conductor will be gradually diſcharged, and the fluid will be ſeen, in a dark room, to flaſh ſtrongly from one ſide to the other: if the jar be inſulated, the flaſhes will be greateſt on the ſide poſitively electrified.—Let a diſcharging rod be applied without its balls to a charged jar, in ſuch manner as to diſcharge the jar gradually: the point which approaches towards the ſide poſitively electrified, will, in a dark room, exhibit ſtar; the other point, a cone or pencil.

Within the receiver of an air-pump place two well-poliſhed braſs balls, the lower ſupported on a braſs ſtem by the plate of the pump, the other fixed on a ſtem which is moveable in the neck of the receiver: let the balls be brought within the diſtance of four or five inches from one another; then let the upper ball be connected with the conductor, and electrified poſitively: a lucid atmoſphere will, in a dark room, appear on the lower ſurface of the upper ball; whereas if the upper ball be negatively electrified, the lucid atmoſphere will be ſeen on the lower ball.—This laſt experiment eſtabliſhes the theory of a *ſingle* electric fluid: for if there were *two* contrary fluids, there muſt in this experiment be an atmoſphere about each ball, attracting each other.

XIX. The electric fluid can be conveyed through an inſulated conductor of any length, and its paſſage from one ſide of a charged jar to the other, is apparently inſtantaneous, through whatever length of a metallic or other good conductor it is conveyed.—Let a long wire, paſſing round a room, ſuſpended by ſilk cords, be a part of the circuit of communication from one ſide of a charged jar to the other, the diſcharge will be apparently at the ſame inſtant in which the communication from one ſide to the other is completed. Let any number of perſons make a part of the circuit of communication; the fluid will paſs inſtantaneouſly through the whole circuit.—The ſhock of the Leyden jar has been tranſmitted through wires of ſeveral miles in length, without taking any ſenſible ſpace of time. Dr. Prieſtley relates ſeveral curious experiments made with a view of aſcertaining this point ſoon after the diſcovery of the Leyden phial. See *Prieſtley's Hiſt. of Electricity*.

XX. The ſudden diſcharge of a charged jar gives a painful ſenſation to any animal placed in the circuit of communication, called the *electric ſhock*.—The diſcovery of the effects of electricity, as exhibited by the Leyden jar, immediately raiſed the attention of all the philoſophers in Europe. The account which ſome of them gave of the firſt experiments to their friends, border very much on the ludicrous. M. Muſchenbroek, who tried the experiment with a glaſs bowl, told M. Reaumur, in a letter written ſoon after the experiment, that he felt himſelf ſtruck in his arms, ſhoulder, and breaſt, ſo that he loſt his breath; and was two days before he recovered from the effects of the blow and the terror. He added, that he would not take a ſecond ſhock for the whole kingdom of France.—M. Allamand, who made the experiment with a common beer-glaſs, ſaid, that he loſt his breath for ſome moments, and then felt ſuch an intenſe pain all along his right arm, that he was apprehenſive of bad conſequences; but it ſoon went off without any inconvenience.—Notwithſtanding the parade made by theſe philoſophers, the ſhock was probably not, by any means, ſtronger than what many children of ſix or ſeven years old would bear without the ſmalleſt heſitation. Their deſcriptions muſt have ariſen through terror impreſſed on the mind by the novelty of the phenomenon, or the love of the marvellous.

The force of the electric ſhock may be increaſed, by

increaſing the ſurface of the coated glaſs. A battery being charged, a fine metallic wire brought into the circuit of the ſhock will be melted.—If a plain piece of metal be placed upon one of the rods of the diſcharger, and upon the other a needle with the point oppoſite to the ſurface of the metal; upon diſcharging the battery, the ſurface of the piece of metal will be marked with coloured circles, occaſioned by thin laminæ of metal raiſed in the exploſion.—If a piece of leaf gold be put between two pieces of glaſs, and the whole faſt bound together, the metal will be melted, and a metallic ſtain will be ſeen on both glaſſes.—If a ſhock be ſent through a needle, it will give it magnetic polarity.—An animal, or plant, may be killed, by being placed in the circuit of a battery.

Perſons not thoroughly converſant in electricity, ſhould be very cautious in uſing large batteries; they ſhould be ſure that they are perfect maſters of a ſmall force, before they meddle with a greater. Such a force of electricity as may be accumulated in batteries is not to be trifled with, ſince the conſequences, if not fatal, may be great and laſting. A large ſhock, taken through the arms and breaſt, which an operator is moſt in danger of receiving, might poſſibly injure the lungs, or ſome other vital part: and if the ſhock were taken through the head, which may eaſily happen when a perſon is ſtooping over the apparatus in order to adjuſt it, it might affect his intellects for the remainder of life. The ingenious profeſſor Richmann, of the imperial academy of St. Peterſburgh, was thus inſtantaneouſly killed by an accidental ſtroke from his large electrical battery.

XXI. If the circuit be interrupted, the electric fluid will become viſible; and where it paſſes, it will leave an impreſſion upon any intermediate body.—Let the fluid paſs through a chain, or through any metallic bodies placed at ſmall diſtances from each other; the fluid, in a dark room, will be viſible between the links of the chain, or between the metallic bodies.

If the circuit be interrupted by ſeveral folds of paper, a perforation will be made through it, and each of the leaves will be protruded by the ſtroke from the middle towards the outward leaves. Let a card be placed under wires which form the circuit, where the circuit is interrupted for the ſpace of an inch: the card will be diſcoloured. If one of the wires be placed under the card, and the other above it, the direction of the fluid may be ſeen.—Spirits of wine, or gunpowder, being made part of the circuit, may be fired.—Inflammable air may alſo be fired by an electric gun. Many ingenious experiments of this kind have been lately made by von Hauch, inventor of the balance diſcharging electrometer. "We ſee, by ſuch experiments, (ſays this philoſopher,) the wonderful advances which have been made in the ſcience of electricity within the laſt forty years, from the time of the invention of Hauſen's glaſs globes, to the erection of the electrical machine now in the Teylerian muſeum at Haerlem. The former was ſcarcely ſufficient to attract the lighteſt bodies; whereas the latter approaches near to nature in its ſtrength, in its awful and wonderful effects; and ſeems to favour the poſſibility of the idea, that there are natural powers capable of impelling heavy bodies with prodigious force; and which, connected by the hand of cultivated and enlightened man, may, ſome centuries hence, baniſh the uſe of gunpowder, as the latter, a few centuries ago, baniſhed the uſe of bows and arrows."

XXII. The atmoſphere is electrified, ſometimes *poſitively*, and ſometimes *negatively*.—Let a kite be ſent up into the air with cord conſiſting of copper thread twiſted with twine; let the lower end of the cord be inſulated by a ſilk line: a metallic conductor ſuſpended from the lower end of the cord will be poſitively or negatively electrified. The air at ſome diſtance from houſes, trees, maſts of ſhips, &c. is generally electrified poſitively; particularly in froſty, clear, and foggy, weather.

The following general laws have been deduced by Mr. Cavallo, from a great number of experiments made during two years in almoſt every degree of the atmoſphere, from 15° to 80° of Fahrenheit's thermometer: 1. The air appears to be electrified at all times; its electricity is conſtantly poſitive, and much ſtronger in froſty than in warm weather; but it is by no means leſs in the night than in the day-time. 2. The preſence of the clouds generally leſſens the electricity of the kite. 3. When it rains, the electricity of the kite is generally negative; and very ſeldom poſitive. 4. The aurora borealis ſeems not to affect the electricity of the kite. 5. The electrical ſpark, taken from the ſtring of the kite, or from any inſulated conductor connected with it, eſpecially if it does not rain, is very ſeldom longer than a quarter of an inch, but it is exceedingly pungent. When the index of the electrometer is not higher than 20°, the perſon that takes ſpark will feel the effect of it in his legs; it appearing more like the diſcharge of an electric jar, than the ſpark taken from a prime conductor. 6. The electricity of the kite is in general ſtronger or weaker, according as the ſtring is longer or ſhorter; but it does not keep any exact proportion to it. The electricity, for inſtance, brought down by a ſtring of a hundred yards, may raiſe the index of the electrometer to 20°, when, with double that length of that ſtring, the index of the electrometer will not go higher than 25°. 7. When the weather is damp, and the electricity is pretty ſtrong, the index of the electrometer, after taking a ſpark from the ſtring, or preſenting the knob of a coated phial to it, riſes ſurpriſingly quick to its uſual place, but in dry and warm weather it riſes exceedingly ſlow.

XXIII. The electric fluid and lightning are the ſame ſubſtance: their properties and effects are conſtantly obſerved to be the ſame.—Flaſhes of lightning are generally ſeen to form irregular lines in the air; the electric ſpark, when ſtrong, has the ſame appearance. Lightning ſtrikes the higheſt and moſt pointed objects; ſeizes in its courſe the beſt conductors; ſets fire to bodies; diſſolves metals; rends to pieces ſome bodies; deſtroys animal life; in all which it agrees (as has been ſhewn) with the phenomena of electric fluid: both cauſes have the ſame power of making iron magnetic. Lightning has been known to ſtrike men with blindneſs. Dr. Franklin produced a ſimilar effect on a pigeon by the electrical fluid. Laſtly, the lightning being brought from the clouds to an electrical apparatus, by a kite or wire, will exhibit all the appearances of the electric fluid.

Take a Leyden phial, five inches in diameter, and thirteen inches in height; on the inſide let the coating riſe till its upper edge be two inches and a half from the rim of the veſſel; on the outſide let the coating riſe no higher than one inch from the bottom. When the phial is thus coated, let it be charged, and a ſpark will paſs from the tin-foil on the outſide to that on the inſide; but its form will reſemble that of a tree, whoſe trunk will increaſe in magnitude and brilliancy, and conſequently in power, as it approaches the edge, owing to ramifications which it collects from all parts of the glaſs. Within two inches of the edge, it becomes one body, or ſtream, and along that interval its greateſt force acts.—When two clouds, or the two correſpondent parts of a cloud, have their equilibrium reſtored by a diſcharge, the appearances are exactly ſimilar to thoſe of the preceding experiment. Each extremity of the flaſh is formed by a multitude of little ſtreams, which gather into one body, whoſe power is undivided in that interval only which ſeparates the poſitive from the negative.

XXIV. Buildings may be ſecured from the effects of lightning, by projecting a pointed iron rod higher than any part of the building, and continuing it, without interruption, to the ground, or the neareſt water.—The electric fluid will, by means of the pointed rod, be gradually conveyed from the cloud to the earth by a continued ſtream, and thus prevent the effects of a ſudden and violent exploſion.

Let

Let a board, ſhaped like the gable end of a houſe, be fixed perpendicularly upon an horizontal board: in the perpendicular board let a hole be made, about an inch ſquare and a quarter of an inch deep; in this hole let a piece of wood nearly of the ſame dimenſions be ſo inſerted as to fall eaſily out of its place, and let a wire be faſtened diagonally to this ſquare piece of wood; let another wire, terminated by a braſs ball, be faſtened to the perpendicular board, with its ball above the board, and its lower end in contact with the diagonal wire in the ſquare piece of wood; let the communication be continued by a wire to the bottom of the perpendicular board. If the wires in this ſtate be made part of a circuit of communication, on diſcharging the jar the ſquare piece of wood will not be diſplaced; but if the communication be interrupted by changing the direction of the diagonal wire, the ſquare piece of wood will, upon the diſcharge, be driven out of its place.—If, inſtead of the upper braſs ball, a pointed wire be placed above the perpendicular board, the diſcharge will be drawn off without an exploſion.

The following directions are given by earl Stanhope, to perſons erecting conductors for lightning: The rods muſt be made of ſuch ſubſtances as are, in their nature, the beſt conductors of electricity; and muſt not be interrupted, and perfectly continuous. They muſt be of ſufficient thickneſs, and muſt be perfectly connected with the common ſtock of electricity, that is, the earth, or neareſt water. The upper extremity of the rods muſt be finely tapered, and as acutely pointed as poſſible: they muſt be very prominent, and ſeveral feet above the chimneys. Each rod muſt be carried in the ſhorteſt convenient direction from its upper end to the common ſtock. There ſhould be no prominent bodies of metal on the top of the building propoſed to be ſecured, but ſuch as are connected with the conductor by ſome proper metallic communication. There ſhould be a ſufficient number of ſubſtantially-erected high and pointed rods. See Principles of Electricity, by Charles viſcount Mahon, now earl Stanhope.

To the ſame work, the reader muſt be referred for an account of a diſcovery made by his lordſhip in the ſcience of electricity, which he denominated the *returning ſtroke*, by which, he aſſerts, that perſons may be killed, and other miſchief enſue, by lightnings at a conſiderable diſtance from the flaſh. It is proper alſo to obſerve, that ſeveral reſpectable electricians, though, willing to admit the fact as diſcovered by earl Stanhope, yet do not think that the danger attending the returning ſtroke can ever be great or formidable. Dr. Hutton's obſervations on this phenomenon, are as follow: "To underſtand properly the meaning of the *returning ſtroke*, it muſt be premiſed that, according to the noble author's experiments, an inſulated ſmooth body, immerged within the electrical atmoſphere, but beyond the ſtriking diſtance of another body, charged poſitively, is at the ſame time in a ſtate of threefold electricity. The end next to the charged body acquires negative electricity; the farther end is poſitively electrified; while a certain part of the body, ſomewhere between its two extremes, is in a natural, unelectrified, or neutral, ſtate; ſo that the two contrary electricities balance each other. (See Prop. XV. and the figure.) It may farther be added, that if the body be not inſulated, but have a communication with the earth, the whole of it will be in a negative ſtate. Suppoſe then a braſs ball, which may be called A, to be conſtantly placed at the ſtriking diſtance of a prime conductor; ſo that the conductor, the inſtant when it becomes fully charged, explodes into it. Let another large or ſecond conductor be ſuſpended, in a perfectly inſulated ſtate, farther from the prime conductor than the ſtriking diſtance, but within its electrical atmoſphere: let a perſon ſtanding on an inſulated ſtool touch this ſecond conductor very lightly with a finger of his right hand; while, with a finger of his left hand, he communicates with the earth, by touching very lightly a ſecond braſs ball fixed at the top of a metallic ſtand, on the floor, which may be called B. Now while the prime conductor is receiving its electricity, ſparks paſs (at leaſt if the diſtance between the two conductors is not too great) from the ſecond conductor to the right hand of the inſulated perſon; while ſimilar and ſimultaneous ſparks paſs out from the finger of his left hand into the ſecond metallic ball B, communicating with the earth. At length, however, the prime conductor, having acquired its full charge, ſuddenly ſtrikes into the ball A, of the firſt metallic ſtand, placed for that purpoſe at the ſtriking diſtance. The exploſion being made, and the prime conductor ſuddenly robbed of its elaſtic atmoſphere, its preſſure or action on the ſecond conductor, and on the inſulated perſon, as ſuddenly ceaſes; and the latter inſtantly feels a ſmart returning ſtroke, though he has no direct or viſible communication (except by the floor) with either of the two bodies, and is placed at the diſtance of five or ſix feet from both of them. This returning ſtroke is evidently occaſioned by the ſudden re-entrance of the electric fluid naturally belonging to his body and to the ſecond conductor, which had before been expelled from them by the action of the charged prime conductor upon them; and which returns to its former place in the inſtant when that action or elaſtic preſſure ceaſes. When the ſecond conductor and the inſulated perſon are placed in the denſeſt part of the electrical atmoſphere of the prime conductor, or juſt beyond the ſtriking diſtance, the effects are ſtill more conſiderable; the returning ſtroke being extremely ſevere and pungent, and appearing conſiderably ſharper than even the main ſtroke itſelf, received directly from the prime conductor. Lord Stanhope obſerves, that perſons and animals may be deſtroyed, and particular parts of buildings may be much damaged, by an electrical returning ſtroke, occaſioned even by ſome very diſtant exploſion from a thunder cloud; poſſibly at the diſtance of a mile or more. It is certainly not difficult to conceive that a charged extenſive thunder cloud muſt be productive of effects ſimilar to thoſe produced by the prime conductor; but perhaps the effects are not ſo great, nor the danger ſo terrible, as have been apprehended. If the quantity of electric fluid naturally contained, for example, in the body of a man, were immenſe or indefinite, then the eſtimate between the effects producible by a cloud, and thoſe cauſed by a prime conductor, might be admitted; but ſurely no electrical cloud can expel from a body more than the natural quantity of electricity which it contains. On the ſudden removal therefore of the preſſure by which this natural quantity had been expelled, in conſequence of the exploſion of the cloud into the earth, no more, at the utmoſt, than his whole natural ſtock of electricity can re-enter his body. And perhaps we have no reaſon to ſuppoſe that this quantity is ſo great, as that its ſudden re-entrance into his body ſhould deſtroy or injure him. Allowing therefore the exiſtence of the returning ſtroke, as ſufficiently aſcertained, and well illuſtrated, in a variety of circumſtances, by the noble author's experiments, the magnitude and danger of it do not ſeem to be ſo alarming as he apprehends." See Hutton's Dict. vol. ii. p. 370.

XXV. The electric fluid paſſes eaſily through a *vacuum*.—The air being a non-conductor, in proportion as it is removed, the effort of the electric fluid on the ſurface of the body poſitively electrified to paſs to the next conductor, meets with leſs reſiſtance, and therefore is diffuſed over a greater ſpace.—To exemplify this, let a jar be charged *in vacuo*. Let a *luminous conductor* be placed in the circuit, and obſerve the fluid paſſing through it. Let a *vacuum* be made a part of the circuit in diſcharging a phial.—Or, make a *vacuum* in a double barometer, and let the fluid paſs from one leg to the other by connecting one of the veſſels of mercury with the conductor.—The electric fluid may be made to paſs through a large tube three feet in length, and four or five inches in diameter,

if

if, being well exhauſted, one end of it be connected with a large conductor.—The preceding experiments muſt be performed in a dark room.

From the reſemblance between theſe electrical appearances, and the atmoſpherical phenomena of the *aurora borealis*, meteors, &c. it is inferred, that theſe phenomena are produced by the electric fluid. The ſucceſs of the foregoing experiments depends, it is highly probable, upon the air in the jar, tube, &c. being rarefied in a high degree; for Mr. W. Morgan, who was deeply ſkilled in calculations and political arithmetic, has ſhewn, that a *perfect vacuum* is abſolutely impermeable to the electric fluid. See Phil. Tranſ. vol. lxxv.

XXVI. Some fiſhes have the property of giving ſhocks analogous to thoſe of artificial electricity; namely, the *torpedo*, the *gymnotus electricus*, the *ſilurus electricus*, and the *tetrodon electricus*.—If the torpedo, whilſt ſtanding in water, or out of water, but not inſulated, be touched with one hand, it generally communicates a tremulous motion or ſlight ſhock to the hand. If the torpedo be touched with both hands, at the ſame time, one hand being applied to its *under*, and the other to its *upper*, ſurface, a ſhock will be received exactly like that occaſioned by the Leyden phial. When the hands touch the fiſh on the oppoſite ſurfaces, and juſt over the electric organs, then the ſhock is the ſtrongeſt; but no ſhock is felt, if both hands are placed upon the electric organs of the ſame ſurface; which ſhews that the upper and lower ſurfaces of the electric organs are in oppoſite ſtates of electricity; anſwering to the *plus* and *minus* ſides of a Leyden phial, or coated plate.—The ſhock given by the torpedo when in air, is about four times as ſtrong as when in water; and when the animal is touched on both ſurfaces by the ſame hand, the thumb being applied to one ſurface, and the middle finger to the oppoſite, the ſhock is felt much ſtronger than when the circuit is formed by both hands. This power of the torpedo is conducted by the ſame ſubſtances which conduct electricity, and is interrupted by thoſe ſubſtances which are non-conductors of electricity. A circuit may be made of ſeveral perſons joining hands, and the ſhock will be felt by them all at the ſame time; but the ſhock will not paſs through the leaſt interruption of continuity, not even the diſtance of the two hundredth part of an inch. No elective attraction or repulſion could be ever obſerved to be produced by the torpedo, nor, indeed, by any of the electric fiſhes. The ſhocks of the torpedo ſeem to depend on the will of the animal.

The gymnotus electricus, or electrical eel, poſſeſſes all the electric properties of the torpedo, but in a ſuperior degree. When ſmall fiſh are put into the water wherein the gymnotus is kept, they are generally ſtunned or killed by the ſhock; and then they are ſwallowed, if the animal be hungry. The ſtrongeſt ſhock of the gymnotus will paſs a very ſhort interruption of continuity in the circuit. When the interruption is formed by the inciſion made by a pen-knife on a ſlip of tin-foil that is paſted on glaſs, and that ſlip is put into the circuit, the ſhock, in paſſing through that interruption, will ſhew a ſmall but vivid ſpark, plainly to be ſeen in a dark room. The gymnotus ſeems alſo to be poſſeſſed of a ſort of *new ſenſe*, by which he knows whether the bodies preſented to him are conductors or not. This fact was aſcertained by a great number of experiments made by Mr. Walſh.

The ſilurus electricus is known to have the power of giving a ſtrong ſhock; but not ſo powerful as that of the gymnotus. The fourth electrical fiſh was found on the coaſt of Johanna, one of the Comoro iſlands, in latitude 12° 13′ ſouth, by lieut. William Paterſon, in 1786. It is the Tetrodon electricus of the Linnæan ſyſtem; and an account of it was firſt publiſhed in the 76th vol. of the Phil. Tranſ. For the very curious and intereſting natural hiſtory of theſe electrical fiſhes, and figures of them, ſee the articles GYMNOTUS, RAJA, SILURUS, and TETRODON.

When electricity is ſtrongly communicated to inſulated animal bodies, the pulſe is quickened, and perſpiration increaſed; and, if they receive or part with their electricity on a ſudden, a painful ſenſation is felt at the place of communication. But what is more extraordinary is, that the influence of the brain and nerves upon the muſcles ſeems to be of an *elective* nature. We are indebted for this diſcovery to M. GALVANI, a learned Italian, who denominated that part of the ſcience, ANIMAL ELECTRICITY; and, which, from his name, ſubſequent writers have choſen to denominate GALVANISM. We ſhall give the principal of his obſervations, together with ſome illuſtrative experiments.

1. The nerve of the limb of an animal being laid bare, and ſurrounded with a piece of tin-foil, if a communication be formed between the nerve thus armed, and any of the neighbouring muſcles, by means of a piece of zinc, ſtrong contractions will be produced in the limb. 2. If a portion of the nerve which has been laid bare be armed as above, contractions will be produced as powerfully, by forming the communication between the armed and bare part of the nerve, as between the armed part and muſcle. 3. A ſimilar effect is produced by arming a nerve, and ſimply touching the armed part of the nerve with the metallic conductor. 4. Contractions will take place if a muſcle be armed, and a communication be formed by means of the conductor between it and a neighbouring nerve. The ſame effect will be produced if the communication be formed between the armed muſcle and another muſcle which is contiguous to it. 5. Contractions may be produced in the limb of an animal, by bringing the pieces of metal into contact with each other at ſome diſtance from the limb, provided the latter make part of a line of communication between the two metallic conductors. 6. Contractions can be produced in the amputated leg of a frog, by putting it into water, and bringing the two metals into contact with each other at a ſmall diſtance from the limb. 7. The influence which has paſſed through, and excited contractions in, one limb, may be made to paſs through, and excite contractions in, another limb. 8. The heart is the only involuntary muſcle in which contractions can be excited by theſe experiments. 9. Contractions are produced more ſtrongly the farther the coating is placed from the origin of the nerve. 10. Animals which were almoſt dead have been found to be conſiderably revived by exciting this influence. 11. When theſe experiments are repeated upon an animal that has been killed by opium, or by the electric ſhock, very ſlight contractions are produced; and no contractions whatever will take place in an animal that has been killed by corroſive ſublimate, or that has been ſtarved to death. 12. Zinc appears to be the beſt exciter when applied to gold, ſilver, molybdena, ſteel, or copper. The latter metals, however, excite but feeble contractions when applied to each other. Next to zinc, in contact with theſe metals, tin and lead, and ſilver and lead, appear to be the moſt powerful exciters. Theſe facts are exemplified by the following experiments:

Place the limb of an animal, a frog, for inſtance, upon a table; hold with one hand the principal nerve previouſly laid bare, and in the other hold a piece of zinc; let a ſmall plate of lead or ſilver be then laid upon the table, at ſome diſtance from the limb, and a communication be formed, by means of water, between the limb and the part of the table where the metal is lying. If now, the ſilver be touched with the zinc, contractions will be produced in the limb the moment that the metals come into contact with each other. The ſame effect will be produced, if the two pieces of metal be previouſly placed in contact, and the operator touch one of them with his finger.

Let two amputated limbs of a frog be taken; let one of them be laid upon a table, and its foot be folded in a piece of ſilver; let a perſon lift up the nerve of this limb with a ſilver probe, and another perſon hold in his hand a

piece of zinc, with which he is to touch the ſilver including the foot; let the perſon holding the zinc in one hand, catch with the other the nerve of the ſecond limb, and he who touches the nerve of the firſt limb, is to hold in the other hand the foot of the ſecond; let the zinc now be applied to the ſilver, including the foot of the firſt, and contractions will be immediately excited in both limbs.

Take a living flounder, lay it flat in a pewter plate, or upon a ſheet of tin-foil, and put a piece of ſilver, as a ſhilling, or a half-crown, upon the fiſh. Then, by means of a piece of metal, complete the communication between the pewter plate, or tin-foil, and the ſilver piece, on doing which the animal will give evident tokens of being affected.

Let a perſon lay a piece of zinc upon his tongue, and a half-crown, or other ſilver, by the ſide of it; on forming a communication between thoſe two metals, by bringing their two edges into contact, he will perceive a peculiar ſenſation, a kind of cool ſub-acid taſte, not exactly like, and yet not much different from, that produced by artificial electricity.

In a *medical* view, electricity has been adminiſtered for various diſeaſes. Cavallo has taken great pains in aſcertaining the caſes in which electricity has been ſucceſſfully applied. We are informed by that gentleman, that *rheumatic diſorders*, even of long ſtanding, are relieved, and generally quite cured. Deafneſs, the tooth-ach, ſwellings in general, inflammations of every ſort, palſies, ulcers, cutaneous eruptions, the St. Vitus' dance, ſcrophulous tumours, cancers, abſceſſes, nervous head-achs, the dropſy, gout, agues, and obſtructions, have been all conſiderably relieved, and in many inſtances perfectly cured, by the application of the electrical ſhock, which is to be thrown on the diſeaſed part. This remedy, however, ſhould be reſorted to with great caution; and never applied but under the direction of a regular-bred phyſician.

Animal electricity naturally ſuggeſted *animal magnetiſm*. The firſt notice of the action of electric influence upon the nervous ſyſtem, was brought forward at Paris, by Meſmer and his pupil Deſlon. The ſurpriſe and aſtoniſhment with which, from its novelty, it was accompanied, evidently influenced the powers of the mind. It ſeemed to affect the whole animal economy, and, for a time, excited the moſt extraordinary emotions. Theſe paſſions evidently reſulted more from the influence of the imagination, than from any of the pretended powers of animal electricity. Hence quacks and empirics took advantage of the public credulity, and covering their impoſitions under the faſcinating veil of myſtery, pretended that its occult virtue could change averſion into love, and love into averſion; that it could create pain, heal wounds, and cure diſeaſes, as if by enchantment. The whole of this myſtery, however, and its conſequent fraud, is now unveiled by the experiments of Galvani and his followers, who have clearly defined the operation of electricity upon the animal ſyſtem, and thus introduced a valuable acquiſition to medical practice.

XXVII. There is a conſiderable *analogy*, and *difference*, between magnetiſm and electricity.—The power of electricity is of two ſorts, poſitive and negative; bodies poſſeſſed of the ſame ſort of electricity, repel each other, and thoſe poſſeſſed of different ſorts attract each other. In magnetiſm, every magnet has two poles; poles of the ſame name repel each other, and the contrary poles attract each other.—If a thin glaſs plate coated with red ſealing-wax, be ſet on poſitive and negative globes, and we ſprinkle (from a conſiderable height) a fine powder of black ſealing-wax, and then agitate the plate gently with a glaſs rod, the particles of wax powder will gradually arrange themſelves into curve lines, diverging from the point over one of the globes, and converging to the point over the other, preciſely like the curves formed by iron-filings ſprinkled on a paper held over a magnet. Each little rag of wax becomes electrical by poſition, acquires two poles, and the poſitive pole of one attracts the negative pole of another; and they adhere in a certain determinate poſition, nearly a tangent to the curve, and indicates the law of magnetic action. When in this ſtate, if a hot brick be held over the plate till the wax ſoften a little, the particles of black wax will adhere to the red coating, and give a permanent ſpecimen of the action.

In electricity, when a body in its natural ſtate is brought near to one electrified, it acquires a contrary electricity, and becomes attracted by it. In magnetiſm, when a ferruginous ſubſtance is brought near to one pole of a magnet, it acquires a contrary polarity, and becomes attracted by it.

One ſort of electricity cannot be produced by itſelf. In like manner, no body can have only one magnetic pole. The electric virtue may be retained by electrics, but it eaſily pervades non-electrics. The magnetic virtue is retained by ferruginous bodies, but it eaſily pervades other bodies. On the contrary, the magnetic power differs from the electric, in that it does not affect the ſenſes with light, ſmell, taſte, or noiſe, as the electric does. Magnets attract only iron, whereas the electric power attracts bodies of every ſort.—The electric virtue reſides on the ſurface of electrified bodies, but the magnetic is internal.—A magnet loſes nothing of its power by magnefying other bodies, but an electrified body loſes part of its electricity by electrifying other bodies. See the article MAGNETISM.

LAWS OF ANIMAL ELECTRICITY, OR GALVANISM.

The diſcovery of the electric influence on the animal fibre, and the conſequent experiments publiſhed by Galvani, ſoon drew the attention of philoſophers in all parts, to the inveſtigation of ſo curious and intereſting a phenomenon. It was long contended that this ſecret operation of nature aroſe from a principle altogether different and diſtinct from that of electricity; and, inaſmuch as this principle appeared to be brought into action by the agency of metals, it was believed that all the phenomena reſulted from a *particular fluid* inherent in metallic bodies, which could only be communicated to animal ſubſtances by the force of touch. In the year 1800, however, theſe fallacious hypotheſes were removed, by means of the ingenious apparatus, or pile, of M. Volta, profeſſor of philoſophy in the univerſity of Pavia, with which he was enabled clearly to demonſtrate, that the galvanic influence was neither more nor leſs than an excitation of the common electric fluid.

This apparatus conſiſts of a number of copper or ſilver pieces or plates, with an equal number of plates compoſed of zinc, and a ſimilar number of pieces of card, leather, paſteboard, or woollen cloth, which ſhould be ſoaked in water ſaturated with common ſalt, muriat of ammonia, or nitre. The ſilver or copper may be pieces of money, and the plates of zinc may be caſt of the ſame ſize. A *pile* is then formed, by placing a piece of ſilver on a correſponding one of zinc, and on them a piece of wet cloth, or card: which is to be repeated alternately, till the number required be piled up in regular ſucceſſion. But, as the pieces are apt to tumble down, unleſs properly ſecured, it will be adviſable to ſupport them by means of three rods of glaſs, or baked wood, fixed into a flat wooden pedeſtal, and touching the pieces of metal at three equidiſtant points. Upon theſe may be made to ſlide a ſmall circular piece of wood, perforated with three holes, to receive the glaſs rods at top, which will ſerve to keep the pile firm, and the different layers in cloſe contact. The moiſtened pieces of cloth ſhould be ſomewhat ſmaller than thoſe of the metal, and gently ſqueezed before they are applied, to prevent the ſuperfluous moiſture from inſinuating itſelf between the pieces of metal. Thus conſtructed the apparatus is called the *Voltaic pile*, and will afford a perpetual current of the animal-electric fluid, through any conductor that communi-

cates

The Galvanic Apparatus.

London Published as the Act directs March 1.1804 by J.Wilkes

cities between the uppermoſt and loweſt plate; and, if one hand be applied to the latter, and the other to the higheſt metal, an electric ſhock will be perceived, which may be repeated as often as the contact is renewed. The intenſity of the charge, however, is ſo low, that it cannot penetrate the dry ſkin; it will therefore be neceſſary to wet both hands, and to graſp a piece of metal in each, in order to produce the deſired effect: its power may be conſiderably increaſed, both by an elevation of temperature, and by augmenting the number of pieces that compoſe the pile. Thus twenty pieces of each will emit a ſhock, that is very perceptible in the arms; if one hundred be employed, a very ſevere but tremulous and continued ſenſation will extend even to the ſhoulders; and, if the ſurface of the ſkin be broken, the action of the electric fluid will be uncommonly painful. The ſenſation of a ſhock with this apparatus, does not materially differ from that produced by two ſimple coated plates; but it may be effected in various ways, eſpecially if one or both hands be applied in a wet ſtate to the loweſt plate of the pile; or any part of the face be brought in contact with a wire communicating with the top piece. Or if a wire be held between the teeth, ſo as to reſt upon the tongue, that organ, as well as the lips, will become convulſed, the ſpark will appear before the eye, and a very pungent taſte will be perceived in the mouth.—See figures of the Voltaic pile in the Electricity Plate III. fig. 22, and 23.

As the apparatus loſes its energy, in proportion as the ſubſtances laid on each other become dry, M. Volta endeavoured to prevent this effect by incloſing the pile in wax. He contrived to incloſe in this way two columns, each compoſed of twenty plates, which acted perfectly well during ſeveral weeks, and which, he had reaſon to expect, would continue to do ſo for the ſpace of ſeveral months. The particular combination which he conſiders as the moſt uſeful, is a battery formed by a range of glaſſes, or cups, ſimilar to that of the Leyden jars, and containing warm water or brine. Into each of theſe a plate of ſilver, and another of zinc, are plunged, but without reciprocally touching each other. Between theſe glaſſes, or cups, metallic communications are eſtabliſhed, and diſpoſed in ſuch a way as that, provided they reach, on the one hand, the zinc contained in one of the glaſſes, they ſhould reach the ſilver in the other; and that from the zinc in the latter they ſhould extend to the ſilver in the one by which it is followed; and thus conſecutively throughout the whole of the aſſemblage. When any one places himſelf in the range of the battery, between the firſt and the laſt of the glaſſes, he feels the ſhock. It is eſſential that the plates of metal, plunged in the fluid, ſhould have, at the leaſt, a ſquare inch of ſurface. With reſpect to the communications from one of the glaſſes, or cups, to another, they may have as ſmall an extent as the operator may wiſh. This is called the *Voltaic battery*.

In the ſitting of the French national inſtitute, on the 7th of November, 1801, M. Volta read a memoir, containing the detail and reſults of his new experiments made by this apparatus; which tended to bring freſh and ſtriking evidences of the identity of the galvanic and electric fluids, agreeably to the hypotheſis he had invariably maintained. Theſe proofs were ſo ſatisfactory, that the gold medal was unanimouſly decreed to the learned profeſſor of Pavia. A ſtriking feature adduced by Volta was, that if two diverſe metals, inſulated, and poſſeſſing their natural quantity only of electricity, be brought in contact, it will be found that, as ſoon as they are withdrawn from this contact, they will poſſeſs different ſtates of electricity, or, in other words, one of them will be in the poſitive, the other in the negative, ſtate. Thus, in the mutual contact of copper and zinc, the copper becomes negative, as to its electricity, and the zinc poſitive. The development of the electric fluid is conſequently independent of any humid conductor. All the other facts connected with this leading one, the inſtitute aſcertained to be inconteſtible. The reſult was therefore declared to be, "that the fluid to which the muſcular contractions, and the phenomena of the pile, are aſcribable, notwithſtanding it has long been conſidered as a *particular* fluid, is merely the common *electric fluid*, put in action by a cauſe, the nature of which is unknown, but the effects of which we evidently ſee."

This intereſting diſcovery ſoon gave riſe to ſeveral others, which are principally due to our own countrymen. Mr. Carliſle, and Mr. Nicholſon, ſucceeded in the ſame experiments in England, that profeſſor Volta had made in Italy and France. At a very early part of the inveſtigation, the pile having been formed, and the contacts ſecured by placing a drop of water upon the upper plate of the pile, a diſengagement of gas was obſerved round the conducting wire. The gas, though minute in quantity, ſeemed to Mr. Nicholſon to have the ſmell of hydrogen, when the wire of communication was ſteel. This, with ſome other facts, led him to propoſe to break the circuit, by the ſubſtitution of a tube of water between two wires. Accordingly, a braſs wire through each of two corks was inſerted at the oppoſite ends of a glaſs tube about half an inch in diameter, filled between the corks with water: the diſtance between the points of the wires in the water, was about an inch and three quarters. This compound diſcharger was applied ſo that the external ends of its wire were in contact with the two extreme plates of a pile of thirty-ſix half-crowns with correſpondent pieces of zinc and paſteboard. A ſtream of minute bubbles immediately began to flow from the point of the lower wire in the tube, which communicated with the ſilver, and the oppoſite point of the upper wire became tarniſhed, firſt deep orange, and then black. On reverſing the tube, the gas came from the other point, which was now loweſt, while the upper, in its turn, became tarniſhed and black. Reverſing the tube again, the phenomena again changed their order. In this ſtate the whole was left for two hours and a half. The upper wire gradually emitted whitiſh filmy clouds, which, towards the end of the proceſs, became of a pea-green colour, and hung in perpendicular threads from the extreme half-inch of the wire, the water being rendered ſemi-opaque by what fell off, and in a great part lay, of a pale green, on the lower ſurface of the tube, which, in this diſpoſition of the apparatus, was inclined about forty degrees to the horizon. The lower wire, three quarters of an inch long, conſtantly emitted gas, except when another circuit, or complete wire, was applied to the apparatus; during which time the emiſſion of gas was ſuſpended. When this laſt-mentioned wire was removed, the gas re-appeared as before. The product of gas, during the whole two hours and a half, was two-thirtieths of a cubic inch. It was then mixed with an equal quantity of common air, and exploded by the application of a lighted waxed thread.

Meſſrs. Carliſle and Nicholſon were led, by reaſoning on the firſt appearance of hydrogen, to expect a decompoſition of water; but it was with no little ſurpriſe that they found the hydrogen extricated at the contact with one wire, while the oxygen fixed itſelf in combination with the other wire at the diſtance of almoſt two inches. As the diſtance between the wires formed a ſtriking feature in this reſult, it became deſirable to aſcertain whether it would take place to greater diſtances. When a tube three quarters of an inch in diameter, and thirty-ſix inches long, was made uſe of, the effect failed, though the very ſame wires, inſerted into a ſhorter tube, operated very briſkly. The experiment being tried with tincture of litmus in place of water, and the oxydating wire, namely, from the zinc ſide, being loweſt in the tube, it changed the tincture red in about ten minutes as high as the upper extremity of the wire. The other portion remained blue. Hence it ſeems either an acid was formed, or that a portion of the oxygen combined with the litmus, ſo as to produce the effect of an acid.

It may be here offered as a general remark, that the

electric pile with a card, or with woollen cloth, continues in order for about two days, or ſcarcely three; that, from a ſeries of glaſſes ſet up by Mr. Carliſle, as well as from the pile itſelf, it appears that the ſame proceſs of decompoſition of water is carried on between each pair of plates, the zinc being oxyded on the wet face, and hydrogen given out; that the common ſalt is decompoſed, and exhibits an efflorescence of ſoda round the edges of the pile, exuded, moſt probably, by the hydrogen: and that, on account of the corroſion of the ſurfaces of the zinc, it is neceſſary to renew them previouſly to each conſtruction of the pile. This may be done by ſcraping or grinding. By theſe and other accurate experiments, Mr. Nicholſon aſcertained that the electricity of the zinc was plus, and that of the ſilver minus, whichever of them were at the top of the pile. The electric ſpark was even rendered viſible; ſo that there remained no doubt of the *identity* of the electric and galvanic fluids.

The decompoſition of water, and oxydation of metallic wire, ſuggeſted other experiments. Two ſmall wires of platina were inſerted, as before, in a ſhort tube. When the connection with the pile was formed, the wire from the ſilver gave a plentiful ſtream of gas, and that from the zinc a ſmaller one. In four hours, neither turbidneſs, oxydation, nor tarniſh, appeared. The larger ſtream was naturally ſuppoſed to be hydrogen, the ſmaller oxygen. With thick gold leaf, inſtead of platina, the reſult was the ſame, only the extremity of the ſlip connected with the zinc acquired a coppery or purpliſh tinge. A braſs wire was ſubſtituted for one of the ſlips of gold. When the former was joined to the ſilver end, the two ſtreams were extricated as before; but, when joined to the zinc, it became oxyded, as when both the wires were of braſs.

The ſimple decompoſition of water by platina wires, without oxydation, offered a means of obtaining the gaſes ſeparate from each other. This was tried with a pile of ſixty-eight ſets. A wire from each end of the pile paſſed under ſeparate phials full of water inverted in a faucer of water. A cloud of gas aroſe from each wire, but moſt from the ſilver or minus ſide. Bubbles were extricated from all parts of the water, and adhered to the whole internal ſurface of the veſſels. The proceſs was continued for thirteen hours, after which the wires were diſengaged, and the gaſes decanted into ſeparate bottles. On meaſuring the quantities, which was done by weighing the bottles, it was found that the quantities of water diſplaced by the gaſes were, reſpectively, ſeventy-two grains by the gas from the zinc ſide, and 142 grains by the gas from the ſilver ſide; ſo that the whole volume of gas was 1·17 cubic inches, or near an inch and a quarter. Theſe are nearly the proportions in bulk of what are ſtated to be the component parts of water. The gas from the zinc ſide being tried with one meaſure of nitrous gas, contracted to 1·25, and did not contract more by the addition of another meaſure; the gas from the ſilver ſide, by the ſame treatment, contracted to 1·6. The air of the room, on trial, contracted to 1·28. From the ſmallneſs of the quantity, no attempt was made to detonate the air from the zinc ſide; but a portion of that from the ſilver ſide, being mixed with one ſide of atmoſpheric air, gave a loud detonation. Theſe, and ſimilar experiments ſubſequently made by other philoſophers with the ſame intention, fully eſtabliſh the capacity of the Voltaic pile as a chemical agent for the decompoſition of water.

Several curious experiments on the deflagration of metals were afterwards made with the Voltaic pile; in which diſcs of flannel moiſtened with a ſolution of muriat of ammonia, gave conſiderable force. On this principle, a pile conſiſting of thirty-ſix pair of plates of ſilver and zinc, had the intenſity to deflagrate gold, ſilver, copper, tin, lead, and zinc, with a ſurpriſing facility. The gold burned with a vivid white light, inclining ſomewhat to blue; and there was left on the upper plate a copious oxyd of a deep brown colour, inclining a little to purple. The ſilver gave a vivid flame of a greeniſh hue, and extremely brilliant; the colour was ſomewhat like that of a pale emerald, and the light more intenſe than that from the gold; its oxyd was that of a blackiſh hue. The copper preſented phenomena ſimilar to thoſe which attended the deflagration of the gold. The lead gave a very vivid light, of a dilute bluiſh purple. The tin afforded a light ſimilar to that of the gold, but burned with leſs energy, probably on this account, that the leaves were thicker. The zinc gave a bluiſh white flame, which was edged at the moment of contact with red; it was more difficult of deflagration than any of the preceding metals; but the plates were at the ſame time much thicker. Theſe experiments ſerve to ſhew the great intenſity with which the electric fluid can be given out by the Voltaic pile.

The numerous experiments which now followed, rather tended to incline the public mind to a belief, that the faculty of performing chemical proceſſes, and the power of decompoſing water, belonged peculiarly to the Voltaic pile. But this ſuppoſition, before the cloſe of the year 1801, was effectually done away by an intereſting paper on the *identity* of the galvanic and electric fluids, which was read by Dr. Hyde Wollaſton before the royal ſociety of London, and publiſhed in their Tranſactions. By this paper it appeared that the doctor had ſucceeded in decompoſing water by the means of common electricity, as rapidly as by the pile of Volta. He had obviated the difficulty which was cauſed by the fluid paſſing, in a greater or leſs degree, in the form of ſparks, by employing a gold wire, and a ſilver wire, inſulated in the oppoſite ends of a glaſs tube, and preſenting to each other as fine a point as they could poſſibly be made to receive. The tube in which they were inſerted contained the water to be decompoſed, and conſtituted a part of an electric circuit. As this paper tends to illuſtrate, in a moſt ſatisfactory manner, the primary cauſe of the galvanic and electric phenomena in the decompoſition of water, &c. we ſhall give it in the author's own words:

"Notwithſtanding the power of M. Volta's electric pile is now known to be proportional to the diſpoſition of one of the metals to be oxydated by the fluid interpoſed, a doubt has been entertained by many perſons, whether this power ariſes from the chemical action of the fluid on the metal; or, on the contrary, whether the oxydation itſelf may not be occaſioned by electricity, ſet in motion by the contact of metals that have different conducting powers. That the oxydation of the metal is the primary cauſe of the electric phenomena obſerved, is, I think, to be inferred from the following experiments, which exhibit the galvanic proceſs reduced to its moſt ſimple ſtate.

1. If a piece of zinc and a piece of ſilver have each one extremity immerſed in the ſame veſſel, containing ſulphuric or muriatic acid diluted with a large quantity of water, the zinc is diſſolved, and yields hydrogen gas, by the decompoſition of the water: the ſilver, not being acted upon, has no power of decompoſing water; but, whenever the zinc and ſilver are made to touch, or any metallic communication is made between them, hydrogen gas is alſo formed at the ſurface of the ſilver. Any other metal beſide zinc, which, by the aid of the acid employed, is capable of decompoſing water, will ſucceed equally, if the other wire conſiſts of a metal on which the acid has no effect.

2. If zinc, iron, or copper, be employed with gold, in dilute nitric acid, nitrous gas will be formed, in the ſame manner, and under the ſame circumſtances, as the hydrogen gas in the former experiment.

3. Experiments analogous to the former, and equally ſimple, may alſo be made with many metallic ſolutions. If, for inſtance, the ſolution contains copper, it will be precipitated by a piece of iron, and appear on its ſurface. Upon ſilver merely immerſed in the ſame ſolution, no ſuch effect is produced; but as ſoon as the two metals are

are brought into contact, the ſilver receives a coating of copper. In the explanation of theſe experiments, it is neceſſary to advert to a point eſtabliſhed by means of the electric pile. We know that when water is placed in a circuit of conductors of electricity, between the two extremities of a pile, if the power is ſufficient to oxydate one of the wires of communication, the wire connected with the oppoſite extremity affords hydrogen gas. Since the extrication of hydrogen, in this inſtance, is ſeen to depend on electricity, it is probable that, in other inſtances, electricity may be alſo requiſite for its converſion into gas. It would appear, therefore, that in the ſolution of a metal, electricity is evolved during the action of the acid upon it; and that the formation of hydrogen gas, even in that caſe, depends on a tranſition of electricity between the fluid and the metal. We ſee, moreover, in the firſt experiment, that the zinc, without contact of any other metal, has the power of decompoſing water; and we can have no reaſon to ſuppoſe that the contact of the ſilver produces any new power, but that it ſerves merely as a conductor of electricity, and thereby occaſions the formation of hydrogen gas. In the third experiment alſo, the iron by itſelf has the power of precipitating copper, by means, I preſume, of electricity evolved during its ſolution; and here likewiſe the ſilver, by conducting that electricity, acquires the power of precipitating the copper in its metallic ſtate. The explanation here given receives additional confirmation from comparative experiments which I have made with common electricity; for it will be ſeen that the ſame transfer of chemical power, and the ſame apparent reverſion of the uſual order of chemical affinities in the precipitation of copper by ſilver, may be effected by a common electrical machine. The machine with which theſe experiments were conducted, conſiſts of a cylinder ſeven inches in diameter, with a conductor on each ſide ſixteen inches long, and three inches and a half diameter, each furniſhed with a ſliding electrometer, to regulate the ſtrength of the ſpark received from them.

4. Having a wire of fine ſilver, 1-120th of an inch in diameter, I coated the middle of it, for two or three inches, with ſealing-wax, and, by cutting through in the middle of the wax, expoſed a ſection of the wire. The two coated extremities of the wire, thus divided, were immerſed in a ſolution of ſulphat of copper placed in an electric circuit between the two conductors; and ſparks, taken at one-tenth of an inch diſtance, were paſſed by means of them through the ſolution. After one hundred turns of the machine, the wire which communicated with (what is called) the negative conductor, had a precipitate formed on its ſurface, which, upon being burniſhed, was evidently copper; but the oppoſite wire had no ſuch coating. Upon reverſing the direction of the current of electricity, the order of the phenomena was of courſe reverſed; the copper being ſhortly re-diſſolved by aſſiſtance of the oxydating power of poſitive electricity, and a ſimilar precipitate formed on the oppoſite wire.

5. A ſimilar experiment made with gold wires 1-100th of an inch diameter, in a ſolution of corroſive ſublimate, had the ſame ſucceſs. The chemical agency, therefore, of common electricity is thus proved to be the ſame with the power excited by chemical means; but, ſince a difference has been obſerved in the comparative facility with which the pile of Volta decompoſes water, and produces other effects of oxydation and de-oxydation of bodies expoſed to its action, I have been at ſome pains to remove this difficulty, and can at leaſt produce a very cloſe imitation of the galvanic phenomena by common electricity. It has been thought neceſſary to employ powerful machines and large Leyden jars for the decompoſition of water; but, when I conſidered that the decompoſition muſt depend on duly proportioning the ſtrength of the charge of electricity to the quantity of water, and that the quantity expoſed to its action at the ſurface of communication depends on the extent of that ſurface, I hoped that, by reducing the ſurface of communication, the decompoſition of water might be effected by ſmaller machines, and with leſs powerful excitation, than have hitherto been uſed for that purpoſe; and in this hope I have not been diſappointed.

6. Having procured a ſmall wire of fine gold, and given it as fine a point as I could, I inſerted it into a capillary glaſs tube; and, after heating the tube ſo as to make it adhere to the point, and cover it in every part, I gradually ground it down, till, with a pocket lens, I could diſcern that the point of the gold was expoſed. The ſucceſs of this method exceeding my expectations, I coated ſeveral wires in the ſame manner, and found, that when ſparks from the conductors before-mentioned were made to paſs through water, by means of a point ſo guarded, a ſpark paſſing to the diſtance of one-eighth of an inch would decompoſe water, when the point expoſed did not exceed 1-700th of an inch in diameter. With another point, which I eſtimated at 1-1500th, a ſucceſſion of ſparks, one-twentieth of an inch in length, afforded a current of ſmall bubbles of air. I have ſince found that the ſame apparatus will decompoſe water with a wire one-fortieth of an inch diameter, coated in the manner before-deſcribed, if the ſpark from the prime conductor paſſes to the diſtance of four-tenths of an inch of air.

7. In order to try how far the ſtrength of the electric ſpark might be reduced by a proportional diminution of the extremity of the wire, I paſſed a ſolution of gold in *aqua regia* through a capillary tube, and, by heating the tube, expelled the acid. There remained a thin film of gold lining the inner ſurface of the tube, which, by melting the tube, was converted into a very fine thread of gold, through the ſubſtance of the glaſs. When the extremity of this thread was made the medium of communication through water, I found that the mere current of electricity would occaſion a ſtream of very ſmall bubbles to riſe from the extremity of the gold, although the wire, by which it communicated with the poſitive or negative conductor, was placed in abſolute contact with them. Hence it appears, that the decompoſition of water may take place by common electricity as well as by the electric pile, although no diſcernible ſparks are produced. The appearance of two currents of air may alſo be imitated by occaſioning the electricity to paſs by fine points of communication on both ſides of the water; but, in fact, the reſemblance is not complete; for, in every way in which I have tried it, I obſerved, that each wire gave both oxygen and hydrogen gas, inſtead of their being formed ſeparately, as by the electric pile. I am inclined to attribute the difference in this reſpect to the greater intenſity with which it is neceſſary to employ common electricity: for, that poſitive and negative electricity, ſo excited, have each the ſame chemical power as they are obſerved to have in the electric pile, may be aſcertained by other means. In the precipitation of copper by ſilver, an inſtance of de-oxydation by negative electricity has been mentioned: the oxydating power of poſitive electricity may be alſo proved by its effect on vegetable blue colours.

8. Having coloured a card with a ſtrong infuſion of litmus, I paſſed a current of electric ſparks along it, by means of two fine gold points, touching it at the diſtance of an inch from each other. The effect, as in other caſes, depending on the ſmallneſs of the quantity of water, was moſt diſcernible when the card was nearly dry. In this ſtate, a very few turns of the machine were ſufficient to occaſion a redneſs at the poſitive wire, very manifeſt to the naked eye. The negative wire, being afterwards placed on the ſame ſpot, ſoon reſtored it to its original blue colour. By M. Volta's apparatus, the ſame effects are produced in much leſs time. Beſide the ſimilarity which has thus been traced between the effects of electricity excited by the common machine and thoſe obſerved from the electric pile, I think it appears alſo pro-

bable that they originate from the ſame ſource. With regard to the latter, its power is now known to depend on oxydation; ſo alſo does the excitement in the former appear very much to depend on the ſame proceſs.

9. I have found that, by uſing an amalgam of ſilver, or of platina, which are not liable to be oxydated, I could obtain no electricity. An amalgam of tin, on the contrary, affords a good degree of excitement. Zinc acts ſtill better; but the beſt amalgam is made with both tin and zinc, a mixture which is more eaſily oxydated than either metal ſeparately.

10. But, as a further trial whether oxydation aſſiſts in the production of electricity, I mounted a ſmall cylinder, with its cuſhion and conductor, in a veſſel ſo contrived that I could at pleaſure change the contained air. After trying the degree of excitement in common air, I ſubſtituted carbonic gas, and found that the excitement was immediately deſtroyed, but that it returned upon readmiſſion of atmoſpheric air. In conformity to this hypotheſis, we find that the metal oxydated is, in each caſe, in a ſimilar ſtate of electricity; for the cuſhion of the machine, by oxydation of the amalgam adhering to it, becomes negative; and, in the ſame manner, zinc oxydated by the accumulated power of an electric pile, or ſimply by action of an acid, is alſo negative. This ſimilarity in the means by which electricity and galvaniſm appear to be excited, in addition to the reſemblance that has been traced between their effects, ſhews that they are both eſſentially the ſame, and confirms an opinion that has already been advanced by others, that all the differences diſcoverable in the effects of the latter, may be owing to its being leſs intenſe, but produced in much larger quantity."

While theſe reſearches were going on in England, ſimilar experiments were made by profeſſor Van Marum at Haerlem, by help of the grand Teylerian machine. This able electrician aſſerts, that relatively to the compariſon of the ſenſations, or ſhocks, communicated by the diſcharge of a battery, charged to different degrees of tenſion, by the contacts of the conductor of the electrical machine, with thoſe of charges of the ſame tenſion by means of the pile, he was convinced, by repeated experiments, that there is no perceptible difference in the ſhocks communicated by the diſcharges of the battery, whether charged by the machine, or by the pile, provided the tenſions of the charge are equal. He flatters himſelf that he has proved, in the moſt deciſive manner, by experiments on a large ſcale, the identity of the current of the fluid put in motion by the Voltaic pile, and of that to which an impulſion is given by an electrical machine. The *identity* of the currents of each apparatus having been thus clearly eſtabliſhed, and placed beyond any doubt, it follows as a direct conſequence of all the above-cited experiments, that there can no longer be any pretence for *the action of a particular fluid*, which had been inconſiderately ſuppoſed to reſide in the Voltaic column. Theſe experiments, added to thoſe made by profeſſor Volta himſelf, prove that the action of the above column, or pile, produced by the contact of two metals which touch each other, can be no other than an electrical effect. As the reſults they furniſh are conſtantly explained by the action of two diverſe metals, or of two different ſubſtances which are employed, the ſuppoſition of a *particular* fluid is entirely done away; and, conſequently, the true denomination of the Voltaic pile, ought in future to be called *electric*, and not *galvanic*.

The general opinion relative to animal electricity, which the naturaliſts of Italy, Great Britain, Germany, and France, formed after repeating the experiments of Galvani, was, that the metallic influence is not imparted to the muſcles, until after it has been communicated to the nerves. This concluſion appears to have been dictated by the effects to which the nervous parts, as well as the organs of the ſenſations, are ſubjected in galvanic experiments. It receives an additional ſupport from the aſſurance given by Humboldt, that it is impoſſible to produce the contractions, in a portion of the muſcle prepared in ſuch away as to diveſt it entirely of every nervous ramification. It is, notwithſtanding, certain, that the coatings of the muſcles alone have been ſometimes efficacious in the production of the galvanic effect; and this would be an inconteſtible proof of an irritation independent of the nerves, if it were not likewiſe certain, that this irritation is capable of penetrating into the internal tiſſue of the organs, in which the nerves are concealed. It would, however, be too raſh to circumſcribe to the nervous and ſenſible fibres, the impreſſion of the metallic ſtimulus, ſeeing that, independently of ſeveral rational arguments which prove the contrary of this aſſertion, experiments have demonſtrated that the action of galvaniſm is directed both to the vaſcular and nervous ſyſtems.

Several galvanic experiments and obſervations have been recently publiſhed by M. Bichat, phyſician to the Hotel Dieu in Paris, and author of a celebrated work on anatomy. In ſpeaking of the influence of the deſtruction of the brain on that of the heart, after having proved, conformably to obſervation and experience, that it is not immediately by the interruption of the cerebral action that the heart ceaſes to act, he confirms this fundamental *datum* of phyſiology and pathology, by a ſeries of galvanic experiments, which demonſtrate that the heart is in all caſes independent of the brain.

"Theſe experiments," he obſerves, "were made with the moſt ſcrupulous attention, becauſe ſeveral very reſpectable authors have advanced a contrary opinion, and have endeavoured to prove that the heart, together with the other muſcles of organic life, do not differ, as to their ſuſceptibility to the galvanic influence, from the different muſcles of animal life. I ſhall therefore detail the obſervations I have made on animals with red and cold blood.

"1. In ſeveral experiments made on frogs, I coated the brain, on the one hand, with lead, and the heart and muſcles of the inferior extremities, on the other, with a long lamina of zinc, the upper end of which touched the heart, and the lower end the muſcles. Having, by the means of ſilver, eſtabliſhed a communication between the coatings of the muſcles and thoſe of the brain, the movements of the limbs conſtantly followed; but I could not perceive any acceleration in the contractions of the heart, when it ſtill continued to beat; and when its action had entirely ceaſed, it did not diſplay the ſmalleſt movement. Whichever may be the voluntary muſcle that is coated at the ſame time with the heart, with a view to a compariſon of the phenomena they exhibit at the moment of the metallic communication, there is conſtantly a marked and decided difference.

"2. In the caſe of other frogs, I coated, with a common metallic wire, on the one hand, the cervical part of the ſpinal marrow, in the upper region of the heart, to the end that the coating might be above the part where the nerves which proceed from the great intercoſtal nerve, and thence to the heart, originate; and, on the other hand, the heart, and any one of the voluntary muſcles. I conſtantly noticed a reſult ſimilar to the one which attended the preceding experiment, whenever the communication was eſtabliſhed. There were invariably violent agitations in the voluntary muſcles, without any viſible alteration in the contractile movements of the heart.

"3. I endeavoured to denudate the nerves which lead to the heart of frogs. Several greyiſh filaments, ſcareely perceptible, with the nature of which, I muſt acknowledge, I am not fully aequainted, were coated with a metallic ſubſtanee, at the ſame time that the heart was made to reſt on a ſubſtance of a ſimilar nature. When the communication was eſtabliſhed by means of a third metal, not the ſmalleſt ſenſible effect was to be perceived. It appears to me that theſe trials, which had been partly made before I engaged in them, are well calculated to

decide, in a poſitive manner, whether the brain has any direct influence on the heart, more particularly when they are repeated with the precautions which were taken by me, to coat ſucceſſively, and alternately, the internal and external ſurfaces, and the ſubſtance even of the latter organ. In each of theſe experiments the natural diſpoſition was preſerved between the different parts which ſerve to unite the heart with the brain.

"4. There is another mode of making the experiment, which conſiſts, in the firſt place, in detaching the heart from the breaſt. Secondly, in bringing it in contact with two different metals, at two points of its ſurface, or with portions of fleſh coated with metals. And, thirdly, in eſtabliſhing a communication between the coatings, by means of a third metallic ſubſtance. In theſe caſes, Humboldt obſerves that he has ſeen the movements produced. I muſt confeſs, notwithſtanding, that although I have frequently repeated theſe experiments, with a ſtrict adherence to the forms preſcribed, I could never perceive any ſuch reſult.

"I proceed now to experiments made on animals with red and warm blood. It became the more neceſſary to try them, becauſe the mode of the contractibility of animals with red and cold blood, differs eſſentially from that of animals with red and warm blood.

"1. In the courſe of the winter of the year 1798, I was authorized to make different experiments on the bodies of the unfortunate perſons who had been guillotined. Theſe bodies were brought to me about twenty minutes after the execution had taken place. In ſeveral of them the motive faculty was extinguiſhed; while, in others, I was enabled to excite it, with a greater or leſs degree of facility, in all the muſcles, by the ordinary methods which are reſorted to on theſe occaſions. It was more particularly manifeſted in the muſcles of animal life, by means of the galvanic proceſſes. I could never ſucceed, however, in the production of the ſmalleſt movement, when I coated, either the ſpinal marrow and the heart, or the latter organ and the nerves it receives from the ganglions, by the great intercoſtal, or from the brain, by the *par vagum*. Notwithſtanding this, when mechanical exciters were applied, in a direct and immediate way, to the fleſhy fibres, contractions enſued. 'Did this ariſe from the nervous filaments of the heart having been for ſome time inſulated from the brain? But, in ſuch a caſe, why did thoſe belonging to the voluntary muſcles, which were likewiſe inſulated, favour the production of the galvanic phenomena? The following experiments will clear up this doubt.

"2. In experiments made on dogs and guinea-pigs, I coated, with two metallic ſubſtances, in the firſt place, the brain and heart; next, the trunk of the ſpinal marrow and the latter organ; and, finally, that organ and the nerve of the *par vagum*, from which it receives ſeveral nerves. The two coatings having been made to communicate, there was not the ſmalleſt apparent reſult: I could not perceive that the movements were re-produced, after they had ceaſed; nor that they were accelerated during their continuance.

"3. The cardiac nerves of two dogs having been coated, both in their anterior and poſterior filaments, another coating was applied to the heart, ſometimes at its anterior ſurface, and at others at its poſterior ſurface, and at others, again, at its *faſciculi*. The communication, as in the preceding experiment, did not produce any apparent movements. In experiments of this deſcription, the communication ought not to be made until a certain portion of time has elapſed after the coating has been placed on the heart, to the end that what is merely the effect of metallic irritation, may not be aſcribed to galvaniſm.

"4. Humboldt obſerves, that when the heart is ſuddenly detached from the cavity of the pericardium, taking care that ſeveral of its inſulated nerves ſhould ſtill remain attached to the viſcus, contractions may be produced by coating the latter with a metallic ſubſtance, and by touching the coating with another metal. I tried this experiment repeatedly, but without ſucceſs, except in one particular inſtance, which was attended by feeble contractions. On the other hand, I ſucceeded, almoſt invariably, in producing contractions in animals with red and warm blood, when I took out the heart, and brought it in contact, at two different points, with metallic ſubſtances, between which a communication was eſtabliſhed. It appears to me that this is the only mode of producing on that organ, efficaciouſly and demonſtratively, the galvanic phenomena. It does not, however, prove what is the object of my preſent reſearches, namely, whether the brain has a direct influence on the heart. If, indeed, we grant that the galvanic phenomena have, on theſe two kinds of muſcles, an equal influence, what is proved by this fact? Nothing more than that theſe phenomena are, in their ſucceſſion, governed by laws which are altogether different from thoſe of the phenomena of the nerves with which theſe muſcles correſpond."

Having diſcuſſed this important phyſiological queſtion, M. Bichat proceeds to treat of the influence the deſtruction of the vital energy of the brain has on that of the reſpective organs, which he divides into thoſe of animal life, and thoſe of organic life. He enquires, in the firſt place, whether the interruption of the organic functions, is a direct effect of the ceſſation of the cerebral action. After having proved, as he had already done in the preceding article, both by obſervation and experience, that all the internal functions are, in the ſame way with the action of the heart, withdrawn from the direct aſcendancy of the brain, and that, conſequently, their interruption cannot be immediately derived from the deſtruction of that organ; and after having eſtabliſhed, anatomically and ſubſtantially, that the organic functions are not ſubjected to the immediate influence of the brain, ſeeing that the greater part of the viſcera by which theſe functions are performed, receive few, if any, of the vertebral nerves, but are rather ſupplied with the nervous filaments ariſing from the ganglions, ſuch as are obſerved in the liver, kidneys, pancreas, ſpleen, inteſtines, &c. he demonſtrates the truth of the principle he has eſtabliſhed, by experiments on living animals. Theſe experiments were made on the ſtomach, inteſtines, bladder, uterus, &c. of animals with warm blood, and were conſtantly attended by a reſult ſimilar to the above.' They were afterwards repeated on cold-blooded animals; and juſtified the general inference which he draws, namely, that "with relation to the galvanic fluid, as well as in every other point of view, there is an enormous difference between the muſcles of animal life, and thoſe of organic life."

The arrangement of galvanic combinations, its chemical proceſſes, and general laws, may be ſummed up as follows: Two diſſimilar metals, with an interpoſed fluid; or a ſingle metal, expoſed to the action of two different fluids; or any one of the conducting ſubſtances on which unequal actions can be induced by different fluids; conſtitute a ſimple galvanic combination. A ſeries of ſuch combinations is denominated a galvanic battery.

When two metals are employed, they produce the greateſt effect, when the particular quality of one of them renders it extremely difficult of oxydation, while the other unites with oxygen with the greateſt facility. If, upon a poliſhed plate of ſteel, water be laid, under the common temperature of the atmoſphere, in the courſe of two or three days the ſurface will be conſiderably oxydated. This is occaſioned by the decompoſition of the water. If, upon a ſimilarly moiſtened ſurface of ſteel a plate of zinc be placed, at the end of two or three days the ſurface of the ſteel will be found covered with a white powder, which is the oxyd of zinc. When it is wiped off, the ſteel will ſtill poſſeſs its original poliſh. This proves that the zinc unites more readily with oxygen than does the iron; but if a plate of ſilver be ſubſtituted to the zinc, then the ſteel will be oxydated. Conſequently, ſilver is more difficult of oxydation than ſteel, and ſteel than zinc.

Silver

Silver and zinc, or gold and zinc, form the moſt perfect galvanic combination. All metalic bodies are excellent conductors of electricity; but, when oxydated, they become non-conductors. In this change of capacity electricity is given out. A piece of zinc, placed in a weak ſolution of ſulphuric acid, is ſubjected to but a trifling alteration, compared to the change which enſues when it is brought in contact with a piece of ſilver. This curious phenomenon was firſt noticed by Dr. Aſhe; and was by him advanced as an argument in favour of galvaniſm being the reſult of a chemical operation.

A plate of ſilver, and a plate of zinc, with a piece of cloth, or of any bibulous ſubſtance, moiſtened in water, placed between them, conſtitute a ſimple galvanic combination. In this caſe the zinc becomes oxydated on the portion of its ſurface which is in contact with the wet medium. If a prepared frog be ſubſtituted for the moiſtened cloth, the humidity on its ſurface will produce ſimilar effects on the zinc; and when the circuit is completed between the ſilver and zinc, by any ſubſtance which is a conductor of electricity, the muſcles of the frog will be thrown into action. Theſe contractions will be renewed every time the circuit is completed. By a *prepared frog* is underſtood, a frog divided into two portions by a pair of ſciſſars, through the middle of its body and ſpine, the viſcera being removed, and the lower part ſkinned. The ſciatic nerves riſe very high up in the ſpine in this animal, and are very diſcernible when it is thus arranged. When it is intended to arm the nerves, after the introduction of a pair of pointed ſciſſars beneath them, the ſpine is cut through without dividing them. A portion of the inferior part of the ſpine ſhould be afterwards ſeparated; ſo as to leave room for the nerves to be covered by a piece of tin-foil. This is what is denominated *arming*, or *coating*, the nerves. In ſome experiments, it is more convenient to ſeparate the lower extremities, and employ the crural nerve.

If a ſingle metal be employed, it muſt be of ſuch a deſcription as not to be eaſily acted upon by water. Thus, if a ſilver cup, nearly filled with a weak ſolution of nitric acid, be placed in a glaſs veſſel containing common water, a ſimple galvanic combination will be formed; ſeeing that the inſide of the ſilver veſſel will become oxydated by the acid, while its external ſurface will not undergo any change. If a prepared frog be made to form the circuit between the two fluids, immediately on its completion the convulſions will be produced. The more active the fluid which is employed, the more powerful will be the effects. Thus, ſalt water is better than common water; and acid and water than ſalt and water. Volta aſcribes this difference to the conducting powers of the fluids, and not to any changes induced in the metallic bodies employed.

After a certain period, the metal the moſt liable to oxydation has its ſurface oxydated; and till this is removed the galvanic operation ceaſes. Whenever a metal becomes oxydated, its capacity for electricity is diminiſhed: oxygen cannot enter into union with a metallic ſubſtance, without the electricity which conſtituted a portion of the metal being given out. A metal which is in a ſtate of giving out electricity, will evince poſitive ſigns of the electric fluid, and occaſion a ſenſible electroſcope to diverge with the ſame ſtate of electricity as is produced by excited glaſs.

In the ſeries of metals, of gold, ſilver, copper, iron, tin, lead, zinc, each will become poſitive by its combination with that which precedes it, and negative with that by which it is followed. Thus, gold and ſilver form a ſimple galvanic combination. If a fluid be employed which will act on the ſilver, and not on the gold, as happens with the nitric acid; in this caſe the ſilver will be the oxydable metal, and will therefore give out a portion of its combined electricity. This equally applies to copper and iron, to iron and tin, &c. Silver, when combined with gold, exhibits poſitive ſigns; but when it is arranged with copper, it evinces negative ſigns.

As all metals, with the exception of gold, undergo ſome ſmall changes on the application of an oxydating fluid, the moſt perfect galvanic combination is conſtituted, when one of the metals undergoes the greateſt change, and the other the leaſt. When zinc and copper are employed with a ſolution of a muriat of ammonia, the muriatic acid acts upon the zinc, and a portion of ammonia attacks the copper. In this way the galvanic effect is not ſo powerful as if gold had been employed. All ſubſtances which are conductors of electricity are likewiſe conductors of galvaniſm, and in preciſely the ſame order: the moſt perfect conductors being metallic ſubſtances; next charcoal, muſcular fleſh, &c. nearly in the following order:

CONDUCTORS.—All the metals.—Minerals containing metals not oxydated.—Vegetable coal.—Mineral coal.—Carbonated blend.—Aluminous ſchiſt.—Inflammable ſchiſt.—Siliceous ſubſtances containing carbon.—Grey manganeſe, ariſing from the carbon it contains.—Muſcular fleſh.—Membranes, nerves, ligaments, and blood-veſſels, whether moiſt or dry.—Morells and muſhrooms.—White of an egg.—Water, blood, juices of plants.—Cellular tiſſue of vegetables.—Spirit of wine.—Wine, beer, acids, alkaline ſolutions, ſoft ſoap, and flame, (doubted by ſome.)

NON-CONDUCTORS.—Oxyds of metals.—Oxyds of carbon.—Gaſes.—Perioſteum.—Hair.—Epidermis and cuticle.—Fibres of wood.—Glaſs.—Amber.—White of an egg hardened.—Oil, reſins, and gums.

Volta divides the conductors of electricity into two claſſes, dry, and moiſt. The dry conductors he ranks in the firſt claſs; and the moiſt conductors in the ſecond. When a moiſt conductor and a dry conductor are brought into contact, a diſturbance of the electrical fluid takes place. The mode in which this diſturbance is produced, he does not venture to conjecture; and it is oftentimes ſo low as ſcarcely to be detected by any means at preſent known.

Mr. Pepys has contrived an ingenious apparatus to be adapted to Bennet's electroſcope, ſhewn at O, fig. 24, in the Electricity Plate III. for the purpoſe of evincing all ſuch ſmall ſtates of electricity, developed in galvanic experiments. With this view, inſtead of the tin-foil coatings within-ſide the glaſs, he has ſubſtituted two plates, *n*, *e*, forming an acute angle, which, by a regulating ſcrew, can be adjuſted to any required diſtance from the gold leaves. The angular part is ſecured to the bottom; the open part perpendicularly upwards; and the gold leaves, repreſented oppoſite *c*, hang between them. By this ingenious mode of approximating the coatings to the gold leaves, the reſiſtance being diminiſhed, a weaker intenſity of electricity ſuffices for their diſturbance.—Owing to its ſuperior ſenſibility, this inſtrument is now generally denominated the *Galvanometer*.

Mr. Read, well known by his valuable obſervations on atmoſpherical electricity, is the firſt who applied the galvanic condenſer to this electroſcope; to the end that it ſhould alſo evince ſmaller intenſities of electricity. The very minute portion of the fluid given out by the ſingle contact of two different metals, does not produce any diſturbance of the gold leaves; but when ſeveral minute portions are accumulated, a ſeparation of the leaves will take place. The electroſcope, in its ſimple ſtate, will be as much charged the firſt time as if the contact had been made a thouſand times, and cannot therefore acquire a greater quantity of the fluid than ſuffices to place it *in equilibrio* with the metallic plates. This portion being inadequate to the production of any divergency of the gold leaves, Mr. Read applied the principle of the electrical doubler to the above inſtrument, by which means he was enabled to charge an intervening plate of air. By thus accumulating every minute portion of the

electric

electric fluid imparted by the metallic plate, and by apparently condenſing and increaſing its intenſity, he ultimately ſucceeded in producing marked ſigns of diſturbance. The conſtruction of this apparatus is ſhewn in the ſame figure; where a circular braſs plate, *b*, about four inches in diameter, is ſoldered to the braſs cap of Bennet's electroſcope, O; and, at a right angle with the plane of the cap, a ſimilar braſs plate, *a*, connected with a braſs rod, F, and moveable about the joint, *g*, completes the apparatus. The latter plate, *a*, is non-inſulated, and is never in contact with the plate *b*, being placed at ſuch a diſtance as to allow a thick card to paſs between. Conſequently there will be a plate of air between *a* and *b*; and the charging of this plate of air is preciſely on the principles deſcribed in the explanation of the Leyden phial.

Fig. 25, in the ſame engraving, repreſents two metallic plates, A and B, about ſix inches in diameter, with inſulating handles, as at C C. One of theſe plates is made of zinc, and the other of copper. When they are brought frequently into contact, and when, on each ſeparation, one of them, for inſtance, the zinc plate, is, by its inſulating handle, made to touch the cap of the electroſcope O, fig. 24, each portion of the electricity communicated to the cap, becomes equally diffuſed throughout the whole metallic medium in contact with it, the plate, *b*, participating of the effect. The ſurrounding air is ſo feebly acted on by this very ſmall intenſity, that unleſs its reſiſtance be conſiderably diminiſhed, no ſenſible effects will be produced. The very ſmall plate of air between the two plates *a b*, becoming influenced by this weak ſtate of electricity, the proportion of the fluid it receives on the ſide oppoſed to the plate *b*, it gives out at the ſide contiguous to the plate *a*, which, not being inſulated, admits it with facility. In this way *a* may be conſidered as the coating of the outſide of the jar, and *b* as the inſide coating. On every ſucceſſive charge the plate of air becomes additionally acted upon. So long as the plates *a* and *b* are preſerved in this ſtate, no ſeparation of the gold leaves, repreſented oppoſite *c*, takes place. When a Leyden phial is charged, and then placed on an inſulating ſtand, if a communication be formed with the external coating and an electroſcope, no diſturbance will take place. The air in the external ſurface being in a preciſe balance with the air on the internal ſurface, no change can take place on one ſide ſo long as the other ſide is kept inſulated. Thus it is with the condenſer: the inſtant the plate *a* is ſeparated from the plate *b*, the electricity which had been imparted and received by the intervening plate of air, being now expoſed to the atmoſpheric maſs, moves in the direction in which it meets with the leaſt reſiſtance. This direction is the metallic cap of the electroſcope; and, according to the quantity thus regurgitating, the gold leaves *c*, become diverged. The ſtate of electricity is always poſitive, if the zinc plate be applied; and negative, if the application of the copper-plate be made.

If either the zinc or the copper-plate, be applied to the part of the cap *n*, which is directly oppoſite to the plate *b*, the effects will be ſtronger than when it is applied nearer to the plate *b*. This obſervation was firſt made by Mr. Read; and ſeems to accord with Volta's notion as to moto-electric power. It is a further confirmation of the idea, that the real conductors of electricity are replete with that principle; and that the firſt effects produced, are occaſioned by the diſturbance of the natural electricity of the body. It is well known to be a common property of all univerſally diffuſed fluids, to be more powerfully acted upon in the part which is in a line of direction with the impelling power. This is the caſe with the tranſmiſſion of ſound through ſolids or fluids, and alſo with the apparent motion of light. The ſucceſſive impulſes acting at *n*, the natural electricity of the plate *b*, will alſo more powerfully diſturb the intervening plate of air, than when the contact is made at any other part of the cap. In ſuch a caſe, the motion communicated to the electricity of the plate *b*, will be weakened in proportion to the obliquity of the direction. This fact is eaſily proved, by the greater number of contacts requiſite in one direction than in the other. It would perhaps be more correct to call this inſtrument a *galvaniſcope*, ſeeing that it does not ſo correctly meaſure the powers of a battery as one hereafter mentioned, which may therefore be more properly regarded as a galvanometer. When two diſſimilar metals are employed, ſuch as a plate of ſilver and a plate of zinc, after frequent uſe, the zinc becomes changed on its ſurface, loſes its metallic ſplendour, and has an oxydated appearance. The experiments of Aſhe and Fabroni alſo tend to prove certain chemical changes effected by the contact of two diſſimilar metals with an interpoſed fluid. Suppoſe Z, fig. 26, in the Electricity Plate III. to repreſent a plate of zinc; S, a plate of ſilver; and F, a prepared frog lying between them. Upon completing the circuit between the ſilver and zinc plates, by means of the conductor C, the muſcles of the frog are inſtantly thrown into violent convulſions; and theſe actions are repeated as often as the contact is made, or the circuit complete, by the conducting wire and the two metals. When the prepared frog is in a deſiccated ſtate, without any humidity on the portions in contact with the two plates, no contractions enſue.

The muſcular fibres of a frog are ſo extremely ſenſible to the influence of electricity, as to form the moſt delicate electroſcope hitherto known. The great ſenſibility of the gold-leaf electroſcope of Mr. Bennet, is well known; but, notwithſtanding the improvement of Mr. Read's condenſer, it evinces no diſturbance by the ſimple contact of two diſſimilar metals. But when the plate of zinc, and the ſimilar plate of copper, with inſulating handles, as ſhewn at fig. 25, are brought into contact about twenty times, and one of the plates applied, on each contact, to the condenſer; upon removing the latter, the leaves of gold are ſeen to diverge. The ſtate of electricity with which they diverge, is invariably poſitive, if the zinc plate be applied to the electroſcope; and negative, if the application be on the ſide of the copper-plate. In this caſe, the plates muſt be at leaſt five or ſix inches in diameter. Yet we ſee, on the other hand, that a very minute portion of zinc and ſilver will produce violent convulſions in the limbs of a frog.

If ten perſons moiſten their hands with ſalt and water, and form a circuit, by holding the hands of each other; and if, in this circuit, a prepared frog be placed, one of the perſons holding the animal by the feet, and another by the ſpine, at the ſame time that the firſt perſon in the circuit has in his diſengaged hand a half-crown, and the laſt perſon a plate of zinc held in the ſame way, each time the two metals are brought in contact, the frog will become convulſed.

Gren has remarked how the ſenſations of ſeeing and taſting may at the ſame time be produced, by a very ſtriking experiment, which is as follows: "The muſcular motion, as well as the ſenſations of ſeeing and taſting, may be produced at the ſame inſtant, by means of the electric ſtream. Let four perſons ſtand upon a ſomewhat imperfect conductor, and communicate between themſelves in this way: let the firſt perſon hold in his right hand, well moiſtened, a cylinder of zinc, and touch with the finger of his left hand the point of the finger of the ſecond perſon, who, again, ſhould touch with his finger the bare eye ball of the third: now, let the latter hold the legs of a prepared frog in his well-moiſtened hand, at the ſame inſtant that the fourth perſon, with his moiſtened right hand, lays hold of the rump of the frog, holding in his moiſtened left hand a cylindrical piece of ſilver. If the firſt and laſt of the perſons who form this ſeries bring this zinc and ſilver into contact, and in this way complete the circuit, the perſon whoſe tongue is touched will perceive an acidulous taſte; the touched eye of the third perſon will perceive a flaſh of light; and

the thighs of the frog, which are held by the third and fourth perſons, will be violently convulſed."

Aldini and Humboldt have both obſerved, that, if the legs of a prepared frog be immerſed in mercury, and the nerves be brought in contact with the external ſurface of that fluid, the convulſion will take place every time the circuit is formed. From this experiment theſe phyſiologiſts have deduced, that diſſimilar metals are no ways neceſſary. The celebrated Volta properly obſerves that, although one metal is thus apparently employed, the different ſtates in which the mercury is found, conſtitute what may be conſidered as two diſſimilar metals. As mercury, the inſtant it is expoſed to the air, becomes oxydated, a part of the animal being in contact with the fluid in its metallic ſtate, and the ſciatic nerve being equally ſo with the oxydated ſurface, convulſions will neceſſarily enſue. From all the experiments hitherto brought forward, in which convulſions have been produced by the influence of diſſimilar metals, it would appear that the diſengaged electricity is from the oxydated ſurface of the metal; and that the muſcular fibres of the frog are, in conſequence of their exquiſite ſenſibility, convulſed by the tranſmiſſion of the electricity from the non-oxydated plate to the oxydated plate.

It has been already obſerved, that a ſimple galvanic combination may either conſiſt of two diſſimilar metals, and an interpoſed fluid, or of a ſingle metal placed between two different fluids, one of which acts on the metal without its being influenced by the other. Let A B, fig. 27, in the ſame engraving, repreſent two glaſſes, one filled with a diluted ſolution of nitrous acid, and the other with water. If theſe two veſſels be connected by a copper arc, *a b*, a ſimple galvanic combination will be formed. The part of the copper in the diluted ſolution of nitrous acid will be oxydated, while the portion in the veſſel of water will not be acted on. If one of the extremities of a prepared frog, as at F, be placed in one of the liquids, as ſoon as the other extremity is brought in contact with the liquid in the other veſſel, convulſions will enſue. This effect is more ſtrongly produced in the experiment repreſented at fig. 28, in which B D is a glaſs diſh filled with a ſolution of the ſulphure of pot-aſh; and A, a ſilver cup, or a ſalt-cellar, placed within-ſide, and nearly filled with a weak ſolution of nitric acid. By this arrangement a *perfect* galvanic combination is produced; as ſoon as a prepared frog is made to form a communication between one of the fluids and the other, it will be convulſed.

Upon the principles of ſimple galvanic combinations, many curious phenomena are explicable. Formerly, in applying copper ſheets to the bottoms of ſhips, it being the uſage to employ iron bolts, it was obſerved that the copper ſoon became looſened in the part where the two metals were in contact. This arrangement conſtituted a ſimple galvanic combination of two diſſimilar metals, and an interpoſed fluid. In this caſe the interpoſed fluid was the ſea-water, or a ſolution of the muriat of ſoda, and the metallic ſubſtances, the iron and copper. In a ſimilar arrangement, the iron, the moſt oxydable metal, in becoming oxydated in the part more immediately in contact with the copper, is ſoon deſtroyed, and detached from the latter ſubſtance. In 1795, Creve firſt ſhewed that, in every ſimple galvanic combination, water is decompoſed. The oxygen, in theſe combinations, enters into union with the metal; and the hydrogen is evolved.

The diſcoloration of a ſilver ſpoon, in the act of eating eggs, is a curious galvanic operation. Mr. Carliſle, by a very ingenious analyſis, has proved the exiſtence of ſulphur, both in the yolk and in the albumen of an egg. A tea-ſpoon left immerſed in either of theſe ſubſtances, undergoes no diſcoloration; but the above remarkable phenomenon takes place in the act of eating the egg; the bowl of the ſpoon which is moſt in the mouth, being always found to be diſcoloured. In this caſe the galvanic combination conſiſts of the ſulphurated ſolution, the ſilver tea-ſpoon, and the ſaliva. In every galvanic operation Creve has ſhewn that water is decompoſed. The naſcent hydrogen, readily uniting with the ſulphur, forms ſulphurated hydrogen gas, which produces the diſcoloration. It is this gas, evolved from our coals in the act of combuſtion, which occaſions a ſimilar tarniſh to the ſilver employed for domeſtic purpoſes.

Mr. Davy, chemical profeſſor at the royal inſtitution of London, obſerves, that charcoal poſſeſſes a ſimilar property with metals, of forming a galvanic combination with two diſſimilar fluids. Suppoſing, according to him, A and B, fig. 29, to repreſent two glaſſes, one filled with nitric acid, and the other with water: if a communication be formed, by means of an angular piece of charcoal C D, a galvanic combination will be produced. Charcoal is an exeellent conductor of electricity, and ranks next to metallic ſubſtances. It has been aſſerted, that it was firſt employed by Fontana as a conductor of galvaniſm; but the earlieſt experiment was made by Volta.

Humboldt having noticed that the Lydian ſtone is a conductor, ſuſpected it to poſſeſs that property in conſequence of a certain portion of carbon it contains. On burning it with cauſtic pot-aſh, in an open veſſel, the pot-aſh became mild, and effervеſeed with acids. A proof was thus obtained of its having acquired carbonic acid. From this obſervation we may perceive how delicate a teſt galvaniſm is, in detecting carbon in a ſubſtance in which the preſence of that prineiple was not even ſuſpected. So great, at the ſame time, is the ſenſibility of galvaniſm to good conducting media of this deſcription, that it evinces inſtantaneouſly the exiſtenee of the ſmalleſt portion of carbon. All ſubſtances which have this principle diffuſed through them, become galvanic conductors.

Some perſons have ſuppoſed galvaniſm to differ from electricity, becauſe the conducting powers of charcoal have been found to be greater for the former than for the latter principle. This is, however, far from being the caſe. Charcoal preſerves the ſame rank in the order of conductors, both for electricity and for galvaniſm. That it is found ſuperior to metals, in the deflagration of the latter ſubſtances by galvanic proceſſes, does not depend upon its conducting power, but upon its aiding principle of combuſtion.

Volta has obſerved, that various parts of animals can be excited without the aid of metals; and ſeveral ingenious methods have been propoſed by Galvani for this purpoſe. In the opuſculi of Milan, an account is given of Aldini's experiments, made in the preſence of the inſtitute of Bologna, in 1794. A prepared frog having been immerſed in a ſtrong ſolution of the muriat of ſoda, and removed from thence, the learned profeſſor held one of the extremities in his hand, and allowed the other to hang freely down. While the animal was in this poſition, he raiſed up the nerves with a glaſs rod, on ſuddenly removing which, as often as the nerves touched the muſcular parts, convulſions were produced.

Animal ſubſtances, as conductors of electricity, have their capacities proportioned to their conducting powers. No change can be induced in theſe ſubſtances, without an adequate change in their capacities. Both the muſcular fibre, and the nervous ſubſtance, in their healthy living ſtate, and connected with the ſources by which their energies are preſerved, are, with reſpect to electricity, in a preciſe balance with each other. When a portion of animal ſubſtance is detached and ſeparated, changes are induced, and decompoſitions effected. In cold-blooded animals, the proceſs being very ſlow, the muſcular fibres remain for a long time ſuſceptible to ſo pervading a ſtimulus as electricity. When the ſubſtance is immerſed in a ſolution of the muriat of ſoda, the nervous and muſcular parts ſeem not to undergo equal changes. The part which is the moſt rapidly acted on, will leave the other in a negative ſtate of electricity; and, on the communication being formed, convulſions will be produced. If the communication be made through the medium of a warm-blooded

blooded animal, ſimilar effects will enſue. A curious experiment was tried by La Grave, and related in the Memoirs of the Galvanic Society of Paris. A ſeries of galvanic combinations having been formed of brain and muſcle, cut into ſlices, and layers of hat, moiſtened in ſolution of the muriat of ſoda, evident galvanic effects were induced.

Animal ſubſtances are ſuperior conductors to thoſe which belong to the vegetable kingdom. The ſubſtances which conſtitute the intermediate link between animals and vegetables, ſuch as muſhrooms and morells, preſerve the ſame order in their conducting powers. Gehler, in his Philoſophical Dictionary, firſt remarked this curious circumſtance, which is not dependent on their humid ſtate, ſince, when they are cut and dried, they are found to be good conductors.

Valli was the firſt to notice that a ligature applied to a nerve, prevents the muſcle from being convulſed by metals. Trattori obſerved, that this is not an invariable conſequence. Valli, in his ſubſequent obſervations, diſcovered, that if the ligature be made cloſe to the inſertion of the nerve in the muſcle, it entirely impedes its movements; but if at a diſtance, the experiment ſucceeds perfectly well. However a nerve may be lacerated, if a ſmall fibre of communication be left, the convulſions will be produced. When the nerves of warm-blooded animals are applied to the nerves of cold-blooded animals, the contractions do not take place. Thus, the crural nerve of a mouſe being applied to the crural nerve of a frog, and the nerves ſeparated by about the half of a line, the contractions do not enſue. But if a nerve of the ſame frog be divided, and the parts ſeparated about a line from each other, upon completing the circuit, the contractions will take place.

After pointing out theſe ſimple galvanic combinations, it will be proper to advert to the effect of an increaſe of the ſeries of metals. Volta obſerves, that "a ſeries of this nature reſembles an electric battery, weakly charged, acting inceſſantly, and which charges itſelf after each exploſion." Inſtead of conſiſting of inſulating plates or electric ſtrata, it is armed with conductors. The firſt arrangement he terms a *couronne de taſſes*, conſiſting of glaſs tumblers, half filled with water, or ſalt and water, and forming a regular union by a ſeries of metallic arcs, as repreſented at fig. 30, in which the plates marked S, are either of ſilver or copper, and thoſe marked Z, of zinc. The arcs *a*, *a*, *a*, may be formed of any ſubſtance which is a good conductor of electricity; and the two metals in each glaſs ſhould be ſoldered to the metallic arc, in any part above the one which is immerſed in the liquid. Volta remarks, that alkaline ſolutions are employed with the beſt effect, when one of the metals is tin, and the other ſilver or copper. If zinc be ſubſtituted for tin, then ſalt-water is preferable. When thirty or forty of theſe glaſſes are arranged, one of the experimenter's hands being placed in the fluid contained in the firſt claſs, and the other hand in the laſt of the ſeries, a ſhock is experienced. As often as the circuit is completed, the ſame ſenſations recur.

Mr. Cruickſhank, chemiſt at Woolwich, has conſiderably improved the conſtruction of the Voltaic pile. This is repreſented in the Electricity Plate III. at fig. 31; where A B C D is a wooden trough formed of hard baked mahogany; about thirty inches long. Withinſide, fifty grooves are cut in the ſides and bottom, at equal diſtances from each other. Theſe grooves ſhould be of a thickneſs correſponding to the metallic plates in the Voltaic pile. The plates are cemented ſeparately in each of the grooves, ſo that the fluid will not paſs out of one cell into the other. The plates conſiſt of zinc ſoldered to copper; and in whatever direction the firſt of them is cemented into the box, all the others muſt preſerve the ſame order. Suppoſing the copper ſide of the firſt to be towards B; all the others ſhould be ſo placed in the box as to have their copper ſides towards B, and their zinc ſurfaces towards C. When they are thus arranged, the end C D is called the zinc end of the battery; and the end A B the copper end. In this ſtate the inſtrument is complete. This conſtruction poſſeſſes many advantages which the pile does not. The fluid is applied with greater facility. The apparatus is more convenient for experiments; it continues to be active conſiderably longer; and is attended with little or no trouble in cleaning. In the Voltaic pile, after it has been once uſed, the zinc ſurface of the plates becomes oxydated; inſomuch, that before they can again be uſed, they muſt be ſcraped or filed, which is a tedious and troubleſome operation. In the trough every ſucceſſive operation cleans the plates, by diſſolving the oxydated ſurface of the zinc.

Volta ſuppoſed the fluid employed to act merely as a conductor; and that the differences in fluids depend entirely on their different conducting powers. It has been ſhewn, by the experiments of Aſhe, Creve, Fabroni, and others, that the fluid acts chemically on the eaſieſt oxydable metal; and that thoſe fluids produce the moſt active effects, which influence the metallic ſubſtance the moſt powerfully. Thus acids, alkalies, neutral ſalts, &c. act more powerfully than ſimple water. Acid ſolutions are ſtill more powerful than the former. One part of nitric acid, blended with about twenty parts of water, forms a very active mixture. As this mixture evolves nitrous gas, it is injurious to reſpiration; beſides which, the nitric acid is very expenſive. Sulphuric acid, combined with water, anſwers very well, but its action is too quick. In operating on the zinc, it diſengages ſuch quantities of hydrogen gas, as to be very troubleſome, and is frequently attended with ſuch evolutions of heat, as to looſen the cement. About an ounce of the muriatic acid, or ſpirit of ſalt of the ſhops, blended with a pint of water, conſtitutes a convenient mixture, which acts tranquilly and uniformly, decompoſing the water ſo ſlowly, that the hydrogen gas which is evolved does not annoy the operater; the trough, by the employment of this acid mixture, is kept uniformly clean.

When, for any experiment, ſeveral batteries are requiſite inſtead of one, they ſhould be placed in preciſely the ſame order as if two, three, or more, batteries, were to conſtitute one trough only; obſerving, throughout the whole of the ſeries, that the zinc ſurface of one of the plates ſhould be conſtantly oppoſite to the copper ſurface of the next plate in the ſeries; and that the troughs ſhould be connected to each other by ſome metallic ſubſtance. A ſlip of copper ſheeting, about half the width of the trough, anſwers this purpoſe very well.

On the continent, the Voltaic pile ſtill continues to be employed; the advantages of Mr. Cruickſhank's trough, perhaps, not being as yet known. To render its action more permanent, Monſ. Iſam has ſubſtituted to the moiſtened cloths, ſalt juſt ſufficiently moiſtened to be formed into a layer. He obſerves, that a pile thus formed, retains its powers for a month. The quantity of metallic ſubſtance deſtroyed by the acid is very trivial; ſince it only acts when the circuit is completed. A trough, however, will, with due care, laſt ten or twelve years, if it even be employed ſeveral hours daily. The fluid, when poured in, ſhould not aſcend higher than about a fourth of an inch from the top of the plates; and when the trough is filled, it ſhould, as well as the upper ſurface of the plates, be wiped dry.

When a ſingle metal is employed, ſuch as copper, the plates are cemented in the ſame manner: in one of the cells ſimple water is introduced; and in the other a ſolution of nitric acid. This battery is by no means ſo powerful as when zinc is employed with copper, and one fluid only. So, likewiſe, if plates of gold and ſilver be ſoldered together, a ſolution of nitric acid will be found to anſwer, becauſe it will oxydate the ſilver, and not the gold. Any metallic combinations may be formed, if the fluid which is employed will act on one of the metals, and not on the other: their powers will, however, be feeble, becauſe their

their changes are trivial when compared to thofe of a combination of filver or copper with zinc. The latter of thefe metals oxydates fo readily, as to give out its combined electricity with greater facility than any other metal. In an extenfive battery, filver plates would become expenfive; and, as copper only lofes one-fifth of the power, or, in other words, as eighty plates of filver and zinc are equal in power to about 100 plates of copper and zinc, the difference is amply compenfated by the faving.

Soon after the important communication of Volta on the felf-charging power of his moto-electric apparatus, the celebrated French chemifts, Fourcroy, Vauquelin, and Thenard, fuppofing, *à priori*, that the effects would be in proportion to the metallic furfaces expofed, conftructed plates of zinc and copper about nine or ten inches in diameter. The plates which had been previoufly employed, rarely exceeded the fize of half-a-crown. As one of thefe large plates expofed a furface about forty times greater than that of the fmall plates, it was expected that the effects produced from ten fuch plates would have equalled the effects of four hundred of the fmaller ones; but, to their great furprife, they found that the fenfations were the fame, from an equal number of each; and that the extent of furface did not make any fenfible difference. The power appeared to be regulated by the number of the plates, and not to be influenced by the furfaces expofed. They were equally furprifed, when they found that a feries of ten large plates, the effects of which on the human frame could with difficulty be perceived, poffeffed a power of burning finely-drawn wires, and of deflagrating laminated metals, fuch as gold and filver leaves, equal to that of four hundred fmaller plates, the fum of whofe furfaces was equal to the furface of the larger ones. Thefe curious facts led to an important deduction, that "the influence of the galvanic fluid on the human frame, is in proportion to the feries, or number of the plates employed; while its effects on metals are in the ratio of the furfaces expofed."

In difcharging a galvanic battery, the fenfation will be in proportion to the number of plates between the points of contact. We will fuppofe the trough, A B C D, fig. 31, to conift of fixty plates. If, between B and 1, there are fifteen plates; and between 1 and 2; 2 and 3; and 3 and C, the fame number; and if one of the hands be applied at B, and the other at C, the whole force of the battery will be communicated. But if one of the hands be applied at B, and the other at 1, only one-fourth of the fhock will be felt; and it is confequently in proportion to the number of the plates between the two hands. In this way a given power of electricity is divided into any required minute portions, with an accuracy which cannot be imitated on the common electrical apparatus.

When a communication is formed between B and C, it appears, on a tranfient view, to controvert what has been already ftated, relative to the neceffity of connecting the zinc fide and the copper fide of the fame identical plate, in order to produce a difchargc; feeing that the charges of all the plates are thus communicated. Upon a little reflection, it will, however, be obvious, that this is a neceffary refult, and a powerful confirmation of the doctrine already laid down. When one of the hands is applied at B, fuppofing the latter to be what is termed the copper part of the trough, and the end C the zinc part, the hand at B is not only in contact with the copper furface of the firft plate, but, on account of the regular chain of conducting media, it is alfo connected with the copper furfaces of the other plates. In the fame way the hand at C, which touches the zinc furface of the fame plate, is, by a fimilar channel of communication, in conducting union with the zinc furfaces of all the plates towards B. Let us fuppofe the plates alone, from B to 1, to be under the galvanic action; and the cells from 1 to C to be filled with pieces of charcoal: upon forming the communication between B and C, the united powers of only fifteen plates will be tranfmitted. Now, the plates from 1 to C, in this cafe, act merely as conducting media. It is precifely the fame when all the cells are filled with an acid folution. This fluid keeps up the connection of the chain from plate to plate; and they then reciprocally act as conducting media to each other. From thefe obfervations may be perceived the neceffity of the cells being infulated in fuch a way as that the fluid cannot pafs from one to the other. If fuch a communication fhould exift, there would then be a connecting medium from the copper furface to the zinc furface of the fame plate. On this account it is neceffary that each plate fhould be well cemented in the apparatus. When a battery is carelefsly made, the appearance of the plates will evince the non-infulation of the cells. As was before obferved, the oxydifying procefs can only continue in proportion as the decompofed electricity is difengaged. Thus the plates which conftantly have a connecting and conducting medium from the copper furface to the zinc furface, are rapidly oxydated; while the other plates merely undergo changes, at each of the inftants when the circuits are completed.

In combining feveral batteries, care fhould be taken that they be nearly of equal force. If an imperfect battery be interpofed, the united power of the whole will be merely equal to the fame feries of the imperfect one. In procefles of deflagration, a battery confifting of fmall plates fhould not be ranged with a battery having large large plates, the effects of the latter being diminifhed confiderably by the former.

In difcharging the Voltaic pile, as fhewn at fig. 22, in the engraving, the whole charge goes off at once. If one hand be placed at *f*, and the other at *g*, the whole fhock is inftantly communicated. This pile Volta calls a moto-electric apparatus: its power of electrification continues as long as the pieces or difcs of cloth or pafteboard remain moift; as foon as they become dry, its power ceafes. This pile has been improved by Mr. Nicholfon, for the more obvious operation of decompofing water. It occurred to him, that if the fhock were to be tranfmitted through an interrupted circuit in water, the fact of the decompofition would be clearly afcertained. With this view he conftructed an apparatus, repreferted at fig. 23, in which A B repreferts the Voltaic pile, and C D a glafs tube filled with water, a wire proceeding from the upper part of the pile into the tube at C, and ending at *e*, while another wire paffes from the bottom of the pile through the end D towards *f*, leaving an interruption oppofite *ef*. The apparatus having been thus arranged, one of the wires was obferved rapidly to give out a gas, which, on examination, proved to be hydrogen; while the other became oxydated. When wires of gold or platina were employed, thefe being non oxydable metals, oxygen was, as well as the hydrogen gas, given out. It was invariably remarked, that the wire connected with the zinc end of the battery gave out oxygen, and the other wire hydrogen, gas; as more particularly defcribed in the experiments made by Meffrs. Carlifle and Nicholfon, mentioned above. Perhaps the arrangement repreferted as affixed to the trough, fig. 31, may be more convenient. A wire, *r*, which flides on one of the plates, fupports a brafs cup, in the center of which is a pair of brafs pincers holding a piece of gold wire; over thefe pincers a glafs tube is placed, having, at its extremity, *o*, a piece of gold wire fealed in with a glafs, which fhould not touch the wire at *p*. The tube and brafs cup being filled with water, a wire, *onm*, connected with the top of the glafs tube, joins the other end of the battery, by which means the circuit is completed, and the decompofition goes on. As the gafes are difengaged, they rife up to the top of the glafs tube, and, preffing the water into the cup, the procefs will go on till the whole of it is preffed beneath the upper wire. The operation then ceafes.

The decompofition of water by electricity, according to the mode adopted by Van Marum, is a very tedious procefs. Dr. Wollafton's method above defcribed, by

the means of very ſmall gold wires, ſucceeds in decompoſing water by the electrical machine, nearly in the ſame manner as is effected by galvaniſm. Van Marum's method is by an interrupted exploſion; while, in the caſe of Dr. Wollaſton's, the production is tranquil and progreſſive.

The decompoſition of water by the galvanic pile, is of great uſe in the elucidation of its decompoſition by electricity, which has excited ſo much the attention of philoſophers. It has appeared difficult to comprehend how an electrical exploſion ſhould effect a decompoſition of water; and, when it has been decompoſed, ſhould occaſion its re-compoſition. By the galvanic operation, we find this to be occaſioned by the paſſage of a conſtant current of a ſmall intenſity of electricity, paſſing through an imperfectly conducting medium. The reſiſtance it meets with occaſions the ſeparation of the conſtituent parts of the water, the actual ſubſtance of which is pervaded by this ſubtile principle, which thus breaks the bond of union of its conſtituent parts. When theſe gaſes are inflamed by the electric ſpark, it is not the electricity which directly occaſions the exploſion; it being produced by the caloric elicited from other ſubſtances, by the interrupted paſſage of the electric fluid.

It is a curious and remarkable fact, that inflammable fluids, ſuch as oil, alcohol, &c. cannot be decompoſed by the galvanic proceſs, unleſs by the medium of the paſſage of a ſpark. Thus, in the preceding engraving, at fig. 32, let us ſuppoſe C D to repreſent a glaſs veſſel half filled with alcohol; let A B be two pieces of well-prepared charcoal, one of them connected, by means of a wire, with the zinc end of a powerful battery, and the other piece joined in the ſame way to the copper extremity. As often as the ends E F, which are immerſed in the alcohol, are brought into contact, a brilliant ſpark is produced, and bubbles of air are given out. Upon continuing the proceſs, provided the battery be very powerful, the ſpirits will almoſt boil. The air, which is rapidly diſengaged, when collected in a receiver, proves to conſiſt of carbonic acid gas, and hydro-carbonat gas. As alcohol is compoſed of oxygen, hydrogen, and carbon, at the inſtant of decompoſition new combinations take place. The naſcent hydrogen, uniting with the carbon, conſtitutes the hydro-carbonat; and the remaining portion of carbon, blended with the oxygen, forms the carbonic acid. The ſame reſults follow the decompoſition of oil.

The decompoſition of water by galvaniſm is governed by the laws which apply to animal ſubſtances. The rapidity of the decompoſition is in proportion to the number of the plates, and not to the ſurface; till we reach the limits particularized in ſpeaking of the influence of ſmall plates. In the battery of ſix hundred ſmall plates before deſcribed, the decompoſition is by no means equal to a battery of ſixty plates each of which has a ſurface of four inches.

We are told that it was with the celebrated electrical apparatus at Haerlem, made by Mr. Cuthbertſon, that the beautiful metallic oxyds were firſt ſtruck upon paper, each of the metals having produced its peculiar characteriſtic tint. The mode of performing theſe curious experiments is repreſented in the Electricity Plate III. fig. 33. A B is a plate electrical machine, on the ſame principle with that in the Teylerian muſeum at Haerlem; C D a battery expoſing a coated ſurface of about eighteen feet; and G H a fine metallic wire, ſecured by pins in ſuch a way as to be raiſed from the paper about one-eighth of an inch. The frame of wires is connected with the battery by means of the chain F. Upon diſcharging the battery by the rod E, the wire explodes, and is diſſipated in the air. Having been diſperſed in every direction, a portion of it ſtrikes on the paper, on which it impreſſes beautiful rays. Gold wire gives a purple tint, copper a bright green, tin a greeniſh yellow, lead a pale green, &c.

A powerful charge of electricity oxydates a conſiderable length of metallic wire; while galvaniſm acts on ſucceſſive portions of the metal, whenever it is excited by a conducting medium. Electricity produces all its effects by one ſudden and violent diſcharge; while galvaniſm operates by its continual current. It is on this account, that the ſenſations produced by their diverſe actions, are materially different. The electric ſhock, from a very ſmall jar, operates on the body by a ſudden and percuſſive effect; while the one which follows the galvanic proceſs ſeems to ariſe from a conſtant current, attended by a jarring and tremulous ſenſation.

All finely-drawn metallic wires are rapidly burnt by means of a large galvanic battery, the powers of which are in general aſcertainable by the extent of fine ſteel wires, ſuch as the pendulum ſprings of watches, which the battery will inſtantly render red-hot. This conſtitutes the moſt correct *galvanometer*; while the other, on which we have already touched, ought to be termed a *galvaniſcope*. A powerful battery will induce a red heat on ſeveral inches of the above ſteel wire.

To deflagrate finely laminated metals, good charcoal is the beſt medium which can be employed. As the ſubſtance of the metallic leaves, when laminated, is much thinner than that of any wires which can be drawn, the deflagrations are more brilliant, and the light extremely vivid. Gold leaf, having the thickneſs of the 1-282,000th part of an inch only, is not merely deflagrated, but is likewiſe completely oxydated, and reduced to a purple powder. Silver leaf, which is thicker than gold leaf in the proportion of ſeven to four, is likewiſe converted into an oxyd, and exhibits a beautiful greeniſh light. We thus ſee that, by the powers of galvanic electricity, two metals which reſiſt the utmoſt force of our furnaces, are rapidly oxydated.

Copper leaf has a thickneſs nearly five times greater than that of gold leaf. In its deflagration, red ignited particles of copper are detached, on this account, that copper requiring a very high temperature before it fuſes, the ignition takes place firſt. The copper, before it melts, is conſtantly red-hot, which is not the caſe with tin, lead, &c. The Dutch ſilver leaf, a compoſition of tin and zinc, about ten times as thick as gold leaf, is deflagrated with rapidity. Tin-foil, which is alſo a compoſition of tin and zinc, is about three hundred times thicker than gold leaf. Narrow ſlips of this ſubſtance are alſo eaſily deflagrated. In ſhort, all metals, if in a due ſtate of tenuity, are capable of being deflagrated.

In a medical view, galvanic electricity certainly merits our attention beyond any mere philoſophical reſearch; inaſmuch as its peculiar excitation of the animal functions, offers an inſtantaneous and powerful ſtimulus in many caſes, where other means cannot be ſo readily applied. In the preſent ſtate of our knowledge of the principles of galvaniſm, it has not been aſcertained whether any particular corporeal derangements are the cauſes or effects of a change in the reſpective capacities of the diſeaſed parts for electricity. The aſcertainment of this point would be a conſiderable deſideratum in medicine. The action of galvaniſm on the muſcular and nervous ſyſtems, is found to be more violent, in proportion to its intenſity, than that of common electricity. The charge of a galvanic battery, ſo feeble as not to be able to diſturb a gold-leaf electroſcope, when propelled through the head, is ſaid to produce a ſtronger ſenſation than the one which is experienced from one hundred times the ſame intenſity, produced by a Leyden phial.

In an age like the preſent, when a ſlow and progreſſive progreſs in the ſciences is too apt to be conſidered as a ſtationary ſtate; in an age, in ſhort, when a deſire ſeems manifeſted to collect the fruits before the flowers are formed, the experiments which have, from the moment they were conceived and made, promiſed a ſpeedy and immediate application to the healing art, cannot have failed to attract the particular attention of the public, by whom ſuch an application was in a manner an-

ticipated. It is thus that galvaniſm has been occaſionally recommended as the criterion of death, and at other times as a powerful and ſalutary ſtimulus in the diſeaſes of the nerves. But, when an idea was in the firſt inſtance formed of the electric fluid and its properties, was it not immediately thought, that, in its action on the human body, it would ſupply a remedy for all the diſeaſes to which it is ſubject? In the ſame way, after having noticed the galvanic phenomena, it has been ridiculouſly imagined that two pieces of metal, employed in a particular way, would, as it were by enchantment, recall to life thoſe who have periſhed by aſphyxy, reſtore ſight to the blind, re-eſtabliſh, in all caſes of paralyſis, the uſe of the limbs; and, in a word, produce more ſalutary effects than the faculty have been enabled to obtain, from the multitude of chemical, mechanical, and other, remedies, which have been employed for ſo many ages. Such was the ſhort-lived deluſion of *metallic tractors*.

Dr. Grapengieſſer, in his late celebrated work on Medical Electricity, publiſhed at Berlin, recommends galvaniſm in the following caſes: 1. In palſies of the extremities, occaſioned by the debility or ceſſation of the nervous action, and in thoſe even which have been primarily determined by other cauſes, ſuch as the compreſſion of the brain, the repercuſſion of an exanthematic affection, or a rheumatic affection, when theſe cauſes have been advantageouſly combated by the uſual means. 2. Galvaniſm is indicated in caſes of a debility of ſight, and in the gutta ſerena, when theſe complaints are ſolely aſcribable to a want of excitability in the optic nerve. 3. It is calculated for deafneſs ariſing from a nervous debility, and for particular buzzings in the ears. In the caſe of deafneſs, the cauſe is ſometimes very difficult to aſcertain; but is invariably of the utmoſt importance. With reſpect to the latter ſymptom, when it ariſes, as frequently happens, from the galvanic application, it is not attended by any particular inconvenience, when it ceaſes with the operation itſelf. But when it continues for ſeveral hours after, it is a bad omen. In ſome caſes this application produces in the ears a ſenſation of ſound ſimilar to that of boiling water; to that of the whiſtling of the winds; of the ringing of bells; or of the loud chirping of birds. 4. Galvaniſm appears to be calculated for the treatment of hoarſeneſs, and for that of aphony ariſing from a defect of nervous action. Should theſe ſymptoms follow an inflammation, or ſupervene after the fatigue occaſioned either by ſinging or by crying, it will ſuffice to make the application of the battery, or even of the ſimple apparatus, to the moiſtened ſkin. But if they ſhould appear to be the reſult, either of catarrhal, exanthematous, rheumatic, arthritic, or venereal, affections, the preferable mode would be, to apply the moſt ſimple apparatus to the wounds of veſicatories. It is true that this apparatus acts leſs forcibly; but it has this advantage, which is eſſential in the above-cited caſes, that the patient will be enabled to bear its action much longer. This author alſo apprehends that galvaniſm may likewiſe be ſucceſsfully employed, as a reſolutive, in certain chronical caſes of ſciatica; in the white ſwellings of the joints; in tumors of the glands of the neck; and in incipient caſes of meliceris and atheroma. He obſerves that he derived ſome advantage from it, in a caſe of metaſtaſis, accompanied by inflammation, at the articulations of the elbow and thigh; but that he conſiders galvaniſm, which is in all caſes a powerful ſtimulant of the vital forces, to be principally a powerful mean to be employed, as an auxiliary at the leaſt, in the treatment of many of the diſeaſes of the nervous ſyſtem. Independently of its ſtimulating action, when it is applied over veſicatories, it operates as a powerful derivative.

Valuable, however, as the galvanic influence may appear to be as an auxiliary to medicine, and *ſafe* as may be its application in judicious hands; yet being unqueſtionably the very ſame agent as that which operates in medical electricity, the ſame caution, and perhaps a greater, becomes neceſſary in the uſe of it, ſeeing that its force upon the animal economy is ſuppoſed to be more powerful, and its intenſity greater on the vital organs. As it is admitted on all hands, that an injudicious treatment of the patient by common electricity is extremely dangerous, ſo it follows that the application of the electric fluid from the Voltaic pile can never be ſafe, unleſs directed by perſons of ſkill and knowledge in medical ſcience.

An account is given by Mr. Sprenger, of Jena, of his method of adminiſtering galvaniſm in caſes of deafneſs. A ſmall ball is applied to the external orifice of the ear, and a much larger one is held in the patient's hand. The communication is then formed and interrupted alternately, by the means of machinery, once in every ſecond, for about four minutes daily, for a fortnight or more. He aſſerts, that he has thus reſtored the ſenſe of hearing to forty-five perſons, and to four of them that of ſmelling alſo. Thoſe who were completely deaf experienced relief, with ſcarcely any exception; but a partial deafneſs did not appear to receive the ſame benefit.

Several curious experiments on the treatment of diſeaſes by galvanic electricity, have been recently made by the members of the ſchool of medicine in Paris. The following is a brief ſtatement of the one which appears to be moſt intereſting. The firſt conſideration was the application of the effects of the pile of Volta to the animal economy; and the concluſions which were drawn were to this effect: 1. That, in the employment of the above pile, the galvanic influence penetrates and affects the nervous and muſcular organs, more profoundly than the common apparatus, the latter being calculated by the cuſtomary meaſure of medical electricity. 2. That the effects of the pile produce powerful contractions, and ſtrong ſenſations of pricking and burning, in parts which are, by their diſeaſed ſtate, rendered inſenſible to ſparks, and even to electrical ſhocks. 3. That the duration of this action is ſuch, as to warrant a hope that an efficacious excitement, capable of being ſucceſsfully employed in the treatment of caſes of paralyſis, may be found in the Voltaic pile.

In the application of this apparatus it was likewiſe obſerved, that the effects produced appeared to be proportionate to the extent of the points of contact; inſomuch that the moſt powerful excitation enſued, when the commotion was effected by the meeting of the conductors emanating from the galvanic pile, with metallic conductors fixed on the diſeaſed part, the contact being of a greater or leſs extent.

The experiment above alluded to was made under the immediate direction of M. Halle. A patient, the whole of whoſe muſcles on the left ſide of the face were in a palſied ſtate, in conſequence of a fluxion brought on by the action of cold, had been electrified ſeveral times, but felt neither ſenſation nor contraction when the ſpark was directed to the affected part. Indeed, he was ſcarcely ſenſible of a ſlight contraction in the great zygomatic muſcle, when the application of the electricity was made by commotion. This individual was ſubjected to the galvanic action of a pile conſtructed with fifty metallic plates; and a communication was eſtabliſhed between different points of the diſeaſed cheek and the two extremities of the pile, by means of metallic chains and exciters. At the inſtant of contact, all the muſcles of the face became contracted. The patient felt not only a pain, but a very diſagreeable ſenſation of heat. The eye was convulſed; the tears flowed involuntarily; and a pain and ſwelling enſued at the different points which had been touched. Occaſional applications of the galvanic influence for about ſix months, effected a cure.

Vaſſalli-Eandi, in his Report on the Action of Galvaniſm, and on the Application of this Fluid, and of Electricity, to Medicine, has the following remarks: "I conſider galvaniſm as a modification of electricity; a modification which renders this fluid more active; as the ſmall

ſmall flame ſeparated by the blow-pipe is far more ardent than the large one from which it is taken. I have read to the academy of Turin ſeveral experiments, which ſeem to ſupport this compariſon between electricity and galvaniſm. Animals which were only ſtunned by the ſtrongeſt ſparks from a magic picture, were killed in leſs than three minutes by a very weak degree of galvaniſm. The fluid of a pile compoſed of twenty-five plates of ſilver and zinc, of the ſize of a crown piece, intermixed with pieces of paſteboard moiſtened in water ſaturated with muriat of ammonia, oxydates the metals in decompoſing the water, while it is ſcarcely ſenſible in the fingers, and gives only ſmall ſparks. The brilliant electric ſparks which excite in our bodies a ſtrong ſenſation of pricking, neither oxydate the metals, nor decompoſe the water, if they do not communicate a ſhock. Having made the galvanic current to paſs through the body of a frog, its fluids were decompoſed, and I ſaw it ſwell up ſo much, that it could no longer plunge into the water, though poſſeſſed of great vitality, which I never obſerved to be the caſe in frogs when tormented by ſtrong electric ſparks. All theſe facts, to which many more of a ſimilar kind might be added, confirm the great activity of galvaniſm when compared with electricity. Hence it reſults, that the electric fluid of the Voltaic pile may be very uſeful in caſes in which common electricity would not have ſufficient activity.

Mr. C. H. Wilkinſon, in his Elements of Galvaniſm, publiſhed in 1804, gives the following details, as reſulting from his medical practice of galvanic electricity: "When paralytic affections ariſe from organic defect, as in caſes of palſy of the lower extremities, from diſeaſed ſpine, no good effects can be expected to reſult from the application of galvaniſm. In caſes of hemiplegia, or palſy on one ſide, ariſing from the preſſure of extravaſated fluid in or upon the brain, the ſtimulus of galvaniſm would, it appears to me, be injurious, in conſequence of its action increaſing the extravaſation. In one caſe, of a perſon about the age of thirty, of a full plethoric temperament, who ſuffered the loſs of the uſe of one of the ſides, from an apoplectic attack, I applied gentle ſhocks of galvaniſm through the ſide of the brain oppoſite to the affected part of the body. Upon the third day, a conſiderable giddineſs took place; and the veſſels of the eyes became turgid. I immediately diſcontinued the application, and in a few days theſe unfavourable ſymptoms diſappeared.

"Theſe caſes are but few in number, when compared with thoſe which ariſe from a defective energy in the brain itſelf. In theſe latter inſtances galvaniſm has often proved of very conſiderable advantage. By the means of galvaniſm, I have never ſucceeded in perfectly reſtoring the patient to his original ſenſibility; but have, in many inſtances, conſiderably aſſiſted the powers of motion. Very ſoon after the application of galvaniſm, an areolous redneſs is perceived; and, if it be perſevered in too long, veſications and ſubſequent ulcerations are produced. Theſe ſymptoms, which are a little troubleſome for the moment, do not require any particular treatment in their cure. The part of the body to which the conducting wire from the copper ſide of the battery is applied, is always the moſt powerfully acted on; and, if the conducting wires be kept in contact with the metallic leaves, for the ſpace even of half a minute, without being removed, the one from the copper ſide will produce an acute pricking ſenſation, very much reſembling the bite of a leech.

"In ſome caſes, attention ought to be paid to this difference between the ends of the battery. When it is wiſhed to act on one part of the body more powerfully than on the other, the conducting wire from the copper end ſhould be placed on that particular part. This difference in power correſponds with the effects experienced from the charged Leyden jar, in the caſe of which the part of the body connected with the negative ſide of the jar is more powerfully acted on than the part connected with the poſitive ſide. In recent caſes of hemiplegia, very good effects are ſoon perceived. After a few applications, a ſenſation of returning warmth is felt; and the action of the muſcles of the arm reſtored, as often as the circuit is completed. The effects of this principle, when it is applied to the human body, are not ſo painful as thoſe of electricity, notwithſtanding its actions are more powerful. By preventing the muſcles from remaining conſtantly in a ſtate of torpid inactivity, the loſs of ſubſtance which would otherwiſe take place is guarded againſt.

"From the reports of the foreign practitioners, it would appear that galvaniſm is a ſpecific in caſes of *deafneſs*. Its ſucceſs, in theſe caſes, ſeems to depend on the cauſe which occaſions the defect of hearing. In that of perſons born deaf, and neceſſarily dumb, it ſeems to ariſe from the diſeaſed ſtate of the ſemicircular canals, which, inſtead of being filled with a fluid capable of tranſmitting impreſſions, contain an inelaſtic caſeous-like ſubſtance. Under theſe circumſtances, no good effect can be expected to be derived from galvaniſm. It is fortunately in the particular ſpecies of deafneſs which can rarely be relieved by any other means, that galvaniſm is moſt advantageouſly employed, namely, in a defective energy of the auditory nerve. This ſpecies of deafneſs is aſcertainable by the common practice of placing a ſonorous body in contact with the teeth. If the communication of ſound ſhould not be thus rendered more diſtinct, we may conclude that the defect originates in the nerve; ſeeing that, provided the deafneſs had been owing to any derangement of the other parts of the ear, the ſound, tranſmitted by the medium of the teeth, through the connecting bony ſubſtance, to the ſeat of hearing, would have been diſtinctly perceived. When one ear only is affected, it is not neceſſary to introduce the apparatus into the meatus of the other. In theſe caſes I have directed its paſſage through the affected ear, and to the hand on the other ſide. This is conveniently done by immerſing the hand in a glaſs of water, in which the conducting wire is placed.

"In involuntary actions of the muſcles, I know of no remedy ſo efficacious as galvaniſm. In a contracted ſtate of the fingers, or hands, however violently the latter may be clenched, on the application of this principle for the ſpace of a few minutes, it rarely fails to induce a relaxation. In caſes of cramp, if of long continuance, and even of tetanus, or locked jaw, it has afforded relief in a ſhort ſpace of time. In contractions of the joints, and in all caſes of rigidity, it is found a very advantageous ſtimulus, which will greatly contribute to the reſtoration of motion. In the ſtiffneſs of the joints, occaſioned by the gout, it has come under my obſervation that the ſtimulus of galvaniſm, conjointly with the fleſh-bruſh, has been attended by the happieſt effects.

"Perhaps in no caſe are the advantages of galvaniſm more ſenſibly experienced, than in indolent tumors, or ſcrophulous ſwellings, which have long remained ſtationary. By the influence of this principle, tumors of this kind have in a few days been brought either into a ſtate of ſuppuration or reſolution. Many ſwellings are of ſuch a nature, that their removal by either of theſe means is deſirable. I have frequently applied the galvanic principle with the utmoſt ſucceſs in inguinal tumors, which had reſiſted every other curative intention. The obtuſe aching ſenſation, generally attendant on theſe indolent tumors, is very ſpeedily removed. In ſcrophulous affections of the neck, it has been found very beneficial.

"When the extraordinary influence of the principle of galvaniſm, on the muſcular fibres of dead animals, was firſt obſerved, it was natural to expect that great advantages would reſult from its employment in thoſe particular caſes in which life is not extinguiſhed, but its influence on the animal organization merely ſuſpended. The divided part of an animal, when cut off from the ſources which might be deemed abſolutely requiſite to the ſupport

port of its living energies, ſtill evinces manifeſt ſigns of the exiſtence of a vital principle, when rouſed into action of galvaniſm. Thus the muſcular contractions induced by the influence of a ſmall portion of electricity, were ſtrongly manifeſted in the experiment on the frog, which led Galvani to his important diſcovery. Though the frog, in Galvani's experiment, was at a diſtance from the machine, and not at all connected with it, yet as often as the muſcles were touched with the diſſecting knife, upon a ſpark being drawn from the prime conductor of the electrical machine, the muſcles of the frog were ſet in motion. But Mr. Wilkinſon has placed this fact in a ſtronger point of view, by a very curious experiment on an ox's head, which was thrown into convulſive motions by the influence of ſix galvanic batteries. 'When the head is warm, and has not been long ſeparated from the body of the animal, (ſays this writer,) the convulſive actions are very conſiderable. The eyes open ſpontaneouſly, and the pupils become dilated. The ears and horns move with a conſiderable force; and when the tongue is drawn out, and even ſecured to the table by perforating it with an iron ſkewer which is made to penetrate into the wood more than half an inch, I have frequently obſerved a retraction of that organ, ſo powerful as to detach the ſkewer from the table, and to throw it up into the air, to the diſtance of nearly a yard. When I ſubjected an entire ſheep to the galvanic influence, the motions reſembled the convulſive ſtruggles of animals in an epileptic ſtate, and were much more powerful than the natural actions. The horſes recently killed, which I likewiſe galvanized, required two perſons to reſtrain the motions of each of the legs.'

"When life is merely *ſuſpended*, and the principle of irritability *not deſtroyed*, the ſtimulus of galvaniſm, prudently employed, may rouſe the dormant energies of vitality, and reſtore the ſyſtem to its active ſtate. Fortunately, in moſt caſes of aſphyxia, the principle of irritability is not in any degree leſſened. An animal, whether drowned in water or in hydrogen gas, exhibits nearly the ſame ſymptoms. When expoſed to either of theſe media, the pulſe ſoon becomes weak and frequent; the animal feels at the breaſt an anxiety which it ſtruggles to relieve; and theſe difficulties increaſe until it falls down without ſenſe or motion.

"In caſes of ſuſpended animation, whether from drowning, ſtrangling, or expoſure to noxious gaſes, the body ſhould be diveſted of its clothing, and placed in a warm bed, nearly approaching to the natural temperature. If it can be procured, air, with an increaſed proportion of oxygen, ſhould be introduced into the lungs; and, at the ſame inſtant, very gentle galvanic ſhocks ſhould be paſſed through the body, in ſuch a direction as to influence the heart. By combining this principle with the other uſual means, the moſt advantageous effects may be expected. In the caſe of Forſter, a condemned criminal, five or ſix hours after his execution, ſuch motions were produced by the galvanic apparatus, as to lead the practitioners who were preſent, to ſuppoſe that, at this late period, even a recovery might, by perſeverance, have poſſibly enſued. The general idea that, in caſes of hanging, the vertebræ are diſlocated, is erroneous. Very few inſtances have occurred of any organic derangement; inſomuch, that whether the death be occaſioned by hanging or drowning, the cauſe is merely ſuffocation.

"I have conſtantly entertained a perſuaſion, that complete death takes place from the arteries being emptied of their contents. In the laſt convulſive agonies, thoſe arterial terminations, which do not admit the paſſage of red blood, having loſt their reſiſting power, ſuffer the whole of the blood to be emptied into the venous ſyſtem. In this way the energy of every part of the body is deſtroyed."

Galvanic experiments were very lately made by Mr. Carpue, in the preſence of Dr. Pearſon, and other medical gentlemen, on the body of Michael Carney, a criminal, executed for murder. The principal object was to aſcertain whether galvaniſm, applied immediately to the nerves, could excite action in the internal parts, and particularly thoſe ſubſervient to *reſpiration*. With this view an opening was firſt made into the windpipe, and about three pints of oxygen gas thrown into the lungs; the phrenic nerve was then expoſed to conductors applied to it, and to the inſide of the rectum, the lungs being at the ſame time occaſionally inflated; *yet no action could be excited in the diaphragm*: the nerves do not ſeem to be conductors of the galvanic fluid. Conductors applied to the inſide of the rectum and noſtrils, excited very conſiderable contractions in the right auricle, more than three hours after death; *yet the ventricles were perfectly motionleſs*. Theſe experiments were conducted with perfect accuracy and ſcience; but no new fact appears to have been aſcertained, favourable to the ſtimulus of the reſpirable organ. This reſult ſeems therefore to manifeſt one general and ſerious fact—namely, that when the functions of animal life are annihilated, the active powers and influences of nature, aided even by the moſt ingenious artifice of man, are incompetent to reſtore the action of the lungs, or what is termed *reſpiration*. This experiment indiſputably proves, that how much ſoever electricity might agitate and diſturb *dead matter*, it has no power whatever in the revivification of human life.

ELEC'TRIDES, in ancient geography, iſlands in the Adriatic ſea, which received their name from the quantity of amber (*electrum*) which they produced. They were at the mouth of the Po, according to Apollonius of Rhodes: but ſome hiſtorians doubt of their exiſtence. *Plin. Mela.*

ELECTRI'FEROUS, *adj.* [from the Lat. *electrum*, amber, and *fero*, to bear.] Bearing amber, producing amber.

ELEC'TRINE, *adj.* [from *electrum*, Lat.] Belonging to amber.

ELECTRO'METER, *ſ.* An inſtrument for meaſuring or aſcertaining the ſtrength or intenſity of the electric fluid, whether accumulated by an electrical machine, or generated ſpontaneouſly in the atmoſphere, &c. See the preceding article ELECTRICITY, p. 414–419.

ELECTRO'PHORUS, *ſ.* The moſt ſimple, yet by ſome called *perpetual*, electrical machine. See ELECTRICITY, p. 417.

ELEC'TROSCOPE, *ſ.* An inſtrument conſtructed of very delicate materials, ſo as to be influenced by the ſmalleſt portions of electricity; for inſtance, of fine flaxen or ſilver threads, with or without pith-balls, as invented by Mr. Canton; or ſlips of gold leaf, as firſt contrived by Mr. Bennett. Theſe inſtruments have uſually been termed *electrometers*, but improperly, becauſe they are by no means calculated to meaſure intenſe electricity. They merely ſhew, by their eaſy diſturbance, the preſence of ſmall portions of electricity; as is implied by the word *electroſcope*. For the adoption of this diſtinctive term in electricity, we are indebted to Beccaria.

ELEC'TRUM, *ſ.* [from ἥλεκτος, Gr. the ſun, becauſe of its bright ſhining colour, or from ἕλκω, to draw, becauſe of its magnetic power.] Medical name of amber.

ELEC'TRYON, a king of Argos, ſon of Perſeus and Andromeda. He was brother to Alcæus, and father to Alcmene. He ſent his ſons againſt the Teleboans, who had ravaged his country, and they were all killed except Lycimnius. Upon this, Electryon promiſed his crown and daughter in marriage to him who could undertake to puniſh the Teleboans for the death of his ſons. Amphitryon offered himſelf and ſucceeded. Electryon inadvertently periſhed by the hand of his ſon-in-law. *Apollod.*

ELEC'TUARY, *ſ.* [*electarium*, Lat. *Cælus Aurel.* which is now written *electuary*.] A form of medicine made of conſerves and powders, in the conſiſtence of honey—*Electuaries* made up with honey or ſyrup, when the conſiſtence is too thin, ferment; and when too thick, candy. By both which the ingredients will be altered or impair-

ed. *Quincy.*—We meet with divers *electuaries*, which have no ingredient, except ſugar, common to any two of them. *Boyle.* See PHARMACY.

ELEEMO'SYNA CARUCARUM, or *pro aratris*, or *aratri*, *ſ.* in our ancient cuſtoms, a penny which king Ethelred ordered to be paid for every plough in England, towards the ſupport of the poor. Sometimes it is alſo called *eleemoſyna regis*, becauſe firſt appointed by the king.

ELEEMOSYNA'RIUS, *ſ.* The almoner or officer who received the eleemoſynary gifts and rents, and diſpoſed of them to charitable and pious uſes.

ELEEMO'SYNARY, *adj.* [ελεημοσυνη, Gr.] Living upon alms; depending upon charity. *Not uſed.* Relative to charitable donations.—Which your majeſty muſt entertain in the higheſt degree for thoſe great perſonages, whoſe reſpectable names ſtand upon your *eleemoſynary* liſt. *Cheſterfield.*—The *eleemoſynary* ſort (of corporations) are ſuch as are conſtituted for the perpetual diſtribution of free alms. *Blackſtone.*

ELEEMO'SYNARY, *ſ.* A place in a monaſtery, where the oommon alms were laid up; alſo the almoner's office, to which peculiar rents were allowed.

E'LEGANCE, or ELEGANCY, *ſ.* [*elegantia*, Lat.] Beauty rather ſoothing than ſtriking; beauty without grandeur; the beauty of propriety, not of greatneſs.—St. Auguſtine, out of a kind of *elegancy* in writing, makes ſome difference. *Raleigh.*—Any thing that pleaſes by its nicety. In this ſenſe it has a plural.—My compoſitions in gardening are altogether Pindarick, and run into the beautiful wildneſs of nature, without the nicer *elegancies* of art. *Spectator.*

E'LEGANT, *adj.* [*elegans*, Lat.] Pleaſing by minuter beauties.—Trifles themſelves are *elegant* in him. *Pope.*—There may'ſt thou find ſome *elegant* retreat. *London.*—Nice; not coarſe; not groſs.—Polite with candour; *elegant* with eaſe. *Pope.*

E'LEGANTLY, *adv.* In ſuch a manner as to pleaſe.—Now read with them thoſe organic arts which enable men to diſcourſe and write perſpicuouſly, *elegantly*, and according to the fitteſt ſtile of lofty, mean, or lowly. *Milton.*

In a poem *elegantly* writ,
I will not quarrel with a ſlight miſtake. *Roſcommon.*

Neatly; nicely; with minute beauty; with pleaſing propriety.—Whoever would write *elegantly*, muſt have regard to the different turn and juncture of every period: there muſt be proper diſtances and pauſes. *Pope.*

ELE'GIA, *ſ.* [ελεγεια, Gr. are elegiac verſes, from ελεγος, mourning: but what has that to do with this plant?] In botany, a genus of the claſs dioecia, order triandria, natural order calamariæ, (junci, *Juſſ.*) The generic characters are—I. Male. Calyx: ſpathes within ſpathes, remote, one-valved, coriaceous, lanceolate, deciduous; ſpadix filiform, jointed, with an ament at each joint; ament looſe, with pedicelled florets, diſtinguiſhed by a bracte; bracte briſtle-ſhaped, membranaceous, flat, longer than the florets; perianthium proper, of ſix, briſtle-ſhaped, chaffy, looſe, leaflets. Corolla: none. Stamina: filaments three, very ſhort; antheræ incumbent, oval, larger than the perianthium. II. Female, on a diſtinct individual. Calyx, ſpathe as in the male, but ſhorter; ſpadix as in the male; ament with a compound raceme; perianthium proper, ſix-leaved; valves, the three outer lanceolate, channelled, petaloid, equal; corolla, none; piſtillum, germ ſomewhat oblong; ſtyles three, filiform, the length of the perianthium; ſtigmas ſimple.

Elegia, firſt diſtinguiſhed by Linnæus from the genus reſtio, and afterwards immerſed in it by him, is ſettled by Thunberg to be diſtinct from reſtio, in a diſſertation on that genus. There is, however, but one ſpecies, Elegia juncea: it is a native of the Cape of Good Hope, and has the habit of a ruſh; the ſtems are ſeveral, about a foot high, round, ſmooth, filled, as it were, like thoſe of a ruſh; hard, ſtrong, very ſimple, ſcarcely ſo thick as a quill, with a ſimple joint. There are ſcarcely any leaves, but two or three leafy ſheaths towards the root, imbricated over each other, and of a brown colour; there is alſo a rudiment of a ſimilar ſheath towards the middle of the ſtem; the ſpathe is terminal, and divided into other interior ones, which are alſo compound; the parts of fructification are not very eaſily made out, but are moſt clear in the female flowers.

ELEGI'AC, *adj.* [*elegiacus*, Lat.] Uſed in elegies. Pertaining to elegies. Mournful; ſorrowful:

Let *elegiac* lay the woe relate,
Soft as the breath of diſtant flutes. *Gay.*

ELEGIAM'BIC, *adj.* A ſort of verſe uſed in Horace's Epodes.

ELEGIO'GRAPHER, *ſ.* [*elegiographus*, Lat. ελεγειογραφος, of ελεγεια, and γραφω, Gr. to write.] A writer of elegies.

ELE'GIT, *ſ.* [from the words in the writ, *elegit ſibi liberari*, Lat.] A writ of execution founded on the ſtat. Will. II. c. 13. Edw. I. c. 18. that lies for him who hath recovered debt or damages, or upon a recognizance in any court againſt one not able in his goods to ſatisfy the ſame; directed to the ſheriff, commanding him to make delivery of a moiety of the party's land, and all his goods, beaſts of the plough excepted. And the creditor ſhall hold the ſaid moiety of the land ſo delivered unto him, until his whole debt and damages are paid and ſatisfied; and, during that term, he is tenant by elegit. *Co. Lit.* 289.

Upon an elegit, the ſheriff is to deliver one half of all houſes, lands, meadows, and paſtures, rents, reverſions, and hereditaments, wherein the defendant had any ſole eſtate in fee, or for life, into whoſe hands ſoever the ſame do afterwards come; but not of a right only to land, an annuity, copyhold lands, &c. *Plowd.* 224. And by it the plaintiff, &c. elects *omnia bona & catalla* of the defendant, *præter boves & aſros de caruca ſua*; and alſo a moiety of all the lands which the defendant had at the time of the judgment recovered; but it ought to be ſued within a year and a day after the judgment. *F. N. B.* 267. But though by this ſtatute the lands of the debtor are made liable, as well as his perſonal eſtate, yet if the creditor takes out an elegit, and it appears to the ſheriff that there are goods and chattels ſufficient of the debtor's to ſatisfy the debt, he ought not to extend the lands. 2 *Inſt.* 395. But an elegit executed upon goods only, is not a *fieri facias*, for a *fieri facias* is executed by ſale by the ſheriff; but the elegit by the appraiſement of the goods by a jury, and delivery to the party. 1 *Lev.* 92.

Upon this writ the ſheriff is to impanel a jury, who are to make enquiry of all the goods and chattels of the debtor, and to appraiſe the ſame, and alſo to enquire as to his lands and tenements; and, upon ſuch inquiſition, the ſheriff is to deliver all the goods and chattels, (except the beaſts of the plough,) and a moiety of the lands, to the party, and muſt return his writ, in order to record ſuch inquiſition in that court, out of which the elegit iſſued; and, when the jury have found the ſeiſin and value of the land, the ſheriff, and not the jury, is to ſet out and deliver a moiety thereof to the plaintiff, by metes and bounds. *Cro. Car.* 319.

All writs of execution may be good, though not returned, except an elegit; but that muſt be returned, becauſe an inquiſition is to be taken upon it, and that the court may judge of the ſufficiency thereof. 4 *Rep.* 65. It has been ruled, that if more than a moiety of the lands is delivered on an elegit by the ſheriff, the ſame is void for the whole. 2 *Salk.* 563. And the ſheriff cannot ſell any thing, but what is found in the inquiſition; and, therefore, if he ſell a term for years, &c. miſ-recited in the inquiſition, as to the commencement thereof, the ſale is void. 4 *Rep.* 74.

In debt upon bond, the defendant before the trial conveyed his lands to another, &c. but he himself took the profits; notwithstanding this conveyance, a moiety of his lands was extended on an elegit. *Dyer*, 294. If two persons have each of them a judgment against one debtor, and he who hath the first judgment brings an elegit, and hath the moiety of the lands delivered to him in execution, and then the other judgment creditor sues out another elegit, he shall have only a moiety of that moiety which was not extended by the first judgment. *Cro. Eliz.* 483. When lands are once taken in execution on an elegit, and the writ is returned and filed, the plaintiff shall have no other execution. 1 *Lev.* 92. And if the defendant hath lands in more counties than one, and the plaintiff awards an elegit to one county, and extends the lands upon the elegit, and afterwards files the writ, he cannot, after that, sue out an elegit into the other counties; but he may immediately after entry of the judgment upon the judgment-roll, award as many elegits into as many counties as he thinks fit, and execute all, or any of them, at his pleasure. 1 *Lil. Abr.* 509.

E'LEGY, *s.* [*elegus*, Lat.] A mournful song.—He hangs odes upon hawthorns, and *elegies* upon brambles, all forsooth deifying the name of Rosalind. *Shakespeare.*—A funeral song:

So on Meander's banks, when death is nigh,
The mournful swan sings her own *elegy*. *Dryden.*

A short poem without points or affected elegancies.

ELE'I, a people of Elis in Peloponnesus. They were formerly called *Epei*. In their country was the temple of Jupiter, where also were celebrated the Olympic games, of which they had the superintendance. Their horses were in great repute, hence *Elei equi*, and *Elea palma*. *Lucan.*

ELEI'THIAS, anciently a magnificent city of the Thebais, or Upper Egypt, where are the ruins of a spacious temple, supposed to have been dedicated to Isis. In several compartments of the ruined walls are a great variety of curious paintings, which plainly indicate the hand of a master. Some oxen at plough are represented as harnessed by the horns, and driven by the man who holds the plough; and in another compartment there is a plough drawn by four men, harnessed two and two. The paintings are at this day so perfect, that M. Costaz, who published an account of these antiquities in 1802, declares that the grain scattering from the sower's hand, is plainly seen to be barley, which was employed in making bread long before wheat, which this author supposes was not in common use in Egypt till the reign of Ptolemy Soter. Among all the paintings there is no instrument resembling a harrow; but oxen are seen treading out the corn, exactly as mentioned in Dent. xxv. 4.

ELE'LEUS, a surname of Bacchus, from the word ελελευ, which the Bacchanals loudly repeated during his festivals. *Ovid.*

E'LEMENT, *s.* [*elementum*, Lat.] The first or constituent principle of any thing.—Simple substances are either spirits which have no manner of composition, or the first principles of bodies, usually called *elements*, of which other bodies are compounded. *Watts.*—The four elements, usually so considered, until the late improvements in chemistry, were earth, fire, air, water, of which our world is compounded. When used alone in common speech, *element* commonly means the air.—The king is but a man: the violet smells to him as it doth to me; and the *element* shews to him as it doth to me. *Shakespeare.*—The heavens and the earth will pass away, and the *elements* melt with fervent heat. *Peter.*

The king,
Contending with the fretful *elements*,
Bids the wind blow the earth into the sea,
Or swell the curled waters. *Shakespeare.*

The proper habitation or sphere of any thing; as water of fish.—They shew that they are out of their *element*, and that logic is none of their talent. *Baker.*—An ingredient; a constituent part:

Who set the body and the limbs
Of this great sport together, as you guess?
——One sure that promises no *element*
In such a business. *Shakespeare.*

The letters of any language. The lowest or first rudiments of literature or science.—With religion it fareth as with other sciences; the first delivery of the *elements* thereof must, for like consideration, be framed according to the weak and slender capacity of young beginners, *Hooker.*—We, when we were children, were in bondage under the *elements* of the world. *Gal.* iv. 3.

Democritus stands at the head of the elementary philosophers, in which he is followed by Epicurus, and many others after them of the Epicurean and corpuscular philosophers. Among those who hold the elements corruptible, some will have only one, and some several. Of the former, the principal are, Heraclitus who held fire, Anaximenes air, Thales Milesius water, and Hesiod earth, as the only element. Hesiod is followed by Bernardin, Telesius; and Thales by many of the ancient chemists. Among those who admit several corruptible elements, the principal are the Peripatetics; who, after their leader Aristotle, contend for four elements, viz. fire, air, water, and earth. Aristotle took the notion from Hippocrates; Hippocrates from Pythagoras; and Pythagoras from Ocellus Lucanus, who, it seems, was the first author of it. The Cartesians admit only three elements, fire, air, and earth. See CARTESIAN PHILOSOPHY.—Sir Isaac Newton observes, that it seems probable that God, in the begining, formed matter in solid, massive, hard, impenetrable, moveable, particles, of such sizes and figures, as most conduced to the end for which he formed them; and that these primitive particles, being solids, are incomparably harder than any porous body compounded of them; even so hard as never to wear out; no ordinary power being able to divide what God made one in the first creation. While the particles remain entire, they may compose bodies of one and the same nature and texture in all ages; but should they wear away, or break in pieces, the nature of things, depending on them, would be changed; water and earth, composed of old worn particles, and fragments of particles, would not be of the same nature and texture now, with water and earth composed of entire particles in the beginning. And, therefore, that things may be lasting, the changes of corporeal things are to be placed only in the various separations, and new associations and motions, of those permanent particles; compound bodies being apt to break, not in the midst of solid particles, but where those particles are laid together, and only touch in a few points. It seems to him, likewise, that these particles have not only a *vis inertiæ*, with the passive laws of motion thence resulting, but are also moved by certain active principles; such as gravity, and the cause of fermentation, and the cohesion of bodies.

To E'LEMENT, *v. a.* To compound of elements.—Whether any one such body be met with, in those said to be *elemented* bodies, I now question. *Boyle.*—To constitute; to make as a first principle:

Dull sublunary lover's love,
Whose soul is sense, cannot admit
Of absense, 'cause it doth remove
The thing which *elemented* it. *Donne.*

ELEMEN'TAL, *adj.* Produced by some of the elements:

Soft yielding minds to water glide away,
And sip with nymphs their *elemental* tea. *Pope.*

Arising from first principles.—Leeches are by some accounted poison, not properly, that is by temperamental contrariety, occult form, or so much as *elemental* repugnancy;

nancy; but inwardly taken, they faſten upon the veins, and occaſion an effuſion of blood. *Brown.*

ELEMENTA'RITY, or ELEMEN'TARINESS, *ſ.* Containing rudiments or firſt principles; the ſimplicity of nature, or abſence of compoſition; being uncompounded.—A very large claſs of creatures in the earth, far above the condition of *elementarity*. *Brown*,

ELEMEN'TARY, *adj.* Uncompounded; having only one principle or conſtituent part.—The *elementary* ſalts of animals are not the ſame as they appear by diſtillation. *Arbuthnot.*—Initial; rudimental.—It is probable, that before the time of Ariſtotle there were *elementary* treatiſes of geometry, which are now loſt. *Reid.*

ELEMEN'TATED, *adj.* Made up of the elements, compoſed of the elements. *Not much uſed. Scott.*

ELE'MI, or ELEMNI, *ſ.* called *gum-elemi*, a dry reſinous ſubſtance, brought from the Eaſt Indies and Ethiopia; an inferior ſort is the produce of a ſpecies of olive-tree in the Spaniſh Weſt Indies; the *amyris ſelemifera. Linn.* The elemi tree is alſo called *myrobalanus Zeylanicus*; *elemnifera curaſſavica arbor*; *kækuria.* What we have from the eaſt is wrapped in flag-leaves; is ſoftiſh, ſomewhat tranſparent; of a pale whitiſh yellow colour, inclining to green; inflammable, and of an agreeable flavour when melting; to the taſte it is bitteriſh; it diſſolves totally in rectified ſpirit of wine; by diſtillation with water, about one ounce of eſſential oil is obtained from ſixteen of the gum.

ELEMI'FERA, *ſ.* in botany. See AMYRIS.

ELEN'CH, or ELENCHUS, *ſ.* [*elenchus*, Lat. from ελεγχος, Gr.] In antiquity, a kind of ear-rings ſet with large pearls. In logic, a vicious or fallacious argument, which deceives under the guiſe of truth; the ſame with what is now called *ſophiſm.*—Diſcover the fallacies of our common adverſary, that old ſophiſter, who puts the moſt abuſive *elench* on us. *Decay of Piety.*

ELENC'TICAL, *adj.* [*elencticus*, Lat. of ελεγκτικος, of ελεγχω, Gr. to refute.] That ſerves to convince or confute.

ELEN'GI; *ſ.* in botany. See MIMUSOPS.

E'LENT, a town of Germany, in the archduchy of Auſtria: ſix miles north-north-weſt of Brugg.

ELEOSAC'CHARUM, *ſ.* [of ελαιον, Gr. oil, and *ſaccarum*, Lat. ſugar.] A mixture of oil and ſugar together, which is uſed with the diſtilled oils, to make them mix with aqueous fluids for preſent uſe.

ELEOSELI'NUM, *ſ.* in botany. See APIUM.

E'LEOTS, *ſ.* Some name the apples in requeſt in the cyder countries ſo; not known by that name in ſeveral parts of England. *Mortimer.*

E'LEPH, a city of Paleſtine, ſituated in the tribe of Benjamin. *Joſh.* xviii. 28.

E'LEPHANT, *ſ.* [*elephas*, Lat.] The largeſt of all quadrupeds, for whoſe ſagacity, faithfulneſs, prudence, and even underſtanding, ſee the article ELEPHAS.

The *elephant* hath joints, but not for courteſy;
His legs are for neceſſity, not flexure. *Shakeſpeare.*

Ivory; the teeth of elephants:

High o'er the gate, in *elephant* and gold,
The crowd ſhall Cæſar's Indian war behold. *Dryden.*

E'LEPHANT (knights of), *ſ.* An order of knighthood in Denmark, conferred upon perſons of quality and merit. It is alſo called *the order of St. Mary.* Its inſtitution is ſaid to have been owing to an officer among the Daniſh croiſes having killed an elephant, in an expedition againſt the Saracens, in 1184; in memory of which king Canutus inſtituted this order, the badge of which is a towered elephant, with an image of the Virgin Mary encircled with rays, and hung on a blue ribbon, like the George in England.

E'LEPHANT MOUNTAIN, a mountain on the ſouth-eaſt coaſt of the iſland of Ceylon: ſeventy-four miles ſouth-eaſt of Candy.

E'LEPHANT'S FOOT. See ELEPHANTOPUS.

ELEPHAN'TA, a ſmall iſland in the Indian Sea, on the weſtern coaſt of Hindooſtan, about five miles from Bombay, ceded to the Engliſh by the Mahrattas. Its proper name is *Gali Pouri*; but the Portugueſe, while in their poſſeſſion, gave it the name of *Elephanta*, from the figure of an elephant, as large as life, coarſely, but correctly, ſculptured out of very hard and durable black ſtone, ſtanding on a platform near the landing-place, at the foot of a mountain. In the interior of the iſland is a moſt curious Hindoo temple, cut or mined in the ſolid rock, and decorated with images of the ancient Brahmin idol worſhip; for particulars of which, ſee the article HINDOOSTAN.

ELEPHANTIA'SIS, *ſ.* [from ελεφας, Gr. the elephant.] A horrible cutaneous diſorder, in which the legs grow ſcaly, rough, and wonderfully large, like the legs of an elephant.

ELEPHANTI'NA, or ELEPHAN'TINE, a beautiful iſland of the Nile, famous for the ruins of an ancient temple; ſituated near Syene, at the ſouthern extremity of Upper Egypt, and forming part of the falls or cataracts which terminate the navigation of the Nile in Egypt. See p. 353, of this volume.

ELEPHAN'TINE, *adj.* [*elephantinus*, Lat.] Pertaining to the elephant. In Roman antiquity, it was an appellation given to the books wherein were regiſtered the tranſactions of the ſenate and magiſtrates of Rome, of the emperors or generals of armies, and of the provincial magiſtrates; the births and claſſes of the people, and other things relating to the cenſus. They were ſo called, as being made of leaves of ivory or elephants tuſks.

ELEPHAN'TIS, a poeteſs who wrote laſcivious verſes. *Martial.*—A princeſs by whom Danaus had two daughters. *Apollod.*—An iſland in the river Nile, in Upper Egypt; with a town of the ſame name, called *Elephantina. Strabo.*

ELEPHANTO'MACHI. See ETHIOPIA.

ELEPHAN'TOPUS, *ſ.* ELEPHANT'S FOOT; [ſo named by Vaillant, from the ſhape of the lower leaves in the firſt ſpecies.] In botany, a genus of the claſs ſyngeneſia, order polygamia ſegregata, natural order of compoſitæ capitatæ, (corymbiferæ, *Juſſ.*) The generic characters are—Calyx: involucre of three broad, ſharp, leaflets, many-flowered, large, permanent, without an umbel; perianthium partial, four-flowered, oblong, imbricate; ſcales lance-ſubulate, mucronate, upright, of which the four longer are equal. Corolla: compound tubular; corollets hermaphrodite, five or four, equal, diſpoſed in a ſingle circle; proper one-petalled, tubular; border narrow, five-parted, nearly equal. Stamina: filaments five, capillary, very ſhort; antheræ cylindric, tubular. Piſtillum: germ ovate, crowned; ſtyle filiform, length of the ſtamens; ſtigmas two, ſlender, ſpreading. Pericarpium: none; calyx unchanged. Seeds: ſolitary, compreſſed; down briſtle-form. Receptaculum: naked.—*Eſſential Character.* Calyx, four-flowered; corolla tubular, hermaphrodite; receptaculum naked; down briſtle-form.

Species. 1. Elephantopus ſcaber, or rough-leaved elephant's foot: leaves oblong, ſcabrous. This ſends out from a perennial root many oblong rough leaves, which ſpread near the ground; between theſe, in the ſpring, ariſes a branching ſtalk, little more than a foot high. The ſide-branches are ſhort, and generally terminated by two heads of flowers, each on a ſhort peduncle. The florets are of a pale purple colour. Dillenius deſcribes it more particularly: height commonly eighteen inches or two feet; ſtem rigid, round, and hairy, the thickneſs of the little finger at the bottom; leaves embracing, much wrinkled, hirſute, with hairs over the whole ſurface, ſerrate, but the ſerrature frequently not very conſpicuous, becauſe the leaves are ſo much wrinkled and bent. From the axils of theſe, towards the top, ſpring forth the flowering branches, terminated by leafy heads collected in bundles; each having two or three leaves under it,

inſtead

inſtead of a common calyx; in the boſom of theſe is the flower, the proper calyx of which conſiſts of many narrow, ſharp-pointed, pungent, ſcales, and contains three, four, or five, florets, very pale purple, tubular, commonly divided into five narrow ſegments. Seeds cylindric-compreſſed, crowned with dry white ſegments inſtead of a pappus. According to Browne, it riſes generally from half a foot to three or four feet in height; and is generally adorned with a great number of flowers, gathered into pretty large heads, at the extremities of the branches. The ſeeds are of an oblong form, each crowned with five little briſtles. The common peduncles are very long, and terminate the branches; but, at the ſeparations of them, there is always a ſmaller head growing to the ſtem, without any ſupporter. It is ſuppoſed to be a native of both Indies; Mr. Miller received it from ſeveral parts of America. Browne ſays, it is frequent enough on the north ſide of the iſland of Jamaica. Vaillant gave this plant the name of *elephantopus*, becauſe he took it to be the ſame with the *ana ſchovadi* of the Hortus Malabaricus, which ſignifies the foot-ſtep of an elephant. The accurate Dillenius, however, is doubtful of this; and, perhaps, after all, the Eaſt-Indian and Weſt-Indian plants may be different ſpecies. This is a perennial plant, and flowers at the end of ſummer, and beginning of autumn; but rarely produces ſeeds in England. It was cultivated in the botanic garden at Chelſea in 1695. Browne ſays, that it is accounted a good vulnerary, and much uſed in conſumptive caſes in the Eaſt Indies. The leaves are frequently uſed, inſtead of carduus benedictus, among the inhabitants of the French Weſt-India iſlands.

2. Elephantopus tomentoſus, or woolly-leaved elephant's foot: leaves ovate, tomentoſe. Root-leaves four inches long and three broad, having many tranſverſe nerves; they ſpread flat on the ground, and from among them riſes a ſtiff ſtalk, about a foot high, dividing into ſeveral branches, and terminated by two flowers, which make little appearance; they come out in July, but the ſeeds never ripen in this country. It grows naturally in South Carolina; and frequently comes up as a weed in earth ſent over thence with other plants. Linnæus remarks, that it is very nearly allied to the preceding.

3. Elephantopus ſpicatus, or ſpike-flowered elephant's foot: leaves ovate-lanceolate, ſerrate, ſcabrous; bundles of flowers ſeſſile, lateral; ſtem branched. This generally riſes to the height of fifteen or twenty inches, ſometimes more. At firſt coming up it has many leaves, five inches long, and an inch and a half broad where broadeſt; beginning very narrow, they continue ſo for two inches, and end in a round point; they are hard, ſmooth, dark-green, and indented about the edges. From among theſe a round, ſtrong, green, ſtalk riſes, four feet high, with an embracing leaf at each joint; it has branches towards the top, ſtanding round at every joint, divided into others, which are beſet with ſmaller leaves; from the axils of theſe come out the flowers, without any peduncle, ſtanding in ſeveral green leaves; the corollets are white. Linnæus has called the corollets *ligulate*, whereas they are plainly tubular, equally and deeply five-cleft; he was, perhaps, led into the miſtake, from the two outmoſt ſegments being ſometimes glued together. Native of Jamaica, Hiſpaniola, and Guiana.

4. Elephantopus anguſtifolius, or rough-leaved elephant's foot: ſtem-leaves linear-lanceolate entire, villoſe; flowers glomerate, in ſeſſile and peduncled bundles; ſtem ſimple. Native of Jamaica: Sloane found it about Mount Diablo very plentifully.

Propagation and Culture. Theſe plants are propagated by ſeeds, which ſhould be ſown on a hot-bed in the ſpring; and, when the plants are come up, they muſt be tranſplanted into pots filled with freſh light earth, and plunged into a hot-bed of tanners' bark, obſerving to water and ſhade them until they have taken root; then you ſhould let them have a large ſhare of freſh air in warm weather, and they will require to be frequently refreſhed with water. The firſt, having a perennial root, if it is planted in a pot, and ſheltered in the winter from froſt, may be preſerved ſeveral years, and will annually flower; but the ſecond ſort ſeldom continues longer than two years.

E'LEPHAS, *ſ.* [ελεφας, Gr. אלף *eleph*, Heb.] The ELEPHANT; in zoology, a genus of quadrupeds belonging to the order of bruta. The characters are theſe: it has no *foreteeth* in either jaw, and the tuſks are very long; probocis or trunk long and prehenſile; body ſomewhat naked. Linnæus deſcribes this animal as follows: "The mighty elephant inhabits the torrid zone in Aſia and Africa, in ſwampy places, and by the ſides of rivers; feeds on the leaves and branches of young trees, particularly plantains, eating even the wood; devours grain voraciouſly; is gregarious, docile, long-lived, ſagacious, though the brain is ſmall; proboſcis long, extenſile, contractile, furniſhed at the end with a hook, ſerving the purpoſe of a hand, with which it takes its food and drink, and which being cut off, the animal dies; is afraid of mice, leſt when aſleep they ſhould creep into the trachea; urines backwards; copulates like other quadrupeds; the female is gravid a year; the young ſuck the mother with the lips; carries a turret on its back, its guider ſitting upon the neck; moves quickly; ſwims dexterouſly: is armed for war by the Indians, and was formerly by the Romans, with ſcythes. It is the largeſt of all known quadrupeds, ſometimes weighing 4500 pounds; body cinereous, ſometimes reddiſh or white, thinly ſet with hairs; proboſcis flat beneath, tip truncate; eyes ſmall; tuſks, which are only in the upper jaw, far extended beyond the mouth, reſemble horns, marked with curled fibres; theſe are the ivory of the ſhops, and ſometimes weigh 150 pounds each; ears large, pendulous, dentate; ſkin thick, callous, almoſt impenetrable by muſket-balls, and yet ſenſible of the ſting of flies; teats two, near the breaſt; knees flexible; neck ſhort; hoofs five on each fore-foot, four on each hind-foot." The admeaſurements of different naturaliſts have aſcertained the largeſt elephant hitherto known, to be as follows: from the front to the origin of the tail, ſixteen feet long; from the end of the trunk twenty-five feet, and about fourteen feet high. The circumference of the neck ſeventeen feet, and the circumference of the body at the groſſeſt part twenty-five feet; the tail about ſix feet long, and two and a half in circumference. The circumference of the legs about ſix feet. Theſe are the dimenſions of the largeſt ever meaſured. But the animal differs in ſize in different countries. The muzzle is very different from that of any other quadruped; it is nothing but the origin of its long trunk which hangs between the two large tuſks; the mouth appears behind the trunk, which ſerves in place of an upper lip, and the under lip terminates in a point. The trunk readily performs all the functions of a ſtrong and dexterous arm; it is about eight feet long, five feet and a half in circumference near the mouth, and one foot and a half near the extremity: it is a pipe of an irregular conical figure, and widened at the end: the ſuperior ſide of the trunk is convex, and furrowed tranſverſely; and the inferior ſide is flat, and has two longitudinal rows of ſmall protuberances reſembling the tentacula of the ſilk-worm. The upper part of the trunk correſponds with the extremity of the noſe in other quadrupeds, and anſwers the ſame intention; the inferior part ſerves as an upper lip, including the noſtrils at the ſame time. For the trunk is a continued canal, divided into two cavities by a longitudinal partition: theſe cavities aſcend along the forepart of the upper jaw, where they make a turn inward, and deſcend into the palate, and then terminate in two ſeparate orifices; they have likewiſe each a ſeparate orifice at the end of the trunk. At the place where theſe cavities make a turn, and before they enter into the bones of the head, there is a moveable cartilaginous plate ſituated in ſuch a manner as enables the animal to ſhut the canal, and to prevent the water with which

which it occaſionally fills the trunk from entering into the paſſage of the noſe, where the organs ſerving for the ſenſation of ſmell are placed. The elephant can move the trunk in all directions; he can extend or ſhorten it at pleaſure, without altering the diameters of the two canals within. By this means reſpiration is not interrupted, whatever be the ſituation of the trunk; and the water is allowed to remain till the animal chooſes to throw it out by an exſpiration. Each canal is lined with a ſmooth ſtrong membrane, and the ſurface of the trunk is covered with another ſtrong membrane or ſkin. The ſubſtance contained between the exterior and interior membranes, is a compoſition of longitudinal and tranſverſe muſcles, which ſerve to extend and contract the length of the trunk. At the extremity there is a concave protuberance, in the bottom of which are the two paſſages of the noſtrils. The inferior part of the protuberance is thicker than the ſides, and the ſuperior part is ſtretched out like a finger about five inches long; which, together with the edges of the whole extremity of the trunk, aſſumes different figures according to the neceſſities of the animal. It is by this organ that the animal lays hold of food or other ſubſtances; which he manages with as much dexterity as a man does his hand, taking up grains of corn, or the ſmalleſt blades of graſs, and conveying them to his mouth. When he drinks, he thruſts his trunk into the water, and fills it by drawing in his breath and exhauſting the air: when the trunk is thus filled with water, he can either throw it out to a great diſtance, or drink it by putting the end of the trunk in his mouth. The longevity of the elephant, though not well aſcertained, is nevertheleſs aſſerted to be of very conſiderable duration. It is ſaid that ſome have lived in a domeſtic ſtate upwards of one hundred and thirty years; and in a ſtate of nature they are ſuppoſed to live upwards of two hundred years, and to be capable of propagating their ſpecies until they are one hundred and twenty years old. No quadruped beſides the elephant is furniſhed with a trunk; though the proboſces of the tapiir and great ant-eater approach ſomewhat towards it. In the inſect tribes, however, great numbers are diſtinguiſhed by this conformation.

The elephants of Aſia and of Africa, appear to be two very diſtinct ſpecies; and have been noticed and deſcribed as ſuch by ſeveral modern writers. The Aſiatic elephants are divided by the natives of Bengal into two caſts, the *koomareah*, and the *merghee*; without any regard to the appearance, ſhape, or ſize, of the tuſks; as theſe circumſtances ſerve merely to characterize ſome varieties, as well as the difference of ſex or age. The koomareah caſt is a deep-bodied, ſtrong, compact, elephant, with a large trunk, legs ſhort, but thick in proportion to the ſize of the animal. The merghee caſt, when full grown, is taller than the former, but has not ſo compact a form, nor is he ſo ſtrong, or ſo capable of bearing fatigue; his legs are long, he travels faſt, has a lighter body, and his trunk is both ſhort and ſlender, in proportion to his height. A large trunk is always eſteemed a great beauty in an elephant; ſo that the koomareah is preferred, not only for this, but for its ſuperior ſtrength, by which it can undergo greater fatigue, and carry heavier loads than the merghee. As there appears, however, no predilection in any of theſe elephants to have connection with his own particular kind, from an indiſcriminate intercourſe ſeveral varieties are produced, partaking of the qualities of their reſpective progenitors. This mixed breed is in greater or leſs eſtimation, in proportion as it partakes of the qualities of the koomareah, or merghee, caſt.

Of the African breed of elephants we have the following account in Park's Travels: "Elephants are very numerous in the interior of Africa, and appear to be a diſtinct ſpecies from thoſe found in Aſia. Blumenback, in his figures of objects of natural hiſtory, has given good drawings of a grinder of each; and the variation is evident. M. Cuvier alſo has given, in the Magazin Encyclopedique, a clear account of the difference between them. As I never examined the Aſiatic elephant, I have choſen rather to refer to thoſe writers, than advance this as an opinion of my own. It has been ſaid, that the African elephant is of a leſs docile nature than the Aſiatic, and incapable of being tamed. The negroes certainly do not at preſent tame them; but when we conſider that the Carthaginians had always tame elephants in their armies, and actually tranſported ſome of them to Italy in the courſe of the Punic wars; it ſeems more likely that they ſhould have poſſeſſed the art of taming their own elephants, than have ſubmitted to the expence of bringing ſuch vaſt animals from Aſia. Perhaps, the barbarous practice of hunting the African elephants for the ſake of their teeth, has rendered them more untractable and ſavage, than they were found to be in former times.

"The greater part of the ivory which is ſold on the Gambia and Senegal rivers, is brought from the interior country. The lands towards the coaſt are too ſwampy, and too much interſected with creeks and rivers, for ſo bulky an animal as the elephant to travel through, without being diſcovered; and when once the natives diſcern the marks of his feet in the earth, the whole village is up in arms. The thoughts of feaſting on his fleſh, making ſandals of his hide, and ſelling the teeth to the Europeans, inſpire every one with courage; and the animal ſeldom eſcapes from his purſuers; but in the plains of Bambarra and Kaarta, and the extenſive wild of Jallonkadoo, the elephants are very numerous; and, from the great ſcarcity of gunpowder in thoſe diſtricts, they are leſs annoyed by the natives. Scattered teeth are frequently picked up in the woods, and travellers are very diligent in looking for them. It is a common practice with the elephant, to thruſt his tuſks under the roots of ſuch ſhrubs and buſhes as grow in the more dry and elevated parts of the country, where the ſoil is ſhallow. Theſe buſhes he eaſily overturns, and feeds on the roots, which are, in general, more tender and juicy than the hard woody branches, or the foliage; but when the teeth are partly decayed by age, and the roots more firmly fixed, the great exertions of the animal, in this practice, frequently cauſes them to break or fall off.

"There are certain ſeaſons of the year, when the elephants collect into large herds, and traverſe the country in queſt of food or water; and as all that part of the country, to the north of the Niger, is deſtitute of rivers, whenever the pools in the woods are dried up, the elephants approach towards the banks of that river. Here they continue until the commencement of the rainy ſeaſon, in the months of June or July; and, during this time, they are much hunted by ſuch of the Bambarrans as have gunpowder to ſpare. The elephant hunters ſeldom go out ſingly; a party of four or five join together; and, having each furniſhed himſelf with powder and ball, and a quantity of corn-meal in a leather bag, ſufficient for five or ſix days proviſion, they enter the moſt unfrequented parts of the wood, and examine with great care every thing that can lead to the diſcovery of the elephants. In this purſuit, notwithſtanding the bulk of the animal, very great nicety of obſervation is required. The broken branches, the ſcattered dung of the animal, and the marks of his feet, are carefully inſpected; and many of the hunters have, by experience and obſervation, become ſo expert in their ſearch, that as ſoon as they obſerve the foot-marks of an elephant, they will tell almoſt to a certainty at what time it paſſed, and at what diſtance it will be found. When they diſcover a herd of elephants, they follow them at a diſtance, until they perceive ſome one ſtray from the reſt, and come into ſuch a ſituation as to be fired at with advantage. The hunters then approach with great caution, creeping amongſt the long graſs, until they have got near enough to be ſure of their aim. They then diſcharge all their pieces at once, and throw themſelves on their faces among the graſs. The wounded elephant immediately applies his trunk to the different

wounds; but being unable to extract the ball, and seeing nobody near him, he becomes quite furious, and runs about amongst the bushes, until, by fatigue and loss of blood, he has exhausted himself, and affords the hunters an opportunity of firing a second time at him, by which he is generally brought to the ground. The skin is now taken off, and extended with pegs, to dry; and such parts of the flesh as are most esteemed are cut up into thin slices, and dried in the sun, to serve for provisions on some future occasions. The teeth are struck out with a light hatchet, which the hunters always carry along with with them; not only for that purpose, but also to enable them to cut down such trees as contain honey; for, though they carry with them only five or six days provisions, they will remain in the woods for months, if they are successful; and support themselves upon the flesh of such elephants as they kill, and wild honey."

Mr. Browne, too, in his travels through part of the interior of Africa to the kingdom of Fur, informs us that "the elephant is seen, in the places he frequents, in large herds of four or five hundred. The natives hunt him on horseback, having singled out a straggler from the herd; or aim at him with spears from the trees; or make pits into which he falls. The African elephant is smaller than the Asiatic, and probably a different species. The flesh is an article of food in great esteem with them; and the fat forms a valuable unguent."

The method of taking wild elephants in the East-Indies, is thus related by John Corse, esq. first published in the third volume of the Asiatic Researches. "In the month of November, when the weather has become cool, and the swamps and marshes, formed by the rains in the five preceding months, are lessened, and some of them dried up, a number of people are employed to go in quest of elephants. At this season the males come from the recesses of the forest, into the outskirts, whence they make nocturnal excursions into the plains in search of food, and where they often destroy the labours of the husbandman, by devouring and trampling down the rice, sugar-canes, &c. A herd of elephants, from what I can learn, has never been seen to leave the woods: some of the largest males often stray to a distance, but the young ones always remain in the forest under the protection of the *palmai*, or leader of the herd, and of the larger elephants. The *goondahs*, or large males, come out singly, or in small parties, sometimes in the morning, but commonly in the evening, and they continue to feed all night upon the long grass, that grows amidst the swamps and marshes, and of which they are extremely fond. As often, however, as they have an opportunity, they commit depredations on the rice-fields, sugar-canes, and plantain-trees, which oblige the farmers to keep regular watch, under a small cover, erected on the tops of a few long bamboos, about fourteen feet from the ground: and this precaution is necessary to protect them from the tigers, with which this province abounds. From this lofty station the alarm is soon communicated from one watchman to another, and to the neighbouring villages, by means of a rattle with which each is provided. With their shouts and cries, and noise of the ratties, the elephants are generally scared, and retire. It sometimes, however, happens, that the males advance even to the villages, overturn the houses, and kill those who unfortunately come in their way; unless they have had time to light a number of fires: this element seems to be the most dreaded by wild elephants, and a few lighted whisps of straw or dried grass, seldom fail to stop their progress. To secure one of the males, a very different method is employed from that which is taken to secure a herd: the former is taken by *koomkees*, or female elephants trained for the purpose; whereas the latter is driven into a strong enclosure, called a *keddah*.

"As the hunters know the places where the elephants come to feed, they advance towards them in the evening with four koomkees, the number allotted to each hunting party. When the nights are dark, the male elephants are discovered by the noise they make in cleaning their food, by whisking and striking it against their fore-legs; but by moon-light they can be seen distinctly at some distance. As soon as they have determined on the goondah they mean to secure, three of the koomkees are conducted slowly by their *mahotes* (drivers), at a moderate distance from each other, near to the place where he is feeding; the koomkees advance very cautiously, feeding as they go along, and appear like wild elephants, that had strayed from the jungle or forest. When the male perceives them approaching, if he takes the alarm and is viciously inclined, he beats the ground with his trunk, showing marks of displeasure, and that he will not allow them to approach nearer: if they persist, he will attack and gore them with his tusks: for which reason they take care to retreat in good time. But should he be amorously disposed, which is generally the case, he allows the females to approach, and sometimes he even advances to meet them.

"When from these appearances the mahotes judge that he will become their prize, they conduct two of the females, one on each side close to him, and make them advance backwards, and press gently with their posteriors against his neck and shoulders: the third female then comes up and places herself directly across his tail; in this situation, so far from suspecting any design, he begins to toy with the females, and caress them with his trunk. While thus engaged, the fourth female is brought near, with ropes and proper assistants, who get under the belly of the third female, and put a slight cord (the *chilkah*), round his hind legs; should he move, it is easily broken, in which case, if he takes no notice of this slight confinement, nor appears suspicious of what was going forward, the hunters then proceed to tie his legs with a strong cord (called *bundah*), which is passed alternately, by means of a forked stick, and a kind of hook, from one leg to the other, forming the figure 8; and as these ropes are short, for the convenience of being more readily put around his legs, six or eight are generally employed, and they are made fast by another cord, (the *dagbearee*,) which is passed a few turns perpendicularly between his legs, where the folds of the bundahs intersect each other. A strong cable, (the *phand*,) with a running noose, sixty cubits long, is next put round each hind leg immediately above the bundahs, and again above them, six or eight additional bundahs, according to the size of the elephant, are made fast, in the same manner as the others were: the putting on these ropes generally takes up about twenty minutes, during which the utmost silence is observed, and the mahotes, who keep flat upon the necks of the females, are covered with dark-coloured cloths, which serve to keep them warm, and at the same time do not attract the notice of the elephant. While the people are thus employed in tying the legs of the goondah, he caresses sometimes one, and sometimes another, of the seducers, *kootnee*, by which his desires are excited, and his attention diverted from the hunters; and in these amorous dalliances he is indulged by the females. But if his passions should be so roused, before his legs are properly secured, as to induce him to attempt leaping on one of the females, the mahote, to insure his own safety, and prevent him gratifying his desires any farther, makes the female run away, and, at the same time, by raising his voice and making a noise, he deters the goondah from pursuing; this however happens very seldom; for he is so secured by the pressure of a koomkee on each side, and one behind, that he can neither turn himself, nor see any of the people, who always keep snug under the belly of the third female that stands across his tail, and which serves both to keep him steady, and to prevent his kicking the people who are employed in securing him; but in general he is so much taken up with his decoyers, as to attend very little to any thing else. In case of accidents, however, should the goondah break loose, the people upon the first

alarm can always mount on the backs of the tame elephants, by a rope that hangs ready for the purpoſe, and thus get out of his reach. When his hind legs are properly ſecured, they leave him to himſelf, and retire to a ſmall diſtance: as ſoon as the koomkees leave him, he attempts to follow, but finding his legs tied, he is rouſed to a ſenſe of his ſituation, and retreats towards the jungle or foreſt; the mahotes follow at a moderate diſtance, on the tame elephants, accompanied by a number of people, who, as ſoon as the goondah paſſes near a tree, make a few turns of the phands, or long cables, that are trailing behind him, around its trunk; his progreſs being thus ſtopt, he becomes furious, and exerts his utmoſt force to diſengage himſelf, nor will he then allow any of the koomkees to come near him, but is outrageous for ſome time, falling down and goring the earth with his tuſks. If by theſe exertions the phands are broken, which ſometimes is effected, and he eſcapes into the thick jungle, the mahotes dare not advance for fear of the other wild elephants, and are therefore obliged to leave him to his fate; and in this hampered ſituation, it is ſaid, he is ungenerouſly attacked by the other wild elephants.

"As the cables are very ſtrong and ſeldom give way, when he has exhauſted himſelf by his exertions, the koomkees are again brought near, and take their former poſitions, viz. one on each ſide, and the other behind. After getting him nearer the tree, the people carry the ends of the long cables around his legs, then back and about the trunk of the tree, making, if they can, two or three turns, ſo as to prevent even the poſſibility of his eſcape. For ſtill farther ſecurity, as well as to confine him from moving to either ſide, his fore-legs are tied exactly in the ſame manner as the hind-legs were, and the phands are made faſt to trees or ſtakes driven deep into the earth. During the proceſs of tying both the hind and fore legs, the fourth koomkee gives aſſiſtance where neceſſary, and the people employed cautiouſly avoid going within reach of his trunk; and when he attempts to ſeize them, they retreat to the oppoſite ſide of the koomkees, and get on them, if neceſſary, by means of the rope above-mentioned, which hangs ready for them to lay hold of. Although, by theſe means, he is perfectly ſecured and cannot eſcape, yet as it would be both unſafe and inconvenient to allow him to remain in the verge of the jungle, a number of additional ropes are afterwards put on, for the purpoſe of conducting him to a proper ſtation. When the goondah has become more ſettled, and ate a little food with which he is ſupplied as ſoon as he is taken, the koomkees are again brought near, and a ſtrong rope, *phara*, is then put twice round his body like a girth, and tied behind his ſhoulder; then the long end is carried back cloſe to his rump and there faſtened, after a couple of turns more have been made round his body. Another cord is next faſtened to the phara, and from thence carried under his tail like a crupper (*dooblah*), and brought forward and faſtened by a turn or two, to each of the pharas, or girths, by which the whole is connected, and each turn of theſe cords ſerves to keep the reſt in their places. After this, a ſtrong rope (the *tooman*) is put round his buttocks, and made faſt on each ſide to the girth and crupper, ſo as to confine the motion of his thighs, and prevent his taking a full ſtep. Theſe ſmaller ropes being properly adjuſted, a couple of large cables (the *dools*), with running nooſes, are put round his neck, and after being drawn moderately tight, the nooſes are ſecured from running cloſer, and then tied to the ropes on each ſide forming the girth and crupper already mentioned; and thus all theſe ropes are connected and kept in their proper places, without any riſk of the nooſes of the dools becoming tight, ſo as to endanger the life of the elephant, in his exertions to free himſelf. The ends of theſe cables are made faſt to two koomkees, one on each ſide of the goondah, by a couple of turns round the belly, cloſe to the ſhoulder, like a girth, where a turn is made, and it is then carried acroſs the cheſt and faſtened to the girth on the oppoſite ſide. Every thing being now ready, and a paſſage cleared from the jungle or wood, all the ropes are taken from his legs, and only the tooman remains round his buttocks to confine the motion of his hind legs: the koomkees pull him forward by the dools, and the people from behind urge him on. Inſtead of advancing in the direction they wiſh, he attempts to retreat farther into the jungle, he exerts all his force, falls down and tears the earth with his tuſks, ſcreaming and groaning; and by his violent exertions often bruiſes himſelf very much, and inſtances happen of their ſurviving theſe violent exertions only a few hours, or at moſt a few days. In general, however, they ſoon become reconciled to their fate, will eat immediately after they are taken, and, if neceſſary, may be conducted from the verge of the jungle as ſoon as a paſſage is cleared. When the elephant is brought to his proper ſtation and made faſt, he is treated with a mixture of ſeverity and gentleneſs, and in a few months (if docile) he becomes tractable, and appears perfectly reconciled to his fate. It appears ſomewhat extraordinary, that though the goondah uſes his utmoſt force to diſengage himſelf when taken, and would kill any perſon coming within his reach, yet he never, or at leaſt ſeldom, attempts to hurt the females that have enſnared him, but on the contrary ſeems pleaſed, (as often as they are brought near, in order to adjuſt his harneſſing, or move and ſlacken thoſe ropes which gall him,) ſoothed and comforted by them, as it were, for the loſs of his liberty. All the elephants, ſoon after they are taken, are led out occaſionally for exerciſe by the koomkees, which attend for that purpoſe.

"Having thus related the manner in which the male elephants, called goondahs, are ſecured, I ſhall next deſcribe the methods I have ſeen employed for ſecuring a herd of wild elephants. Female elephants are never taken ſingly, but always in the herd, which conſiſts of young and old of both ſexes. This noble, docile, and uſeful, animal, ſeems naturally of a ſocial diſpoſition, as a herd in general conſiſts of from about forty to one hundred, and is conducted under the direction of one of the oldeſt and largeſt females, called the *palmai*, and one of the largeſt males. When a herd is diſcovered, about five hundred people are employed to ſurround it, who divide themſelves into ſmall parties, called *chokeys*, conſiſting generally of one mahote and two coolies, at the diſtance of twenty or thirty yards from each other, and form an irregular circle in which the elephants are incloſed: each party lights a fire, and clears a foot-path to the ſtation that is next him, by which a regular communication is formed through the whole circumference from one to the other. By this path reinforcements can immediately be brought to any place where an alarm is given. The firſt circle (the *dawkee*), being thus formed, the remaining part of the day and night is ſpent in keeping watch by turns, or in cooking for themſelves and companions. Early next morning, one man is detached from each ſtation, to form another circle in that direction where they wiſh the elephants to advance. When it is finiſhed, the people, ſtationed neareſt to the new circle, put out their fires, and file off to the right and left, to form the advanced party, thus leaving an opening for the herd to advance through; and by this movement both the old and new circle are joined, and form an oblong. The people from behind, now begin ſhouting and making a noiſe with their rattles, *tomtoms*, or drums, &c. to cauſe the elephants to advance; and as ſoon as they are got within the new circle, the people cloſe up, take their proper ſtations, and paſs the remaining part of the day and night as before. In the morning the ſame proceſs is repeated, and in this manner the herd advances ſlowly in that direction, where they find themſelves leaſt incommoded by the noiſe and clamour of the hunters, feeding, as they go along, upon branches of trees, leaves of bamboos, &c. which come in their way. If they ſuſpected any ſnare, they could eaſily break through the circle; but this inoffenſive animal,

mal, going merely in queſt of food, and not feeing any of the people who ſurround him, and who are concealed by the thick jungle, advances without ſuſpicion, and appears only to avoid being peſtered by their noiſe and din. As fire is the thing elephants ſeem moſt afraid of in their wild ſtate, and will ſeldom venture near it, the hunters always have a number of fires lighted, and particularly at night, to prevent the elephants coming too near.

" In this manner the herd is gradually driven to the *keddah*, or place where they are to be ſecured. As the natives are extremely ſlow in their operations, they ſeldom bring the herd above one circle in a day, except on an emergency, when they exert themſelves and advance two circles. The ſeaſon is then ſo mild, that the people ſleep at night by the fires they have lighted, and an accident ſeldom happens except to ſtragglers about the outſkirts of the wood, who are ſometimes carried off by tigers. The keddah, or place where the herd is to be ſecured, is differently conſtructed in different places: here it conſiſts of three encloſures, communicating with each other by means of narrow openings or gateways. The outer encloſure, where the elephants are to enter, is the largeſt; the middle one is generally, though not always, the next in ſize; and the third or inner is the ſmalleſt: theſe proportions, however, are not always adhered to in making of a keddah, nor indeed does there appear to me any reaſon for making three encloſures; but as my intentions are merely to relate facts, I ſhall proceed to obſerve, that when in the third or laſt encloſure, the elephants are then only deemed ſecure: here they are kept ſix or eight days, and are regularly, though ſcantily, fed from a ſcaffold on the outſide, cloſe to the entrance of an outlet called the *roomee*, which is about ſixty feet long and very narrow, and through which the elephants are to be taken out one by one. Theſe encloſures are all pretty ſtrong, but the third is the ſtrongeſt; nor are the elephants deemed ſecure, as already obſerved, till they have entered it. This encloſure has, like the other two, a deep ditch on the inſide; and, upon the bank of earth that is thrown up from the excavation, a row of ſtrong palliſades of middle-ſized trees is planted, ſtrengthened with croſs bars, which are tied to them about the diſtance of fourteen inches from each other; and theſe are ſupported on the outſide by ſtrong poſts like buttreſſes, having one end ſunk in the earth, and the other preſſing againſt the croſs bars to which they are faſtened. When the herd is brought near to the firſt encloſure, or *baigcote*, which has two gateways towards the jungle, through which the elephants are to advance, (theſe as well as the other gateways, are diſguiſed with branches of trees and bamboos, ſtuck in the ground ſo as to give them the appearance of a natural jungle,) the greateſt difficulty is to get the herd to enter this firſt or outer encloſure; for, notwithſtanding, the precautions taken to diſguiſe both the entries as well as the paliſade which ſurrounds this encloſure, the palmai, or leader, appears to ſuſpect ſome ſnare, from the difficulty and heſitation with which in general ſhe paſſes into it; but, as ſoon as ſhe enters, the whole herd implicitly follows. Immediately, when they are all paſſed the gateway, fires are lighted round the greateſt part of the encloſure, and particularly at the entries, to prevent the elephants from returning. The hunters from without then make a terrible noiſe by ſhouting, beating of tomtoms, firing cartridges, &c. to urge the herd on to the next encloſure. The elephants, finding themſelves enſnared, roar, and make a noiſe; but, ſeeing no opening except the entrance to the next encloſure, and which they at firſt generally avoid, they return to the place through which they lately paſſed, thinking, perhaps, to eſcape, but now find it ſtrongly barricaded, and, as there is no ditch at this place, the hunters, to prevent their coming near and forcing their way, keep a line of fire conſtantly burning all along where the ditch is interrupted, and ſupply it with fuel from the top of the paliſade, and the people from without make a noiſe, ſhouting, and hallooing to drive them away. Whenever they turn, they find themſelves oppoſed by burning fires, except towards the entrance of the ſecond encloſure, or *doobraze-cote*. After traverſing the baigcote for ſome time, and finding no chance of eſcaping but through the gateway into the next encloſure, the leader enters, and the reſt follow: the gate is inſtantly ſhut, by people who are ſtationed on a ſmall ſcaffold immediately above it, and ſtrongly barricaded, fires are lighted, and the ſame diſcordant din made and continued, till the herd has paſſed through another gateway into the inner encloſure, or *rajecote*, the gate of which is ſecured in the ſame manner as the former. The elephants, being now completely ſurrounded on all ſides, and perceiving no outlet through which they can eſcape, appear deſperate, and in their fury advance frequently to the ditch, in order to break down the paliſade, inflating their trunks, ſcreaming louder and ſhriller than any trumpet, ſometimes grumbling like the hollow murmur of diſtant thunder, but, wherever they make an attack, they are oppoſed by lighted fires, and by the noiſe and ſhouts of the hunters. As they muſt remain ſome time in this encloſure, care is always taken to have part of the ditch filled with water, which is ſupplied by a ſmall ſtream, either natural, or conducted through an artificial channel from ſome neighbouring reſervoir. The elephants have recourſe to this water to quench their thirſt and cool themſelves after their fatigues, by ſucking the water into their trunks, and then ſquirting it over every part of their bodies. While they remain in this encloſure, they continue ſulky, and ſeem to meditate their eſcape; but the hunters build huts, and form an encampment, as it were, around them, cloſe to the paliſade; watchmen are placed, and every precaution uſed, to prevent their breaking through.

" When the herd has continued a few days in the keddah, the door of the roomee is opened, into which ſome one of the elephants is enticed to enter, by having food thrown firſt before, and then gradually further on into the paſſage, till the elephant has advanced far enough to admit of the gate being ſhut. Above this wicker-gate, or door, two men are ſtationed on a ſmall ſcaffold, who throw down the food. When the elephant has paſſed beyond the door, they give the ſignal to a man who, from without, ſhuts it by pulling a rope, and they ſecure it by throwing two bars that ſtood perpendicular on each ſide, the one acroſs the other; and then two ſimilar bars are thrown acroſs each other behind the door next to the keddah, ſo that the door is in the center: for farther ſecurity, horizontal bars are puſhed acroſs the roomee, through the openings of the paliſades, both before and behind thoſe croſſes, to prevent the poſſibility of the doors being forced. The roomee is ſo narrow, that a large elephant cannot turn in it; but, finding his retreat thus cut off, he advances, and exerts his utmoſt force to break down the bars, which were previouſly put acroſs a little farther on in the outlet, by running againſt them, ſcreaming and roaring, and battering them, like a ram, by repeated blows of his head, retreating and advancing with the utmoſt fury. In his rage, he riſes and leaps upon the bars with his fore-feet, and ſtrives to break them down with his huge weight. In February, 1788, a large female elephant dropt down dead in the roomee, from the violent exertions ſhe made. When the elephant is ſomewhat fatigued by theſe exertions, ſtrong ropes, with running nooſes, are placed in the outlet by the hunters; and as ſoon as he puts a foot within the nooſe, it is immediately drawn tight, and faſtened to the paliſades. When all his feet have been made pretty faſt, two men place themſelves behind ſome bars, that run acroſs the roomee, to prevent his kicking them, and with great caution tie his hind-legs together, by paſſing a cord alternately from the one to the other, like the figure 8, and then faſtening theſe turns as above deſcribed. After this,

the

the phara, dools, &c. are put on in ſucceſſion, in the ſame manner as on the goondah, only that here the people are in greater ſecurity. While theſe ropes are making faſt, the other hunters are careful not to go too near, but keep on the outſide of the paliſade, and divert his attention as much as they can, by ſupplying him with graſs, and ſometimes with plantain-leaves and ſugar-canes, of which he is remarkably fond, by preſenting a ſtick, giving him hopes of catching it, or by gently ſtriking or tickling his proboſcis. He frequently, however, ſeizes the ropes with his trunk, and endeavours to break them, particularly thoſe with which his feet are tied, and ſometimes tries to bite them through with his grinders; but the hunters then goad him with ſharpened bamboos, or light ſpears, ſo as to make him quit his hold. Thoſe who are employed in putting the ropes round his body, ſtand above him, on a ſmall kind of platform, conſiſting of a few bars run acroſs through the openings of the paliſades, and, as an elephant cannot ſee any thing that is above, and rather behind his head, they are very little incommoded by him, although he appears to ſmell them, and endeavours to reach them with his trunk. When the whole apparatus is properly ſecured, the ends of the two cables (*dools*), which were faſtened round his neck, are brought forward to the end of the roomee, where two female elephants are waiting; and to them theſe cables are made faſt. When every thing is ready, the door, at the end of the outlet, is opened, the croſs bars are removed, and the paſſage left clear. The ropes, that tied his legs to the paliſades, are looſened, and, if he does not advance readily, they goad him with long poles, ſharpened at the ends or pointed with iron, and urge him on with their noiſe and din, and, at the ſame time, the females pull him gently forward: as ſoon as he has cleared the roomee, his conductors ſeparate, ſo that if he attempts to go to one ſide, he is prevented by the elephant, that pulls in the oppoſite direction, and *vice verſa*. The bundahs, which tie his hind legs, though but looſely, yet prevent his going faſt; and, thus ſituated, he is conducted like an enraged bull, that has a cord faſtened to his horns on each ſide, ſo that he cannot turn either to the right or left to avenge himſelf. In like manner is this noble animal led to the next tree, as the goondahs, before-mentioned, were. Sometimes he becomes obſtinate, and will not advance; in which caſe, while one of his conductors draws him forward, the other comes behind and puſhes him on: ſhould he lie down, ſhe puts her ſnout under and raiſes him up, ſupporting him on her knee, and with her head puſhing him forward with all her ſtrength, the hunters likewiſe aſſiſt by goading him, and urging him forward by their noiſe and din: ſometimes they are even obliged to put lighted torches near, in order to make him advance. In conducting ſmall elephants from the roomee, only one cable and one koomkee are made uſe of. As ſoon as each elephant is ſecured, he is given in charge to the mahote, or keeper, who is appointed to attend and inſtruct him; and, under him, there are from two to five coolies, according to the ſize of the elephant, in order to aſſiſt and to ſupply food and water, till he becomes ſo tractable as to bring the former himſelf. Theſe people erect a ſmall hut immediately before him, where the mahote, or one of the coolies, conſtantly attends, ſupplies him with food, and ſoothes and careſſes him by a variety of little arts. By degrees he advances cautiouſly to his ſides, and ſtrokes and pats him with his hand, ſpeaking to him all the while in a ſoothing tone of voice, and, in a little time, he begins to know his keeper, and obey his commands. Thus the mahote becomes familiar to him, and at length gets upon his back from one of the tame elephants, and, as the animal becomes more tractable, he advances gradually forward towards his head, till at laſt he is permitted to ſeat himſelf on his neck, from which place he afterwards regulates and directs all his motions. While they are training in this manner, the tame elephants lead out the others in turn, for the ſake of exerciſe, and likewiſe to eaſe their legs from the cords with which they are tied, and which are apt to gall them moſt terribly, unleſs they are regularly ſlacked and ſhifted. In five or ſix weeks the elephant becomes obedient to his keeper, his fetters are taken off by degrees, and generally, in about five or ſix months, he ſuffers himſelf to be conducted by the mahote from one place to another: care, however, is always taken not to let him approach his former haunts, leſt a recollection of the freedom he there enjoyed, ſhould induce him again to recover his liberty. This obedience to his conductor ſeems to proceed partly from a ſenſe of generoſity, as it is, in ſome meaſure, voluntary; for, whenever an elephant takes fright, or is determined to run away, all the exertions of the mahote cannot prevent him, even by beating or digging the pointed iron hook into his head, with which he directs him; on ſuch an occaſion the animal totally diſregards theſe feeble efforts, otherwiſe he could ſhake or pull him off with his trunk, and daſh him in pieces. Accidents of this kind happen almoſt every year, eſpecially to thoſe mahotes who attend the large goondahs, but ſuch accidents are in general owing to their own careleſſneſs and neglect. It is neceſſary to treat the males with much greater ſeverity than the females to keep them in awe; but it is too common a practice among the mahotes, either to be negligent in uſing proper meaſures to render their elephants docile, or to truſt too much to their good-nature, before they are thoroughly acquainted with their diſpoſitions. The iron hook, with which they direct them, is pretty heavy, about ſixteen inches long, with a ſtraight ſpike advancing a little beyond the curve of the hook, ſo that altogether it is like the boat-hook which ferrymen or boatmen uſe, faſtened to a long pole."

The natural hiſtory of this animal has been till lately very ill underſtood. Much of abſurdity and indecorous fable has in conſequence been impoſed on the credulous public, particularly concerning the mode of propagation and geſtation of the elephant. De Feynes and Tavernier, J. C. Wolfe, and the comte de Buffon, aſſure us, with great gravity, that theſe monſtrous animals embrace like man and woman: that "the male makes a pit or hollow in the ground, and aſſiſts his conſort to lay herſelf on her back; and, in caſe he finds her perfectly compliant and agreeable, very complaiſantly helps her up again after the buſineſs is finiſhed, (for ſhe cannot poſſibly riſe of herſelf,) by throwing his trunk round her neck!"—"Theſe animals," ſays Tavernier, "cannot intermix in any other manner: they require, therefore more time and conveniency for this operation than other quadrupeds; and it is perhaps for this reaſon that they never copulate but when they enjoy full liberty, and have every neceſſary article at their command. The female muſt not only conſent, but ſolicit the male, by a poſition which ſhe never aſſumes unleſs when ſhe thinks herſelf in perfect retirement."

M. Bles, and the comte de Buffon alſo aſſure us, that "elephants obſerve the greateſt delicacy in their amours, abhorring nothing ſo much as to be ſeen on thoſe occaſions. The troop divide themſelves into couples, ſteal off into the moſt ſecret receſſes of the foreſt, and there give way to all the impulſes of nature."—The mode of connection, ſays Buffon, "cannot be like that of other quadrupeds, becauſe the female hath the vagina placed near the middle of the belly; and on the other hand, the male organ is by no means proportioned to the magnitude of the animal's body, nor capable of being extended to ſo long an interval: naturaliſts as well as travellers agree, that the penis does not exceed that of a horſe, either in length or diameter." But it is plain that theſe naturaliſts and travellers, any more than comte de Buffon himſelf, had never ſeen, or correctly examined, the living animals, or they would not have impoſed ſuch unfounded ſtories upon the credulity of their readers.

"The approach of the ſeaſon of love," argue theſe writers, "is very eaſily known, becauſe for ſome days before it happens, an oily liquor is ſeen to flow from a ſmall hole on each ſide the head, in both ſexes. The domeſtic female on theſe occaſions ſometimes makes her eſcape, and joins the wild males in the woods. Some days afterward her cornack or keeper goes in queſt of her, and calls her by her name till ſhe comes. She ſubmits to him with complacence, and allows herſelf to be conducted home, and ſhut up in the ſtable. From caſes of this kind, it has been aſcertained, that the female elephant brings forth at the end of nine months." This opinion was alſo adopted by Mr. Pennant, becauſe he appeared to have no better information. See Encyclopædia Britannica, vol. vi. p. 549, 550, &c.

But the advances recently made in ſcience and literature have not only detected theſe impoſitions, but have afforded likewiſe the moſt ſatisfactory accounts of the natural hiſtory and economy of this noble animal. In the "*Anatomique d'un Elephant*," by Peter Camper, profeſſor of anatomy in the Athenium of Amſterdam, publiſhed at Paris, in folio, in 1802, with twenty ſuperb engravings, the phyſiology of the elephant is clearly defined. The information derived from this ſource, is likewiſe conſiderably aided by "Obſervations on the Manners, Habits, and Natural Hiſtory, of the Elephant," by John Corſe, eſq. publiſhed in the Tranſactions of the Royal Society of London for 1799; and to whom the world is indebted for the preceding account of the method of taking wild elephants. By a reſidence of more than ten years in Bengal, and by having the elephant-hunters for five years under his abſolute direction, viz. from 1792 to 1797, he was peculiarly qualified to render the ſubject of this article particularly intereſting and inſtructive.

"The elephant (ſays Mr. Corſe) has been declared to poſſeſs the ſentiment of modeſty in a high degree; and, by ſome, his ſagacity was ſuppoſed to excite feelings for the loſs of liberty, ſo acute, as to cauſe him to refuſe to propagate his ſpecies while in ſlavery, leſt he ſhould entail on his progeny a fate ſimilar to his own; whilſt others have aſſerted, that he loſt the power of procreation in the domeſtic ſtate. So circumſtanced, I was deſirous of taking advantage of my ſituation, and of making ſuch experiments and obſervations, as might tend to render more perfect the natural hiſtory of this uſeful animal. The young of the elephant, at its birth, is about thirty-five inches high; and, as a knowledge of its progreſſive growth forms the beſt criterion by which we can judge of the age of this animal, I ſhall here note ſome obſervations made on this ſubject, till the elephant has attained its full ſize; for, after this period, till ſigns of old age appear, I do not know any marks by which a tolerable gueſs can be made of the number of its years, unleſs we could examine the teeth accurately; and, even then, there would be much uncertainty. The following obſervations, of the gradual increaſe of growth, were made upon a young elephant belonging to Mr. Stephen Harris, which was accurately meaſured from time to time, and upon a female elephant of my own, till I left Tiperah. Mr. Harris's clephant, at its birth, October 16, 1789, was thirty-five inches high.

	Feet.	Inches.
In one year he grew 11 inches, and was	3	10 high.
In the 2d year 8	4	6
In the 3d year 6	5	0
In the 4th year 5	5	5
In the 5th year 5	5	10
In the 6th year $3\frac{1}{2}$	6	$1\frac{1}{2}$
In the 7th year $2\frac{1}{2}$	6	4

"Except during his fourth and fifth years, the above meaſurement ſhews a gradual decreaſe in the proportion of growth for every year; and there was no opportunity of tracing the growth of this elephant farther than its ſeventh year. Another elephant, ſix feet nine inches high at the time ſhe came into my poſſeſſion, was ſuppoſed to be fourteen years old; but, as the accuracy of the hunters cannot be depended on, it will be proper to take Mr. Harris's elephant, whoſe age is exactly known, as a ſtandard; and, judging from its annual increaſe, this will lead us to conſider the elephant, at the time I received her, to be only eleven years old; giving a period of four years, for the addition of five inches. I have made a greater allowance of time, on account of this elephant being a female, and Mr. Harris's a male, which there is much reaſon to believe grows faſter.

"During the next five years, before ſhe was covered, ſhe grew only ſix inches; but, what is extremely curious, while pregnant, ſhe grew, in twenty-one months, five inches; and, in the following ſeventeen months, though again pregnant, ſhe grew only half an inch; at which time ſhe was ſent from Comillah, as I was then preparing to leave India. At this time ſhe was about nineteen years old, and had, perhaps, attained her full growth. Her young one was then (November 1796) not twenty months old; yet he was four feet five inches and a half high, having grown eighteen inches ſince his birth; which is the greateſt progreſſive growth, in the elephant, that I have known. Theſe obſervations, when applied to the general growth of elephants, are to be taken with ſome allowance; ſince, during the ſtate of the firſt pregnancy, there is ſo great an irregularity in the growth of female elephants, as alone occaſions conſiderable difficulty, even ſuppoſing the progreſſive growth nearly equal in the ſpecies. It is probable, however, that this is not by any means equal; for, as elephants vary greatly in ſize, and as males are generally much taller than females, we muſt conclude they either grow faſter, or are longer in attaining their full growth. But it may be ſafely aſſerted, that elephants, like moſt quadrupeds, propagate their ſpecies before they have acquired their full growth. Many females have been known, when taken while pregnant, to have grown ſeveral inches higher before delivery; and, as it has been ſtated, that the female elephant on which my obſervations were made, could not exceed ſixteen years when ſhe received the male, it is probable the wild female elephants are in heat before that period.

"If, from the above data, it may be allowed to form a probable conjecture, elephants attain their full ſize between eighteen and twenty-four years of age. The height of the elephant, I believe, has been often much exaggerated. In India, the height of females is, in general, from ſeven to eight feet; and that of males, from eight to ten feet, meaſured at the ſhoulder. I have never heard but of one elephant, on good authority, that much exceeded ten feet; this was a male belonging to Aſoph ul Dowlah, vizier of Oude. His dimenſions were as follow: meaſured on the 18th of June, 1796.

	Feet.	Inch.
From foot to foot, over the ſhoulder . . .	22	$10\frac{1}{2}$
From the top of the ſhoulder, perpendicular height	10	6
From the top of the head, when ſet up, as he ought to march in ſtate	12	2
From the front of the face to the inſertion of the tail	15	11

"Captain Sandys, of the Bengal eſtabliſhment, ſhewed me a liſt of about one hundred and fifty elephants, of which he had the management during the war with Tippoo Sultaun, in Myſore, and not one of them was ten feet, and only a few males nine feet and a half high. I was very particular in aſcertaining the height of the elephants employed at Madras, and with the army under marquis Cornwallis, where there were both Ceylon and Bengal elephants; and I have been aſſured, that thoſe of Ceylon were neither higher, nor ſuperior, in any reſpect, to thoſe of Bengal.

"The Madras elephants have been ſaid to be from ſeventeen

ſeventeen to twenty feet high; but, to ſhew how much the natives of India are inclined to the marvellous, and how liable Europeans themſelves are to miſtakes, I will relate a circumſtance that happened to myſelf. Having heard, from ſeveral gentlemen who had been at Dacca, that the nabob there had an elephant about fourteen feet high, I was deſirous to meaſure him; eſpecially as I had ſeen him often myſelf, during the year 1785, and then ſuppoſed him to be above twelve feet. After being at Tiperah, and having ſeen many elephants caught, in the years 1786, 1787, and 1788, and finding all of them much inferior in height to what I ſuppoſed the nabob's elephant, I went to Dacca, in 1789, determined to ſee this huge animal meaſured. At firſt, I ſent for the *mahote* or driver, to aſk ſome queſtions concerning this elephant; he, without heſitation, aſſured me he was from ten to twelve cubits, that is, from fifteen to eighteen feet, high; but added, he could not, without the nabob's permiſſion, bring me the elephant to be examined. Permiſſion was accordingly aſked, and granted: I had him meaſured exactly, and was rather ſurpriſed to find he did not exceed ten feet in height. The Eaſt-India company's ſtandard, for ſerviceable elephants, is ſeven feet and upwards, meaſured at the ſhoulder, in the ſame manner as horſes are. At the middle of the back they are conſiderably higher; the curve or arch of which, particularly in young elephants, makes a difference of ſeveral inches.

"It has been ſtated by Buffon, and others, that the ſagacity of the elephant is ſo great, and his memory ſo retentive, that when once he has received an injury, or been in bondage, and afterwards eſcapes, it is not poſſible, by any art, again to entrap him. Great as my partiality is for this noble animal, whoſe modes of life and general ſagacity I have had ſo many opportunities of obſerving, yet a regard to truth compels me to mention ſome facts, which contradict that opinion. The following hiſtory of an elephant taken by Mr. Leeke, of Longford Hall, Shropſhire, while reſident at Tiperah, contains many intereſting particulars on this ſubject. The elephant was a female, and was taken at firſt, with a herd of many others, in 1765, by rajah Kiſhun Maunick, principal zemindar of Tiperah, who, about ſix months after, gave her to Abdoor Rezah, a man of rank in the diſtrict. In 1767, the rajah ſent a force againſt Abdoor Rezah, for ſome refractory conduct; who, in his retreat to the hills, turned her looſe into the woods, after having uſed her above two years as a riding elephant. In January, 1770, ſhe was retaken by the rajah; but, in April, 1771, ſhe broke looſe from her pickets, or faſtenings, in a ſtormy night, and eſcaped to the hills. On the 25th of December, 1782, ſhe was driven by Mr. Leeke's elephant hunters into a keddah, as above deſcribed; and, the day following, when Mr. Leeke went to ſee the herd that had been ſecured, this elephant was pointed out to him by the hunters, and particularly by a driver who had had charge of her for ſome time, and well recollected her. They frequently called to her by name; to which ſhe ſeemed to pay ſome attention, by immediately looking towards them, when her name, *Juggut-Peauree*, was repeated; nor did ſhe appear like the wild elephants, which were conſtantly running about the keddah in a rage, but ſeemed perfectly reconciled to her ſituation. From the 25th of December to the 13th of January, (a ſpace of eighteen days,) ſhe never went near enough the outlet (or roomee) to be ſecured; from a recollection, perhaps, of what ſhe had before ſuffered. Orders, however, had been given not to permit her to enter the outlet, had ſhe been ſo inclined, as Mr. Leeke wiſhed to be preſent when ſhe was taken out of the keddah. On the 13th of January, 1783, Mr. Leeke went out, when there were only herſelf, another female, and eight young ones, remaining in the enclofure. After the other female had been ſecured, by means of the koomkees, or female decoyers, ſent in for that purpoſe, the hunters were ordered to call *Juggut-Peauree*. She immediately came to the ſide of the ditch, within the enclofure; on which, ſome of the drivers were deſired to carry in a plantain-tree, the leaves of which ſhe not only took from their hands, with her trunk, but opened her mouth, for them to put a leaf into it, which they did, ſtroking and careſſing her, and calling to her by name. Mr. Leeke, ſeeing the animal ſo tame, would not permit the hunters to attempt tying her; but ordered one of the trained elephants to be brought to her, and the driver to take her by the ear, and order her to lie down. At firſt, ſhe did not like the koomkee to go near her, and retired to a diſtance, ſeemingly angry; but, when the drivers, who were on foot, called to her, ſhe came immediately, and allowed them to ſtroke and careſs her, as before; and, in a few minutes after, permitted the trained females to be familiar. A driver, from one of theſe, then faſtened a rope round her body, and inſtantly jumped on her back; which, at the moment, ſhe did not like, but was ſoon reconciled to it. A ſmall cord was next faſtened round her neck, for the driver to put his feet in, who, ſeating himſelf on the neck, in the uſual manner, drove her about the keddah, the ſame as any of the tame elephants. After this, he ordered her to lie down, which ſhe inſtantly did; nor did ſhe riſe till ſhe was deſired. He fed her from his ſeat, gave her his ſtick to hold, which ſhe took with her trunk, and put into her mouth, kept, and then returned it, as ſhe was directed, and as ſhe formerly had been accuſtomed to do. In ſhort, ſhe was ſo obedient, that had there been more wild elephants in the keddah, to tie, ſhe would have been uſeful in ſecuring them. Mr. Leeke himſelf then went up, took her by the ear, and bade her lie down; a command ſhe inſtantly obeyed.

"I have known ſeveral other inſtances of elephants being taken a ſecond time; and was myſelf a witneſs both of the eſcape and retaking of one, as follows: In June, 1787, *Jattra-Mungul*, a male elephant, taken the year before, was travelling, in company with ſome other elephants, towards Chittigong, laden with a tent and ſome baggage, for our accommodation on the journey. Having come upon a tiger's track, which elephants diſcover readily by the ſmell, he took fright, and ran off to the woods, in ſpite of the efforts of his driver. On entering the wood, the driver ſaved himſelf, by ſpringing from the elephant, and clinging to the branch of a tree under which he was paſſing; when the elephant had got rid of his driver, he ſoon contrived to ſhake off his load. As ſoon as he ran away, a trained female was diſpatched after him, but could not get up in time to prevent his eſcape; ſhe, however, brought back his driver, and the load he had thrown off, and we proceeded, without any hope of ever ſeeing him again. Eighteen months after this, when a herd of elephants had been taken, and had remained ſeveral days in the enclofure, till they were enticed into the outlet, there tied, and led out in the uſual manner, one of the drivers, viewing a male elephant very attentively, declared he reſembled the one which had run away. This excited the curioſity of every one to go and look at him; but, when any perſon came near, the animal ſtruck at him with his trunk, and, in every reſpect, appeared as wild and outrageous as any of the other elephants. At length, an old hunter, coming up and examining him narrowly, declared that he was the very elephant that had made his eſcape about eighteen months before. Confident of this, he boldly rode up to him on a tame elephant, and ordered him to lie down, pulling him by the ear at the ſame time. The animal ſeemed quite taken by ſurpriſe, and inſtantly obeyed the word of command, with as much quickneſs as the ropes, with which he was tied, permitted; uttering, at the ſame time, a peculiar ſhrill ſqueak through his trunk, as he had formerly been known to do; by which he was immediately recognized by every perſon who had ever been acquainted with this peculiarity.

"Thus we ſee that this elephant, for the ſpace of eight or ten days, during which he was in the keddah, and

and even while he was tying in the outlet, appeared equally wild and fierce as the boldeſt elephant then taken; ſo that he was not even ſuſpected of having been formerly taken, till he was conducted from the outlet. The moment, however, he was addreſſed in a commanding tone, the recollection of his former obedience ſeemed to ruſh upon him at once; and, without any difficulty, he permitted a driver to be ſeated on his neck, who, in a few days, made him as tractable as ever. Theſe, and ſeveral other inſtances which have occurred, clearly evince, that elephants have not the ſagacity to avoid a ſnare into which they have, even more than once, fallen; nor that, if domeſtic females were ſuffered to ſtray into the woods in queſt of the males, they would ever return, at the call of their cornack, to ſlavery again. Beſides, in what part of thoſe immenſe foreſts ſhould he go to find them?

"The general idea that tame elephants would not breed, has doubtleſs prevented trials being made, to aſcertain whether, under particular circumſtances, this ſuppoſed reluctance could be got the better of. I was however convinced, from obſervation, as well as from ſome particular facts, that elephants had their ſeaſons in which they were in heat; I ſhall, therefore, firſt mention the circumſtances which induced me to attempt breeding from tame elephants, and then relate the ſucceſs of the experiments inſtituted for this purpoſe. The circumſtances to which I allude, happened in January, 1790, at a keddah near to Comillah, the capital of Tiperah. Meſſrs. Henry Buller and George Dowdeſwell, of Chittigong, being then on a viſit at Comillah, accompanied me and ſeveral others, to ſee a herd of elephants which had been lately taken. Our viſitors then propoſed a trial being made, of tying the wild elephants immediately, in the keddah, in the manner practiſed at Chittigong, inſtead of waiting till they were enticed, one after another, into the narrow outlet, there to be ſecured, and led out in the uſual manner. This mode they recommended ſo earneſtly, from a conviction of its ſuperior utility, that Mr. John Buller, to whom the keddah belonged, aſſented to the trial being made, and gave orders for the trained females, and proper aſſiſtants, to go directly within the encloſure. Having but few trained females preſent, it was judged adviſable to ſend in a fine male elephant, taken many years before, and thoroughly broke in, to aſſiſt them, as well as to keep the herd in awe. He had no ſooner entered the encloſure, and been brought near the herd, than, diſcovering one of the females to be in heat, impelled by deſire, and eager to cover her, he daſhed through the herd, regardleſs of the orders and ſevere diſcipline of the driver, and had nearly accompliſhed his purpoſe. The driver, being alarmed for his own ſafety, exerted in vain all his ſtrength, to turn him, and bring him from among the wild elephants; but the drivers of the trained females, coming ſpeedily to his aſſiſtance, ſoon ſurrounded this furious animal, and ſeparated him from the herd. In reſentment, however, of his diſappointment, he attacked a ſmall koomkee, with ſuch violence as completely overturned her and her rider; and, had he not been of the ſpecies called *mucknah*, which have not the long tuſks, he moſt probably would have transfixed, and killed her on the ſpot: fortunately, neither ſhe nor her driver received any conſiderable hurt. This accident prevented the trial being then made, to tie the wild elephants in the manner propoſed.

"Reflecting on the diſobedience ſhown by an elephant remarkably docile, and which had been domeſticated for many years, when his paſſions were excited, and recollecting alſo, that a wild elephant had covered a female, in February, 1778, before many ſpectators, juſt after the herd had been ſecured in the encloſure, I was aſſured in my own mind, that it was not from any ſenſe of modeſty, either wild or tame elephants did not gratify their paſſions in public; but no opportunity offered of proſecuting this enquiry, till 1792. Having then taken upon myſelf the management of the elephant hunters, a very fine male was caught in November: he was both young and handſome, and alſo of a moſt docile diſpoſition; I therefore promiſed his driver a conſiderable gratuity, if he would get him into high order, ſo that I might have an opportunity of bringing his procreative powers to trial, with a tame female.

"In March, 1793, the driver of a favourite female elephant informed me, that ſhe had then ſigns of being in heat; and that, if the male and ſhe were kept together, and highly fed, an intimacy would probably ſoon take place. They were therefore, ſhortly after this, brought near to Comillah, where a ſpacious ſhed was erected for their accommodation. In the day they went out together to feed; they alſo brought home a load of ſuch ſucculent food as their drivers and attendants could collect. After their return, they ſtood together, ſlept near each other, and every opportunity was granted them to form a mutual attachment. It is always a good ſign, when an elephant lies down to ſleep, within a few months after he is taken; as it ſhews him to be of a good temper, not ſuſpicious, but reconciled to his fate. Elephants, particularly goondahs, have been known to ſtand twelve months at their pickets, without lying down to ſleep; though they ſometimes take a nap ſtanding. In this way a partiality took place, as was evident from their careſſing each other with their trunks; and this without ceremony, before a number of other elephants, as well as their attendants. Near the end of June, I was ſatisfied the male would not, even to regain his freedom, quit the object of his regard; I therefore ordered the keepers to picket the female, by one of her fore-legs only, in the houſe where they ſtood, but to leave the male at full liberty. Fearful, however, of hurting their ſuppoſed delicacy, and thinking the nearneſs and ſight of the attendants might poſſibly give umbrage to their modeſty, I deſired them to remain quiet in a little hut, erected on the outſide of the building appropriated to the elephants, where they could ſee equally well as if nearer.

"On the evening of the 28th of June, 1793, the male was let looſe from his pickets; and, ſoon after, he covered the female without any difficulty, although before this ſhe never could have received the male, being taken when very young, about five years and a half prior to this period. The male was then led quietly to his ſtall; but, early in the morning of the 29th, he became ſo troubleſome, that the drivers, in order, as they ſaid, to quiet him, but partly, I ſuſpect, to indulge their own curioſity, permitted him to cover her a ſecond time; which he readily did, before the uſual attendants, as well as a number of other ſpectators. About two in the afternoon of the ſame day, I was deſired to repair to the place where the elephants ſtood, as the male had been trying to get nearer the female. On this, I proceeded to the ſpot, with captain Gregory; when we arrived, I ordered the male to be freed from his ſhackles; and, after ſome time toying, and a few mutual careſſes, we had the ſatisfaction to ſee him cover the female. She remained perfectly ſtill during the coitus. When the male had finiſhed, he ſtood quietly by her ſide, while ſhe careſſed him with her trunk; and, as they then appeared well pleaſed, and gentle as uſual, I went up and patted them both, as I had formerly been accuſtomed to do, without the ſmalleſt apprehenſion. In the evening, they were both brought home to be fed; and, though only a few hours had elapſed ſince his laſt embrace, the male ſeemed inclined to make another attempt; to which I would have conſented, to gratify a croud of people then preſent, had I not learned, that he had covered the female in the open plain, about ten in the morning, when going out for food, in ſpite of the exertions of the drivers and attendants; at leaſt ſo they alleged, in excuſe for having permitted it, contrary to my orders. As he had already covered four times in about ſixteen hours, I was afraid a further indulgence might be prejudicial, and therefore

would not permit it; eſpecially as Mr. Imhoff, to whom he belonged, was abſent. That gentleman, however, returned two days after; but, when the two elephants were brought together, in order that Mr. Imhoff's curioſity might be indulged with ſo novel a ſight, the female, being no longer in heat, was ſo uncivil as to give the male a kick in the face, when he was uſing what ſhe then thought improper liberties; nor did ſhe afterwards permit him to cover her, though, when ſtanding together, they mutually indulged in a few careſſes.

"During the time they were kept together, the male never ſhowed ſigns of his paſſions being excited, by any exudation from the ducts of the glands near his temples; which has been conſidered as the ſign of a male elephant being peculiarly ready for the female. This, I am inclined to believe, is a vulgar error; as not one of the elephants I have ſeen cover, in a domeſtic ſtate, nor any of the males which were caught ſingly, or rather entrapped, by their deſire to have connexion with the tame females, had, at thoſe times, the ſmalleſt appearance of ſuch an exudation. Had this happened, in any one inſtance, during my reſidence in Tiperah, I muſt have known it; for, when this exudation takes place, the elephant has a dull heavy look, and it is dangerous for ſtrangers to go near him. I have ſeen elephants in this ſituation, after they had been many years caught; but, though they were then ſaid to have their paſſions excited, I have never known one to cover during the continuance of this exudation: nor have elephants, ſo far as I have been able to obſerve, any particular ſeaſons of love, like horſes. Of five inſtances of elephants covered at Tiperah, one received the male in February, another in April, a third in June, a fourth in September, and the fifth in October. Beſides theſe, an attempt was made by a tame male, to cover, in the month of January, a wild female, then in heat. When the female is in heat, the parts of generation ſhow it, by the fulneſs of the labia; and, if ſhe is placed near a male, ſhe endeavours, by careſſes, to excite his deſires. It may here be proper to obſerve, in refutation of what has been aſſerted by the comte de Buffon, and for the purpoſe of correcting the errors of other zoologiſts in ſo much miſrepreſented article of natural hiſtory, that the penis of a full-grown elephant is from two feet four to two feet ſix inches in length, and from fourteen to ſixteen inches in circumference. I cauſed the penis of two males to be meaſured, after their paſſions were excited, in order to aſcertain the real fact. On ſome occaſions, I have ſeen the penis abſolutely touch the ground, when the elephant has been walking.

"After the female had been covered by the male, as above related, there being then no other female ready, he was placed with an elephant which had had a young one about four years before, and ſome months ago was reported to have been in heat. It was thought, after ſome trial, that ſhe was likely to permit him to cover, as ſhe careſſed him occaſionally, and rouſed his paſſions; but ſhe would not allow him to gratify his deſire. The drivers, tired of this coyneſs, and ſtimulated perhaps by the hopes of another gratuity, were ſo brutal as to tie her, and let the male make an attempt upon her, while tied. His attempt, however, was to no purpoſe; though he continued his efforts till he appeared to be quite exhauſted. This being told me, I ſeverely reprimanded the people; and ordered the female to be left at full liberty to reject or receive the male, as ſhe might think proper. Here, however, was poſitive proof, that the male would have effected his purpoſe by force, when he found he could not obtain it any other way. He remained at Comillah till October, 1793, without my being able to procure a female that was in heat; he was then ſent to Calcutta.

"I now became extremely ſolicitous about the health of the female which was covered in June; and gave particular directions not to overheat her, but merely to give her as much food and exerciſe as were likely to keep her in the beſt condition, as ſhe was now known to be pregnant. In three months after ſhe was covered, ſhe became fuller, her fleſh felt ſofter, and her breaſts began to ſwell. Theſe marks of her being with young, were ſo evident to the driver, that he mentioned them of his own accord; which convinced me, that an elephant, three months after conception, may be known by the keepers to be pregnant. She was ſeven feet three inches high, when covered; but, after this increaſed ſo faſt, not in bulk only, but alſo in height, as to exceed ſeven feet eight inches, before ſhe brought forth. On the 16th of March, 1795, ſhe produced a fine male; juſt twenty months and eighteen days after ſhe was firſt covered. The young one was thirty-five inches and a half high; and had every appearance of having arrived at its full time, being the largeſt I had known produced in Tiperah. We have many young produced every year, by the females which are taken while breeding, and theſe ſeldom exceed thirty-four inches; this, however, may be owing to the weak and reduced ſtate the mothers are brought to, while breaking in.

"The young of the elephant, at leaſt all thoſe I have ſeen, begin to nibble and ſuck the breaſt ſoon after birth; preſſing it with the trunk, which, by natural inſtinct, they know will make the milk flow more readily into the mouth, while ſucking: but the young certainly never ſuck with the trunk, as aſſerted by ſome authors. Elephants never lie down to give their young ones ſuck; and it often happens, when the dam is tall, that ſhe is obliged, for ſome time, to bend her body towards her young, to enable him to reach the nipple with his mouth; conſequently, if ever the trunk was uſed to lay hold of the nipple, it would be at this period, when he is making laborious efforts to reach it with his mouth, but which he could always eaſily do with his trunk, if it anſwered the purpoſe. In ſucking, the young elephant always graſps the nipple (which projects horizontally from the breaſt) with the ſide of his mouth. I have very often obſerved this; and ſo ſenſible are the attendants of it, that, with them, it is a common practice to raiſe a ſmall mound of earth for the young one to ſtand on, and thus ſave the mother the trouble of bending her body every time ſhe gives ſuck, which ſhe cannot readily do when tied to her picket.

"Tame elephants are never ſuffered to remain looſe; as inſtances occur of the mother leaving even her young, and eſcaping into the woods; from which they never return of their own accord, as has been ſo confidently aſſerted. Another circumſtance deſerves notice: if a wild elephant happens to be ſeparated from her young, for only two days, though giving ſuck, ſhe never afterwards recognizes or acknowledges it. This ſeparation ſometimes happened unavoidably, when they were enticed ſeparately into the outlet of the keddah. I have been much mortified at ſuch unnatural conduct in the mother; particularly when it was evident the young elephant knew its dam, and, by its plaintive cries and ſubmiſſive approaches, ſolicited her aſſiſtance.

"Having mentioned a ſufficient number of inſtances, to prove the ability, as well as the inclination, of the elephant, to propagate his ſpecies in a domeſtic ſtate, and that without any ſigns of peculiar modeſty, and having aſcertained the period of geſtation to be twenty months and eighteen days, it may be neceſſary to obſerve, that it is a difficult matter to bring a male, which has been taken about the prime of life, into good condition to act as a ſtallion; for, being naturally bolder, and of a more ungovernable diſpoſition, than the female, he is not in general eaſily tamed, till reduced very low; and it requires conſiderable time, as well as much expence and attention, before he can be brought into ſuch high order as is requiſite. He muſt alſo be of a gentle temper, and diſpoſed to put confidence in his keeper; for he will not readily have connexion with a female, whilſt under the

influence of fear or diſtruſt. Of this I have ſeen many inſtances; nor do I recollect one male elephant in ten, which had been taken after having attained his full growth, much diſpoſed to have connexion with a female. This is a moſt convincing proof, that thoſe males which are taken early in life, and have been domeſticated for many years, more readily procreate their ſpecies than elephants taken at a later period. In their wild ſtate, however, they ſhow no reluctance; for, beſides all the males that are entrapped, from their deſire to have connexion with the trained females which, though not in heat, are carried out to ſeduce them, ſeveral inſtances have occurred, of wild elephants covering, immediately after being taken, in the keddah.

"On the 3d of April, 1795, a very fine male elephant covered a female twice, in the midſt of the wild herd, and before all the hunters. On the 4th, I ſaw him attempting to cover a third time, when he was ſuddenly diſturbed, by the noiſe the hunters made to drive away ſome of the herd which had come too near the paliſade. In conſequence of this interruption, he threw down firſt one and then another ſmall elephant, and gored them terribly with his tuſks, though they came between him and the female only for their protection: he had, before this, killed four, and wounded many others. When the poor animals were thrown down, conſcious of their impending fate, they roared moſt piteouſly; but, notwithſtanding their proſtrate ſituation, and ſubmiſſive cries, he unfeelingly and deliberately drove his tuſks through, and tranſfixed them to the ground; yet none of the large elephants, not even the dams of the ſufferers, came near to relieve them, or ſeemed to be ſenſibly affected. This ſavage animal had been then confined four days in the encloſure, along with the herd, upon a very ſcanty allowance of food, and could have but very little hope of eſcaping; yet here his paſſions were ſtronger than his fears. It was on account of this ſavage diſpoſition, the hunters had aſked permiſſion to ſhoot him, before I had either ſeen him or the herd, and thence judged he was a goondah, that had lately joined. Having never before known any elephant killed wilfully, in the keddah, by the larger males, and having no idea that he would commit ſuch terrible havock, I unluckily refuſed to grant their requeſt, being deſirous to ſave ſo ſtately an elephant. When the paliſade was finiſhed, I got him tied, and led out; but, not brooking reſtraint, he languiſhed about forty days, after he was ſecured, and then died. From this inſtance, as well as many concurring circumſtances, I am convinced that theſe goondahs generally leave the herd of their own accord, and join it when they think proper, or are induced to it from a female being in heat; yet it has been ſuppoſed, that they are driven from the herd, at an early period of life, by their ſeniors. This appears improbable, as it is not often that very large males are taken with an herd of elephants; for, depending on their own ſtrength, they ſtray ſingly, or in ſmall parties, from the woods into the plains, and even to the villages; and it is in theſe excurſions they are taken, by means of the trained females. As theſe goondahs are much larger, and ſtronger, than the males generally taken with the herd, it is not probable they would ſubmit to be driven from it, unleſs at an early period. I have ſeldom ſeen, in a herd of elephants, a male ſo large as may be commonly met with among two or three goondahs; but, if theſe laſt were driven from the herd when young, the very reverſe would be obſerved.

"In the courſe of this narrative, I have, in general, related only ſuch particulars concerning the elephant as came within my own knowledge, and which were either not known, or not publiſhed. To enter into a particular hiſtory of the elephant was not my intention; and, although the procreation of tame elephants has been proved, yet the expence incurred by breeding them, may deter others from making attempts of this kind. But it opens a field of curious enquiry to the naturaliſt; and, now that the facility with which it may be done is aſcertained, it ſuggeſts itſelf as a mode by which the breed of elephants may be improved, in ſize, ſtrength, and activity. In this way, any expence which might be incurred, would more than repay itſelf, in the future benefits to be derived from a ſuperior breed of elephants."

From the koomareah and merghee caſts of Aſiatic elephants above-deſcribed, the *ſunkareah* breed is produced, beſides other varieties. But the nearer an elephant approaches to the true koomareah, the more he is preferred, eſpecially by the natives, and the higher price he will conſequently bear. Europeans are not ſo particular, and will ſometimes prefer a merghee female for hunting and riding on, when ſhe is known to have good paces, and to be of a mild and tractable diſpoſition.

"The elephants for the ſervice of the Eaſt-India company, (ſays Mr. Corſe,) are generally taken in the provinces of Chittigong and Tiperah; but, from what I have heard, thoſe to the ſouthward of Chittigong, in the Burmah territories and kingdom of Pegu, are of a ſuperior breed. In confirmation of this opinion, I may obſerve, that the elephants taken to the ſouth of the Goomty river, which divides the province of Tiperah from eaſt to weſt, are generally better than thoſe taken to the north of that river; and, though elephants are taken at Pilibet, as far north as latitude 29 deg. in the vizier of Oude's territories, yet the vizier, and alſo the officers of his court, give thoſe taken in Chittigong and Tiperah a decided preference, they being much larger and ſtronger than the Pilibet elephant. Till the year 1790, Tiperah was a part of the Chittigong province; and, ſo ſenſible was the Bengal government of the ſuperiority of the ſouthern elephants, for carrying burdens, enduring fatigue, and being leſs liable to caſualties, that, in the late contracts for ſupplying the army with thoſe uſeful animals, the contractor was bound not to ſend any elephant to the military ſtations, taken north of the Chittigong province. Hence we may conclude the torrid zone to be the natural clime, and the moſt favourable for producing the largeſt, the beſt, and the hardieſt, elephant; and that, when this animal migrates beyond the tropics, the ſpecies degenerates. On the coaſt of Malabar, elephants are taken as far north as the territories of the coorgah rajah; but theſe are much inferior to the Ceylon elephant, and, from this circumſtance, the report of the ſuperiority of the Ceylon elephant to all others has probably originated. Moſt of the accounts we have had reſpecting the Aſiatic elephant, have been given by gentlemen who reſided many years ago on the coaſt of Malabar or Coromandel; where, at that time, they had but few opportunities of ſeeing the Chittigong or Pegu elephant.

"After premiſing theſe general obſervations, I may here obſerve, with reſpect to elephant's tuſks, that thoſe in ſome of the females are ſo ſmall as not to appear beyond the lip, whilſt in others they are almoſt as large as in one variety of the koomareah male, named *mooknah*. The largeſt tuſks, from which the beſt ivory is ſupplied, are taken from that variety of the male named *dauntelah*, or *toothy*, in conſequence of his large tuſks, and whoſe countenance, from this circumſtance, is the moſt oppoſite, in appearance, to that of the mooknah; which, as juſt obſerved, is hardly to be diſtinguiſhed, by his head, from a female elephant. Though there is a material difference in the appearance of a mooknah and a dauntelah, yet, if they are of the ſame caſt, *(zat,)* ſize, and diſpoſition, and perfect, that is, free from any defect or blemiſh, there is ſcarcely any difference in their price. An elephant is ſaid to be perfect, when his ears are large and rounded; his eyes full and lucid, of a dark hazle colour, free from ſpecks; the roof of his mouth, and his tongue, free from black ſpots of any conſiderable ſize; his trunk large, and his tail long. His head muſt be well ſet on, and carried rather high. The arch or curve of his back riſing gradually from the ſhoulder to the middle, and thence deſcending to the inſertion of the tail; and all his

his joints firm and ſtrong. The figure of the elephant given in the annexed engraving, is of the mooknah breed, and was tranſmitted to the editors as a real and ſtriking portrait of one which had been in the family of the nabob of Arcot upwards of a hundred years. His tuſks, which were never long, had fallen many years before his portrait was taken, as ſuppoſed, from extreme old age.

"The varieties between the mooknah and dauntelah are conſiderable, and for theſe there are appropriate names, according as the form of the tuſks varies from the projecting horizontal, but rather elevated, curve of the pullung daunt of the perfect dauntelah, to the nearly ſtraight tuſks of the mooknah, which point directly downwards. *Pullung* ſignifies a bed or cot, and *daunt*, teeth; and, from the tuſks projecting ſo regularly, and being a little curved and elevated at the extremities, the natives ſuppoſe a man might lie on them at his eaſe, as on a bed. When a dauntelah has never had but one tuſk, and this of the pullung ſort, he is ſaid to be a *goneiſh* or *ganeſa*, and will ſell to the Hindoo princes for a very high price, to be kept in ſtate, and worſhipped as the Hindoo god of wiſdom. I have ſeen elephants apparently of this kind; but, when accurately examined, the tuſk wanting appeared to me to have been loſt by accident, ſo that I cannot ſay I ever ſaw a male which had originally only one tuſk.

"A ſecond variety of the dauntelah is, when the large tuſks point downwards, projecting only a little way beyond the trunk; he is then ſaid to have *ſoor* or *choor daunt*; that is, hog's teeth. A third variety is the *puttel-dauntee*, whoſe tuſks are ſtraight, like thoſe of the mooknah, only much longer, and thicker. A fourth variety is the *ankoos-dauntee*, or crooked, where one tuſk grows nearly horizontal, like the pullung-daunt, and the other like the puttel-daunt. Beſides theſe, the elephant-keepers notice other varieties, which are leſs diſtinct."

The elephants of Ceylon, Cochin-china, &c. being of the true Aſiatic ſpecies, are more or leſs ſubject to the ſame varieties. Thoſe in China, as we are informed by ſir George Staunton, are brought from the neighbourhood of the equator, and are of a lighter and ſmaller breed than thoſe of Cochin-ehina. "Theſe, however diſcreet in their amours, (ſays ſir George,) are found to unite in the manner of other quadrupeds, notwithſtanding a formation apparently inconvenient on both ſides, but which accommodates itſelf to particular purpoſes." See Embaſſy to China, vol. ii. p. 312.

The mode of *dentition* in the elephant, is a new and intereſting ſubject of inveſtigation, which has been purſued with great labour and attention by Mr. Corſe. "All the tuſks in the male (ſays this writer) are fixed very deep in the upper jaw; and the root or upper part, which is hollow and filled with a core, goes as high as the inſertion of the trunk, round the margin of the naſal opening to the throat; which opening is juſt below the protuberance of the forehead. Through this opening the elephant breathes, and by its means he ſucks up water into his trunk; between it and the roots of the tuſks there is only a thin bony plate. The firſt or milk tuſks of an elephant never grow to any ſize, but are ſhed between the firſt and ſecond year, when not two inches in length. Theſe, as well as the firſt grinders, are named by the natives *dood-hau-daunt*, which literally ſignifies *milk teeth*. The tuſks which are ſhed have a conſiderable part of the root or fang abſorbed or decayed before this happens; as may be ſeen, by comparing one that has been ſhed, with another lodged in the ſocket of a young elephant, before it had cut the gum. The time at which the tuſks cut the gum, varies conſiderably. I have known a young one get his tuſks when about five months old; whereas, the tuſks of another did not cut the gum till he was ſeven months old. Thoſe tuſks which are deciduous, are perfect, and without any hollow in the root, in a fœtus which is come to its full time; at this period, the ſocket of the permanent tuſk begins to be formed, on the inner ſide of the deciduous tuſk. A young elephant ſhed one of his milk tuſks on the 6th of November, 1790, when near thirteen months old, and the other on the 27th of December, when above fourteen months old: they were merely two black-coloured ſtumps, when ſhed; but, two months afterwards the permanent ones cut the gum, and, on the 19th of April, 1791, they were an inch long, but black and ragged at the ends. When they became longer, and projected beyond the lip, they ſoon were worn ſmooth, by the motion and friction of the trunk.

"The permanent tuſks of the female are very ſmall, in compariſon with thoſe of the male, and do not take their riſe ſo deep in the jaw; but they uſe them as weapons of offenee, in the ſame manner as the male named mooknah; that is, by putting their head above another elephant, and preſſing their tuſks down into the animal. Theſe tuſks are never ſhed, except by accident, or extreme old age; and ſometimes they grow to a very large ſize in the male dauntelah. The largeſt I have known in Bengal, did not exceed ſeventy-two pounds, avoirdupois: at Tiperah, they ſeldom exceed fifty pounds; but both theſe weights are very inferior to that of the tuſks brought from other places to the India-houſe, where I have ſeen ſome near 150 pounds each. From what part of Aſia they came, I could not learn, but ſuſpect they were imported from Pegu to Caleutta, and thenee to London.

"The African elephant is ſaid to be ſmaller than the Aſiatic; yet I am credibly informed, by the ivory-dealers in London, that the largeſt tuſks generally come from Africa, and are of a better texture, and leſs liable to turn yellow, than the Indian ivory, after being manufactured. This probably is owing to the tuſks having lain longer in Africa, before they were imported, than thoſe brought from Aſia. In the latter country, moſt of the tuſks exported are taken from elephants immediately after their death; whereas, the Africans find many teeth in the deſert places which have been frequented by this animal. The intenſe heat of a vertical ſun will undoubtedly render the ivory firmer and harder, if the tuſks happen to lie on the ſcorching ſand, or in any other dry ſituation.

"The increaſe of the tuſk ariſes from circular layers of ivory, applied internally, from the core on which they are formed, ſimilar to what happens in the growth of the horns of ſome animals. When the tuſks of the living elephant are ſawn through, and the remaining portion expoſed ſome months to the air, this ſtructure is clearly ſhewn. If the period in which one of theſe circular layers is completed could be aſcertained, this might lead us to fix, with tolerable preciſion, the age of an elephant, by counting the circles in each tuſk. Cutting off a portion of the tuſks of a living elephant is a common practiee; it is done with a view to make the tuſks grow thicker, when they are too long and ſlender, and alſo ſometimes for the ſake of uniformity, when they grow in a wrong direction.

"With regard to the ſtructure of the grinders, it muſt be obſerved, that a grinder is compoſed of ſeveral diſtinct laminæ or teeth, each covered with its proper enamel; and that theſe teeth are merely joined to each other by the common oſſeous matter. This, being much ſofter than the enamel, wears away faſter by the maſtication of the food; and, in a few months after ſome of theſe teeth cut the gum, the enamel remains conſiderably higher, ſo that the ſurface of each grinder ſoon acquires a ribbed appearance, as if originally formed with ridges: this however is not the caſe, as may be ſeen by examining a grinder juſt cutting the gum, but both its ſides have a fluted form, owing to the junction of the different ſtrata. Theſe ſtrata, when firſt formed, have no firm attachment to each other, but always appear ſeparate and diſtinct, when contained in their bony ſockets within the jaw, after their membranes and ſoft parts are deſtroyed. Before any part of a grinder cuts the gum, there is a bony cruſt formed above the enamel, which gives a ſmoothneſs to the grinding ſurface. But, after the grinders cut the gum,

and

and the convex ſurface has been worn down by the trituration of the food, each lamina appears to have been formed on ſeveral points, which are covered by a ſtrong enamel. There are from four to eight of theſe points, joined together by the common bony matter, which fills up the ſpace between the enamelled portions. When the grinder, however, is farther advanced in the mouth, its foremoſt laminæ are gradually worn down by the maſtication of the food; and theſe enamelled points or denticuli diſappear, one after another, till the enamel, at laſt, runs quite acroſs the tooth, ſurrounding the central part on which it was formed, and taking the irregular indented plaited ſhape of the lamellæ. This bony centre, on which the enamel is formed, is harder than the matter which joins the teeth together, does not wear ſo faſt, and conſequently remains higher.

"The number of teeth of which a grinder is compoſed, varies from four to twenty-three, according as the elephant advances in years; ſo that a grinder, *or caſe of teeth*, in full grown elephants, is more than ſufficient to fill one ſide of the mouth; in proportion, however, as the foremoſt layers are worn away, the ſucceeding ones come forward, to ſupply their places. The denticuli of which each layer or tooth is compoſed, are much larger, and fewer in number, in old than in young elephants; in conſequence of this, the ſame number of laminæ generally fills the jaw of a young or of an old elephant; and, from three till fifty years, there are from ten to twelve teeth or laminæ in uſe, in each ſide of either jaw, for the maſtication of the food.

"When ſeveral of the anterior teeth of which a grinder is compoſed have been completely formed, and each tooth covered with its proper enamel, they become firmly united (beginning at the fore part) by the intervention of the common bony matter, which gradually fills up the interſtices between them. When the bodies of ſeveral of the anterior laminæ have been connected together, the inferior edge of each becomes united in the ſame manner, to the one next it, till the whole are thus gradually joined, and form a grinder or caſe of teeth. As ſoon as the anterior part of the grinder is thus firmly united, the fangs or roots are next added: theſe, at firſt, appear in the form of a thin curtain or lamella of bone; extending backwards, along ſome of the anterior laminæ, at their lower edges. A fang common to the three anterior teeth, firſt begins to be formed by the oſſification ſhooting acroſs from each ſide, in a circular direction, at the anterior portion of the firſt and the poſterior part of the third lamina. Theſe join and become longer, aſſuming a conical ſhape: the hollow is gradually filled up by ſucceſſive layers of the ſubſtance of the tooth, as the fang lengthens, till at laſt it becomes ſolid. This, however, does not happen, till the three layers to which the fang is attached are nearly worn away. When its oſſification is almoſt completed, another proceſs begins to take place, which is, the abſorption of the fang from its external ſurface.

"By the time that the anterior layers of the grinders are completely worn down, both the fangs and the alveolar proceſſes begin to be abſorbed. Their places are gradually ſupplied by the next laminæ of the grinder, and their fangs, coming forward in a conſtant ſucceſſion. When the laſt tooth of a grinder has advanced ſufficiently in the jaw to ſupply the place of its predeceſſor, the anterior tooth of the next ſucceeding grinder comes forward, to ſupply its place. From this peculiar manner in which the grinders are ſupplied from behind, *but never from beneath*, a preceding grinder, (as is the caſe in the human ſpecies, and in moſt other animals,) it muſt appear evident, that an elephant can never ſhed his teeth; but, from this regular ſucceſſion, he may, at one period, have only a ſingle grinder in each ſide of either jaw; at another, there may be one and part of a ſucceeding grinder; even a ſtill greater variety in the appearance of the grinders will take place, according as the anterior one is more or leſs worn away, and the waſte ſupplied by its ſucceſſor. In this manner, the growth of new teeth, to compoſe a ſucceeding grinder, and the oſſification and formation of the fangs, are conſtantly going on, in regular ſucceſſion; ſo that, after the ſecond year, the mouth of the elephant is conſtantly filled with as many laminæ of the grinders on each ſide as it can hold.

"While the grinders thus advance forward in the mouth, in regular ſucceſſion, the alveolus or ſocket of each advances along with them; and, as the anterior fangs are abſorbed or decayed, the ſame proceſs is going on in the alveoli. In like manner, the partition between this and the incipient alveolus of the next ſucceeding grinder will come forward in the jaw, in proportion as the grinder itſelf comes into uſe. In the partition between each alveolus there is a communication, which, in young elephants, is larger than in thoſe farther advanced in years; and it is probable, that this canal or ſinus between the different alveoli, admits the paſſage of an elongation of the membrane, from the anterior to the poſterior grinder. The time requiſite for the complete formation of one of theſe caſes of teeth, conſtituting a grinder, varies from two to ſix or eight years; and, when an elephant has attained its full ſize, a conſiderable number of the anterior laminæ muſt be worn away, and the fangs abſorbed, before the poſterior ones can be ſufficiently advanced to cut the gum.

"In the lower jaw, the ſame circumſtances take place; the teeth of the grinders riſe by the addition of their fangs, force their way through the alveoli, and cut the gum, as they advance forward in the jaw. The grinding ſurface in the lower jaw has rather a concave form, to adapt itſelf to that of the grinder in the upper jaw. The number of layers does not always correſpond with thoſe of the grinder in the upper jaw; but, like them, conſiſts of from four to about twenty-three teeth or laminæ. In the lower jaw, the portion of the alveolus which is attached to the inner plate, is thick and ſpongy; and, through the under part of this ſpongy ſubſtance, there is a large foramen, for tranſmitting the blood-veſſels and nerves which ſupply the teeth and lower jaw. The alveolus or ſocket of the grinder advances in the ſame manner in the lower as in the upper jaw; and, as the fangs are abſorbed, it is abſorbed alſo. In proportion as the fangs or roots are added to the grinder, it riſes through the alveolus, and cuts the gum; at the ſame time, the bottom of the alveolus, in which the grinder is formed, becomes more ſpongy, and ſhoots up between the fangs, firmly embracing them, and thus preventing the grinder from being ſhaken or diſturbed by the trituration of the food.

"The firſt ſet of grinders, or milk teeth, begin to cut the gum eight or ten days after birth; and the grinders of the upper jaw appear before thoſe of the lower one. Though this happens at firſt, yet, in a few months, the grinders in the lower jaw come forward faſter than thoſe of the upper. In about ſix weeks, the firſt ſet of grinders can be eaſily felt, conſiſting of four teeth, viz. one on each ſide of either jaw; and, as young elephants begin to eat graſs, or ſome ſoft ſucculent food, before they are three months old, we may conclude, that the firſt ſet of grinders have then completely cut the gum, and that dentition is not attended with any ſymptoms of pain, or irritation, in the ſyſtem. By a ſet I mean four, one grinder in each ſide of either jaw. The milk grinders are not ſhed, as the tuſks are, but are gradually worn away, during the time the ſecond ſet are coming forward; and, as ſoon as the body of the grinder is nearly worn away, the fangs begin to be abſorbed.

"I have not been able to aſcertain the exact time when the ſecond ſet of grinders make their appearance, as I could never get an elephant to open his mouth in ſuch a manner as to permit me to examine his teeth accurately; but, when the elephant is about two years old, the ſecond ſet are completely in uſe. At this period, the third ſet

begin to cut the gum. From the end of the ſecond to the beginning of the ſixth year, the third ſet come gradually forward, as the jaw lengthens, not only to fill up this additional ſpace, but alſo to ſupply the place of the ſecond ſet, which are, during the ſame period, gradually worn away, and their fangs abſorbed. From the beginning of the ſixth to the end of the ninth year, the fourth ſet of grinders come forward, to ſupply the gradual waſte of the third ſet. After this period, ſeveral other ſets are produced. In what time theſe ſucceeding grinders come forward, in proportion to their predeceſſors, I have not been able to aſcertain; but, from the data already given, I conclude, that every ſucceeding grinder takes at leaſt a year more than its predeceſſor to be completed; conſequently, that the fifth, ſixth, ſeventh, and eighth, ſet of grinders, (a further ſucceſſion I have not been able to trace,) will take from five to eight years (and probably much longer) each ſet, before the poſterior lamina has cut the gum. All theſe circumſtances conſidered, I may venture to affirm, that the formation of the teeth and mode of dentition, in the elephant, has but little analogy with thoſe of any other quadruped; nature having, by a peculiar and wonderful contrivance, and in the moſt convenient manner, ſupplied this animal with a regular ſucceſſion of teeth, until he attains a very advanced period of life.

"The mode in which the elephant's grinders are originally formed, my ſhort ſtay at Tiperah did not allow me ſufficient opportunities to inveſtigate; but, ſince my return to England, I have had frequent converſations with Mr. Everard Home, F.R.S. upon that ſubject, who, from an examination of the teeth brought home by me, and ſome preparations in the late Mr. Hunter's collection, has been enabled to proſecute the ſubject with conſiderable ſucceſs."

The object of this gentleman was not only to explain the ſtructure of the elephant's teeth, and hence the different ſources and diſtinctions between *ivory* and *bone*; but alſo to ſhew the general principle upon which all teeth are formed, that have the enamel intermixed with the ſubſtance of the teeth; a ſubject which appears never before to have been inveſtigated.

"The teeth of the elephant (ſays Mr. Home) differ from others, in being compoſed of a great many flattened oval proceſſes; theſe, while growing, are detached; but, when completely formed, their baſes unite together, and make the body of the tooth, to which the fangs are afterwards added; and, as the fangs are lengthened, the tooth riſes in the jaw. This is what may be conſidered as the tooth itſelf, being compoſed of the ſame materials as the teeth of carnivorous animals; but, in addition, there is another ſubſtance, which unites all the proceſſes together, laterally, into one maſs; this is ſofter than the ſubſtance of the tooth, and, upon examination, proves to be ſimilar, in its texture and formation, to common bone. As teeth have been hitherto conſidered of the ſame texture with common bone; it is probable that nothing but the two ſubſtances being united in the ſame maſs, could have led me to the diſcovery of their differing materially from each other. It will therefore be proper to explain the circumſtances which firſt gave me the preſent view of the ſubject.

"To obtain an accurate knowledge of the different parts of the elephant's tooth, a longitudinal ſection was made, of one that was full grown. This ſection expoſed the lateral connection between the different proceſſes, and the intermediate ſubſtance which unites them into one maſs; it alſo ſhewed the mode in which the proceſſes are continued into the body of the tooth and fangs. That the internal ſtructure might be made more diſtinct, the ſurface of this ſection was poliſhed very highly, which led to the diſcovery of the proceſſes of the tooth having a more compact texture than the intermediate ſubſtance; for, although both had the ſame appearance after being ſawn, the proceſſes bore a poliſh, which the other did not, and were laminated, like ivory; while the other parts were porous, like the internal ſtructure of common bone. This led me to examine preparations of the elephant's teeth, in a growing ſtate, preſerved in ſpirit, which explained the mode of growth of theſe two ſubſtances to be different. In theſe preparations it was found, that the proceſſes of the tooth, which may be called *ivory*, were all formed upon ſo many portions of one common pulp, which had its origin in the jaw; and that the intermediate ſubſtance, which may be called *bone*, was formed upon a ſpecies of ligament ſituated immediately under the gum, from which, membranous elongations extended into the ſpaces between the proceſſes of the tooth.

"This ſtructure of tooth is not peculiar to the elephant, but common to the teeth of all animals whoſe food requires to be ground, or much bruiſed, before it is ſwallowed. In the elephant's tooth, from the largeneſs of its ſize, the parts are more diſtinct, and more readily contraſted with each other; but, in other animals, even thoſe of a ſmall ſize, as the ſheep, the different ſtructures are readily detected. It is ſingular that this ſtructure ſhould have eſcaped the accurate inveſtigation of the late Mr. Hunter; particularly as the formation of the teeth was one of the firſt objects he employed himſelf upon; and he continued to purſue it to the end of his life, marking the varieties which occur in different animals.

"A mixture of bony matter with the enamel and the ſubſtance of the tooth, is a ſtructure, as has been mentioned, not confined to the elephant, being common to all truly graminivorous quadrupeds. But the whole number of grinding teeth belonging to each ſide of the jaw being confined in a caſe of bone, ſo as to form one large grinding ſurface, and the teeth being puſhed forward from behind, inſtead of a ſecond ſet being formed immediately under the fangs of the firſt, as in other animals, are peculiarities not met with in any teeth hitherto deſcribed, except thoſe of the elephant, and the *ſus Æthiopicus*. It is curious that the Ethiopian hog ſhould differ ſo widely from all the others of its genus, in reſpect to its teeth; and ſhould be allied to the elephant in the ſtructure of its tuſks, the mode of formation of the grinding teeth, and the manner in which they ſucceed one another. From theſe circumſtances it appears, that the *ſus Æthiopicus*, in a natural ſtate, is ſupplied with a different kind of food from that of other hogs, and is an animal of greater longevity."

This ſingular mode of dentition has not been noticed by profeſſor Camper, in his ingenious work above-mentioned; but he has ſhewn that the ſtructure of the cranium is admirably adapted to afford a ſufficient extent of ſurface for the inſertion of the tuſks, the proboſcis, and muſcles, without unneceſſarily increaſing its weight; for otherwiſe the animal would never have been able to carry its head erect. We ſhall give a tranſlation of the account of this piece of mechaniſm as follows: "In order to include the encephalon within proper bounds, and to allow a ſufficient ſpace for the inſertion of the tuſks, proboſcis, and muſcles, without loading the head with a weight of oſſeous matter, the tables are ſeparated from each other by a great number of bony partitions, prolonged to the diſtance of ſeveral inches. The intervals, filled by an infinity of little cells more or leſs ſpacious, communicate with the throat by means of the euſtachian tube, and are charged with air, inſtead of blood or marrow, which are generally found in the diploë of the mammalia claſs. Perrault, Blair, and Daubenton, have remarked this ſtructure in the elephant, boar, and other quadrupeds: but M. Camper was the firſt to notice its analogy with the ſtructure of the cranium in birds. The oſtrich and the eagle, but above all the owl tribe, particularly the ſcreech-owl, have the tables of the ſkull ſeparated by numerous cells, perfectly ſimilar to thoſe which diſtinguiſh the elephant. The atmoſpheric air enters them in the ſame way; and this admirable mechaniſm, which birds particularly require to diminiſh the

weight of their bones, was neceſſary to the elephant, in order to lighten its head, which would have otherwiſe been much more heavy than the animal could have been able to ſupport."

What has been here ſtated of the proceſs of dentition in the elephant, we have endeavoured to illuſtrate by the annexed Engraving. Fig. 1, repreſents the deciduous or milk *grinder*, worn down to the fangs, with the action of abſorption or decay going on both in the fang and body of the grinder. Where the abſorption has taken place, the grinders and roots have a rough ulcerated appearance.

Fig. 2, is intended to repreſent a deciduous or milk *tuſk* of an elephant, with the proceſs of abſorption or decay taking place in the fang of the tuſk, in order to its being ſhed. A, the deciduous tuſk, projecting from its ſocket. B, the middle of the tuſk, where the decay has commenced. C, the crooked fang, which muſt be abſorbed, before the body of the deciduous tuſk can be ſhed, to make way for the permanent one. D, the ſmall rounded cavity, which is the incipient ſocket for the permanent tuſk, which is now to take place.

Fig. 3, exhibits the firſt and ſecond grinders in the lower jaw; A, is the anterior or milk grinder, repreſented above; this is ſeen to conſiſt of four laminæ; and as this is abſorbed, the others come forward to ſupply its place. B B, the two fangs not yet full grown, but being ſtill hollow at the points. C C, the ſecond grinder, conſiſting of nine teeth. D, the fang common to the three anterior ones, partly formed. E, the bony lamellæ or incipient roots, partly added to the next three teeth. F, the three poſterior teeth or laminæ, juſt beginning to unite.

Fig. 4, ſhews the inferior parts of the grinder in the lower jaw, and the manner in which each tooth or lamina is joined to the one next it. The three anterior teeth are completely joined to each other, and are partly ſeen within their common fang; but the junction of the three poſterior ones is not complete, except at the centre. The roots of theſe, at the lower part, are beginning to be formed; but, anteriorly, are farther advanced, and join the fang common to the three foremoſt teeth, as being firſt to come into uſe. A A, the nine teeth of which the grinder is compoſed. B, the three anterior teeth, completely joined to each other. C, three of the poſterior teeth, where the union is completed only in the middle. D D, the ſpace between the lamellæ of the ſeparate teeth, where they are approaching to join each other, and cover the enamel. E E E, the centres of the different teeth, which will afterwards be filled up, as the oſſification of the fangs advances.

Fig. 5, ſhews the grinder of the lower jaw in its matured ſtate, and repreſents the gradual mode in which one ſet or caſe of teeth ſucceeds another, in proportion as the anterior ones are worn away and abſorbed. F F, ſhews the uneven ſurface of the grinder, with the enamel ſurrounding the bony matter of each tooth which has cut the gum, and come into uſe. G G, the fluted appearance of the grinder, by the junction of the different teeth of which it is compoſed.

Fig. 6, repreſents a grinder of the upper jaw, worn away almoſt to the fangs, even at the poſterior part: the anterior part completely worn away, and great part of the roots and their alveolar proceſſes abſorbed. In this grinder, the indented puckered form of the enamel is finely ſhewn, and alſo its ribbed ſurface. Of the three teeth of the ſucceeding grinder, which had laſt cut the gum, the aftermoſt tooth ſhews eight denticuli or points, each ſurrounded with its proper enamel: the next ſhews five denticuli; but the anterior tooth of this grinder has the centre completely ſurrounded with enamel. The appearance of this grinder is very happily repreſented; the poſterior teeth neareſt the gum being covered with a whitiſh bony cruſt above the enamel; but, nearer the roots, they are not yet joined together. H H, the alveolar proceſſes, which proceed from the alveolus, between the roots of the grinders. I, the ſmooth bony ſurface of the three anterior layers of the grinder, without enamel, which has been completely worn away. K K K, the enamel of the different teeth, ſurrounding their bony centres. L L L, the centres of the teeth of which a grinder is compoſed. M M, the bony matter which joins the teeth to each other. N N, the denticuli or points of the teeth, before they are much worn down; each point ſurrounded with its proper enamel.

There is an obvious variation between the teeth of the African and Aſiatic elephants. In the African elephant, the proceſſes of which the tooth is compoſed are not flattened ovals, as in the Aſiatic, but are in the form of an oblong ſquare or parallelopipedon, ſo that, in the middle line of the tooth, the proceſſes are in contact with each other, although at no other part; by this means, the middle line of the tooth is the hardeſt; the whole ſurface therefore does not wear regularly, as in the Aſiatic elephant, but with a ridge in the middle. To ſhew the true ſhape of each proceſs, it is neceſſary that the points ſhould be worn down to ſome depth, as repreſented in the grinder of an African elephant, at fig. 7, where indeed this is only the caſe with the four largeſt; the other three, which are leſs worn, ſhew the different thickneſſes of the proceſſes, nearer their termination on the upper ſurface of the tooth, having not been brought ſo much into uſe.

In remote ages great pains were taken in taming elephants for war. When Alexander penetrated into India, the natives oppoſed him upon the tame elephants, which they had trained to military diſcipline. The majeſtic elephant, on which Porus rode in his battle with Alexander, diſplayed a ſtrong attachment to his maſter. When the Indian monarch, exhauſted with fatigue, and covered with wounds, obſtinately refuſed to retire or yield himſelf a priſoner, and the Grecian ſoldiers preſſed hard upon him, his elephant ſtill obeyed his direction; and, though all his companions had fled, he ſtill defended his maſter, and attacked thoſe who approached againſt him, with firm and ardent courage. The Greeks, who at firſt beheld the elephant with terror, after triumphing over the nations of the eaſt, introduced them into their own armies. Either a part of thoſe very elephants which Alexander had brought from India, or others introduced ſoon after into Greece, were carried by Pyrrhus into Italy, when he went to oppoſe the Romans. His elephants, with the Macedonian tactics, rendered him, at firſt, no unequal match to the warriors of Rome. But Roman diſcipline, and Roman magnanimity, ſoon triumphed over his military ſkill, and his gigantic cavalry. The Carthaginians, as well as Pyrrhus, found them but weak aids againſt Roman valour. Elephants were often after that exhibited at Rome. In the circus they were at firſt driven about, and ſlain with darts. They were afterwards oppoſed to bulls, and to the rhinoceros. Pliny relates that a number of elephants, exhibited in the circus by Pompey, when they found themſelves deſtined to immediate death, made a vigorous, but ineffectual, effort to break through the iron railing in which they were incloſed: fruſtrated in the attempt, they, with a wailing tone, and, in a ſuppliant poſture, ſeemed to implore the compaſſion of the ſpectators; and ſo impulſively were the whole people ſaid to be affected with the diſtreſs and the ſenſibility ſhewn by thoſe majeſtic animals, that they with one aſſent aroſe, and imprecated deſtruction on the head of the magnificent general who had entertained them with ſuch an affecting ſpectacle; imprecations, ſays the hiſtorian, which ſoon after took effect.

The ſucceſſors of Alexander appear to have long continued the uſe of elephants in their armies. One of the brave Jewiſh brothers, the Maccabees, terminated his life in a glorious manner, by piercing the belly of an elephant, in the army of one of thoſe monarchs fighting againſt his countrymen, with a deadly wound, and ſuffering himſelf to be cruſhed to death under the falling maſs. Elephants trained to war among the Greeks, had turrets raiſed on their backs, from which troops of armed men annoyed

The permanent Teeth, or Grinders of the Elephant.

London, Published as the Act directs March 3, 1804 by J. Wilkes.

annoyed the enemy; while a perſon ſitting on the neck, directed the motions of the elephant, and animated him to fight with his trunk. But, when ſcared or wounded, they diſdained all government, and ſpread confuſion, not leſs readily among their friends, than through the ranks of the adverſe army.

The eaſt is the great theatre on which the ſtrength, the ingenuity, and the generous qualities, of this noble animal have been diſplayed. The Indian princes eſtimate their power and grandeur by the number of their elephants. Many of the Indians are perſuaded that ſo majeſtic a body muſt be animated by the ſoul of a departed king or hero. In Siam, Pegu, and Laos, white elephants, and elephants with one tuſk, are viewed with peculiar veneration, as the living manes of deceaſed emperors. Each has a ſplendid habitation, a faithful domeſtic to attend him, golden veſſels, choice food, and ſplendid robes! They are ſubjected to no ſervile labours, and are taught to bow the knee to the emperor, but before none elſe.

In China, according to ſir George Staunton, the elephant is ſtill found as an appendage of greatneſs, both about the palaces, and in the cavalcades, of the emperor. It is there no leſs regarded for its docility and ſtrength, than for its diſpoſition to be uſeful and obedient to man in all its labours. In Cochin-China, according to the ſame author, elephants are trained for war, by placing ranks of ſoldiers, carved in wood, before them, whom they are taught to attack with great fury, ſeizing them with their trunks, toſſing them in the air, and trampling them under foot. In that country they alſo ſerve for food, and are preferred to the fleſh of the buffalo. See the article COCHIN-CHINA, vol. iv. p. 728.

During our war in India againſt Tippoo Sultaun, the marquis Cornwallis employed elephants to great advantage, in conveying the baggage and ſtores of the Engliſh army. "The great objection at firſt made to elephants being employed, (ſays major Dirom, in his Narrative of that Campaign,) was the difficulty of their ſubſiſtence; as it was ſuppoſed they could not live without a very large daily allowance of rice. This idea, which their keepers are intereſted and careful to inculcate, neceſſity and experience have at length ſet aſide. The elephant is not only the moſt powerful and moſt uſeful, but one of the moſt hardy animals that can be employed with an army. He carries a load equal to ſixteen bullocks, and without riſk of loſs or damage on the march. He ſubſiſts upon the leaves or ſmall branches of trees, on the ſugar-cane, or the plantain-tree: in ſhort, he lives upon forage which horſes and bullocks do not eat; any kind of grain will ſupport him, and he will work as long without grain as any other animal. The loſs of elephants, although they had their full ſhare of hardſhip and fatigue, was inconſiderable in proportion to that of cattle; and far from being an incumbrance, or an expedient of neceſſity to ſupply the want of bullocks, they will hereafter be conſidered as the firſt and moſt eſſential claſs of cattle that ought to be provided for the carriage of an Indian army."

A tame elephant is really the moſt docile, gentle, and obedient, of all animals. He forms an attachment to his keeper; comprehends ſigns; learns to diſtinguiſh the various flections of the human voice, as expreſſive of anger, approbation, or command; is even capable of being taught to underſtand the import of articulate language; adopts, in many inſtances, the manners and the ſentiments of mankind; diſcovers a ſenſe of duty, and of honour, and expects to be honeſtly dealt with; is generous, grateful, patient, magnanimous, and humane. Hence many ludicrous ſtories, compounded of truth and fable, have been related of the elephant, merely to place his ſentient acquirements in a pleaſing point of view. But there are ſufficient well-atteſted proofs of his docility and intelligence, without any neceſſity of reſorting to the marvellous. M. d'Obſonville relates an anecdote of an elephant which places him in a very amiable light. In the Laknaor, the capital of Soubah, during the rage of an epidemic diſtemper, the principal road to the palace gate was covered with ſick and dying people, extended on the ground, and incapable of moving, though at a time when the nabob was to paſs on his elephant. The indifference of the prince about the lives of his periſhing ſubjects, the haſte with which he was to paſs, and the towering motions and heavy ſteps of the elephant, ſeemed to threaten inevitable death to thoſe unhappy wretches who chanced to be in his way. But the generous quadruped, without receiving any command to the purpoſe, and even without ſlackening his pace, dexterouſly aſſiſted the poor creatures with his trunk, removing ſome, raiſing others, and ſtepping over the reſt; ſo that none ſuffered the ſlighteſt injury.

A ſtill more ſingular fact is related by the ſame author. An elephant, who, in the courſe of the war between the French and Engliſh in the Eaſt Indies in 1759, had received a wound by a cannon ball: after being once or twice conducted to the hoſpital to have his wound dreſſed, he conſtantly attended of himſelf at the proper time, till it was healed. That the ſurgeon might operate, he readily extended himſelf on the ground. He bore with patience the application even of a burning cauſtic to his wound. The acuteneſs of the pain would ſometimes force from him a plaintive groan; but to the hand who, by inflicting momentary torments, ſought to accompliſh his cure, he expreſſed none but emotions of gratitude. Gratitude is indeed repreſented by all who have had opportunities of obſerving his manners, as the moſt eminent feature in the character of the domeſtic elephant.

Yet, in a wild ſtate, the rage and fury of this animal is unſpeakable. A more convincing and affecting proof of it cannot be adduced, than that given by captain Edward Riou, in his Journal of a Journey from the Cape of Good Hope, publiſhed in 1792. "A large male elephant (ſays this writer) came one day up to the waggons. We inſtantly purſued and attacked him; when, after he had received ſeveral ſhot, and had twice fallen, he crept into a very thick thorny underwood. Thinking that we had fully done for him, Tjaart Vander Waldt, Lodewyk Prins, and Ignatius Mulder, advanced to the ſpot where he was hid, when he ruſhed out, in a furious manner, from the thicket, and with his trunk catching hold of Lodewyk Prins, who was on horſeback, pulled him off, and trod him to death; and, driving one of his tuſks through the man's body, threw him into the air, to the diſtance of thirty feet. The others, perceiving that there was no poſſibility of eſcaping on horſeback, diſmounted, and crept into the thicket to hide themſelves. The elephant having nothing now in view, but the horſe of Van der Waldt, followed it for ſome time: but turned about, and came to the ſpot near to where the dead body lay, looking about for it. At this inſtant our whole party renewed the attack, in order to drive him from the ſpot; when, after he had received ſeveral ſhots, he again eſcaped into the thickeſt of the wood. We now thought that he was far enough off, and had already begun to dig a grave for our unfortunate companion; at which we were buſily employed, when the elephant ruſhed out again, and driving us all away, remained by himſelf there on the ſpot. Tjaart Vander Waldt got another ſhot at him, at the diſtance of an hundred paces. We every one of us then made another attack upon him; and, having now received ſeveral more bullets, he began to ſtagger; then falling, the Hottentots, with a ſhot or two more, killed him, as he lay on the ground. The fury of this animal is indeſcribable. Thoſe of our party who knew any thing of elephant-hunting, declared, that it was the fleeteſt and moſt furious they had ever beheld." Truly aſtoniſhing it is, that an animal, ſo powerful and implacable in its wild ſtate, ſhould ſo eaſily be tamed; and ſo ſoon be made ſubſervient to the purpoſes and pleaſures of man!

With reſpect to the natural affection of theſe animals towards each other, the Dutch writers appear to have

given us the moſt authentic information. We are told by thoſe hiſtorians, that, in the iſland of Ceylon, now belonging to Great Britain, the elephants live in ſmall troops or families. In wandering from place to place, the males, who are armed with the largeſt tuſks, put themſelves at the head of the troop. Theſe are the firſt to face every danger. In ſwimming over any large river they lead the van, and ſeek out a landing-place; next follow the young elephants that have not yet attained their full growth, clinging together by the trunks; the reſt of the full-grown bring up the rear.

But the moſt ſtriking feature of ſexual regard in this animal, was exemplified in the manners of a male and female elephant, brought to Paris from the Hague, in 1797. The place allotted for their reception had been long prepared. It is a ſpacious hall in the muſeum of natural hiſtory, well aired and lighted. A ſtove is placed in it to warm it during the winter, and it is divided into two apartments, which have a communication with each other by means of a large door reſembling a portcullis. The encloſure round theſe apartments conſiſts of rails made of ſtrong thick beams; and a ſecond encloſure, breaſt high, runs round them, to keep the ſpectators at ſome diſtance, and preſerve them from accidents. The morning after their arrival, theſe animals were put in poſſeſſion of their new habitation. The firſt conducted to it was the male, who iſſued from his iron cage with precaution, and ſeemed to enter his apartment with a degree of ſuſpicion. His firſt care was to reconnoitre the place. He examined each bar with his trunk, and tried their ſolidity by ſhaking them. Care had been taken to place on the outſide the large ſcrews by which they are held together. Theſe he ſought out, and, having found them, tried to turn them, but was not able. When he arrived at the portcullis, which ſeparates the two apartments, he obſerved that it was fixed only by an iron bar, which roſe in a perpendicular direction. He raiſed it with his trunk, puſhed up the door, and entered into the ſecond apartment, where he received his breakfaſt. He ate quietly, and appeared to be perfectly eaſy. During this time people were endeavouring to make the female enter. It is proper here to mention the former mutual attachment of theſe two animals, and with what difficulty they were parted at the Hague, and induced to travel ſeparately. From the time of their departure they had not ſeen each other, not even at Cambray, where they paſſed the winter. They had however been ſenſible that they were near neighbours. The male never lay down, but always ſtood upright, or leaned againſt the bars of his cage, and kept watch for his female, who lay down and ſlept every night. On the leaſt noiſe, or the ſmalleſt alarm, he ſent forth a cry to give notice to his companion. The joy which they expreſſed on ſeeing each other, after ſo long a ſeparation, was very remarkable. When the female entered, ſhe ſent forth a cry expreſſive only of the pleaſure which ſhe felt at finding herſelf more at large. She did not at firſt obſerve the male, who was buſy feeding in the ſecond apartment. The latter alſo did not immediately diſcover that his companion was ſo near him; but the keeper having called him, he turned round, and immediately the two animals ruſhed toward each other, and ſent forth cries of joy ſo animated and loud, that they ſhook the whole hall. They breathed alſo through their trunks with ſuch violence, that the blaſt reſembled an impetuous guſt of wind. The joy of the female was the moſt lively; ſhe expreſſed it, by quickly flapping her ears, which ſhe made to move with aſtoniſhing celerity. She drew her trunk over the body of the male with the utmoſt tenderneſs. She, in particular, applied it to his ear, where ſhe kept it a long time, and, after having drawn it over the whole body of the male, ſhe would often move it affectionately towards her own mouth. The male did the ſame thing over the body of the female; but his joy was more concentrated. He ſeemed to expreſs it by his tears, which fell from his eyes in abundance! The ſociety of theſe two animals, their habits, their mutual tenderneſs, and their natural attachment, ſtill excited by the privation of liberty, may hereafter furniſh curious obſervations for the hiſtory of their ſpecies, ſhould they be able to endure the viciſſitudes of our climate. Theſe two elephants, which are natives of Ceylon, were brought to Holland when quite young. They are now about twenty years of age; and their height is from ſeven to eight feet. We might here remark, that all the elephants heretofore imported into Europe, however liberally fed, and carefully managed, have periſhed by a premature death. At St. Peterſburgh, though clothed, and kept in houſes warmed by ſtoves, and fed on rice, their moſt favourite food, they could not ſurvive the ſeverity of the climate.

The tuſks of the elephant have long been applied, under the denomination of ivory, to a variety of important uſes in the arts. In the country of Sogno, in Lower Ethiopia, the natives diſtil a water from the bones of the elephant's legs, which they eſteem an excellent remedy for aſthma, ſciatica, and ſeveral other complaints. The Giaghi regard the tail of this animal with religious veneration. When a chief or ſovereign dies, an elephant's tail is conſecrated to preſerve his memory. But a ſacred tail muſt always have been cut off from a living elephant, and at a ſingle ſtroke.

Over all the north of Aſia, and through ſeveral other parts of the globe, entire or partial ſkeletons of the elephant are occaſionally found in a foſſil ſtate. Grinders and tuſks are numerous throughout Siberia. Theſe were once aſcribed to an imaginary animal under the name of *mammoth*. In America too, there are large animal ſkeletons found in a foſſil ſtate, which, though their ſtructure appears ſomewhat different from that of the elephant, they approach, however, nearer to this than to any other known ſpecies, and are therefore now referred to this genus. See the article MAMMOTH.

We are greatly indebted to Mr. Corſe, and Mr. Everard Home, for the new and valuable information contained in this article.

E'LEPHAS, *ſ.* in botany. See RHINANTHUS.

E'LERO, a river of Piedmont, which runs into the Tanaro, near Carri.

ELESCHE'VI, a town of Ruſſian Siberia, in the government of Tobolſk, on the Tchulim: eighty-four miles eaſt-north-eaſt of Tomſk.

ELET'TARI, *ſ.* in botany. See AMOMUM.

To E'LEVATE, *v. a.* [*elevo*, Lat.] To raiſe up aloft.—This ſubterranean heat or fire, which *elevates* the water out of the abyſs. *Woodward.*—To exalt; to dignify.—A gentleman of the popular faction had been long declaiming againſt any kind of honours, that tended to *elevate* a body of people into a diſtinct ſpecies from the reſt of the nation. *Shenſtone.*—To raiſe with great conceptions.—In all that great extent, wherein the mind wanders, in thoſe remote ſpeculations it may ſeem to be *elevated* with, it ſtirs not beyond ſenſe or reflection. *Locke.*

Now riſing fortune *elevates* his mind,
He ſhines unclouded, and adorns mankind. *Savage.*

To elate with vicious pride:

To miſchief ſwift, hope *elevates*, and joy
Brightens his creſt. *Milton.*

To leſſen by detraction. This ſenſe, though legitimately deduced from the Latin, is not now in uſe.—When the judgments of learned men are alleged againſt you, what do they but either *elevate* their credit, or oppoſe unto them the judgments of others as learned? *Hooker.*

E'LEVATE, *part. adj.* Exalted; raiſed aloft:

On each ſide an imperial city ſtood,
With tow'rs and temples proudly *elevate*
On ſeven ſmall hills. *Milton.*

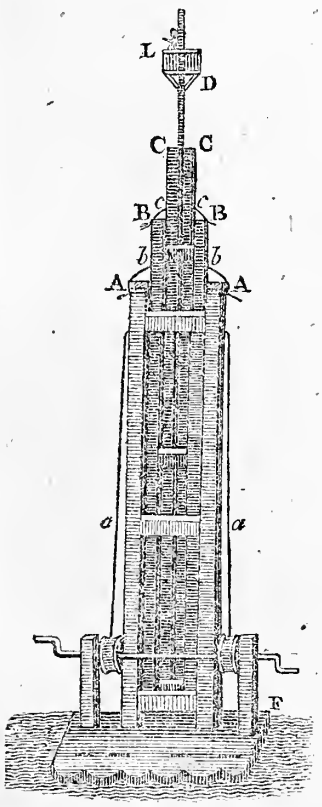
ELEVA'TION, *ſ.* [*elevatio*, Lat.] The act of raiſing aloft.—The diſruption of the ſtrata, the *elevation* of ſome, and

and depreſſion of others, did not fall out by chance, but were directed by a diſcerning principle. *Woodward.*—Exaltation; dignity.—Angels, in their ſeveral degrees of *elevation* above us, may be endowed with more comprehenſive faculties. *Locke.*—Exaltation of the mind by noble conceptions.—We are therefore to love him with all poſſible application and *elevation* of ſpirit, with all the heart, ſoul, and mind. *Norris.*—Exaltation of ſtyle.—His ſtyle was an elegant perſpicuity, rich of phraſe, but ſeldom any bold metaphors; and ſo far from tumid, that it rather wanted a little *elevation*. *Wotton.*—Attention to objects above us.—All which different *elevations* of ſpirit unto God are contained in the name of prayer. *Hooker.*—The height of any heavenly body with reſpect to the horizon.—Some latitudes have no canicular days, as thoſe which have more than ſeventy-three degrees of northern *elevation*, as Nova Zembla. *Brown.*

ELEVA'TOR, *ſ.* [from *eleviate.*] A raiſer or lifter up.

ELEVA'TOR, *ſ.* in anatomy, the name of ſeveral muſcles, ſo called from their ſerving to raiſe the parts of the body to which they belong. In ſurgery, it is an inſtrument for raiſing depreſſed or fractured parts of the ſkull. See SURGERY.

ELEVA'TOR, *ſ.* A machine for raiſing any thing to an height from the ſurface of the earth; lately invented by Dr. Collin, of the American Philoſophical Society, who was honoured with the Magellanian gold medal for this invention. The main body of the baſe is a rectangular ſolid floor, as repreſented in the figure. The pillars A A, ſtand vertical on the long diameter of the baſe, equally diſtant from its ends. Their feet enter into it, and are by ſtrong faſtenings incorporated with its body. Theſe pillars are pairs. Their inner ſides have grooves from top to bottom, which terminate by offsets in cylindric ſegments. Near the tops are central embraſures, whoſe ſides are fortified with iron plates that reach within the ſolid parts above and below. The pulleys are of metal, with ſteel axes and braſs naves for eaſy turning, and deep channels for ſecuring the cords. The pillars are joined by three pairs of ribs. Theſe are rectangular; and wide, but comparatively thin; placed horizontally, between the tops and embraſures, about the middles, and near the feet. Their ends are cloſely fitted within the pillars, and well faſtened. The piers B B, are more ſlender than A A, with ſhorter heads; but the length of their bodies is equal to the whole of theſe. They have ſimilar grooves, embraſures, pulleys, and joining ribs. Their faces are parallel rectangles. The backs of their bodies have tongues along the middles that fit the grooves of A A. Theſe are vertical rectangular ridges, and parts of the very pieces, formed by cutting down both ſides to a proper level. Theſe lower ſurfaces, being even and ſmooth, will thus move cloſe along the correſponding plain parts of A A, while the tongues glide in contact with the ſides of the grooves. The cords *a a*, are well paired in length and texture. They ply over the pulleys of A A, in the ſaid hollows behind the grooves; having their ends fixed under the feet of B B, and on the boxes of the windlaſs. This is well ſecured in the baſe, cloſe to and right beneath the pillars. The cords *b b* are faſtened by one end on the heads of A A. They paſs over the pulleys of B B, and reach as far below them as *a a* reach below the pulleys of A A, which is the diſtance of theſe pulleys from the baſe. Their other ends are tacked a little above the bottoms of the piers C C. Theſe piers are with their apparatus framed like B B; have leſs bulk and ſhorter heads. Their pulleys clear the tops of B B when the machine is down. The cords *c c* have the ſame length with *b b*, below the pulleys of C C; plying over theſe; faſtened on the heads of B B, and ſomewhat above the bottom of the pier D. This is a ſingle piece. It has two backs to fit the grooves of C C, formed like the backs of the other pieces. A frame is accurately fixed and poiſed on the top of D. In this the load L is placed, ſo that its center of gravity is exactly or very nearly over the center of the frame. When the power begins to wind the cords *a a*, theſe raiſe the piers B B. As they riſe, their pulleys recede from the tops of A A, and by ſtretching the cords *b b*, lift the piers C C. Theſe recede at the ſame time from the tops of B B, and lift the pier D. Thus while B B are wound up from the baſe to the height of the pulleys of A A, D riſes treble that height; and, however great may be the number of moving pieces, it multiplies the celerity and acquired elevation of the uppermoſt by that of the firſt. As the duration and celerity of all the movements is the ſame, the lengths of all the cords below the reſpective pulleys muſt be equal. As the whole acquired elevation is by thoſe parts of the piers which are drawn out of their folds, theſe ought to have a very great proportion. Therefore B B reach the baſe when down; and the heads of A A are but long enough to keep them ſafe in their grooves, when drawn up. Again, as the ends of the cords *b b* will be above the baſe according to the length of the heads of A A, the heads of B B are ſhortened, and the bodies of C C are prolonged below thoſe ends in order to ſave room, and yet afford theſe piers a ſecure depth in the grooves of B B, when drawn up. On the ſame principle the heads of C C are ſhortened, and a part of D left under the ends of *c c*. The pier D preſſes the cords *c c* by its own weight, and the load L. This preſſure cauſes an equal pulling, and conſequential reſiſtance in the tops of the piers B B. The pulleys of the piers C C muſt bear this double preſſure $= 2L + 2D$. Theſe therefore preſs the cords *b b*, with ſaid weight and their own $= 2L + 2D + CC$. This doubled $= 4L + 4D + 2CC$ is the preſſure on the pulleys of B B: but their heads are pulled up by $L + D$: the difference of theſe forces added to their own weight is the preſſure of theſe piers on the cords *a a*, $= 3L + 3D + 2CC + BB$. The power on the windlaſs muſt be equal to this. The form of the windlaſs determines, in combination with the preceding, the ſpeed of operation, and the degree of power. It admits various modes: for example, one might be placed on either ſide of the pillars, with long handles on the winches, by which eight men can work together. This model is intended to ſhew conſiderable effects from an eaſy apparatus; accordingly two men lift another, and three tiers of piers; they are aided by a ſufficient projection of the winches beyond the ſemidiameter of the boxes: this has ſuch proportion to the height of the pulleys in the pillars, and the equal length of the cords *a a* below them, that the whole winding is done by a few turns. The dimenſions of the piers are not ſpecified; but the machine has great ſtability, and the baſe is not extenſive.



This machine combines theſe advantages: ready approach to heights otherwiſe not acceſſible without great trouble; ſpeedy aſcent and deſcent; convenient folding for keeping under cover, and for eaſy conveyance. It can be applied to ſeveral uſeful purpoſes: quick hoiſting and lowering of things on many occaſions; particularly ſaving

of goods from upper ſtories in caſes of conflagration; high elevation and ſpeedy exchange of ſignals; theſe being light may be raiſed three hundred feet, and above interjacent hills; elevation of a perſon for taking views, and quick deſcent when required; as on reconnóitring an enemy within ſhot: a machine calculated for lifting him at leaſt one hundred feet by eight men can be light enough for carrying on a waggon by two horſes.

ELE'VE, *ſ.* [Fr.] Diſciple.—He attached himſelf to ſir Robert Walpole, and was one of his ableſt *eleves*. *Cheſterfield's Characters.*

ELE'VEN, *adj.* [ænbleꝑen, Sax.] Ten and one; one more than ten.—Had I a dozen ſons, and none leſs dear than Marcius, I had rather *eleven* die nobly for their country, than one voluptuouſly ſurfeit out of action. *Shakeſpeare.*

ELE'VENTH, *adj.* The next in order to the tenth.—In the *eleventh* chapter he returns to ſpeak of the building of Babel. *Raleigh.*

ELEU'SINE, *ſ.* in botany. See CYNOSURUS.

ELEUSI'NIA, *ſ.* A celebrated feſtival obſerved every fourth year by the Celeans, Phliaſians, as alſo by the Pheneatæ, Lacedæmonians, Parrhaſians, and Cretans; but more particularly by the people of Athens, every fifth year, at Eleuſis in Attica, where it was introduced by Eumolpus, B. C. 1356. It was the moſt celebrated of all the religious ceremonies of Greece, whence it is often called by way of eminence, μυστηρια, the myſteries. It was ſo ſuperſtitiouſly obſerved, that if any one ever revealed it, it was ſuppoſed that he had called divine vengeance upon his head, and it was unſafe to live in the ſame houſe with him. Such a wretch was publicly put to an ignominious death. This feſtival was ſacred to Ceres and Proſerpine; every thing contained a myſtery, and Ceres herſelf was known only by the name of αχθεια, from the ſorrow and grief (αχθος), which ſhe ſuffered for the loſs of her daughter. This myſterious ſecrecy was ſolemnly obſerved, and enjoined to all the votaries of the goddeſs; and if any one ever appeared at the celebration, either intentionally, or through ignorance, without proper introduction, he was immediately puniſhed with death. Perſons of both ſexes and all ages were initiated at this ſolemnity, and it was looked upon as ſo heinous a crime to neglect this ſacred part of religion, that it was one of the heavieſt accuſations which contributed to the condemnation of Socrates. The initiated were under the more particular care of the deities, and therefore their life was ſuppoſed to be attended with more happineſs and real ſecurity than that of other men. This benefit was not only granted during life, but it extended beyond the grave, and they were honoured with the firſt places in the Elyſian fields, while others were left to wallow in perpetual filth and ignominy. As the benefits of expiation were ſo extenſive, particular care was taken in examining the character of ſuch as were preſented for initiation. Such as were guilty of murder, though againſt their will, and ſuch as were convicted of witchcraft, or any heinous crime, were not admitted, and the Athenians ſuffered none to be initiated but ſuch as were members of their city. This regulation, which compelled Hercules, Caſtor, and Pollux, to become citizens of Athens, was ſtrictly obſerved in the firſt ages of the inſtitution, but afterwards all perſons, barbarians excepted, were freely initiated. The feſtivals were divided into great and leſs myſteries. The leſs were inſtituted from the following circumſtance: Hercules paſſed near Eleuſis while the Athenians were celebrating their myſteries, and deſired to be initiated. As this could not be done, becauſe he was a ſtranger; and as Eumolpus was unwilling to diſpleaſe him on account of his great power, and the ſervices which he had done to the Athenians, another feſtival was inſtituted without violating the laws. It was called μικρα, and Hercules was ſolemnly admitted to the celebration, and initiated. Theſe leſs myſteries were obſerved at Agræ near the Iliſſus. The greater were celebrated at Eleuſis, from which place Ceres has been called *Eleuſinia*. In later times the ſmaller feſtivals were preparatory to the greater, and no perſon could be initiated at Eleuſis, without a previous purification at Agræ. This purification they performed by keeping themſelves pure, chaſte, and unpolluted, during nine days, after which they came and offered ſacrifices and prayers, wearing garlands of flowers, called ισμερα, or ιμερα, and having under their feet Διος κωδιον, Jupiter's ſkin, which was the ſkin of a victim offered to that god. The perſon who aſſiſted was called υδρανος, from υδωρ, water, which was uſed at the purification, and they themſelves were called μυσται, the initiated. A year after the initiation at the leſs myſteries, they ſacrificed a ſow to Ceres, and were admitted in the greater, and the ſecrets of the feſtivals were ſolemnly revealed to them, from which they were called εφοροι, and εποπται, inſpectors. The inſtitution was performed in the following manner: The candidates, crowned with myrtle, were admitted by night into a place called μυστικος σηκος, the myſtical temple, a vaſt and ſtupendous building. As they entered the temple, they purified themſelves by waſhing their hands in holy water, and received for admonition that they were to come with a mind pure and undefiled, without which the cleanneſs of the body would be unacceptable. After this, the holy myſteries were read to them, from a large book, called πετρωμα, becauſe made of two ſtones, πετραι, fitly cemented together. After this, the prieſt, called ιεροφαντης, propoſed to them certain queſtions, to which they readily anſwered. After this, ſtrange and amazing objects preſented themſelves to their ſight, the place often ſeemed to quake, and to appear ſuddenly reſplendent with fire, and covered with gloomy darkneſs and horror. Sometimes thunders were heard, or flaſhes of lightning appeared on every ſide. At other times hideous noiſes and howlings were heard, and the trembling ſpectators were alarmed by ſudden and dreadful apparitions. This was called αυτοψια, intuition. After this, the initiated were diſmiſſed with the barbarous words of κογξ, ὀμπαξ. The garments in which they were initiated were held ſacred, and of no leſs efficacy to avert evils than charms and amulets. From this circumſtance, therefore, they were never left off before they were totally unfit for wear, after which they were appropriated for children, or dedicated to the goddeſs. The chief perſon that attended at the initiation was called ιεροφαντης, the revealer of ſacred things. He was a citizen of Athens, and held his office during life, though among the Celeans and Phliaſians it was limited to the period of four years. He was obliged to devote himſelf totally to the ſervice of the deities; his life was chaſte and ſingle, and he uſually anointed his body with the juice of hemlock, which is ſaid, by its extreme coldneſs, to extinguiſh the carnal appetite. The hierophantes had three attendants; the firſt was called δαδουχος, torch-bearer, and was permitted to marry. The ſecond was called κηρυξ, a crier. The third adminiſtered at the altar, and was called ο επι βωμω. The hierophantes is ſaid to have been a type of the powerful Creator of all things, δαδουχος of the Sun, κηρυξ of Mercury, and ο επι βωμω of the Moon. There were, beſides theſe, other inferior officers, who took particular care that every thing was performed according to cuſtom. The firſt, called βασιλευς, was one of the archons; he offered prayers and ſacrifices, and took care that there was no indecency or irregularity during the celebration. Beſides him there were four others called επιμελητοι, curators, elected by the people. One of them was choſen from the ſacred family of the Eumolpidæ, the other was one of the Ceryces, and the reſt were from among the citizens. There were alſo ten perſons who aſſiſted at this and every other feſtival, called ιεροποιοι, becauſe they offered ſacrifices. This feſtival was obſerved in the month Boedromion or September, and continued nine days, from the 15th till the 23d. During that time it was unlawful to arreſt any man, or preſent any petition on pain of forfeiting a thouſand drachmas,

drachmas, or, according to others, on pain of death. It was alſo unlawful for thoſe who were initiated to ſit upon the cover of a well, to eat beans, mullets, or weazels. If any woman rode to Eleuſis in a chariot, ſhe was obliged, by an edict of Lycurgus, to pay ſix thouſand drachmas. The deſign of this law was to deſtroy all diſtinction between the richer and poorer ſort of citizens. The firſt day of the celebration was called αγορμος, aſſembly, as it might be ſaid that the worſhippers firſt met together. The ſecond day was called αλα δε μυσται, to the ſea, you that are initiated, becauſe they were commanded to purify themſelves by bathing. On the third day ſacrifices, and chiefly a mullet, were offered; as alſo barley from a field of Eleuſis. Theſe oblations were called θυα, and held ſo ſacred, that the prieſts themſelves were not, as in other ſacrifices, permitted to partake of them. On the fourth day they made a ſolemn proceſſion, in which the καλαθιον, holy baſket of Ceres, was carried about in a conſecrated car; while on every ſide the people ſhouted, Χαιρε Δημητερ, Hail, Ceres! After theſe, followed women, called κιστοφοροι, who carried baſkets, in which were ſeſanum, carded wool, grains of ſalt, a ſerpent, pomegranates, reeds, ivy boughs, certain cakes, &c. The fifth was called η των λαμπαδων ημερα, the torch day, becauſe on the following night the people ran about with torches in their hands. It was uſual to dedicate torches to Ceres, and contend which ſhould offer the biggeſt, in commemoration of the travels of the goddeſs, and of her lighting a torch in the flames of mount Etna. The ſixth day was called Ιακχος, from Iacchus, the ſon of Jupiter and Ceres, who accompanied his mother in her ſearch after Proſerpine, with a torch in his hand. From that circumſtance his ſtatue had a torch in its hand, and was carried in ſolemn proceſſion from the Ceramicus to Eleuſis. The ſtatue, with thoſe that accompanied it, called Ιακχαγωγοι, were crowned with myrtle. In the way, nothing was heard but ſinging, and the noiſe of brazen kettles, as the votaries danced along. The way through which they iſſued from the city was called ιερα οδος, the ſacred way; the reſting place, ιερα συκη, from a fig-tree which grew in the neighbourhood. They alſo ſtopped on a bridge over the Cephiſus, where they derided thoſe that paſſed by. After they had paſſed this bridge, they entered Eleuſis by a place called μυστικη εισοδος, the myſtical entrance. On the ſeventh day were ſports, in which the victors were rewarded with a meaſure of barley, as that grain had been firſt ſown in Eleuſis. The eighth day was called Επιδαυριον ημερα, becauſe once Æſculapius, at his return from Epidaurus to Athens, was initiated by the repetition of the leſs myſteries. It became cuſtomary, therefore, to celebrate them a ſecond time upon this, that ſuch as had not hitherto been initiated might be lawfully admitted. The ninth and laſt day of the feſtival was called πληροχοαι, earthen veſſels, becauſe it was uſual to fill two ſuch veſſels with wine, one of which being placed towards the eaſt, and the other towards the weſt, which, after the repetition of ſome myſtical words, were both thrown down, and the wine, being ſpilt on the ground, was offered as a libation. Such was the manner of celebrating the Eleuſinian myſteries, which have been deemed the moſt ſacred and ſolemn of all the feſtivals obſerved by the Greeks. Some have ſuppoſed them to be obſcene and abominable, and that from thence proceeded all the myſterious ſecrecy. They were carried from Eleuſis to Rome in the reign of Adrian, where they were obſerved with the ſame ceremonies as before, though perhaps with more freedom and licentiouſneſs. They laſted about 1800 years, and were at laſt aboliſhed by Theodoſius the Great. *Ælian. Pauſanias.*

ELEU'SIS, anciently a city in Attica, between Megara and the Piræus, celebrated for the feſtivals of Ceres, above deſcribed. It is now a ſmall village, at the eaſtern extremity of a rocky brow, on which was once a caſtle; and is inhabited by a few Albanian families, employed in the culture of the plain, and ſuperintended by a Turkiſh governor, who reſides in an old ſquare tower. Its extenſive ruins ſtill manifeſt its ancient magnificence, and afford various ſubjects of information and curioſity to the antiquarian and inquiſitive traveller.

ELEU'THERA, or ALABASTER ISLAND, one of the Bahama iſlands; the climate is healthy, and the ſoil is fertile. It has a fort and a ſmall garriſon. Lat. 25. 14. N. lon. 76. 31. W. Greenwich.

ELEUTHE'RIA, a feſtival celebrated at Platæa in honour of Jupiter Eleutherius, or the aſſertor of liberty, by delegates from almoſt all the cities of Greece. Its inſtitution originated in this: after the victory obtained by the Grecians under Pauſanias over Mardonius the Perſian general in the country of Platæa, an altar and ſtatue were erected to Jupiter Eleutherius, who had freed the Greeks from the tyranny of the barbarians. It was further agreed upon in a general aſſembly, by the advice of Ariſtides the Athenian, that deputies ſhould be ſent every fifth year from the different cities of Greece to celebrate Eleutherian *feſtivals of liberty*. The Platæans celebrated alſo an anniverſary feſtival in memory of thoſe who had loſt their lives in that famous battle. The celebration was thus: At break of day a proceſſion was made with a trumpeter at the head, ſounding a ſignal for battle. After him followed chariots loaded with myrrh, garlands, and a black bull, and certain free young men, as no ſigns of ſervility were to appear during the ſolemnity, becauſe they, in whoſe honour the feſtival was inſtituted, had died in the defence of their country. They carried libations of wine and milk in large eared veſſels, with jars of oil and precious ointments. Laſt of all appeared the chief magiſtrate, who, though not permitted at other times to touch iron, or wear garments of any colour but white, yet appeared clad in purple; and, taking a water-pot out of the city chamber, proceeded through the middle of the town with a ſword in his hand, towards the ſepulchres. There he drew water from a neighbouring ſpring, and waſhed and anointed the monuments; after which he ſacrificed a bull upon a pile of wood, invoking Jupiter and infernal Mercury, and inviting to the entertainment the ſouls of thoſe happy heroes who had periſhed in the defence of their country. After this he filled a bowl with wine, ſaying, I drink to thoſe who loſt their lives in the defence of the liberties of Greece. There was alſo a feſtival of the ſame name obſerved by the Samians in honour of the god of love. Slaves alſo, when they obtained their liberty, kept a holiday, which they called *Eleutheria*.

ELEUTHE'RUS, in ancient geography, the name of a river in Paleſtine. 1 *Macc.* xi. 7.

ELEU'THES, a kingdom of Tartary, ſituated on the north-weſt of Chineſe Tartary. It was conquered, in 1759, by the emperor of China.

ELF, *ſ.* plural *elves*; [*elf*, Welſh. *Baxter's* Gloſſ.] A wandering ſpirit, ſuppoſed to be ſeen in wild unfrequented places; a fairy:

The king of *elfs* and little fairy queen
Gambol'd on heaths, and danc'd on ev'ry green. *Dryd.*

If e'er one viſion touch'd thy infant thought,
Of all the nurſe and all the prieſt have taught;
Of airy *elves* by moonlight ſhadow ſeen
The ſilver token, and the circled green. *Pope.*

A devil:

That we may angels ſeem, we paint them *elves*;
And are but ſatires to ſet up ourſelves. *Dryden.*

[Figuratively.] A diminutive perſon:

Though now he crawl along the ground ſo low,
Nor weeting how the muſe ſhould ſoar on high,
Wiſheth, poor ſtarv'ling *elf*, his paper-kite may fly.
Shenſtone.

To ELF, *v. a.* To entangle hair in ſo intricate a manner, that it is not to be unravelled. This the vulgar have ſuppoſed

ſuppoſed to be the work of fairies in the night; and all hair ſo matted together, hath had the name of *elf-locks*. *Hanmer.*

My face I'll grime with filth,
Blanket my loins, *elf* all my hair in knots. *Shakeſpeare.*

ELF-ARROWS, *ſ.* in Engliſh antiquity, flint-ſtones ſharpened on each ſide in ſhape of arrow-heads, made uſe of in war by the ancient Britons; of which ſeveral have been found in England, and greater plenty in Scotland, where it is ſaid the common people imagined they dropt from the clouds; or were made by the *elves* or fairies. See the article ARCHERY, vol. ii. p. 51.

ELFE'DSJ, a mountain of Arabia, in the province of Yemen: twelve miles north-eaſt of Abu-Ariſch.

EL'FELD, or ELTVIL, a town of Germany, in the circle of the Lower Rhine, and electorate of Mentz: fourteen miles north-weſt of Mentz.

EL'FIN, *adj.* Relating to fairies; elfiſh; belonging to elves:

Now when that idle dream was to him brought,
Unto that *elfin* knight he bade him fly,
Where he ſlept ſoundly. *Spenſer.*

EL'FIN, *ſ.* Little urchin:

And in thoſe *elfins'* ears would oft deplore
The times, when truth by popiſh rage did bleed. *Shenſt.*

ELF'ISH, *adj.* [ælf, Sax. *larva.*] Clad in diſguiſe:

Thou talk'ſt it ſmoothly, ſtripling; yet we fear,
Thou art ſome *elfiſh* truant. *Maſon's Argentile.*

ELF'LOCK, *ſ.* Knots of hair twiſted by elves:

This is that very Mab,
That plats the manes of horſes in the night,
And cakes the *elf-locks* in foul ſluttiſh hairs,
Which, once untangled, much misfortune bodes.
Shakeſpeare.

ELFS'BORG GAMLA, or OLD ELFSBORG, a town of Sweden, in the province of Weſt Gothland, with a ſtrong caſtle near the ſea. In 1563 it was burned, and the caſtle taken by the Danes; but reſtored to the Swedes. In 1611, the Danes became maſters of it again; but two years after it was returned to the Swedes: four miles ſouth-weſt of Gottenburg.

ELFS'BORG (NEW), a fortreſs of Sweden, in the province of Weſt Gothland, built in the year 1646, on an iſland at the mouth of the Moldal: four miles weſt of Gothenburg.

EL'GA, a river which riſes three miles north from Penna Macor, in Portugal, and runs into the Tagus, between Alcantara and Roſmarilhal, ſeparating the countries of Spain and Portugal during its whole courſe of about thirty miles.

ELGATTAR', a town of Africa, in the country of Algiers: thirty-ſeven miles ſouth of Bona.

EL'GEND, a town of Arabia, in the country of Hadramaut: ſixty miles weſt of Hadramaut.

ELGG, a town and lordſhip of Swiſſerland, in the canton of Zurich.

ELGIEBA'MA, a town of Africa, in the empire of Morocco, about two leagues from mount Atlas.

EL'GIN, a town of Scotland, and capital of the county of Murray, or Elginſhire, near the river Loſſie, formerly the ſee of a biſhop. Ruins of the cathedral, founded in 1224, yet remain, and give evidence of its ancient magnificence. The lead was taken off the cathedral to pay the troops, in the year 1567. The town and cathedral were burnt in 1339, by the earl of Buchan, called the *Wolf of Badenoch*, for his impiety: thirty miles eaſt of Inverneſs, and one hundred north of Edinburgh.

EL'GIN (COUNTY). See MURRAY.

EL'GIS, a town of Egypt: ſix miles ſouth of Abu-Girgeh.

ELGOY'BAR, a town of Spain, in the province of Guipuſcoa: thirteen miles weſt-ſouth-weſt of St. Sebaſtian.

EL'GUZE, *ſ.* in aſtronomy, the bright ſtar in the left ſhoulder of Orion.

EL'HAM, a ſmall town in Kent, ſituated on the leſſer Stour, between Wye and Hythe, ten miles from Canterbury, ten from Dover, ſix from Folkſtone, and ſixty-ſeven from London. It lies low, and cloſe by is exceeding good running-water: the land in general is poor, cold, and ſtoney. The place has in ages paſt been conſiderably larger. Its market, which was formerly kept on Mondays, is not in uſe at preſent. There are four annual fairs, viz. Palm Monday, Eaſter, and Whit Mondays, and the 20th of October. Here is a good charity-ſchool, founded by the late ſir John Williams, knight.

ELHAM'MA, or EL HAMMA, a town of Africa, in the country of Tripoli. Lat. 34. N. lon. 28. 26. E. Ferro.

ELHA'NAN, [Heb. the grace of God.] A man's name.

E'LI, [עלי Heb. i.e. offering or lifting up.] High-prieſt of the Iſraelites, and judge of that people for forty years, was of the family of Ithamar, the younger branch of Aaron's houſe, and appears to have united the prieſtly and judicial character about the year before Chriſt 1156. During almoſt the whole of his adminiſtration, the Iſraelites were in a ſtate of vaſſalage to the Philiſtines, into whoſe hands they were delivered as a puniſhment for their national vices and degeneracy; and Eli, notwithſtanding that he appears to have been a pious and good man, contributed much to that degeneracy, by his want of fortitude and reſolution in reproving and puniſhing immorality, and by ſuffering even his own ſons, Hophni and Phineas, to countenance, by their practice, the exceſſes of debauchery and irreligion. This remiſſneſs in Eli was ſo offenſive to God, that a prophet was commiſſioned to upbraid him for his ingratitude and indifference, and to predict the approaching ruin of his houſe. Young Samuel was alſo appriſed, in a viſion, of the puniſhment which would ſhortly be inflicted upon Eli's family; and, when ſolemnly adjured not to conceal what had been revealed to him, he related the particulars of the divine denunciation. On hearing them, the aged high-prieſt, ſenſible how juſtly he merited the threatened calamity, could only exclaim, "It is the Lord; let him do what ſeemeth him good." Not long after this, the Iſraelites, having ſuſtained conſiderable loſs in an attempt to emancipate themſelves from their thraldom, brought the ark of God into their camp, to invigorate their people with freſh courage, and to ſtrike a terror into their enemies. But this extraordinary meaſure was only a prelude to their complete defeat, in which the two ſons of Eli, who bare the ark, were killed, and that ſacred ſymbol of the divine preſence fell into the hands of the Philiſtines. When tidings of theſe fatal diſaſters were brought to Eli, he was unable to bear up under the afflicting intelligence, and falling backwards from his ſeat, broke his neck, and died. At the time of his death he was ninety-eight years of age.

E'LIAB, [Heb. God is my father.] A man's name.

ELI'ADA, [Heb. the knowledge of God.] A man's name.

ELI'AKIM, [of אל God, and קים he aroſe; i.e. God ariſes.] A proper name of a man in ſcripture.

ELI'AM, [Heb. the people of God.] A man's name.

E'LIANT, a town of France, in the department of Finiſterre, and chief place of a canton, in the diſtrict of Quimper: two leagues and a half eaſt of Quimper.

ELI'AS, [Heb. the powerful God.] A man's name.

ELI'AS LEVITA, a learned Jewiſh rabbi, who flouriſhed in the ſixteenth century, was a native of Germany, but ſpent the greater part of his life at Rome and at Venice, in which cities he taught the Hebrew language to numerous Chriſtian pupils. He was one of the moſt learned and enlightened critics of whom the modern Jews have to boaſt, who judiciouſly exploded many of their unfounded traditions; and, among others, that which refers the invention of the vowel-points to ſo high an antiquity as the time of Ezra, aſcribing it, with greater probability,

probability, to the Jewiſh doctors of the ſchool of Tiberias, about the ſixth century of the Chriſtian era. His work, entitled *Maſſoret Hammaſſoret*, and his *Sepher Zichroneth*, or Collection of Maſſoretic Obſervations from ancient Authors, will be found of eſſential ſervice in illuſtrating the difficulties of the Maſſora. He has alſo contributed more than any other of the learned Jews to facilitate our acquaintance with the Targums, or Chaldee paraphraſes, by drawing up A Chaldaic, Talmudic, and Rabbinic, Lexicon, which was publiſhed in 1541, in folio. Beſides the treatiſes above-mentioned, he was the author of a Hebrew gloſſary, entitled *Thiſbi*, publiſhed by Paul Fagius, in Hebrew and Latin, in 1542, 8vo. ſeveral works on Hebrew grammar, beſides illuſtrations of Kimchi's valuable performance on the ſame ſubject, highly uſeful to thoſe who would thoroughly underſtand the Hebrew tongue. *Traditio Doctrinæ*, 4to. in Hebrew, 1538, and with the verſion of Munſter, in 8vo. 1539. *Collectio Locorum in quibus Chaldæus Paraphraſtes interjecit Nomen Chriſti, verſa à Genebrardo*, 8vo. 1572.

ELI'ASHIB, [Heb. the God of converſion.] A man's name.

ELI'ATHAH, [Heb. my God comes.] The name of a man.

E'LICHMAN (John), a native of Sileſia in the ſeventeenth century, who practiſed phyſic at Leyden, and was remarkable for underſtanding ſixteen languages. He ſupported an opinion, that the German and Perſian languages were derived from the ſame origin. His Latin tranſlation of The Tablet of Cebes, with the Arabic verſion and the Greek, was printed at Leyden in 1640, under the care of Salmaſius.

ELICHRY'SO, *ſ.* in botany. See ACHYRANTHES, BACCHARIS, IVA, TARCHONANTHUS, and CONYZA.

ELICHRY'SUM, *ſ.* in botany. See ATHANASIA, CHRYSOCOMA, CONYZA, GUAPHALIUM, STOEBE, TANACETUM, TARCHONANTHUS, and XERANTHEMUM.

To ELI'CITE, *v.a.* [*elicio*, Lat.] To ſtrike out; to fetch out by labour or art.—Although the ſame truths may be *elicited*, and explicated by the contemplation of animals, yet they are more clearly evidenced in the contemplation of man. *Hale.*

ELI'CIT, *adj.* [*elicitus*, Lat.] Brought into act; brought from poſſibility to real exiſtence.—The ſchools diſpute whether, in morals, the external action ſuperadds any thing of good or evil to the internal *elicit* act of the will. *South.*

ELICITA'TION, *ſ.* [*elicio*, Lat.] The *elicitation* which the ſchools intend, is a deducing of the power of the will into act: that drawing which they mention, is merely from the appetibility of the object. *Bramhall.*

To E'LIDE, *v.a.* [*elido*, Lat.] To break in pieces; to cruſh.—We are to cut off that whereunto they, from whom theſe objections proceed, fly for defence, when the force and ſtrength of the argument is *elided*. *Hooker.*

ELIE'NESS, a cape of Scotland, on the ſouth coaſt of the county of Fife, at the mouth of the frith of Forth. Lat. 56. 10. N. lon. 0. 22. E. Edinburgh.

ELIE'ZER, ſaid to have been a Jewiſh rabbi, and author of a work, entitled The Chapters of Rabbi Eliezer, which is a compound of hiſtory and allegory. It is held in eſteem among the Jews, and conſidered as one of the moſt ancient books in their poſſeſſion. Some of them have placed the author in ſo early a period as the year 73 or 75 of the Chriſtian era, and repreſent him to have been one of the compilers of the Miſhna. Father Morin, however, has ſhewn, that the writer of that book did not compile it before the year 700; and that he was moſt probably an impoſtor, who aſſumed the name of Eliezer, and collected the fabulous materials which are diſperſed through it, from the Talmud and other rabinical writings. Voſſius, in the preface to his tranſlation of it, gives it as his opinion, that it is of a much later date than the Jews pretend; and, though it is replete with abſurd tales and fables, it furniſhes many valuable interpretations, which ſerve to illuſtrate the hiſtory and the traditions of the Jews.

ELIGIBI'LITY, *ſ.* Worthineſs to be choſen.—The buſineſs of the will is not to judge concerning the nature of things, but to chooſe them in conſequence of the report made by the underſtanding as to their *eligibility* or goodneſs. *Fiddes.*

EL'IGIBLE, *adj.* [*eligibilis*, Lat.] Fit to be choſen; worthy of choice; preferable.—Certainty, in deep diſtreſs, is more *eligible* than ſuſpenſe. *Clariſſa.*

EL'IGIBLENESS, *ſ.* Worthineſs to be choſen; preferableneſs.

ELIGURI'TION, [Lat.] The act of haſty eating or devouring.

ELIHO'REPH, [Heb. the god of winter.] A man's name.

ELI'HU, [of אל my God, and הוא he, i.e. he is my God.] One of Job's friends.

ELI'JAH, [of אל God, and יה the Lord, i.e. God the Lord.] Sometimes called ELIAS, one of the greateſt of the Hebrew prophets, had the ſurname of the *Tiſhbite*, moſt probably from the town or diſtrict in which he was born, and was a reſident among the inhabitants of Gilead, if not a native of their country. He commenced his prophetic office nearly 920 years before Chriſt, under the reign of Ahab, who was a prince of an impious character, and introduced among the Iſraelites the abominable rites of the Sidonian idolatry. The firſt commiſſion which the prophet received, was to appear before Ahab; and, after ſeverely reproving him for his apoſtacy, to threaten him with a long drought, in which there ſhould be no rain, unleſs it were in anſwer to the prophet's prayers. For this reproof Ahab was ſo incenſed againſt Elijah, that he determined to make him feel his vengeance; but the prophet, on receiving a divine admonition, withdrew from his power, and retired to a ſecret place, where he was for ſome time miraculouſly ſuſtained. We refer to the ſacred books for the particulars of his miſſion, the narrative of which cannot be abridged without injury to its beauty and effect. Elijah's tranſlation took place in the year 896 before Chriſt. The Jews, by miſconſtruing the prophecy in Malachi iv. 5. had very generally entertained the opinion, that before the advent of the Meſſiah, Elijah would again perſonally appear on the earth, as the harbinger of that illuſtrious character. But, if they had interpreted the prophetical language in this paſſage in the ſame manner which they were obliged to adopt in others, where a future prophet was promiſed in the name of a preceding one, as, for inſtance, the Meſſiah himſelf under the name of David, they could not have fallen into ſuch an error. They would only have expected the coming of a prophet, as the forerunner of the Meſſiah, who ſhould appear in the ſpirit and power of Elijah, or animated by the ſame ſanctity, courage, and zeal for reformation, which diſtinguiſhed that celebrated prophet. As to the numerous apocryphal tales and reveries which ſome of their writers, as well as ſome Chriſtians and Mahometans, have related concerning this prophet, we have no room for their inſertion. The curious reader may find ſpecimens of theſe fables in Bayle. Origen has cited a book, entitled The Aſſumption, Apocalypſe, or the Secrets of Elias, which he ſeemed to conſider in the light of a genuine production; but it is now generally allowed to be ſuppoſitious.

ELI'KA, [Heb. the pelican of God.] A man's name.

E'LIM, [Heb. the valleys.] The fifth encampment of the Iſraelites in their journey from Egypt to Canaan: here they found twelve wells of water, and ſeventy palm-trees. *Exod.* xv. 27.

ELIMA'IS. See ELYMAIS.

To E'LIMATE, *v.a.* [*elimatum*, ſup. of *elimo*, Lat.] To file; to poliſh; to ſmooth.

ELI'MELECH, [Heb. God, my king.] A man's name.

ELIMINA'TION, *ſ.* [*elimino*, Lat.] The act of baniſhing; the act of turning out of doors; rejection.

ELINGUA'TION, *ſ.* [Lat.] The act of cutting out the tongue.

E'LINS, a town of Poland, in the palatinate of Braclaw: twenty-ſix miles north-eaſt of Braclaw.

ELJOBE'LE, a town of Arabia, in the country of Yemen: twenty-eight miles ſouth of Abu-Ariſch.

ELIOCAR'MOS, *ſ.* in botany. See ORNITHOGALUM.

ELIOE'NAI, [Heb. my eyes are towards him.] A man's name.

ELI'OT (John), a pious divine of the ſeventeenth century, and not undeſervedly called the apoſtle of the North-American Indians, was born in England, in 1604; but we are not informed of the place of his birth. He appears to have been educated in the univerſity of Cambridge; after which he engaged in the employment of an uſher to a ſchool. Having connected himſelf, however, with the puritan party, he became involved in the ſeverities exerciſed towards them during the reign of Charles I. and determined, like many others, to remove to America. This reſolution he put in practice in 1631; and, arriving at New England, became a member of the congregational church at Boſton. From hence, in 1632, he removed to Roxbury, where he was ordained miniſter and ſpent the greateſt part of his life. Mr. Eliot's glory ariſes from the diſintereſted zeal and indefatigable labours by which he endeavoured to introduce the advantages of civilization and chriſtian knowledge into the barbarous Indian tribes. To this work he began to devote a conſiderable part of his time in 1646, having been encouraged to the undertaking by many well-wiſhers to the intereſts of humanity and virtue, and particularly by his brethren in the miniſtry, who engaged to ſupply his place in the church at Roxbury whenever he ſhould be abſent among the Indians. The firſt ſtep he took was to learn their language, and reduce it to the form of a grammar, which he afterwards publiſhed. Having overcome this difficulty, he paid his firſt viſit to an aſſembly of Indians, to whom he preached in their native tongue, in the year above mentioned. The ſucceſs which he met with encouraged him to perſevere in his truly philanthropic undertaking during the remainder of his life; dividing his time between the Indians, and his flock at Roxbury, and not diſheartened by the incredible hardſhips to which he was obliged to ſubmit, the obſtacles which he met with in the prejudices, ſuſpicions, and brutal manners, of the ſavages, and the terrible dangers to which he was often expoſed. His zeal and diligence likewiſe prompted him to engage in the arduous taſk of tranſlating the whole Bible into the Indian language. When this work was completed, it was printed for the firſt time at Cambridge in New England, in 1664, and, a little time after Mr. Eliot's death, a ſecond time, with the corrections of Mr. Cotton, miniſter of Plymouth, who was a fellow-labourer in the Indian miſſion. Mr. Eliot tranſlated into the ſame tongue ſeveral Engliſh treatiſes in practical divinity, catechiſms, grammars, &c. By his influence many of the wandering Indian tribes were collected into regular ſocieties, and formed into congregations, which were inſtructed by him, and others who joined him in the work, in the manner beſt ſuited to their capacities; and ſchools were appointed, in which great numbers ſoon became proficients in reading and writing, and ſeveral were qualified for a more liberal education, which they afterwards received. To aid and encourage theſe meaſures for humaniſing and converting the Indians, large contributions were made in England, with which eſtates were purchaſed, and placed in the hands of truſtees, who were afterwards incorporated by charter, under the name of The Society for the Propagation of the Goſpel in Foreign Parts. Mr. Eliot's miſſionary labours were continued as long as his bodily ſtrength permitted; and, even when he was in the eighty-fourth year of his age, we are informed, that he was occaſionally engaged in preaching to his Indian converts. He died at Roxbury in 1690, when he had nearly attained to the advanced period of eighty-ſix years.

ELI'OTT (Alexander), ſon of ſir Gilbert Eliott, of Stobbs, and brother of lord Heathfield, was one of the Engliſh council at Bengal, under Mr. Haſtings, and was allowed to poſſeſs the moſt elevated ſpirit that ever dignified human nature. At that period, the French intrigues at the court of Poonah, added to their hopes of detaching the affection of the Berar Rajah from the Engliſh, endangered the exiſtence of the Engliſh empire in the Eaſt. To preſerve the alliance of that prince, Mr. Haſtings fixed on Mr. Eliott to be reſident at the court of Nagpour. Another accident happened after he had left Bengal for that purpoſe, which cauſed him to redouble his ſpeed: M. Chevalier, the French governor of Chandernagore, had eſcaped from thence, and was purſuing the ſame route before him. M. Chevalier was a perſon of firſt-rate abilities, and as warm in the intereſt of France as Mr. Eliott was in that of England. He alſo was on his way to Nagpour; and from thence intended to return to France, where his great knowledge of the politics of India would have enabled his court to form plans the moſt pernicious to the ſafety of our Indian empire. Mr. Eliott had ſet out in the rainy ſeaſon, without any proſpect of accommodations neceſſary to his precarious ſtate of health, labouring under a diſorder peculiar to the eaſt, originating in bilious obſtructions, the cure of which depended on the quantity of mercury. In thoſe circumſtances, he heard that M. Chevalier was at no great diſtance before him; he puſhed on by forced journeys: unfortunately, juſt as he had his chace in view, his progreſs was retarded by a ſudden overflow of one of the great branches of the Cattack river. Regardleſs of his health, or the dangerous medicines he had taken, he plunged into the rapid ſtream, followed by a few of his attendants and ſepoys, and found M. Chevalier before him at the capital Cattack. He claimed his perſon as an Engliſh priſoner with ſuch powerful eloquence, that the rajah ſurrendered him. Mr. Eliott then engaged the paroles of M. Chevalier and his companion M. Monneron, to return and ſurrender themſelves at Calcutta, to the governor-general, which they did in the moſt honourable manner. Mr. Eliott purſued his journey, and, in a few days, in October, 1778, at a ſmall caravanſera, fell, devoted to genuine patriotiſm and fidelity to the intereſts of his country. The Mahrattas have ſince built round it a town; and, ſtill farther to preſerve his memory, named it, in honour of him, *Eliott-gunge*, or Eliott's town. Mr. Haſtings cauſed a monument to be erected over his grave: he experienced an affliction equal to his loſs; and, in his paſſage to England, compoſed an Elegy expreſſive of it, in imitation of Horace, ode xvi. book ii. equally a proof of his affection, as of his elegant turn for compoſitions of this nature. It has been twice reprinted.

ELI'OTT (George Auguſtus, lord Heathfield), a military officer of ſingular merit, the youngeſt ſon of ſir Gilbert Eliott of Stobbs, in Roxburgſhire, Scotland. He was born about 1718; and after receiving the rudiments of education under a domeſtic tutor, was ſent at an early age to the univerſity of Leyden, where he improved himſelf in claſſical learning, and acquired a knowledge of the French and German languages. As he was deſtined to a military life, his father properly reſolved to give him a profeſſional courſe of inſtruction. At the royal military ſchool of La Fere, in Picardy, he made himſelf maſter of the theory of tactics, and of fortification and engineering in all their branches; and then proceeding to the practice of the art, he made a tour through thoſe parts of the continent which afforded the moſt inſtruction, and concluded with ſerving ſome time as a volunteer in the Pruſſian army. Returning to Scotland, he was entered as a volunteer in the 23d regiment of foot, then lying at Edinburgh. He afterwards entered into the artillery corps at Woolwich; and at length, fully accompliſhed in diſcipline of various kinds, was preſented by his uncle, colonel Eliott, with an adjutant's commiſſion in the ſecond troop of horſe grenadiers. He diligently employed himſelf in perfecting the diſcipline of his troop, with which he went to Germany in the war that

that enſued. He was in ſeveral actions, and received a wound at the battle of Dettingen. He roſe through the gradations of captain, major, and lieutenant-colonel; and was afterwards appointed aid-de-camp to George II. and became diſtinguiſhed as an able officer. In 1759, he was appointed to raiſe the regiment of light horſe which made itſelf ſo well known, under the name of Eliott's, for activity, diſcipline, and enterpriſe. This he commanded in Germany, where he acted as a ſtaff-officer, and on all occaſions maintained his reputation. He was recalled from the continent, in order to be ſent as ſecond in command on the expedition againſt the Havannah. There he not only diſtinguiſhed himſelf in his military capacity, but diſplayed alſo a diſintereſted regard to juſtice. His regiment, the 15th of light dragoons, obtained from the king the honorary appellation of *Royals*. The general continued to pay that attention to military affairs which became his ruling paſſion; and in 1775, he was named commander-in-chief of the troops in Ireland. But finding that there were political interferences in this department which he could not brook, he ſolicited to be recalled; and was ſoon after appointed to a ſtation in which he might exerciſe his talents without controul. This was the important place of governor of Gibraltar, which proved the chief theatre of his glory. For this he was excellently fitted by a habit of unremitting vigilance and undeviating regularity, in addition to his thorough knowledge of all the detail of fortification and gunnery. He had, moreover, accuſtomed himſelf to a mode of life which rendered him ſuperior to every inconvenience and privation that can occur in a beſieged fortreſs. The ſiege of Gibraltar, which began ſoon after the declaration of hoſtilities by Spain, was one of the moſt remarkable events of the war, and attracted the notice of all Europe. With a ſmall number of men, Eliott foiled all the attempts of a numerous foe; and when the operations of the ſiege were quickened, and rendered more formidable, by the aid of a more active enemy, he ſtill maintained that ſuperiority of defence which kept danger at a diſtance. The final grand attack by the famous floating batteries, afforded one of the moſt awful ſpectacles of deſtruction ever beheld. Beſides the ſpirit of exact diſcipline which he infuſed into his garriſon, and his judicious management of the means of defence, he was very aſſiduous in his attention to the preſervation of the health of his men, under their long privations of freſh and wholeſome diet. His own partiality for vegetable food ſuggeſted to him extraordinary efforts to form gardens on the ſcanty ſoil, which ſucceeded to a degree that proved highly beneficial. On his return to England after the peace, the general was received with great applauſe by the public; and the king, beſides conferring upon him the order of the Bath, raiſed him to the peerage in 1787, by the ſtyle of Lord Heathfield, baron of Gibraltar. He was meditating a return to his government, with the intention of ending his life on the rock he had ſo well defended, when he was ſeized by a paralytic ſtroke, which carried him off at Aix-la-Chapelle, in July, 1790, in his ſeventy-third year. By his lady, the daughter of ſir Francis Drake, of Devonſhire, he left a ſon and a daughter.

ELI'PHALET, [Heb. the God of deliverance.] A man's name.

EL'IPHAZ, [of אל God, and פז he ſtrengthened, Heb. the ſtrength of God.] One of Job's friends.

ELIQUA'TION, *ſ.* an operation in chemiſtry, by means of which a more fuſible ſubſtance is ſeparated from another which is leſs fuſible. It conſiſts in the application of a degree of heat ſufficient to fuſe the former, but not the latter. It may be effected either by uſing a perforated crucible, or in the large way, by a furnace conſtructed to anſwer the ſame purpoſe. In order that a ſeparation may follow by this method, it is neceſſary that the combination between the two ſubſtances ſhould be by no means intimate. Thus ſulphur may be ſeparated from its earthy admixtures by the gentle heat neceſſary to fuſe it; but it cannot, in the ſame manner, be ſeparated from its metallic combinations. So likewiſe lead may be ſeparated by eliquation from copper; but tin cannot.

E'LIS, a country of Peloponneſus at the weſt of Arcadia, and north of Meſſenia, extending along the coaſt, and watered by the river Alpheus. The capital of the country is called *Elis*, now *Belvidere*. It was originally governed by kings, and received its name from Eleus, one of its monarchs. Elis was famous for the horſes it produced, whoſe celerity was ſo often known and tried at the Olympic games. *Virgil.*

ELI'SAVETGRAD, a town of Ruſſia, in the government of Ekaterinoſlav, on the Ingul: 108 miles weſt of Ekaterinoſlav.

ELI'SHA, [אלישע, Heb. of אל and ישע, ſalvation, &c. i. e. the ſalvation of God.] The ſon of Shaphat, a Hebrew prophet, and the ſucceſſor of Elijah, was taken from the plough to be initiated in the duties of the prophetic character. From the particulars, however, which are recited by the ſacred hiſtorian, he appears to have been a perſon of ſome weight in the community; for when Elijah found him, "he was ploughing with twelve yoke of oxen before him, and he with the twelfth." The number of working cattle and ſervants employed by him lead us to conclude that he was a wealthy agriculturiſt, who, according to the manners of ancient times, took himſelf an active part in the labours of the field. Elijah's manner of informing him that he was ſelected to become his ſervant and diſciple was by caſting his mantle upon him. He was preſent when Elijah was tranſlated; upon which event he entered on the exerciſe of the prophetic office, and ſoon gave proof of the authority which was transferred to him, by miraculouſly correcting the pernicious qualities in the waters at Jericho, and curing the barrenneſs of the ſoil. We refer the reader to the ſcripture account of this celebrated prophet, who died about the year before Chriſt 830.

ELI'SHAH, [Heb. it is God.] A man's name.

ELI'SHAH (iſles of), ſo named from Eliſhah, grandſon of Japheth; repreſented by the prophet Ezekiel, as trading with Tyrus. *Ezek.* xxvii. 7. *Gen.* x. 4.

ELISH'AMAH, [Heb. God heareth.] A man's name.

ELISH'EBA, [Heb. the oath of God.] The name of a woman.

ELI'SHUA, [Heb. God my ſalvation.] A man's name.

ELI'SION, *ſ.* [*eliſio*, Lat.] The act of cutting off; as, *can't th' attempt*, there is an eliſion of a ſyllable.—You will obſerve the abbreviations and *eliſions*, by which conſonants of moſt obdurate ſounds are joined together, without any ſoftening vowel to intervene. *Swift.*—Diviſion; ſeparation of parts.—The cauſe given of ſound, that it would be an *eliſion* of the air, whereby, if they mean any thing, they mean a cutting or dividing, or elſe an attenuating of the air, is but a term of ignorance. *Bacon.*

ELI'SORS, *ſ.* [electors, in law.] In caſes of challenge to the ſheriff and coroners for partiality, &c. the venire to ſummon a jury ſhall be directed to two clerks of the court, or two perſons of the county named by the court and ſworn. And theſe two, who are called eliſors, ſhall indifferently name or chooſe the jury; and their return is final, no challenge being allowed to their array. *Co. Lit.* 158.

ELIXA'TION, *ſ.* [*elixus*, Lat.] The act of boiling or ſtewing any thing.—Even to ourſelves, and more perfect animals, water performs no ſubſtantial nutrition; ſerving for refrigeration, dilution of ſolid aliments, and its *elixation* in the ſtomach. *Brown.*

ELIX'IR, *ſ.* [from אלקסר *elekſer*, Arab.] A medicine made by ſtrong infuſion, where the ingredients are almoſt diſſolved in the menſtruum, and form a compound tincture:

For when no healing art prevail'd,
When cordials and *elixirs* fail'd,
On your pale cheek he dropp'd the ſhow'r,
Reviv'd you like a dying flow'r. *Waller.*

The extract or quinteſſence of any thing.—In the ſoul,

when the ſupreme faculties move regularly, the inferior paſſions and affections following, there ariſes a ſerenity infinitely beyond the higheſt quinteſſence and *elixir* of worldly delight. *South.*—Any cordial; or invigorating ſubſtance:

What wonder then, if fields and regions here
Breathe forth *elixir* pure! *Milton.*

ELIXIVA'TION, *ſ.* [from *elixo*, to boil, or *lixivium*, Lat. ley.] The extraction of a fixed ſalt from vegetables by an affuſion of water.

ELI'ZABETH, [Ελισαβετ, Gr. of אלישבע, Heb. God hath ſworn.] The mother of John Baptiſt.—A woman's name. Bryant obſerves that it was a Canaanitiſh name, the ſame as Eliſa, Elcuſa, Elaſa, of Greece and other countries. It was a compound of *El-Ees*, and related to the god of light. It was made a feminine in aſtertimes, and was a name aſſumed by women of the country ſtiled Phœnicia, as well as by thoſe of Carthage. Hence Dido has this as a ſecondary appellation; and mention is made by the poet of *Dii morientis Elizæ*, though it was properly the name of a deity. The worſhip of Eliſa was carried to Carthage from Canaan and Syria: in theſe parts ſhe was firſt worſhipped; and her temple from that worſhip was called *Eliza-Beth.*

ELI'ZABETH, queen of England, daughter of Henry VIII. and Anna Bolcyn, born at Greenwich, September 7th, 1533. She was early inſtructed in the learned languages; and acquired likewiſe conſiderable knowledge of the Italian, Spaniſh, and French, languages. That the Latin was familiar to her, is evident from her ſpeech to the univerſity of Cambridge, and another to that of Oxford, when ſhe was near ſixty; alſo from her ſpirited anſwer to the Poliſh ambaſſador in 1598. She had likewiſe a taſte for poetry and muſic. She wrote, 1. The Mirror, or Glaſs of the Sinful Soul. This was tranſlated out of the French verſe into Engliſh proſe, when ſhe was only eleven years of age. It was dedicated to queen Catherine Parr. Probably it was never printed; but the dedication and preface are preſerved in the *Sylloge epiſtolarum*, in Hearne's edition of *Livii Foro-Julienſis*. 2. Prayers and Meditations, &c. dedicated to her father, dated at Hatfield, 1545. Manuſcript, in the royal library. 3. A dialogue out of Xenophon, in Greek, between Hiero a King, and Simonides a Poet. 4. Two Orations of Iſocrates, tranſlated into Latin. 5. Latin Oration at Cambridge; preſerved in the king's library. 6. Latin Oration at Oxford. 7. A Comment on Plato. 8. *Boethius de conſolatione philoſophiæ*, tranſlated into Engliſh 1593. 9. *Salluſt de bello Jugurthino*, tranſlated into Engliſh 1590. 10. A play of Euripides, tranſlated into Latin. 11. A Prayer for the uſe of her fleet in the great expedition in 1596. 12. Part of Horace's Art of Poetry, tranſlated into Engliſh 1598. 13. *Plutarch de curioſitate*, tranſlated into Engliſh. 14. Letters on various occaſions to different perſons; ſeveral ſpeeches to her parliament; and a number of other pieces. See the article ENGLAND in this volume, for her noble reign, and high character.

ELI'ZABETH, empreſs of Ruſſia, diſtinguiſhed by her ſignal clemency. She made a vow, that no perſon ſhould be put to death in her reign, and ſhe ſtrictly obſerved it. See the article RUSSIA.

ELI'ZABETH, a county of the American States, in Virginia, between York and James rivers, having Warwick and York counties on the weſt, and Cheſapeak bay on the eaſt and north. There are ſeveral ſmall iſlands on its ſea coaſt, the chief of which are Long and Egg iſlands. Point Comfort is the ſouth-eaſtern extremity of the county. It contains, by the cenſus of 1796, 3450 inhabitants.

ELI'ZABETH, the ſouthern arm of James river, in Virginia, North America. It affords an excellent harbour, large enough for three hundred ſhips. The channel is from one hundred and fifty to two hundred fathoms wide; and at common flood tide it has eighteen feet water to Norfolk, which ſtands near the mouth of its eaſtern branch. The ſouth branch riſes in the Diſmal Swamp. Craney iſland, at the mouth of Elizabeth, lies five miles ſouth-weſt of Point Comfort, at the mouth of James river.

ELI'ZABETH, a townſhip of the American States, in Lancaſter county, Pennſylvania, with a Dutch church: eighteen miles north-weſt by weſt of Lancaſter, and eighty-four weſt by north of Philadelphia.

ELI'ZABETH BAY, a bay in the ſtraits of Magellan. Lat. 53. 43. S. lon. 73. 24. W. Greenwich.

ELI'ZABETH ISLAND, in the ſtraits of Magellan, in South America. Here freſh water, herbs fit for ſallad, and wild fowl, may be had in great plenty. The ſhores alſo abound with ſhell-fiſh.

ELI'ZABETH ISLANDS, ſeveral ſmall iſlands on the ſouth-eaſt ſide of Buzzard's bay, in North America, extending ſouth-weſterly from the extremity of Barnſtaple county, in Maſſachuſetts, and bearing north-weſt from Martha's Vineyard; ſituated between 41. 24. and 41. 32. north latitude, and between 70. 38. and 70. 56. weſt longitude. They are about ſixteen in number; the chief of which are Naſhawn, Paſqui, Naſhawenna, Pinequeſe, and Chatahunk iſlands. All theſe belong to Duke's county.

ELI'ZABETHTOWN, a poſt-town and borough of the American States, in Eſſex county, New Jerſey; pleaſantly ſituated on a ſmall creek which empties into Arthur Kull. Its ſoil is equal to any in the ſtate. In the town are two brick churches, one for Preſbyterians, very handſome, the other for Epiſcopalians, and an academy. This is one of the oldeſt towns in the ſtate, having been purchaſed of the Indians as early as 1664, and ſettled ſoon after: ſix miles ſouth of Newark, and fifteen ſouth-weſt by weſt of New York.

ELI'ZABETHTOWN, a poſt-town of the American States, in Maryland, and capital of Waſhington county, formerly called Hagarſtown, ſeated in the fertile valley of Conegocheague. It has ſeveral ſtreets regularly laid out, and the houſes are principally built of brick and ſtone. Epiſcopalians, Preſbyterians, and German Lutherans, have each a church. The court-houſe and market-houſe are handſome buildings, and the jail is of ſtone, and ſubſtantial. The trade with the weſtern country is conſiderable; and there are a number of mills in the neighbourhood, on Antietam creek.

ELI'ZABETHTOWN, the chief town of the American ſtates, in Tyrrel county, in Edenton diſtrict, North Carolina: forty miles from Fayetteville, and fifty-five from Wilmington.

ELI'ZABETHTOWN, a poſt-town of the American States, and the chief in Bladen county, North Carolina, ſituated on the north-weſt branch of Cape Fear: thirty-ſix miles ſouthward of Fayctteville, and forty-ſeven north-weſt of Wilmington.

ELIZE'US, the name of a man. *Ecclus.* xlviii. 12.

ELI'ZUR, [Heb. God my rock.] A man's name.

ELK, *ſ.* [ælc, Sax.] See the article CERVUS, vol. iv. p. 51.

And, ſcarce his head
Rais'd o'er the heapy wreath, the branching *elk*
Lies ſlumb'ring ſilent in the white abyſs. *Thomſon.*

ELK, a creek in Northumberland county, Pennſylvania, which uniting with Penn's creek, falls into the Suſquehanna, five miles below Sunbury.

ELK, a navigable river of the eaſtern ſhore of Maryland, which riſes in Cheſter county, Pennſylvania, by two branches; Big and Little Elk creeks. At their confluence ſtands Elkton.

ELK, a navigable river, in the ſtate of Tenneſſee. It riſes on the north-weſt ſide of Cumberland mountain, runs ſouth-weſterly, and falls into the Tenneſſee, a little above the Muſcle ſhoals; about forty miles weſt-north-weſt of the Creeks' Croſſing Place.

ELK,

ELK LAKE, one of the chain of ſmall lakes in North America, which connects the lake of the Woods with lake Superior. Lat. 48. 41. N. lon. 93. W.

ELKA'NAH, [Heb. the reed of God.] A man's name.

ELKAR'RIE, a town of Arabia, in the country of Yemen: twenty-four miles north-eaſt of Abu-Ariſch.

ELKAS'SAREN, a town of Arabia, in the country of Yemen: eight miles eaſt of Chamir.

ELKAT'TA, a town of Egypt: fourteen miles north-weſt of Cairo.

ELKE, *ſ.* A kind of yew to make bows. Statute 32 Hen. VIII. c. 9.

EL'KO, or EDKO, a lake of Egypt, formed in the year 1800, by an encroachment of the ſea. See the article EGYPT, p. 363, of this volume.

ELK'RIDGE, a town of the American States, in Ann Arundel county, Maryland, ſituated on the ſouth bank of Patapſco river, and on the weſt ſide of Deep Run; famous for the bright tobacco called *kite's foot*: eight miles ſouth-weſt of Baltimore, and nineteen north-weſt of Annapolis. Lat. 39. 12. 30. N.

ELK'TON, a poſt town of the American States, of conſiderable trade, ſituate at the head of Cheſapeak bay, in Maryland, and the capital of Cecil county. It is ſeated at the confluence of the head branches of Elk river, thirteen miles from its mouth at Turkey Point, and a mile above French town. The tide flows up to the town, and it enjoys great advantages from the carrying trade, between Baltimore and Philadelphia. Upwards of 250,000 buſhels of wheat are collected here annually, for ſupplying thoſe markets, and the neighbouring mills: twelve miles ſouth-weſt of Chriſtiana bridge, ten north-eaſt of Charleſtown, forty-ſeven ſouth-weſt of Philadelphia, and fifty-ſix north-eaſt of Baltimore.

ELK'UVAR, a river of Ruſſia, which runs into the Tobol. Lat. 52. 55. N. lon. 81. E. Ferro.

ELL, *ſ.* [eln, Sax. *ulna*, Lat.] A meaſure containing forty-five inches, or a yard and a quarter.—They are ſaid to make yearly forty thouſand pieces of linen cloth, reckoning two hundred *ells* to the piece. *Addiſon.*

The ells moſt uſed with us are the Engliſh and Flemiſh; the former containing three feet nine inches, or one yard and a quarter; the latter only 27 inches, or three quarters of a yard; ſo that the ell Engliſh is to the Flemiſh ell as five to three. In Scotland, the ell contains $37\frac{2}{10}$ Engliſh inches. M. Ricard, in his Treatiſe of Commerce, reduces the ells thus: 100 ells of Amſterdam are equal to $98\frac{3}{4}$ of Brabant, Antwerp, and Bruſſels; to $58\frac{1}{2}$ of England and France; to 120 of Hamburgh, Francfort, Leipſic, and Cologne; 125 of Breſlaw; 110 of Bergen and Drontheim; and 117 of Stockholm.

EL'LA, [ellen, Sax. valour.] The firſt king of the South Saxons.

EL'LAR, a town of Germany, in the circle of Weſtphalia, and principality of Naſſau Dillenburg: twelve miles ſouth-ſouth-eaſt of Dillenburg.

ELLASAR', the king of which joined Chedorlaomer, when he invaded Canaan, and was vanquiſhed by the patriarch Abraham. *Gen.* xiv. It bears great affinity in name with Thelaſar, 1 *Kings*, xix. 12. and Telaſſar, *Iſaiah*, xxxvii. 12. which, though differently ſpelt, are one in reality; and Ellaſar is very probably the ſame place.

ELLE'BORINE, *ſ.* in botany. See ASTRANTIA, CYPRIPEDIUM, and SERAPIAS.

ELLE'BORUM, and ELLEBO'RUS, *ſ.* in botany. See HELLEBORUS.

EL'LEDAT, a town of the iſland of Ceylon: twelve miles ſouth of Candy.

EL'LEHOLM, a ſea-port town of Sweden, on the ſouth coaſt of the province of Blekingen, on the Baltic: eight miles weſt of Carlſcron.

EL'LEN, a town of Germany, in the circle of Weſtphalia, and duchy of Juliers: four miles ſouth-eaſt of Juliers.

EL'LENBOGEN, a town of Germany, in the county of Bregentz: ſeventeen miles ſouth-ſouth-eaſt of Bregentz.

EL'LENHOSEN, a town of Germany, in the county of Bregentz: fourteen miles eaſt-north-eaſt of Bregentz.

ELLERE'NA, a town of North America, in Mexico, and province of Zacatecas: twenty-five miles weſt of Zacatecas.

ELLERE'NA, or ELERENA, a town of Spain, in the province of Eſtremadura, belonging to the knights of the order of St. Jago, by whom it was founded: fifty-five miles north of Seville, and fifty-two weſt of Cordova. Lat. 38. 8. N. lon. 10. 48. E. Peak of Teneriffe.

EL'LESMERE, a neat and pleaſant town in the county of Salop, diſtant from London 144 miles, ſixteen from Shrewſbury, and twenty-three from Cheſter. This town is of Saxon origin, and takes its name from the water, which was called *Aelſmere*, or the greateſt mere, being the chief in this part of the county. This lake is one hundred acres in dimenſions; and is exceedingly well ſtocked with fiſh. The environs have two advantages; a good town borders on one ſide; the fine park of Ockle, or Ottley, on the other. This is the ancient ſeat of the Kynaſtons. The manſion appears to be very old, and ſtands low; but the park is very fine, having the greateſt quantity of the fineſt elm-trees perhaps to be found in any part of England. Elleſmere water is the property of the duke of Bridgewater; and from this place his grace takes the title of baron. This town has little to boaſt except its ſituation. The principal trade is that of malt, the barley of the neighbourhood being remarkably good. It has a market on Tueſdays; fairs, third Tueſday in April, Whit-Tueſday, Auguſt 25, and November 14. On Caſtlehill there is one of the fineſt bowling-greens in the kingdom; nine different counties are ſeen from the green. A new canal is cut to this town, called the Elleſmere canal. The country round Elleſmere is moſtly flat, dirty, and unpleaſing. On the approach to the town it becomes more agreeable, and about it breaks into moſt beautiful riſings, fertile, and finely wooded. The bottoms are indeed deſtitute of rivers, but frequently filled with little lakes, called *meres*, elegantly bordered by the cultivated hills. It is ſingular, that none of them are the parents of ſtreams; their increaſe from rain and ſprings, and their loſs by exhalations, appear to keep equal pace.

ELL'FELD, a town of Germany, in the circle of Upper Saxony, and circle of the Vogtland: two miles ſouth of Auerbach.

ELLICHPOUR', a city of Hindooſtan, and capital of a circar of the ſame name, in the country of Berar, ſubject to the Nizam. It was formerly the capital of Berar: 144 miles north-eaſt of Aurungabad. Lat. 21. 12. N. lon. 78. 5. E. Greenwich.

EL'LINGTON, a townſhip of the American States, in Tolland county, Connecticut: twelve miles north-eaſt of Hartford city, and ſix weſt of Tolland.

ELLI'PSE, *ſ.* An oval figure.—A circle ſeen obliquely will appear an *ellipſe*. *Reid.* See CONIC SECTIONS, vol. v. p. 80.

ELLIP'SIS, *ſ.* [*ellipſe*, Fr. *elliſſe*, It. *ellipſis*, Lat. of ἔλλειψις, Gr.] A figure of rhetoric, by which ſomething is left out neceſſary to be ſupplied by the hearer; as, *the thing I love*, for *the thing* which *I love*.—The words are delivered by way of *ellipſis*, Rom. iv. 18. *Hammond.*—[In geometry.] An oval figure generated from the ſection of a cone, by a plane cutting both ſides of the cone, but not parallel to the baſe, which produces a circle, and meeting with the baſe when produced. *Harris.*

ELLIP'SOID, *ſ.* An elliptical ſpheroid, being the ſolid generated by the revolution of an ellipſe about either axis.

ELLIP'TIC, or ELLIPTICAL, *adj.* Having the form of an ellipſis; oval.—In animals, that gather food from the ground, the pupil is oval or *elliptical*; the greateſt diameter going tranſverſely from ſide to ſide. *Cheyne.*—According to ellipſis, the rhetorical figure.—See where this *elliptical* phraſe is expreſſed at length. *Tyrwhitt.*

ELLIPTO'IDE, *ſ.* An infinite or indefinite ellipſis, defined by the indefinite equation $ay^{m+n} = bx^m . \overline{a - x^n}$ when m or n are greater than 1: for when they are each $= 1$, it denotes the common ellipſe. There are ſeveral kinds or degrees of elliptoides, denominated from the exponent $m + n$ of the ordinate y. As the cubical elliptoide, expreſſed by $ay^3 = bx^2 . \overline{a - x}$; the biquadratic, or ſurfolid $ay^4 = bx^2 . \overline{a - x^2}$; &c.

EL'LIS, [according to Camden from *Ellas.*] Formerly a Chriſtian name, now a ſurname.

ELLI'SIA, *ſ.* [ſo named in memory of *John Ellis*, F.R.S. author of a treatiſe on Corallines, &c.] In botany, a genus of the claſs pentandria, order monogynia, natural order of luridæ, (borragineæ, *Juſſ.*) The generic characters are—Calyx: perianthium one-leafed, five-parted; diviſions ſharp, gaping. Corolla: one-petalled, funnel-form, ſmaller than the calyx; border five-cleft. Stamina: filaments five, ſhorter than the tube; antheræ roundiſh. Piſtillum: germ roundiſh; ſtyle filiform, ſhort; ſtigma two-cleft, oblong. Pericarpium: capſule bag-form, leathery, two-valved, two-celled, the calyx then very large, flat, ſtar-form. Seeds: in each cell two, globoſe, black, hollow-dotted; but one ſeed over the other, ſcarcely ſeparated by a tranſverſe partition.—*Eſſential Character.* Corolla funnel-form, narrow; berry dry, two-celled, two-valved; ſeeds two, dotted, one placed over the other.

Elliſia nyctelea, or cut-leaved elliſia: a ſingle ſpecies. It is allied to hydrophyllum. Root annual; ſtem herbaceous, brittle, dichotomous, very much branched, diffuſed, proſtrate, round; leaves reſembling thoſe of hydrophyllum, alternate, petioled, pinnatifid, during foliation imbricate backward, the diviſions ſharp, with a tooth on each ſide; flowers drooping; corolla white, with minute purple dots on the inſide of the diviſions. The poſition of the ſeeds is ſingular. Native of Virginia; flowers in July and Auguſt. See DURANTA.

EL'LOBUS, *adj.* [from ἐν, in, and λοβος, a lobe.] In botany, an epithet of ſuch ſeeds as are contained in pods or lobes.

ELLO'RE, one of the northern circars of Hindooſtan, ſituated to the north-eaſt of Condapilly, and north-weſt of the Bay of Bengal.

ELLO'RE, a town of Hindooſtan, and capital of a circar of the ſame name, thirty-two miles north of Maſulipatam. Lat. 16. 43. N. lon. 81. 11. E. Greenwich.

EL'LYS (Anthony), a learned prelate of the church of England in the eighteenth century, born in 1693, but at what place is uncertain. He was entered at Clare-hall, Cambridge, where he took his degree of bachelor of arts in 1712, and that of maſter of arts in 1716. In 1724 he was preſented to the vicarage of St. Olave, Jewry, in the city of London, and to the rectory of St. Martin, Ironmonger-lane; and in the following year was promoted to a prebend ſtall in the cathedral church of Glouceſter; he was afterwards vicar of Great Marlow, in Buckinghamſhire. In 1728, when George II. paid a viſit to the univerſity of Cambridge, Mr. Ellys was one of the perſons who were created doctors of divinity on that occaſion. In 1736, he publiſhed A Plea for the Sacramental Teſt, as a juſt Security to the Church eſtabliſhed, &c. 4to. which was afterwards reprinted among his poſthumous pieces. His next publication was intitled, Remarks on an Eſſay concerning Miracles, publiſhed by David Hume, Eſq. 4to. 1752; which is a ſenſible and candid work. In the ſame year Dr. Ellys was promoted to the ſee of St. David's; which advancement he owed to the reputation of having been employed for many years in preparing for the preſs a grand work, the deſign of which ſhould be to illuſtrate, confirm, and vindicate, the principles of religious liberty, and the reformation from popery as founded upon thoſe principles. Why this work did not make its appearance during the biſhop's life-time, has not been ſatisfactorily explained. After his promotion to St. David's, Dr. Ellys continued to hold his prebend of Glouceſter, and his city preferment *in commendam.* He died at Glouceſter, in 1761, aged ſixty-eight years. After his death, in 1763, was publiſhed the firſt part of the great work which had been the principal object of the biſhop's life, intitled, Tracts on the Liberty, ſpiritual and temporal, of Proteſtants in England, &c. 4to. The ſecond part appeared in 1765, intitled, Tracts on the Liberty, ſpiritual and temporal, of Subjects in England, 4to.

ELM, *ſ.* [Saxon.] In botany. See the article ULMUS.

The rural ſeat,
Whoſe lofty *elms* and venerable oaks,
Invite the rook, who high amid' the boughs
In early ſpring his airy city builds. *Thomſon.*

It was uſed to ſupport vines, to which the poets allude:

Thou art an *elm*, my huſband; I a vine,
Whoſe weakneſs married to thy ſtronger ſtate,
Makes me with thy ſtrength to communicate. *Shakeſpeare.*

ELM, a town of Swiſſerland, in the canton of Glaris: ſix miles ſouth of Glaris.

EL'MA, a river of Ruſſia, which runs into the Petchora, at Elma.

EL'MA, a town of Ruſſia, in the government of Archangel, at the conflux of the Elma and the Petchora: 312 miles eaſt of Archangel.

ELMAHAD', a town of Arabia, in the country of Yemen: eight miles north-north-weſt of Zebid.

EL'MACIN (George), an Egyptian of Syrian deſcent, ſon of a ſecretary to the council of war under the ſultans of Egypt, ſucceeded his father in the ſame office, A. D. 1238. He is known as the author of a chronicle of the Mahometan caliphs, written in Arabic, which commences with Mahomet, and goes down to the reign of Moſtader-Billah, who died in the year of the hejira 512, A. D. 1118. From the manner in which this hiſtorian mentions the Chriſtians, it is concluded that he was of their religion. His work was printed in Arabic, with a Latin verſion by Arpenius, at Leyden, in 1625, under the title of *Hiſtoria Saracenica.* See the Article EGYPT, p. 368, of this volume.

ELMEDE'A, or ELMADIA, or EL MEDEA, called likewiſe *Africa*, a ſea-port town of Africa, in the country of Tunis; formerly a place of great ſtrength and importance; but the harbour is now ruined and choked up: ſix leagues north of Cape Oudia.

EL'MEDINE, or ALMEDINE, a town of Africa, in the empire of Morocco, on the edge of Mount Atlas.

EL'MEDINE, a town of Africa, in the empire of Morocco, near the ſea-coaſt.

EL'MEN, or ALT SALZA, a town of Germany, in the circle of Lower Saxony, and the principality of Magdeburg: ten miles ſouth-ſouth-eaſt of Magdeburg.

EL'MENAU. See ILMENAU.

EL'MESHORN, a town of Germany, in the duchy of Holſtein: eighteen miles north-weſt of Hamburg.

ELMO'DAM, [Heb. the God of meaſure.] A man's name.

EL'MORE, a townſhip of the American States in Orleans county, Vermont.

ELN, *ſ.* A meaſure of three feet and one inch. *Phillips.*

ELNA'THAN, [Heb. the gift of God.] A man's name.

ELNBO'GEN, a town of Bohemia, and capital of a circle, or diſtrict, within the circle of Saatz, called the *Circle of Elbogen*, or *Loket*; ſituated on a rock, ſurrounded with mountains, near the Egra: ſixty-two miles weſt of Prague, and thirty-two ſouth-weſt of Saatz.

EL'NE, a town of France, in the department of the Eaſtern Pyrennees, and chief place of a canton, in the diſtrict of Perpignan; formerly the ſee of a biſhop, ſuffragan of Narbonne. It ſuffered very much in the civil wars, during the reign of Louis XI. in the ſeventeenth century: two leagues and a half ſouth-ſouth-eaſt of Perpignan.

EL'NE,

EL'NE, a river of England, in the county of Cumberland, which runs into the Iriſh ſea: four miles north of Workington.

EL'NIA, a town of Ruſſia, in the government of Smolenſk: thirty-two miles eaſt-ſouth-eaſt of Smolenſk. Lat. 54. 25. N. lon. 51. 5. E. Ferro.

ELOCU'TION, *ſ.* [*elocutio*, Lat.] The power of fluent ſpeech. Power of ſpeaking; ſpeech:

Whoſe taſte, too long forborne, at firſt eſſay
Gave *elocution* to the mute, and taught
The tongue not made for ſpeech to ſpeak thy praiſe. *Milt.*

The power of expreſſion or diction; eloquence; beauty of words.—The third happineſs of a poet's imagination is *elocution*, or the art of clothing or adorning that thought ſo found, and varied, in apt, ſignificant, and ſounding, words. *Dryden.*

ELO'DES, *ſ.* [from ελος, Gr. a marſh or ſwamp.] A bog, a place full of fens. *Phillips.*—The medical term for the ſweating fever, from its great moiſture.

E'LOGY, or EULOGY, *ſ.* [*eloge*, Fr. *elogio*, Ital. and Span. *elogium*, Lat. of ευλογιον, Gr.] Praiſe; panegyric.—Some excellent perſons, above my approbation or *elogy*, have conſidered this ſubject. *Holder.*

ELO'HI, or ELOHIM, in ſcripture, one of the diſtinguiſhing names of Jehovah.

ELO'I, [Syr.] My God.

To ELO'IGNE, or ELOINE, *v. a.* [*eloigner*, Fr.] To put at a diſtance; to remove one far from another:

I'll tell thee now, dear love! what thou ſhalt do
To anger deſtiny, as ſhe doth us;
How I ſhall ſtay though ſhe *eloigne* me thus,
And how poſterity ſhall know it too. *Donne.*

In law, to remove or ſend a great way off: in this ſenſe it is uſed where it is ſaid that if ſuch as are within age be *eloined*, ſo that they cannot come to ſue perſonally, their next friends ſhall be admitted to ſue for them. 13 *Edw.* I. c. 15.

To ELO'INE. See *To* ELOIGNE.

ELOIGN'MENT, *ſ.* Remotion.—He diſcovers an *eloignment* from vulgar phraſes much becoming a perſon of quality. *Shenſtone.*

ELOI'SA. See HELOISE.

E'LON, a city of Paleſtine, ſituated in the tribe of Dan. *Joſh.* xix. 43.

E'LON-BETH-HANAN, a city of Paleſtine, probably the above city; one of the ſtations of Solomon's purveyors. 1 *Kings*, iv. 9.

ELONGA'TA, *ſ.* in law, a return of the ſheriff in replevin, that cattle are not to be found, or are removed, ſo that he cannot make deliverance, &c. 2 *Lil. Abr.* 454.

To ELON'GATE, *v. a.* [from *longus*, Lat.] To lengthen; to draw out; to protract; to ſtretch. To put farther off.—The firſt ſtar of Aries, in the time of Meton the Athenian, was placed in the very interſection, which is now *elongated* and moved eaſtward twenty-eight degrees. *Brown.*

To ELON'GATE, *v. n.* To go off to a diſtance from any thing.—About Cape Frio in Braſilia, the ſouth point of the compaſs varieth twelve degrees unto the weſt; but *elongating* from the coaſt of Braſilia, towards the ſhore of Africa, it varieth eaſtward. *Brown.*

ELONGA'TION, *ſ.* The act of ſtretching or lengthening itſelf.—To this motion of *elongation* of the fibres, is owing the union or conglutination of the parts of the body when they are ſeparated by a wound. *Arbuthnot.*—The ſtate of being ſtretched. An imperfect luxation, when the ligament of any joint is ſo extended or relaxed as to lengthen the limb, but yet not let the bone go quite out of its place. *Quincy.*—*Elongations* are the effect of an humour ſoaking upon a ligament, thereby making it liable to be ſtretched, and to be thruſt quite out upon every little force. *Wiſeman.*—Departure; removal.—Nor then had it been placed in a middle point, but that of deſcent, or *elongation*. *Brown.*—Diſtance; ſpace at which one thing is diſtant from another.—The diſtant points in the celeſtial expanſe appear to the eye in ſo ſmall a degree of *elongation* from one another, as bears no proportion to what is real. *Glanville.*—See the article ASTRONOMY, vol. ii.

E'LONITE, *ſ.* A deſcendant of Elon.

To ELO'PE, *v. a.* [*loopen*, Dut. to run.] To run away; to break looſe; to eſcape from law or reſtraint.—It is neceſſary to treat women as members of the body politic, ſince great numbers of them have *eloped* from their allegiance. *Addiſon.*

The fool whoſe wife *elopes* ſome thrice a quarter,
For matrimonial ſolace dies a martyr. *Pope.*

ELO'PEMENT, *ſ.* Departure from juſt reſtraint; rejection of lawful power: commonly uſed of a wife.—An *elopement* is the voluntary departure of a wife from her huſband to live with an adulterer, and with whom ſhe lives in breach of the matrimonial vow. *Ayliffe.*

E'LOPS, *ſ.* [ελλοψ, Gr. a fiſh, or other dumb animal, which Milton ſeems to have miſtaken for a ſerpent.] In ichthyology, a genus belonging to the order of abdominales. The generic character ariſes from the great number of rays in the membrane of the gills, being moſtly thirty and upwards, and armed on the outſide and in the middle with five teeth. Linnæus has but one ſpecies, which was firſt diſcovered by Sloane, and formed into a genus by Linnæus; it has ſeven fins, and the head is ſmooth; teeth in the edges of the jaws and palate.

1. Elops ſaurus, the ſaur-fiſh. Specific character, tail armed above and beneath; a long plate at the chin. This plate is formed of a thin oval bone, fixed in front to the lower jaw, and behind to the membrane of the gills, where the lower jaw joins that membrane. It ſeems deſtined to ſupport the membrane of the gills, which is furniſhed only with very weak rays, though to the number of thirty-four; the pectoral fin has 18 rays, the ventrals 15, the anal $\frac{7}{16}$, the tail 30, the dorſal $\frac{4}{24}$; (the upper figures denoting the ſpinous rays, the lower the whole number.) The head is compreſſed, without ſcales, long, and ſomewhat flatted at top; the lower jaw is longer than the upper, and both, as well as the palate and tongue, are furniſhed with a great number of ſmall teeth; the bones of the lips are long, and ſomewhat ſerrated. The noſtrils are double. The eyes are almoſt vertical, with double irides, yellow and red. The gills have a wide aperture, and the membrane is looſe. The lateral line runs ſtrait to the middle of the tail, which is bifurcated. The ſcales are thin and ſmooth. The rays of the fins are ſoft, tender, and ſplit at the extremities. The back is bluiſh, the ſides and belly ſilvery, the fins red and grey. There is an appendage above the ventral fin, and (what has been obſerved in no other fiſh) alſo above the pectoral. There is a round ſpot and a long one on the fin of the tail. The ventral fin is oppoſite the dorſal. Linnæus deſcribes his ſaurus with a double branchial membrane, and a ſpine at the origin of the tail-fin both above and below; theſe peculiarities Bloch did not obſerve in the ſpecimen he examined, which leads him to doubt whether his might be a different ſpecies, or at leaſt whether Linnæus's might not be the male. It is found in Carolina and the Weſt-Indian ſeas.

2. Elops megalops, the great-eyed ſaur-fiſh. This is a new ſpecies deſcribed by Cepede from Commerſon's MSS. The eyes are very large; and it has twenty-four rays only in the membrane; not having thirty, to anſwer exactly the generic character, therefore Cepede has made it a diſtinct genus, by the name of Megalops, or large-eye. The laſt ray of the dorſal fin terminates in a very long thin filament. Commerſon diſcovered it near fort Dauphin, in the iſland of Madagaſcar.

EL'OQUENCE, *ſ.* [*eloquentia*, Lat.] The power of ſpeaking with fluency and elegance. See ORATORY.

Action is *eloquence*, and the eyes of the ignorant
More learned than the ears. *Shakeſpeare.*

His infant ſoftneſs pleads a milder doom,
And ſpeaks with all the *eloquence* of tears. *Heigh.*

Elegant language uttered with fluency:
Fit words attended on his weighty ſenſe,
And mild perſuaſion flow'd in *eloquence*. *Pope.*

EL'OQUENT, *adj.* [*eloquens*, Lat.] Having the power of oratory; having the power of fluent and elegant ſpeech. —The Lord of hoſts doth take away the captain of fifty, and the honourable man, and the counſellor, and the cunning artificer, and the *eloquent* orator. *Iſaiah*, iii. 3.

O death! all *eloquent*, you only prove
What duſt we dote on, when 'tis man we love. *Pope.*

ELO'RA, a town of Hindooſtan, in the country of Aurungabad; celebrated for its pagodas, cut out of the natural rock: thirteen miles north of Aurungabad. Theſe pagodas extend to within a very ſmall diſtance of Dowlatabad, and reſemble the ſubterraneous work at Elephanta; but are infinitely ſuperior in magnitude. Thevenot, who viſited them, ſays, that they reached above two leagues, a matchleſs aſſemblage of temples, choultries, and chapels, ſupported by columns, and covered with ſtatues of coloſſal ſize, but of bad ſculpture, being of great antiquity, and the work of the early Hindoos: but more probably of colonies from Egypt.

E'LOTH. See ELATH.

E'LOTZ, a town of Ruſſia, in the government of Orlov: 112 miles eaſt-north-eaſt of Orel. Lat. 53. 20. N. lon. 57. E. Ferro.

ELOV'KA, a town of Ruſſia, in the government of Tobolſk: ſixteen miles weſt-north-weſt of Tomſk.

ELO'YES, a town of France, in the department of Voſges, and chief place of a canton, in the diſtrict of Remiremont: two leagues and a half ſouth-eaſt of Epinal.

ELPE'NOR, one of the companions of Ulyſſes, changed into a hog by Circe's potions, and afterwards reſtored to his former ſhape. He fell from the top of a houſe where he was ſleeping, and was killed. *Homer.*

EL'PHIN, a town of Ireland, in the county of Roſcommon; the ſee of a biſhop, ſaid to have been founded by St. Patrick, in the fifth century; the cathedral is the pariſh church, neither large nor elegant; the biſhop's palace is near the town: eight miles north of Boyle, and ſixteen north of Roſcommon.

EL'PHINSTON (William), an eminent Scotch prelate, born at Glaſgow in 1431. He was educated in the univerſity of that place, and afterwards went to France to ſtudy civil and canon law in the univerſity of Paris, where he became a profeſſor of that faculty, and continued to deliver lectures with conſiderable reputation for the ſpace of ſix years. He then returned to his native country, where he entered into orders, and was at firſt promoted to be official of Glaſgow, and afterwards of St. Andrew's. He was alſo admitted a member of the king's council. A miſunderſtanding having taken place between James III. of Scotland, and Louis XI. of France, he was nominated joint commiſſioner with the biſhop of Dunkeld and the earl of Buchan, who repaired to the court of Verſailles, and ſucceeded in terminating the differences which had occaſioned their appointment. For the prudence and eloquence which Elphinſton diſplayed on this occaſion, he was, on his return, promoted to the biſhopric of Roſs; whence, about the year 1484, he was tranſlated to the ſee of Aberdeen, and at the ſame time made chancellor of the kingdom. On the acceſſion of James IV. his talents as a ſtateſman were again called into action, and he was appointed ambaſſador to the emperor Maximilian, to endeavour to bring about a marriage-treaty between his daughter and the king of Scotland; but he found that the princeſs was already promiſed elſewhere, and returned home, not without rendering beneficial ſervice to his country, by the negociations which he carried on for terminating an enmity of long ſtanding between the Dutch and Scotch. By his influence the bull was obtained from the pope for eſtabliſhing an univerſity at Aberdeen; and to his perſonal exertions and ſuperintendence was it chiefly owing that the building of King's college was undertaken and completed. To that foundation he proved himſelf a munificent benefactor, and bequeathed large ſums of money for its ſupport. He died in 1514, about eighty-three years of age. He was the author of a hiſtory of his native country, of which the beſt, if not the only entire copy, is among ſir Thomas Fairfax's manuſcripts, in the Bodleian library at Oxford.

ELPINI'CE, a daughter of Miltiades, who married a man that promiſed to releaſe from confinement her brother and huſband, whom the laws of Athens had made reſponſible for the fine impoſed on his father. *C. Nepos.*

EL'RICH, a town of Germany, in the circle of Upper Saxony, and county of Klettenburg; formerly the capital of the county. Here are ſome conſiderable manufactures: ſix miles north-weſt of Nordhauſen.

ELS, a town of Moravia, in the circle of Brunn: thirty-two miles weſt of Olmutz, and twenty-four north-north-weſt of Brunn.

EL'SA, a river of Tuſcany, which runs into the Arno, about a mile weſt from Empoli.

ELS'DON, a ſmall town in the county of Northumberland, diſtant 300 miles from London, and twenty-eight from Newcaſtle. It has no market, and only one fair, Auguſt 26. An imperfect altar was dug up here ſome time ago, with the bones of beaſts, burnt aſhes, and broken urns. Near Elſdon was the field of battle between the Engliſh and Scots in 1388, wherein Henry Percy, called *Hotſpur*, was taken priſoner; and Douglas, the Scots general, was killed. On this battle was founded the ancient hiſtorical ballad of Chevy-chace, the field of battle being ſituated near the river Rhead, on the ſouth ſide of the Cheviot-hills. The entrenchments are ſtill viſible, and a number of tumuli ſcattered over the adjacent ground, mark to future ages the ſlaughter of that famous conteſt.

ELSE, *pron.* [elle, Sax.] Other; one beſides; it is applied both to perſons and things.—To ſtand ſtained with travel, and ſweating with deſire to ſee him; thinking of nothing *elſe*, putting all affairs *elſe* in oblivion, as if there were nothing *elſe* to be done but to ſee him. *Shakeſpeare.*

He ſays, 'twas then with him, as now with you;
He did it when he had nothing *elſe* to do. *Denham.*

ELSE, *adv.* Otherwiſe.—What ways are there whereby we ſhould be aſſured, but either by an internal impreſſion of the notion of a God upon our minds, or *elſe* by ſuch external and viſible effects as our reaſon tells us muſt be attributed to ſome cauſe? *Tillotſon.*—Beſide; except that mentioned:

Pleaſures which no where *elſe* were to be found,
And all Elyſium in a ſpot of ground. *Dryden.*

It has ſometimes *or* before it ſuperfluouſly:

Be more abſtemious,
Or elſe good night your vow. *Shakeſpeare.*

Elſewhere:

But if thee liſt to ſee thy courſer ronne,
Or prove thyſelfe, this ſad encounter ſhonne,
And ſeek *els* without hazard of thy hede. *Spenſer.*

ELSE, a river of Sileſia, which runs into the Oder, near Oderberg.

EL'SEN, a town of Germany, in the circle of Weſtphalia, and biſhopric of Paderborn: two miles weſt-north-weſt of Paderborn.

EL'SEWHERE, *adv.* In any other place.—Although ſeaſoned bodies may and do live near as long in London as *elſewhere*, yet new comers and children do not. *Graunt's Bills of Mortality.*—In other places; in ſome other place:

Let us no more contend, nor blame
Each other, blam'd enough *elſewhere*. *Milton.*

ELS'FLETH, a town of Germany, in the circle of Weſtphalia, and county of Oldenburg; at the conflux of the

the Hunte and the Weſer, whoſe toll amounts to 30,000 rixdollars a-year: ſeventeen miles north-eaſt of Oldenburg.

ELS'GAU, a part of the biſhopric of Bâle, which lies between the mountains and the Larg, comprehending the town and bailiwic of Porentrui, and twenty pariſhes.

ELSHEI'MER (Adam), a painter of great merit, born in 1574, at Frankfort-on-the-Main. A decided inclination for the pencil cauſed him to be placed for inſtruction under Philip Uffenbach, who was ſoon ſurpaſſed by his ſcholar. A laudable ambition to excel inſpired Elſheimer with the reſolution of completing his ſtudies in Italy. Attentive to nothing but his improvement, he avoided ſociety, and employed himſelf aſſiduouſly in copying the various objects of art and nature preſented by that country, in which he was aſſiſted by a happy memory, which enabled him to copy with great exactneſs in the morning, what he had contemplated the preceding evening. He formed to himſelf a peculiar ſtyle of painting, conſiſting of landſcapes, with hiſtorical figures in ſmall, which he finiſhed with exquiſite neatneſs. The diminutive ſize of his pictures did not prevent a grand taſte in his deſigns, and no one better underſtood the management of lights and ſhades, and all the magic of colouring. His drawing is correct, his touch light and fine, and his pieces will bear the minuteſt examination. He purchaſed theſe excellences by the renunciation of fortune; for he worked ſo ſlowly, that though in his lifetime his pictures bore an extraordinary price, he was unable to live by his profeſſion. He reſided in Italy, where he married, and had a large family. He was received into the academy of St. Luke, and was patroniſed by the pope; yet he became overwhelmed with debt, and was thrown into priſon. His friends releaſed him from confinement; but the diſgrace ſo preyed upon his ſpirits, that he ſoon after died at Rome, in 1620, at the age of forty-ſix. He left ſeveral capital performances, which are highly valued. His principal picture is the Flight into Egypt, of which there is a print by his friend and benefactor, count Goud. Several others of his works have been engraved. It is ſaid to have been from the ſtudy of his manner that David Teniers and Bamboccio acquired their excellence.

EL'SINBURG. See HELSINGBORG.

ELSINO'RE. See HELSINGOER.

ELSNAB'BEN, a ſea-port town of Sweden, in the province of Sudermania, on the coaſt of the Baltic: thirty-two miles eaſt-north-eaſt of Nikioping.

ELS'NER (James), doctor of theology, a counſellor of the conſiſtory to his Pruſſian majeſty, firſt preacher in the reformed parochial church of Berlin, and director of the philological claſs in the academy of ſciences, born in March, 1692, at Saalfeld, in Pruſſia, where his father, a rich citizen originally from Bohemia, deſtined him for trade, and therefore treated him with great ſeverity on account of his attachment to letters. After he had received the rudiments of his education in the provincial ſchool, he went to Utrecht and Leyden, where he formed an intimacy with the moſt eminent literary characters of thoſe two cities. In 1720 he left Holland, in conſequence of an invitation from his Pruſſian majeſty, to be profeſſor of theology and of the oriental languages at Lingen; but before he quitted Utrecht he got himſelf admitted to the degree of doctor; and on taking poſſeſſion of his new office, delivered an excellent oration on the zeal proper for a divine. At the ſame time he was appointed paſtor of the church in that city; but he had ſcarcely remained two years in this ſituation, when he was made firſt maſter of Joachim's ſchool at Berlin. On the 28th of October, 1722, he pronounced an inaugural diſcourſe on the obligation of uniting piety to learning; and the month after was choſen a member of the royal academy of ſciences. His occupations did not prevent him from appearing in the pulpit, and his diſcourſes were heard with great approbation. As he had a ſtrong predilection for the miniſtry, he reſigned his rectorſhip in 1730, and accepted the place of paſtor of the parochial church of the Cloiſter. He was alſo made a counſellor of the conſiſtory, and he retained the inſpection of the ſchool in which he had been rector. In 1742, Elſner became director of the claſs of the belles-lettres in the royal academy; and when the ſociety was renewed in 1744, he retained the ſame office, and maintained the character which he had always ſupported, both by attention to his academical duties, and by the learned diſſertations with which he enriched the memoirs of the inſtitution. He died on the 8th of October, 1750. His principal works are, 1. *Obſervationes ſacræ in Novi Teſtamenti Libros, Tom.* i. *Libros hiſtoricos complexus*; Utrecht, 1720, 8vo. 2. *Tom.* ii. *Epiſtolas Apoſtolorum & Apocalypſin complexus*; ibid. 1728, 8vo. 3. *Diſſertat. in Locum Act.* xiii. 48; Lingen, 1721, 4to. 4. *Diſſertat. in Locum vexatum Deut. xxix.* 18; ibid. 1721, 4to. Both theſe are to be found in *Theſaurus Hollandicus.* 4. *Commentatio in illuſtre Jacobi Oraculum, Geneſ.* xlix. 10, *eminentiſſimum Veritatis Chriſtianæ Propugnaculum, nova Ratione communitum*; Berol. 1729, folio. 5. New Deſcription of the State of the Greek Chriſtians in Turkey, with Annotations; ibid. 1737, 8vo. 6. The Epiſtle of Paul to the Philippians explained, in a Series of Sermons, with Notes, and an Introduction; ibid. 1741, 4to. 7. *Schediaſma criticum, quo Auctores aliaque Antiquitatis Monumenta, Inſcriptiones item & Numiſmata emendantur, vindicantur & exponuntur, ad Continuationem, Tom. vii. Miſcellaneorum Regiæ Societat. Scientiarum Berolin*; ibid. 1744, 4to. 8. Continuation of the Neweſt Deſcription of the State of the Greek Chriſtians in Turkey; ibid. 1747, 8vo. Beſides theſe works, he wrote ſeveral diſſertations on different ſubjects, which may be found in the Tranſactions of the Academy of Sciences at Berlin.

EL'STER, a town of Germany, in the circle of Upper Saxony, and circle of Thuringia: ſix miles eaſt of Wittenberg.

EL'STER, a river of Germany, in the circle of Upper Saxony, which paſſes by Adorf, Oelnitz, Plauen, Zeitz, Pegau, Leipſic, &c. and joins the Sala about five miles from Halle.

EL'STER, a town of Germany, in the circle of Upper Saxony, on a river of the ſame name, in the circle of the Vogtland: ten miles ſouth of Oelnitz.

EL'STER (Schwartz), or BLACK ELSTER, a river of Germany, in the circle of Upper Saxony, which riſes about ten miles eaſt from Stolpenin, in the marggraviate of Meiſſen, and runs into the Elbe ſix miles eaſt of Wittenberg.

EL'STERBERG, a town of Germany, in the circle of Upper Saxony, and circle of the Vogtland: fifteen miles ſouth-weſt of Zwickau.

ELSTERWER'DA, a town of Germany, in the circle of Upper Saxony, and marggraviate of Meiſſen: ſeventeen miles north of Meiſſen, and twenty-ſix north-north-weſt of Dreſden.

EL'STOB (William), an Engliſh divine and antiquary, born at Newcaſtle-upon-Tyne, in 1673. His grammatical education he received at Eton, whence he was ſent to Catharine-hall, Cambridge; but the air of that country not agreeing with him, he removed to Queen's-college, Oxford. In this ſeminary he acquired ſo much reputation, that he was choſen fellow of Univerſity-college, and appointed one of the tutors of that inſtitution. In 1697, he was admitted maſter of arts; and, in 1701, he tranſlated into Latin the Saxon Homily of Lupus, with notes, for Dr. Hickes. About the ſame time he tranſlated into Engliſh ſir John Cheke's Latin verſion of Plutarch *De Superſtitione*, which tranſlation was printed at the end of Strype's Life of Cheke. In 1702, Mr. Elſtob was appointed rector of the united pariſhes of St. Swithin and St. Mary Bothaw, in the city of London; which appears to have been the only eccleſiaſtical preferment that he ever obtained. In the following year he publiſhed an edition of Roger Aſcham's Latin Letters. He was alſo the author of An Eſſay on the great Affinity and mutual Agreement

between the two Profeſſions of Law and Divinity, which was printed at London, with a preface by Dr. Hickes. In 1709, Mr. Elſtob publiſhed, in the Saxon language, with a Latin tranſlation, The Homily on St. Gregory's Day. He had alſo compiled an Eſſay on the Hiſtory and Uſe of the Latin tongue; collected materials for a Hiſtory of Newcaſtle, &c. the manuſcripts of which are now loſt; and he had projected ſeveral literary deſigns, the execution of which was prevented by his death, which took place in 1714, when he was only forty-one years of age. The moſt conſiderable of his deſigns was an edition of the Saxon laws, with great additions, and a new Latin verſion by Somner, together with the notes of various learned men; and a prefatory hiſtory of the origin and progreſs of the Engliſh laws, down to the Conqueror, and to Magna Charta. This great plan was completed, in 1721, by Dr. David Wilkins, who, in his preface, ſpeaks in very handſome terms of Mr. Elſtob's proficiency in Saxon lore, and the loſs which the lovers of antiquarian learning had ſuſtained from his early death. He intended alſo a tranſlation, with notes, of Alfred's Paraphraſtic Verſion of Oroſius; of which his tranſcript, with collations, was in the poſſeſſion of the late Dr. Pegge; and another tranſcript by Mr. Ballard, with a large preface on the uſe of Anglo-Saxon literature, is in the library of the ſociety of antiquaries.

EL'STOB (Elizabeth), ſiſter of the preceding, born at Newcaſtle, in 1683. The rudiments of her education ſhe is ſaid to have received from her mother, of whoſe inſtructions ſhe was deprived by her death when Elizabeth was only eight years of age. Upon that event, her guardians endeavoured to diſcourage as much as poſſible her application to literature, conſidering it to be an improper purſuit for her ſex; but their efforts were fruitleſs, and ſhe was permitted to indulge her favourite propenſity. When, in the year 1709, Mr Elſtob publiſhed the Homily on St. Gregory's Day, ſhe accompanied it with an Engliſh tranſlation, and a preface, in which ſhe anſwers the objections made to female learning, by producing the example of the celebrated Anna Maria Schurman, whom ſhe calls the glory of her ſex. Her next publication was a tranſlation of Madame Scudery's Eſſay on Glory. She likewiſe aſſiſted her brother in an edition of Gregory's Paſtoral, which was probably intended to include both the original and the Saxon verſion; and ſhe had tranſcribed all the hymns from an ancient manuſcript in Saliſbury cathedral. By the encouragement of Dr. Hickes, ſhe undertook a Saxon Homiliarium, with an Engliſh tranſlation, notes, and various readings. And to promote that deſign, Mr. Bowyer printed for her, in 1713, Some Teſtimonies of learned Men, in favour of the intended Edition of the Saxon Homilies, concerning the Learning of the Author of theſe Homilies, &c. and the lord treaſurer obtained for her queen Anne's bounty towards printing that work. But the queen's death ſoon deprived Mrs. Elſtob of that benefit; and ſhe was not otherwiſe ſufficiently patroniſed ſo as to be able to complete her deſign. A few only of the Homilies were printed at Oxford, in folio. In the year 1715, ſhe publiſhed a Saxon Grammar, the types for which had been cut at the expence of lord-chief-juſtice Parker, afterwards earl of Macclesfield. She had other literary deſigns in view, which the narrowneſs of her circumſtances and the want of the neceſſary encouragement prevented her from proſecuting; and after her brother's death ſhe became reduced. In this ſituation, ſome worthy friends, by a recommendation of her to queen Caroline, obtained for her a penſion of twenty guineas a-year. On the death of that princeſs, however, ſhe was again involved in difficulties, and, though miſtreſs of eight languages beſides her own, was obliged to ſolicit employment as a preceptreſs of children. It was her good fortune, in 1739, to be received in this capacity into the family of the ducheſs dowager of Portland, where ſhe continued till her death, in 1756, aged ſeventy-three.

EL'STRA, a town of Luſatia: two miles ſouth of Camenz.

ELS'WICH (John Herman de), a learned German Lutheran divine, born at Rendſburg, in Holſtein, in 1684. He proſecuted his ſtudies ſucceſſively at Lubeck, Roſtock, Leipſic, Jena, and Wittemberg; and in the latter univerſity took his degree of maſter of arts. In 1717, he was ſettled in the exerciſe of the miniſtry at Stade, at which place he died in 1721. Though ſo young at the time of his death, he left behind him various works, which reflect credit on his literary diligence; and plans of others which he did not live to complete. Among the former are, 1. An edition of Peter Simonius's treatiſe *De Literis Pereuntibus*, with notes. 2. *Epiſtolæ familiares varii, theologici potiſſimum, Argumenti.* 3. An edition of Launoy's treatiſe *De Varia Ariſtotelis Fortuna in Schola Pariſienſi*; to which he added, *Schediaſma de varia Ariſtotelis in Scholis Proteſtantium Fortuna.* 4. *Commentatio de Reliquiis Papatus Eccleſiæ Lutheranæ temerè afflictis.* 5. *Diſſertationes de Melchiſedecho.* 6. *Formulæ Concordiæ in Dania non combuſta.* 7. *Recentiorum in Novum Fœdus Critica.* 8. *Fanaticorum Palinodia.* 9. *Obſervationes Philologicæ ſuper Witteri Commentationem in Geneſim*; and, 10. *Vindiciæ Diaſcepſeos Hunnianæ.*

ELSYN'GE (Henry), a perſon eminent for parliamentary knowledge, born at Batterſea, in 1598. His father was clerk of the houſe of lords. Henry was educated at Weſtminſter-ſchool and Chriſtchurch-college, Oxford, and afterwards ſpent ſeven years in foreign travel. He was highly valued for his accompliſhments; and by the intereſt, it is ſaid, of archbiſhop Laud, obtained the place of clerk of the houſe of commons, which he filled with ſingular ability and good conduct. He acquired the eſteem of all parties in times of great turbulence and faction, and kept his poſt under the long parliament till December, 1648, when he deſired permiſſion to reſign. A decline of health was the pretext; but it was underſtood that he was unwilling to take any part in the trial of the king. He retired to his houſe at Hounſlow, and there died in 1654. His principal work is intitled The ancient Method and Manner of holding Parliaments in England; printed firſt in 1663. It is a ſmall piece, but valuable from its matter and method. It has been ſeveral times reprinted; the laſt edition, in 1768, is the moſt correct, and is enriched by a large addition taken from the author's original manuſcript in the Britiſh Muſeum.

EL'TEKEH, a city of Paleſtine, ſituated in the tribe of Dan; and one of the cities of the Levites, of the family of Kohath. *Joſh.* xxi. 23.

EL'TEKON, a city of Paleſtine, in the tribe of Judah, ſituated in the mountains of that province. *Joſh.* xv. 59.

EL'TEN, a town of Germany, in the circle of Weſtphalia, and duchy of Cleves: five miles north of Cleves.

EL'TERLEIN, a town of Germany, in the circle of Upper Saxony, and circle of Erzgebirg: two miles eaſt-north-eaſt of Grunhayn.

ELT'HAM, a pleaſant town in the county of Kent, eight miles from London, on the road to Maidſtone, and midway between Bromley and the Thames. Anthony Beck, biſhop of Durham, having fraudulently ſecured the poſſeſſion of this manor, in 1290, beautified the capital manſion, and left it to Eleanor, the queen of Edward I. Edward II. frequently reſided here. His queen was here delivered of a ſon, who had the name of John of Eltham. Poſſibly from this circumſtance, it is improperly called King John's Palace; unleſs it obtained this appellation from the ſumptuous entertainment given here by Edward III. to the captive King John of France. Succeeding princes, and particularly Henry VII. enlarged and improved this palace; but it was neglected, after Greenwich became the favourite country reſidence. The Britiſh princes often celebrated their feſtivals at Eltham with great pomp. The laſt of theſe feaſts was held at Whitſuntide, in 1515, when Henry VIII. created ſir Edward Stanley baron Monteagle, for his ſervices at Flodden-field. Part of the ſtately hall which was the ſcene of thoſe feaſts, is ſtill in being,

and is uſed as a barn. The roof is ſomewhat like that of Weſtminſter-hall. The large moat round the palace, although the greateſt part of it is dry, and covered with verdure, has ſtill two ſtone bridges over it, one of which conſiſts of four arches. The farm-houſe in the incloſure, though ſomewhat modernized, was part of this ancient palace. In the garden of Mr. Dorrington is the conſervatory, in which were formerly kept the exotics of that eminent botaniſt, Dr. Sherrard. The *Hortus Elthamienſis* is well known to the curious in botany. On Shooter's-hill, in this pariſh, the eye is charmed with the loveliеſt of proſpects. Here are two charity-ſchools well endowed. It has a market on Mondays; and five fairs, viz. Palm-Monday, Eaſter-Monday, Whit-Monday, and October 10. Near Eltham is Chiſſelhurſt, noted for the retirement of the famous Camden, who here compoſed the greateſt part of his Annals of Queen Elizabeth. Here the preſent lord Camden has a noble ſeat, in whoſe park may be ſeen that celebrated piece of ancient architecture, called the Lantern of Demoſthenes.

ELT'MAN, a town of Germany, in the circle of Franconia, and biſhopric of Wurzburg: eight miles weſt-north-weſt of Bamberg, and forty eaſt-north-eaſt of Wurzburg.

EL'TOLAD, or TOLAD, a city of Paleſtine, in the tribe of Judah, ſituated in the ſouthern parts of that province, near the borders of Edom; it was afterwards aſſigned to the tribe of Simeon, as their inheritance was included within that of Judah. *Joſh.* xv. 30. xix. 4. and 1 *Chron.* iv. 29.

EL'VAS, a city of Portugal, in the province of Tralos-Montes, the ſee of a biſhop ſuffragan of Evora, ſaid to have been founded by the Gauls, in the year of the world 3009. It contains, beſides the cathedral, three pariſh churches, two hoſpitals, and ſeven convents. The Spaniards beſieged it in 1659; and the French and Spaniards in 1706, without ſucceſs. The town and environs contain 12,000 ſouls; near it is a fortreſs, called the Lippe, built in 1764, under the direction of count Erneſt de Schomberg Lippe. An academy was founded here in 1733: 104 miles eaſt of Liſbon. Lat. 38. 44. N. lon. 11. 43. E. Ferro.

To ELU'CIDATE, *v. a.* [*elucido*, Lat.] To explain; to clear; to make plain.—To *elucidate* a little the matter, let us conſider it. *Boyle.*

ELUCIDA'TION, *ſ.* Explanation; expoſition.—We ſhall, in order to the *elucidation* of this matter, ſubjoin the following experiment. *Boyle.*

ELUCIDA'TOR, *ſ.* Explainer; expoſitor; commentator.—Obſcurity is brought over them by the courſe of ignorance and age, and yet more by their pedantical *elucidations*. *Abbot.*

ELUCUBRA'TION, *ſ.* [from the Lat. *e*, from, and *lucubro*, to ſtudy by candle-light.] The act of ſtudying by candle-light, the produce of cloſe ſtudy.

To ELU'DE, *v. a.* [*eludo*, Lat.] To eſcape by ſtratagem; to avoid any miſchief or danger by artifice.—He who looks no higher for the motives of his conduct than the reſentments of human juſtice, whenever he can preſume himſelf cunning enough to *elude*, rich enough to bribe, or ſtrong enough to reſiſt it, will be under no reſtraint. *Rogers.*—To mock by an unexpected eſcape:

My gentle Delia beckons from the plain,
Then, hid in ſhades, *eludes* her eager ſwain;
But feigns a laugh to ſee me ſearch around,
And by that laugh the willing fair is found. *Pope.*

ELU'DIBLE, *adj.* Poſſible to be defeated.—There is not any common-place more inſiſted on than the happineſs of trials by juries; yet if this bleſſed part of our law be *eludible* by power and artifice, we ſhall have little reaſon to boaſt. *Swift.*

ELVE'LA. See AGARICUS, HELVELLA, and TREMELLA.

EL'VEN, a town of France, in the department of the Morbiban, and chief place of a canton, in the diſtrict of Vannes: two leagues and a half north-eaſt of Vannes.

ELVES, the plural of *elf*. See ELF.

Fairy *elves*
Whoſe midnight revels by ſome foreſt ſide,
Or fountain, ſome belated peaſant ſees,
Or dreams he ſees. *Milton.*

Ye ſylphs and ſylphids to your chief give ear;
Fays, fairies, genii, *elves*, and demons, hear. *Pope.*

EL'VESLOCK, *ſ.* Knots in the hair ſuperſtitiouſly ſuppoſed to be tangled by the fairies.—From the like might proceed the fears of polling *elveſlock*, or complicated hairs of the head. *Brown.*

EL'VISH, *adj.* [the plural of *elf*: it is written more properly *elfiſh*.] Relating to elves, or wandering ſpirits.—Thou *elviſh* markt, abortive rioting hog! *Shakeſpeare.*

No muſe hath been ſo bold,
Or of the latter or the old,
Thoſe *elviſh* ſecrets to unfold,
Which lie from others reading. *Drayton.*

ELU'L, *ſ.* in ancient chronology, the twelfth month of the Jewiſh civil year, and the ſixth of the eccleſiaſtical: it conſiſted of only twenty-nine days, and anſwered nearly to our Auguſt.

ELUM'BATED, *adj.* [*elumbis*, Lat.] Weakened in the loins.

EL'VO, a river of Italy, which runs into the Seſia, two miles north of Vercelle.

ELU'SION, *ſ.* [*eluſio*, Lat.] An eſcape from enquiry or examination; a fraud; an artifice.—An appendix, relating to the tranſmutation of metals, detects the impoſtures and *eluſions* of thoſe who have pretended to it. *Woodward.*

ELU'SIVE, *adj.* Practiſing eluſion; uſing arts to eſcape:

Eluſive of the bridal day, ſhe gives
Fond hopes to all, and all with hopes deceives. *Pope.*

ELU'SORY, *adj.* Tending to elude; tending to deceive; fraudulent, deceitful; fallacious.—It may be feared they are but Parthian flights, ambuſcade retreats, and *eluſory* tergiverſation. *Brown.*

To ELU'TE, *v. a.* [*eluo*, Lat.] To waſh off.—The more oily any ſpirit is, the more pernicious; becauſe it is harder to be *eluted* by the blood. *Arbuthnot.*

ELUTE'RIA, *ſ.* in botany. See CLUYTIA.

ELU'THERA, or ALABASTER, one of the Bahama or Lucaya iſlands, where above ſixty families formerly ſettled under deputy-governor Holmes, and erected a fort.

ELUTHE'RIA. See ELEUTHERIA.

To ELU'TRIATE, *v. a.* [*elutrio*, Lat.] To decant; or ſtrain out.—The preſſure of the air upon the lungs is much leſs than it has been computed by ſome; but ſtill it is ſomething, and the alteration of one-tenth of its force upon the lungs muſt produce ſome difference in *elutriating* the blood as it paſſes through the lungs. *Arbuthnot.*

ELUTRIA'TION, *ſ.* A term uſed by chemiſts to denote the proceſs of waſhing, as practiſed by metallurgiſts and others; and indeed this laſt and more familiar word is now moſt frequently uſed. Thus the metallic ores are cleared of earthly admixtures by elutriation, that is to ſay, waſhing with water, which carries off the lighter earthy parts, while the heavier metallic parts ſubſide to the bottom.

ELU'VIES, *ſ.* [a quagmire, from *eluo*, Lat. to cleanſe.] The effluvium from a foul or ſwampy place. Alſo the humour diſcharged in a fluor albus.

EL'VIUS (Peter), ſecretary of the royal academy of ſciences at Stockholm, born at Upſal in 1710, and applied to mechanics under Triewald and Polheim, and to the higher mathematics under Klingſtierna, who firſt introduced them into Sweden. In 1738, the royal college of mines entruſted him with the care of its collection of machines.

machines. In 1740, he conſtructed a fulling-mill according to a theory of his own; and, in 1748, in conjunction with baron C. Harleman, he went to aſcertain the poſition of the Swediſh lakes. During this excurſion, he determined the ſituation of Gottenburgh and the adjacent coaſt, of which he conſtructed charts. Much might have been expected from the zeal and activity of this eminent man, had he not been carried off by a premature death, in the thirty-eighth year of his age, on the 27th of September, 1749. The academy of ſciences cauſed a medal to be ſtruck in honour of his memory, and the journal of his laſt tour to Trollhatta was publiſhed, in the Swediſh language, at Stockholm, in 1751.

ELU'ZAI, [Heb. God my ſtrength.] A man's name.

EL'WAD-AD, a town of Arabia, in the country of Yemen: thirty miles ſouth-ſouth-eaſt of Chamir.

ELWAN'GEN, a principality of Germany, bordering on the duchy of Wurtemberg, in the circle of Swabia. It was firſt a Benedictine convent, founded in 764, afterwards became an abbey; and, in 1461, ſecuriſed into a provoſtſhip and principality; and is protected by the duke of Wurtemberg. It pays eighty florins for a Roman month, and is taxed 175 rix-dollars and ſeventy-eight kruitzers. The prince has a regency, an eccleſiaſtical council, and a chamber of finances.

ELWAN'GEN, a town of Germany, and in a principality of the ſame name, on the river Jaxt: thirty-two miles north of Ulm, and forty two north-north-weſt of Augſburg. Lat. 48. 53. N. lon. 27. 47. E. Ferro.

EL'WES (John), an eccentric genius, admitted to notice in this Encyclopædia, merely from the ſingularity of his character as a *miſer*. He was member for Berkſhire in three ſucceſſive parliaments. His family name was Meggot; and his father was a brewer of great eminence, diſtinguiſhed by no peculiarity of character: but his mother, though ſhe was left nearly 100,000l. by her huſband, is ſaid to have ſtarved herſelf to death! At an early period of life he was ſent to Weſtminſter ſchool, where he remained for ten or twelve years. During that time he certainly had not miſapplied his talents; for he was a good claſſical ſcholar to the laſt: and it is a circumſtance not a little remarkable, though well authenticated, that he never read afterwards, nor had he ever any knowledge in accounts; to which may in ſome meaſure be attributed the total ignorance he was always in as to his affairs. From Weſtminſter ſchool Mr. Meggot removed to Geneva, where he entered upon purſuits more agreeable to him than ſtudy. The riding-maſter of the academy there had then to boaſt, perhaps, of three of the boldeſt riders in Europe, Mr. Worſley, Mr. Elwes, and ſir Sydney Meadows. Of the three, Elwes was reckoned the moſt courageous; the young horſes were always put into his hands, and he was the rough-rider to the other two. On his return to England, after an abſence of three years, he was to be introduced to his uncle, ſir Harvey Elwes, who was then living at Stoke in Suffolk, the moſt perfect picture of human penury then exiſting. The attempts at ſaving money were in him ſo extraordinary, that Mr. Elwes, perhaps, never quite reached them, even at the laſt period of his life. Of what temperance can do, ſir Harvey was an extraordinary inſtance. At an early period of life he was given over for a conſumption, and he lived till betwixt eighty and ninety years of age. On his death, his fortune, which was at leaſt 250,000l. fell to his nephew Mr. Meggot, who by will was empowered to aſſume the name and armorial bearings of Elwes. To this uncle, and this property, Mr. Elwes ſucceeded when he had advanced beyond the fortieth year of his age. And for fifteen years previous to this period, he was known in the moſt faſhionable and extravagant circles of London. He had always a turn for play; and it was only late in life, and from paying always, and not always being paid, that he conceived diſguſt at it. The theory which he profeſſed, "that it was impoſſible to aſk a gentleman for money," he perfectly confirmed by the practice; and he never violated this feeling to the lateſt hour of his life.

The manners of Mr. Elwes were ſuch; ſo complacent, ſo attentive, ſo gentlemanly, and ſo engaging, that rudeneſs could not ruffle them, nor ſtrong ingratitude break their obſervance. He retained this peculiar feature of the old court to the laſt: but he had a praiſe beyond this; he had the moſt gallant diſregard of his own perſon, and all care about himſelf, that can be imagined. The inſtances in younger life, in the moſt imminent perſonal hazard, are innumerable; but when age had deſpoiled him of his activity, and might have rendered care and attention about himſelf natural, he knew not what they were: He wiſhed no one to aſſiſt him: "He was as young as ever; he could walk, he could ride, and he could dance; and he hoped he ſhould not give trouble even when he was old:" He was at that time ſeventy five! It is curious to reflect how he contrived to mingle ſmall attempts at ſaving, with objects of the moſt unbounded diſſipation. After ſitting up a whole night at play for thouſands with the moſt faſhionable and profligate men of the time, amidſt ſplendid rooms, gilt ſofas, wax lights, and waiters attendant on his call, he would walk out about four in the morning, not towards home, but into Smithfield, to meet his own cattle, which were coming to market from Thaydon-hall, a farm of his in Eſſex! There would this ſame man, forgetful of the ſcenes he had juſt left, ſtand in the cold or rain bartering with a carcaſs butcher for a ſhilling! Sometimes, when the cattle did not arrive at the hour expected, he would walk on in the mire to meet them; and more than once has gone on foot the whole way to his farm without ſtopping, which was ſeventeen miles from London, after ſitting up the whole night. Had every man been of the mind of Mr. Elwes, the race of innkeepers muſt have periſhed, and poſtchaiſe and poſting taxes muſt have returned unproductive to thoſe who made them; for it was the buſineſs of his life to avoid every kind of expence. He always travelled on horſeback or on foot. To ſee him ſetting out on a journey, was a matter truly curious; his firſt care was to put two or three eggs, boiled hard, into his great coat pocket, or any ſcraps of bread which he found; baggage he never took: then mounting one of his hunters, his next attention was to get out of London into that road where turnpikes were the feweſt: then, ſtopping under any hedge where graſs preſented itſelf for his horſe, and a little water for himſelf, he would ſit down and refreſh himſelf and his horſe together. His chief reſidence at this period of his life was in Berkſhire, at his ſeat at Marcham. Here he had two natural ſons born, who inherit the greateſt part of his property. The keeping a pack of fox-hounds, was the only inſtance in the whole life of Mr. Elwes of his ever ſacrificing money to pleaſure; and it may be ſelected as the only period when he forgot the cares, the perplexities, and the regret, which his wealth occaſioned. But even here every thing was done in the moſt frugal manner. Scrub, or Mungo, when compared with Mr. Elwes's huntſman, had an idle life of it. This famous huntſman might have fixed an epoch in the hiſtory of ſervants: for in a morning, getting up at four o'clock, he milked the cows; he then prepared breakfaſt for Mr. Elwes, and any friends he might have with him; then ſlipping on a green coat, he hurried into the ſtable, ſaddled the horſes, unkenneled the hounds, and away they went to the coverts. After the fatigues of hunting, he refreſhed himſelf by rubbing down the horſes; then running into the houſe to lay the cloth, and wait at dinner; then hurrying again into the ſtable to feed the horſes, diverſified with the cows to milk, the dogs to feed, and the hunters to litter down for the night. In the penury of Mr. Elwes there was ſomething that ſeemed like a judgment from heaven. All earthly comforts he voluntarily denied himſelf: he would walk home in the rain in London rather than pay a ſhilling for a coach; he would ſit in wet clothes ſooner than have a fire to dry them; he would eat his proviſions

viſions in the laſt ſtage of putrefaction ſooner than have a freſh joint from the butcher.

Mr. Elwes had reſided about thirteen years upon his uncle's eſtate in Suffolk, when the conteſt for Berkſhire preſented itſelf on the diſſolution of the parliament; and when, to preſerve the peace of that county, he was nominated by lord Craven. Mr. Elwes, though he had retired from public buſineſs for ſome years, had ſtill left about him ſome of the ſeeds of more active life, and he agreed to the propoſal. It came farther enhanced to him, by the agreement, that he was to be brought in by the freeholders for nothing. All he did on the occaſion was dining at the ordinary at Reading; and he got into parliament for eighteen-pence! Though a new man, Mr. Elwes could not be called a young member; for he was at this time nearly ſixty years of age. But he was in poſſeſſion of all his activity; and, preparatory to his appearance on the boards of St. Stephen's chapel, he uſed to attend conſtantly during the races and other public meetings in all the great towns where his voters reſided. At the different aſſemblies, he would dance amongſt the youngeſt to the laſt, after riding on horſeback, frequently in the rain, to the place of meeting.

The honour of parliament made no alteration in the dreſs of Mr. Elwes; on the contrary, it ſeemed to have attained additional meanneſs; and nearly to have reached that happy climax of poverty, which has more than once drawn on him the compaſſion of thoſe who paſſed him in the ſtreet. For the ſpeaker's dinners, however, he had one ſuit, with which the ſpeaker in the courſe of the ſeſſions became very familiar. The miniſter likewiſe was well acquainted with it; and at any dinner of oppoſition ſtill was his apparel the ſame. The wits of the minority uſed to ſay, "that they had full as much reaſon as the miniſter to be ſatisfied with Mr. Elwes, as he never turned his coat." At this period of his life Mr. Elwes wore a wig. Much about the time when his parliamentary life ceaſed, that wig became worn out; ſo then, being older and wiſer as to expence, he wore his own hair; which, like his expences, was very ſmall. All this time the income of Mr. Elwes was increaſing hourly, and his preſent expenditure was next to nothing; for the little pleaſures he had once engaged in, he had now given up. He kept no houſe, and only one old ſervant, the huntſman, and a couple of horſes: he reſided with his nephew; his two ſons he had ſtationed in Suffolk and Berkſhire, to look after his reſpective eſtates; and his dreſs certainly was no expence to him; for had not other people been more careful than himſelf, he would not have had it even mended.

As Mr. Elwes came into parliament without expence, he performed his duty as a member would have done in the pure days of our conſtitution. What he had not bought, he never attempted to ſell; and he went forward in that ſtraight and direct path, which can alone ſatisfy a reflecting mind. Amongſt the ſmaller memorials of the parliamentary life of Mr. Elwes may be noted, that he did not follow the cuſtom of members in general, by ſitting on any particular ſide of the houſe, but ſat as occaſion preſented itſelf, on either indiſcriminately; and he voted much in the ſame manner, but never roſe to ſpeak. In his attendance at the houſe, he was always early and late; and he never left it for dinner, as he had accuſtomed himſelf to faſting, ſometimes for twenty-four hours in continuance.

When he quitted parliament, he was, in the common phraſe, "a fiſh out of water!" The ſtile of Mr. Elwes's life had left him no domeſtic ſcenes to which he could retire; his home was dreary and poor; his rooms received no cheerfulneſs from fire; and while the outſide had all the appearance of a "Houſe to be let," the inſide was a deſert; but he had his penury alone to thank for this, and for the want of all the little comforts and conſolations which ſhould attend old age, and ſmooth the paſſage of declining life. At the cloſe of the ſpring of 1785, he wiſhed again to viſit, which he had not done for ſome years, his ſeat at Stoke, in Suffolk. But then the journey was a moſt ſerious object. The famous old ſervant was dead; the horſes that remained with him were a couple of worn-out brood-mares; and he himſelf was not in that vigour of body in which he could ride ſixty or ſeventy miles on the ſuſtenance of two boiled eggs. The mention of a poſt-chaiſe was a crime—"He afford a poſt-chaiſe, indeed! where was he to get the money?" At length he was carried into the country as he was carried into parliament, free of expence, by a gentleman who was certainly not quite ſo rich as Mr. Elwes. When he reached Stoke, once the ſeat of more active ſcenes, and where his fox-hounds had ſpread ſomewhat like vivacity around, he remarked, "he had expended a great deal of money once very fooliſhly; but that a man grew wiſer by time."

The rooms at this ſeat, which were much out of repair, and would have fallen in but for his ſon, John Elwes, eſq. who reſided there, he thought too expenſively furniſhed, as worſe things might have ſerved. If a window was broken, there was to be no repair but that of a little brown paper, or piecing in a bit of broken glaſs. To ſave fire, he would walk about the remains of an old greenhouſe, or ſit with a ſervant in the kitchen. During the harveſt, he would amuſe himſelf with going into the fields to glean the corn on the grounds of his own tenants; and they uſed to leave a little more than common to pleaſe the old gentleman, who was as eager after it as any pauper in the pariſh. In the advance of the ſeaſon, his morning employment was to pick up any ſtray chips, bones, or other things, to carry to the fire, in his pocket.

As no gleam of favourite paſſion, or any ray of amuſement, broke through this gloom of penury, his inſatiable deſire of ſaving was now become uniform and ſyſtematic. He uſed ſtill to ride about the country on one of the brood mares; but then he rode her very economically, on the ſoft turf, adjoining the road, without putting himſelf to the expence of ſhoes, as he obſerved, "The turf was ſo pleaſant to a horſe's foot!" And when any gentleman called to pay him a viſit, and the boy who attended in the ſtables was profuſe enough to put a little hay before his horſe, old Elwes would ſlily ſteal back into the ſtable, and take the hay very carefully away. That very ſtrong appetite which Mr. Elwes had in ſome meaſure reſtrained during the long ſitting of parliament, he now indulged moſt voraciouſly, and on every thing he could find. To ſave, as he thought, the expence of going to a butcher, he would have a whole ſheep killed, and ſo eat mutton to the—end of the chapter. When he occaſionally had his river drawn, though ſometimes horſe-loads of ſmall fiſh were taken, not one would he ſuffer to be thrown back; for he obſerved, "He ſhould never ſee them again!" Game in the laſt ſtate of putrefaction, and meat that walked about his plate, would he continue to eat, rather than have new things killed before the old proviſion was finiſhed. With this diet, the charnel-houſe of ſuſtenance, his dreſs kept pace, equally in the laſt ſtage of abſolute diſſolution. Sometimes he would walk about in a tattered brown-coloured hat, and ſometimes in a red and white woollen cap, like a priſoner confined for debt. His ſhoes he never would ſuffer to be cleaned, leſt they ſhould be worn out by the bruſh. But ſtill, with all this ſelf-denial, that penury of life to which the inhabitant of an alms-houſe is not doomed, ſtill did he think he was profuſe, and frequently ſay, "He muſt be a little more careful of his property." His diſquietude on the ſubject of money was continual. When he went to bed, he would put five or ten guineas into a bureau; and then, full of his money, after he had retired to reſt, and ſometimes in the middle of the night, he would come down to ſee whether it was ſafe.

The ſcene of mortification at which Mr. Elwes was now arrived, was all but a denial of the common neceſſaries of life: and indeed it might have admitted a doubt,

whether or not, if his manors, his fiſh-ponds, and ſome grounds in his own hands, had not furniſhed a ſubſiſtence, where he had not any thing actually to buy, he would not, rather than have bought any thing, have ſtarved. Strange as this may appear, it is not at all exaggerated. He one day, during this period, dined upon the remaining part of a moor-hen, which had been brought out of the river by a rat! and at another he ate an undigeſted part of a pike which a larger one had ſwallowed, but had not finiſhed, and which were taken in this ſtate in a net. At the time this circumſtance happened, he diſcovered a ſtrange kind of ſatisfaction; for he ſaid to a friend, "Aye! this was killing two birds with one ſtone!" In the room of all comment, of all moral, let it be remarked, that at this time Mr. Elwes was perhaps worth nearly *eight hundred thouſand pounds!* and, at this period, he had not made his will, of courſe was not ſaving from any ſentiment of affection for any perſon.

The ſummer of 1788 Mr. Elwes paſſed at his houſe in Welbeck-ſtreet, London; and he paſſed that ſummer without any other ſociety than that of two maid-ſervants; for he had now given up the expence of keeping any male domeſtic. His chief employment uſed to be that of getting up early in a morning to viſit ſome of his houſes in Mary-le-bone, which during the ſummer were repairing. As he was there generally at four o'clock in a morning, he was of courſe on the ſpot before the workmen; and he uſed contentedly to ſit down on the ſteps before the door, to ſcold them when they came. The neighbours, who uſed to ſee him appear thus regularly every morning, and who concluded, from his apparel, he was one of the workmen, obſerved, "there never was ſo punctual a man as the old carpenter." During the whole morning he would continue to run up and down ſtairs to ſee the men were not idle for an inſtant, with the ſame anxiety as if his whole happineſs in life had been centered in the finiſhing this houſe, regardleſs of the greater property he had at ſtake in various places, and for ever employed in the minutiæ only of affairs.

In the muſcular frame of Mr. Elwes, there was every thing that promiſed extreme length of life; and he lived to above ſeventy years of age without any natural diſorder attacking him: but, as lord Bacon has well obſerved, "the minds of ſome men are a lamp that is continually burning;" and ſuch was the mind of Mr. Elwes. Removed from thoſe occaſional public avocations which had once engaged his attention, money was now his only thought. He roſe upon money—upon money he lay down to reſt; and as his capacity ſunk away from him by degrees, he dwindled from the real cares of his property into the puerile concealment of a few guineas. This little ſtore he would carefully wrap up in various papers, and depoſiting them in different corners, would amuſe himſelf with running from one to the other to ſee whether they were all ſafe. Then forgetting, perhaps, where he had concealed ſome of them, he would become as ſeriouſly afflicted as a man might be who had loſt all his property. Nor was the day alone thus ſpent: he would frequently riſe in the middle of the night, and be heard walking about different parts of the houſe, looking after what he had thus hidden and forgotten.

Mr. George Elwes having been ſettled at his ſeat at Marcham in Berkſhire, he was naturally deſirous that, in the aſſiduities of his wife, his father might at length find a comfortable home. In London he was certainly moſt uncomfortable; but ſtill, with theſe temptations before and behind him, a journey with any expence annexed to it was inſurmountable. This, however, was luckily obviated by an offer from his friend Mr. Partis, to take him to his ancient ſeat in Berkſhire, with his purſe perfectly whole. But there was one circumſtance ſtill very diſtreſſing: the old gentleman had now nearly worn out his laſt coat, and he would not buy a new one; his ſon, therefore, with a pious fraud, contrived to get Mr. Partis to buy him a coat, and make him a preſent of it. Thus, formerly having had a good coat, then a bad one, and at laſt no coat at all, he was kind enough to accept one from a neighbour.

Mr. Elwes carried with him into Berkſhire five guineas and a half, and half-a-crown. Leſt the mention of this ſum may appear ſingular, it ſhould be noticed, that previous to his journey he had carefully wrapped it up in various folds of paper, that no part of it might be loſt. On the arrival of the old gentleman, Mr. George Elwes and his lady did every thing they could to make the country a ſcene of quiet to him. But "he had that within" which baffled every effort of the kind. Of his heart, it might be ſaid, "there was no peace in Iſrael." His mind, caſt away upon the vaſt and troubled ocean of his property, extending beyond the bounds of his calculation, returned to amuſe itſelf with fetching and carrying about a few guineas, which in that ocean was indeed a drop. But nature had now carried on life nearly as far as ſhe was able. The firſt ſymptoms of more immediate decay was his inability to enjoy his reſt at night. Frequently would he be heard at midnight as if ſtruggling with ſome one in his chamber, and crying out, "I will keep my money, I will; noboby ſhall rob me of my property." On any one of the family going into his room, he would ſtart from this fever of anxiety, and, as if waking from a troubled dream, again hurry into bed, and ſeem unconſcious of what had happened. At length, on the 26th of November, 1789, expired this miſerably rich man, whoſe property, nearly reaching to a million ſterling, extended itſelf almoſt through every county in England. His property was divided between his two natural ſons.

EL'WY, a river of North Wales, which runs into the Cluyd near St. Aſaph.

EL'XAI, or ELCESAI, the reputed founder of the ſect of the Elceſaites, or Sampſæans, was a Jew by nation, who appears to have propagated his opinions in the beginning of the ſecond century, under the reign of the emperor Trajan. According to Epiphanius, it is doubtful whether he is to be claſſed among Jews or Chriſtians. But from what that writer has himſelf further related of the reſpect paid to him by the followers of four ſects, who, in ſome meaſure, borrowed their opinions from him, viz. the Ebionites, two ſorts of Nazarenes, and the Oſſenes; and the moſt credible judgment that can be formed concerning their tenets, we conceive that he is clearly to be ranked among Chriſtians. It ſeems moſt probable that his followers concurred generally, if not entirely, with the ſects above-named in their diſtinguiſhing opinions. It appears that they regarded many parts of the Old Teſtament, and the Goſpels at leaſt in the New, as ſacred books, but that they rejected ſome, if not all, of the apoſtolical writings. It does not appear that this ſect ever ſpread much beyond the confines of Paleſtine.

ELY, [probably of ἕλος, Gr. a marſh, or *helig*, C. Br. a willow, becauſe, like other fenny places, it abounds with willows.] The ancient city and metropolis of the county of Cambridge, ſituated on the Ouſe, in a fenny country, called *The Iſle of Ely*, which extends forty miles weſt, ſix north, ſix ſouth, and three eaſt, from the city. It was erected into a biſhopric in the year 1107, in favour of Hervey, removed from Bangor. The biſhop poſſeſſes nearly all the rights of a county palatine, and is ſovereign: he appoints a judge to hear and determine all cauſes within the iſle, holds aſſizes, gaol delivery, and quarter ſeſſions of the peace within the liberty, and has his chief and under bailiffs for execution of proceſs, and his cuſtos rotulorum: yet it is not a county palatine, but a royal franchiſe. See the article COUNTY, vol. v. p. 290. Here was an abbey of nuns in the ſeventh century, which was deſtroyed by the Danes in the year 868. In the year 970, an abbey of monks was founded, which, in 1413, was mitred, and continued till the diſſolution, when it was valued at 1084l. The cathedral, which is its chief ornament,

ment, has a ſtately lantern, ſeen at a vaſt diſtance; but it ſeems to totter with every blaſt of wind. The choir was removed to the eaſt end of the church, and a general repair took place in 1792, when a very handſome window of painted glaſs was put up at the eaſt end, over the altar. The city is not populous nor beautiful, but has great plenty of proviſions; the number of inhabitants is about 2500. It has one broad handſome well-paved ſtreet; and it is the only city in England ſubordinate to the biſhop in its civil government, and unrepreſented in parliament. The iſle of Ely, from its fenny ſituation, has frequently held out a long time againſt foreign and domeſtic foes; and particularly was the laſt place in the kingdom which ſubmitted to William the Conqueror. Here is a free-ſchool and two charity-ſchools. The aſſizes are held here in March or April, and at Wiſbeach in October. The market is on Saturday. Fairs, Aſcenſion-day and October 29. The dioceſe contains all Cambridgeſhire, and the iſle of Ely, excepting Iſelham, which belongs to the ſee of Rocheſter, and fifteen other pariſhes that are in the dioceſe of Norwich; but it has a pariſh in Norfolk, viz. Emneth. The number or pariſhes in this dioceſe are 141, whereof ſeventy-five are impropriate. This ſee hath given two ſaints and two cardinals to the church of Rome; and to the Engliſh nation nine lord chancellors, ſeven lord treaſurers, one lord privy-ſeal, one chancellor of the exchequer, one chancellor to the univerſity of Oxford, two maſters of the rolls, and three almoners. To the cathedral belong a biſhop, a dean, an archdeacon, eight prebendaries, with vicars, lay-clerks, choriſters, a ſchoolmaſter, uſher, and twenty-eight king's ſcholars. Ely is ſeventeen miles north of Cambridge, and ſixty-nine north of London.

ELYCH'NIOUS, *adj.* Having no match, void of light. *Cole. Not uſed.*

ELYCHRY'SUM, *ſ.* in botany. See STÆHELINA.

ELYMA'IS, a country of Perſia, between the Perſian gulf and Media. The capital of the country was called Elymais, and was famous for a rich temple of Diana, which Antiochus Epiphanes attempted to plunder. The Elymeans aſſiſted Antiochus the Great in his wars againſt the Romans. None of their kings are named in hiſtory. *Strabo.*

EL'YMI, a nation deſcended from the Trojans, in alliance with the people of Carthage. *Pauſanias.*

EL'YMAS, [Arab. a magician.] A man's name.

EL'YMUS, *ſ.* [from ελυω, Gr. to involve, the ſpike in ſome ſpecies being involved in the involucre.] In botany, a genus of the claſs triandria, order digynia, natural order gramina, gramineæ, or graſſes. The generic characters are—Calyx: receptacle, common, lengthened into a ſpike; glume four-leaved, two-ranked, two ſubulate leaflets being placed under each ſpikelet. Corolla: two-valved; valve exterior, larger, acuminate, awned, interior flat; nectary two-leaved; leaflets oblong, ſharp, ciliate. Stamina: filaments three, hair-form, very ſhort; antheræ oblong, two-cleft at the baſe. Piſtillum: germ top-ſhaped, ſtyles two, divaricated, hairy, inflected; ſtigmas ſimple. Pericarpium: none; corolla involving the ſeed. Seed: ſingle, linear, convex on one ſide, covered. —*Eſſential Character.* Calyx, lateral, two-valved, aggregate, many-flowered.

Species. 1. Elymus arenarius, or ſea lime-graſs: ſpike upright, cloſe; calyxes tomentoſe, longer than the floret. Leaves reedy, glaucous or whitiſh, involute and mucronate, channelled and rigid; ſtems two or three feet high and more, ſtrengthened by three or four joints; ſpike tomentoſe, linear, eight or nine inches long, as large as a full-ſized ear of wheat, but leſs compact; ſpikelets two, ſtraight, two-flowered, awnleſs. Like *arundo arenaria*, or ſea-reed-graſs, it prevents the ſea-ſand from blowing about by means of its matted roots. Dr. Withering conjectures that it may poſſibly admit of being made into ropes, as ſtipa tenaciſſima is in Spain. It is perennial, frequent on the ſea-coaſt in many parts of Europe, and flowers from June to Auguſt.

2. Elymus Sibiricus, or Siberian lime-graſs: ſpike pendulous, cloſe; ſpikelets in pairs, longer than the calyx. Stems tall, round, and ſmooth; leaves moderately broad, and commonly diſtinguiſhed by a kind of glaucous powdery complexion on the under ſides. Perennial; native of Siberia, flowering in June and July.

3. Elymus Philadelphicus, or Philadelphia lime-graſs: ſpike pendulous, patulous; ſpikelets ſix-flowered, the lower ones ternate. This, in its habit and whole ſtructure, is extremely ſimilar to the *canadenſis*, but the ſpikes in this are nodding or deſcending: the ſpikelets in this are alſo ſix-flowered; in the other four-flowered: in this alſo the awns are leſs ſtraight, and a little flexuoſe, even while flowering; whereas in the other they are ſtraight: the calyx is as ſhort again as the ſpikelet. Native of Philadelphia; perennial.

4. Elymus Canadenſis, or Canadian lime-graſs: ſpike nodding, patulous; lower ſpikelets ternate; upper binate. This agrees in moſt circumſtances with the ſecond ſpecies; it differs, however, in theſe: 1. The ſpikelets are villoſe, not naked. 2. The involucres end in an awn longer than the ſpikelet itſelf; whereas, in the other, the awn is much ſhorter than the ſpikelet. 3. The lower ſpikelets are three together; but, in elymus Sibiricus, they are no more than two. 4. The ſpikelets, when in flower, ſtand wide from the ſcape; whereas, in the other, they approximate to it. At the baſe of each floret, on the inſide of the ſpikelets, is a dot or ſpot of a rufous-brown colour. The leaves of this are bluiſh, eſpecially underneath, which is not the caſe in elymus Sibiricus. The awns alſo of the corolla, when the ſeed is ripening, from ſpreading become reflex, which in the other ſpecies they do not. Native of Canada and Virginia. Introduced before 1699, by the Rev. John Banniſter. It flowers in July and Auguſt, and is perennial.

5. Elymus caninus, bearded or dog's lime-graſs, or wheat-graſs: ſpike nodding, cloſe; ſpikelets ſtraight, without any involucre; the loweſt double. Leaves bare of hairs underneath. It differs from triticum repens, in the root not being creeping; the ſpikelets longer, narrower, and rounder, furniſhed with long awns; whereas, in triticum repens, they are very ſhort, if any. Linnæus removed this from the genus triticum, wherein he had firſt placed it, on account of the lower ſpikelets being in pairs. Schreber never could diſcern this. Krocker, however, affirms that it really is ſo in the Sileſian plants. Perennial; growing in woods and hedges; as between Greenwich and Woolwich, about Croydon, Ripton wood, Huntingdonſhire, Stokenchurch woods, Oxfordſhire, &c. in the north frequent. It flowers in June and July.

6. Elymus tener, or pliant elymus: ſpike pendulous; florets double. Culm two feet high, ſmooth and even, with red joints. Native of Siberia.

7. Elymus Virginicus, or Virginian lime-graſs: ſpike erect; ſpikelets three-flowered; involucre ſtreaked. In this ſpecies the ſpike exceeds that of an ear of common barley, and there are two ſeſſile involucres affixed to each denticulated axis or baſe: each of theſe involucres conſiſts of two rays, which are longer than the flowers, and thicker, and are terminated by a long awn. Perennial; native of Virginia; introduced in 1781 by Mr. William Curtis.

8. Elymus Europæus, or wood lime-graſs, or barley-graſs: ſpike upright; ſpikelets two-flowered, equal to the involucre. Culm upright, ſtout, two feet high and more, having four or five joints. The leaf at each of theſe is about a ſpan in length, and a quarter of an inch or more in breadth; ſmooth to appearance, but roughiſh to the touch, eſpecially round the edges. It very much reſembles elymus Virginicus; but the leaves of the involucre are not ſcored, as they are in that. The florets, together with their awns, are longer than the involucre; they are two in number, whereas in that they are three. In ſtructure it is an elymus; in habit it approaches rather more to the hordeum: in truth, it ſeems the connecting link between both. Native of Germany, Swiſ-

ſerland,

ferland, England, in woods, with us in a calcareous ſoil, as near Berkhamſtead, in Herts; Marlow and Hambleton, in Bucks; Henley and Stokenchurch, in Oxfordſhire; Ripton woods, Huntingdonſhire; rocks oppoſite Matlock baths; in the north frequent. Perennial; flowering in June. It is a coarſe graſs, like moſt of thoſe which grow in woods; and like them is ſometimes drawn up to a great height.

9. Elymus caput Meduſæ, or Portugal lime-graſs: ſpikelets two-flowered; involucres briſtle-form, ſpreading very much. Native of Spain and Portugal, on the coaſts. Annual; flowering in July.

10. Elymus hyſtrix, or rough lime-graſs: ſpike upright; ſpikelets without involucre, ſpreading. Native of the Levant; flowers here in July and Auguſt.

11. Elymus giganteus, or large elymus: ſpike erect, cloſe; ſpikelets in ſixes, ſix-flowered, villoſe; calyxes awl-ſhaped, ſmooth, longer that the ſpikelets. Its country is unknown. For the propagation and culture, ſee GRASS: and ſee HORDEUM and ZIZANIA.

EL'YOT (ſir Thomas), a learned man in the reign of Henry VIII. ſon of ſir Richard Elyot, of Suffolk, born about the commencement of the ſixteenth century. He was educated at St. Mary's-hall, Oxford, and afterwards travelled abroad. On his return he was knighted, and employed by the king in various embaſſies. He was at Rome in 1532, negociating the affair of the divorce of queen Catharine; and, in 1536, was ſent to the emperor Charles V. He lived in habits of intimacy with ſeveral of the learned men of his time, among whom were ſir Thomas More, and Leland the antiquary, the laſt of whom addreſſed a copy of Latin verſes to him in his Encomia illuſtrium Virorum. He died in 1546. Sir Thomas Elyot was the author of a number of works, which appear to have been chiefly tranſlations and compilations, but had their uſe at the time in promoting knowledge and enriching the Engliſh language. One of the moſt noted of theſe was his Caſtell of Health, ſeveral times reprinted. Another work entitled The Governor, became popular. Its purpoſe was to give moral inſtructions to the higher orders of ſociety. Its ſatirical vein is ſaid to have given ſome offence; but the book was much applauded by the king. He alſo wrote on education; on remarkable events in Engliſh hiſtory; on good women; and a library or dictionary. It ought not to be omitted, that he is ranked among literary impoſtors, on account of his Image of Governance compiled of the Acts and Sentences notable of Alexander Severus, which he pretended to have tranſlated from a Greek manuſcript of Encolpius, lent him by a Neapolitan gentleman, but which is proved to have been taken from Lampridius and Herodian, with miſrepreſentations and additions from his own invention.

E'LYS BAY, a bay of the iſland of Antigua, on the north coaſt, a little to the ſouth of Beggar's Point.

ELY'SIUM, *ſ.* [ελυσιον, Gr. or of עלז, Heb. to rejoice.] The place aſſigned by the heathens to happy ſouls; any place exquiſitely pleaſant:

To have thee with thy lips to ſtop my mouth,
So ſhould'ſt thou either turn my flying ſoul,
Or I ſhould breathe it ſo into my body,
And then it liv'd in ſweet *Elyſium*. *Shakeſpeare.*

According to the mythology of the ancients, Elyſium was the paradiſe where the ſouls of the virtuous were placed after death. There happineſs was complete, the pleaſures were innocent and refined. Bowers for ever green, delightful meadows, with pleaſant ſtreams, were the moſt ſtriking objects. The air was wholeſome, ſerene, and temperate; the birds continually warbled in the groves, and the inhabitants were bleſſed with another ſun and other ſtars. The employments of the heroes who dwelt in theſe regions of bliſs were various; the manes of Achilles are repreſented as waging war with the wild beaſts, while the Trojan chiefs are innocently exerciſing themſelves in managing horſes, or in handling arms. To theſe innocent amuſements ſome poets have added continual feaſting and revelry, and they ſuppoſe that the Elyſian fields were filled with all the incontinence and voluptuouſneſs which Mahomet has pictured to his diſciples as the reward of every true muſſelman, who ſhould periſh in attempting to eſtabliſh the doctrines of the Koran. The Elyſian fields were, according to ſome, in the fortunate iſlands on the coaſt of Africa, in the Atlantic. Others place them in the iſland of Leuce; and, according to the authority of Virgil, they were ſituate in Italy. According to Lucian, they were near the moon; or in the center of the earth, if we believe Plutarch. *Virg. Æn.* vi. *Homer. Od.* iv.—Dr. Bryant and other modern writers place the Elyſian fields upon the ſide of the charonian canal, near the ancient Memphis, in Egypt.

ELY'TRA, *ſ.* The ſhells or wing-caſes of the coleoptric order of inſects. They are generally highly poliſhed, and enriched with various colours. See the article ENTOMOLOGY, in this volume.

ELY'TROCELE, *ſ.* [from ελυτρον, Gr. the vagina, and κηλη, a tumour.] In medicine, a hernia in the vagina.

ELYTROI'DES, *ſ.* [from ελυτρον, Gr. a ſheath, and ειδος, a likeneſs.] In anatomy, the name of the tunica vaginalis, becauſe it includes the teſtes as it were in a ſheath.

ELY'TRON, *ſ.* [from ελυω, Gr. to involve.] The vagina. A ſheath. In anatomy, the membranes which involve the ſpinal marrow are called elytra.

EL'ZE, or ELTZ, a town of Germany in the circle of Lower Saxony, and biſhopric of Hildeſheim, on the Saale: nine miles ſouth-weſt of Hildeſheim.

EL'ZEVIRS, famous printers of Amſterdam and Leyden, are juſtly commemorated for the many valuable books they printed, and the perfection to which they carried their art, at a comparatively early period. Lewis, the firſt of the family, was diſtinguiſhed for his editions from the year 1595. He was ſucceeded by Bonaventure, Abraham, and Daniel, the latter of whom died about 1680. The Elzevirs were leſs learned than the Etiennes, (Stephenſes,) but they equalled them in the choice of books and the knowledge of buſineſs, and ſurpaſſed all the world in the beauty of typography. Their ſmall types, in particular, have a clearneſs and elegance which perhaps have never been equalled. Their Virgil, Terence, Greek Teſtament 1633, and ſome other books diſtinguiſhed by characters in red ink, are reckoned maſter-pieces; and the beſt of their claſſics ſtill maintain a high value. The laſt catalogue of their editions was printed by Daniel in 1674, in ſeven parts, but it contains many books not of their own printing.

'EM. A contraction of *them*:

For he could coin and counterfeit
New words with little or no wit;
And when with haſty noiſe he ſpoke *'em*,
The ignorant for current took *'em*. *Hudibras.*

EMACERA'TION, *ſ.* A making lean or waſting; alſo ſoaking or ſowſing.

To EMA'CIATE, *v. a.* [*ematio*, Lat.] To waſte; to deprive of fleſh.—All dying of the conſumption, die *emaciated* and lean. *Graunt.*

To EMA'CIATE, *v. n.* To loſe fleſh; to pine; to grow lean.—He *emaciated* and pined away in the too anxious enquiry of the ſea's reciprocation, although not drowned therein. *Brown.*

EMACIA'TION, *ſ.* [*emaciatus*, Lat.] The act of making lean. The ſtate of one grown lean.—Searches cannot tell whether this *emaciation* or leanneſs were from a phthiſis, or from a hectic fever. *Graunt.*

EMA'CITY, *ſ.* [*emacitas*, Lat.] A deſire to be always buying.

To EMA'CULATE, *v. a.* [*emaculare*, Lat.] To take out ſpots.

EMACULA'TION, *ſ.* [*emaculo*, Lat.] The act of freeing any thing from ſpots or foulneſs.

E'MANANT,

E'MANANT, *adj.* [*emanans*, Lat.] Iſſuing from ſomething elſe.—The firſt act of the divine nature, relating to the world, and his adminiſtration thereof, is an *emanant* act: the moſt wiſe counſel and purpoſe of Almighty God, terminate in thoſe two great tranſient or *emanant* acts or works, the work of creation and providence. *Hale.*

To E'MANATE, *v. n.* [*emano*, Lat.] To iſſue or flow from ſomething elſe.—They have their reſidence in a city, whoſe conſtitution has *emanated*, neither from the charter of their king, nor from their legiſlative power. *Burke.*

EMANA'TION, *ſ.* [*emanatio*, Lat.] The act of iſſuing or proceeding from any other ſubſtance.—Ariſtotle ſaid, that it ſtreamed by connatural reſult and *emanation* from God, the infinite and eternal Mind, as the light iſſues from the ſun. *South.*—That which iſſues from another ſubſtance; an efflux; effluvium.—The experience of thoſe profitable and excellent *emanations* from God, may be, and commonly are, the firſt motive of our love. *Taylor.*

Such were the features of her heav'nly face;
Her limbs were form'd with ſuch harmonious grace;
So faultleſs was the frame, as if the whole
Had been an *emanation* of the ſoul. *Dryden.*

EMAN'ATIVE, *adj.* [from *emano*, Lat.] Iſſuing from another.

To EMAN'CIPATE, *v. a.* [*emancipo*, Lat.] To ſet free from ſervitude; to reſtore to liberty.—Having received the probable inducements of truth, we become *emancipated* from teſtimonial engagements. *Brown.*—They *emancipated* themſelves from dependence. *Arbuthnot.*

EMANCIPA'TION, *ſ.* The act of ſetting free; deliverance from ſlavery.—Obſtinacy in opinions holds the dogmatiſt in the chains of error, without hope of *emancipation*. *Glanville.*

EMAN'UEL, or IMMANUEL, a name given to Chriſt. A man's name.

EMANUEN'SIS, *ſ.* One who writes what another dictates or directs. This is more uſually written *amanuenſis*.

To EMAR'GINATE, *v. a.* [*margo*, Lat.] To take away the edge or margin of any thing.

EMAR'GINATED, *part.* Deprived of the margin, cut or indented in the form of a heart, indented on the edge.

EMARGINA'TION, *ſ.* Cleaning off the ſcurf which gathers about the edge of a wound. *Scott.*

EMAS'CULATE, *ſ.* [from *emaſculo*, Lat. to render impotent.] The malady or imperfection of having the teſticles in the belly, and not fallen into the ſcrotum.

To EMAS'CULATE, *v. a.* [*emaſculo*, Lat.] To caſtrate; to deprive of virility.—When it is found how many ewes, ſuppoſe twenty, one ram will ſerve, we may geld nineteen; for if you *emaſculate* but ten, you ſhall, by promiſcuous copulation, hinder the increaſe. *Graunt.*—To effeminate; to weaken; to viciate by unmanly ſoftneſs.—Dangerous principles impoſe upon our underſtandings, *emaſculate* our ſpirits, and ſpoil our temper. *Collier.*

From wars and from affairs of ſtate abſtain;
Women *emaſculate* a monarch's reign. *Dryden.*

EMASCULA'TION, *ſ.* Caſtration. Effeminacy; womaniſh qualities; unmanly ſoftneſs. See the article CASTRATION, vol. iii. p. 891.

EMA'THIA, a name given anciently, and particularly by the poets, to the countries which formed the empires of Macedonia and Theſſaly. *Virgil.*

EMA'THION, a ſon of Titan and Aurora, who reigned in Macedonia. The country was called *Emathia* from his name. Some ſuppoſe that he was a famous robber deſtroyed by Hercules. *Ovid.*

EMBA'BEH, a town of Egypt, near the pyramids of Girgeh, two miles weſt of Cairo.

To EMBA'LE, *v. a.* [*emballer*, Fr.] To make up into a bundle. To bind up; to incloſe:

Below her ham her weed did ſomewhat train,
And her ſtraight legs moſt bravely were *embal'd*
In golden buſkins of coſtly cordwain. *Spenſer.*

EMBA'LL, *v. a.* [*emballer*, Fr.] To make up in a ball. *Shakeſpeare.*

To EMBA'LM, *v. a.* [*embaumer*, Fr. *embalſamar*, Span.] To impregnate a body with aromatics, that it may reſiſt putrefaction. See EGYPT, p. 352, of this volume.

Verſe *embalms* virtue, and tombs or thrones of rhymes,
Preſerve frail tranſitory frame as much
As ſpice doth bodies from corrupt air's touch. *Donne.*

Muſe! at that name thy ſacred ſorrows ſhed;
Thoſe tears eternal that *embalm* the dead. *Pope.*

EMBALM'ER, *ſ.* One that practiſes the art of embalming and preſerving bodies.—The Romans were not ſo good *embalmers* as the Egyptians, ſo the body was utterly conſumed. *Bacon.*

To EMBAR', *v. a.* To ſhut; to incloſe:

Themſelves for fear into his jaws to fall,
He forc'd to caſtle ſtrong to take their flight;
Where firſt *embar'd* in mighty brazen wall,
He has them now four years beſieg'd to make them thrall.
Spenſer.

To ſtop; to hinder by prohibition; to block up:

If this commerce 'twixt heav'n and earth were not
Embar'd, and all this traffic quite forgot,
She, for whoſe loſs we have lamented thus,
Would work more fully and pow'rfully on us. *Donne.*

EM'BAR, a town of Africa, in the country of Senegal.

EMBARCADE'RE, *ſ.* (on the American coaſt.) A haven or bay which ſerves ſome inland city as a port or place for ſhipping. *Scott.*

EMBARCA'TION, *ſ.* The act of putting on ſhipboard.—The French gentlemen were very ſolicitous for the *embarcation* of the army, and for the departure of the fleet. *Clarendon.*—The act of going on ſhipboard.

EMBAR'GO, *ſ.* [*embargar*, Span.] A prohibition to paſs; in commerce, a ſtop put to trading veſſels.—After an *embargo* of our trading ſhips in the river of Bourdeaux, and other points of ſovereign affront, there did ſucceed the action of Rheez. *Wotton.*

To EMBAR'GO, *v. a.* To lay on an embargo; to detain.—The *embargo* upon our ſhips in the ports of Ruſſia was in conſequence of ſeveral captains attempting to ſmuggle wheat on-board. Thoſe diſcovered were immediately *embargoed*, and others were prevented from proceeding to ſea, until they ſhould be ſearched. *Evening Mail.*

To EMBA'RK, *v. a.* [*embarquer*, Fr.] To put on ſhipboard. To engage another in any affair.—The king had provided a good fleet, and had cauſed a body of three thouſand foot to be *embarked* on thoſe ſhips. *Clarendon.*

Straight to the ſhips Æneas took his way,
Embark'd his men, and ſkim'd along the ſea. *Dryden.*

To EMBA'RK, *v. n.* To go on ſhipboard. To engage in any affair:

I ſhould with ſpeed *embark*,
And with their embaſſy return to Greece. *Phillips.*

EMBAR'QUEMENT, *ſ.* [Fr. from *to embark*.] The ſtate, or being on ſhipboard; any thing put on ſhipboard, a cargo, in which laſt ſenſe it apparently occurs in Shakeſpeare's Coriolanus.—*Embarquement* all of fury.—Mr. Maſon in his Suppl. to Johnſon, confounds the word with *embargo*. *Monthly Mag.*

To EMBAR'RAS, *v. a.* [*embaraſſer*, Fr.] To perplex; to diſtreſs; to entangle.—I ſaw my friend a little *embarraſſed*, and turned away. *Spectator.*

EMBAR'RASSMENT, *ſ.* Perplexity; entanglement. —Let your method be plain, that your hearers may run through it without *embarraſſment*, and take a clear view of the whole. *Watts.*

To EMBA'SE, *v. a.* To vitiate; to depauperate; to lower; to deprave; to impair.—I will rather chooſe to wear a crown of thorns, than to exchange that of gold for one of lead, whoſe *embaſed* flexibleneſs ſhall be forced to bend. *King Charles.*—A pleaſure high, rational, and angelical; a pleaſure *embaſed* with no appendant ſting; but ſuch a one as being honey in the mouth, never turns to gall or gravel in the belly. *South.*—To degrade; to vilify:

Joy of my life, full oft for loving you
I bleſs my lot, that was ſo lucky plac'd;
But then the more your own miſhap I rue,
That are ſo much by ſo mean love *embas'd*. *Spenſer.*

EM'BASIS, *ſ.* [from ἐν, Gr. in, and βαινω, to go.] A deep tub or veſſel for waſhing the body, generally applied to medical baths.

EMBAS'SADE, *ſ.* [Fr.] Embaſſy:

But when her words *embaſſade* forth ſhe ſends,
Lord! how ſweet muſic that unto them lends! *Spenſer.*

EMBAS'SADOR, *ſ.* One ſent on a public meſſage. See the article AMBASSADOR, vol. i. p. 398.

EMBAS'SADRESS, *ſ.* A woman ſent on a public meſſage:

With fear the modeſt matron lifts her eyes,
And to the bright *embaſſadreſs* replies. *Garth.*

The wife of an embaſſador.—Do you frequent the Dutch embaſſador or *embaſſadreſs*. *Cheſterfield.*

EM'BASSAGE, or EMBASSY, *ſ.* [It may be obſerved, that though authors write almoſt indiſcriminately *embaſſador* or *ambaſſador*, *embaſſage* or *ambaſſage*; yet there is ſcarcely an example of *ambaſſy*, all concurring to write *embaſſy*.] A public meſſage: a meſſage concerning buſineſs:

The peace polluted thus, a choſen band
He firſt commiſſions to the Latian land,
In threat'ning *embaſſy*. *Dryden.*

Any ſolemn meſſage.—He ſends the angels on *embaſſies* with his decrees. *Taylor.*—An errand, in an ironical ſenſe.—A bird was made fly with ſuch art to carry a written *embaſſage* among the ladies, that one might ſay, If a live bird, how taught? If dead, how made? *Sidney.*

Nimble miſchance, that art ſo light of foot,
Doth not thy *embaſſage* belong to me;
And am I laſt that know it? *Shakeſpeare.*

EMBAS'SAGE, *ſ.* Conveyance of thoughts:

And ever and anone, when none was ware,
With ſpeaking looks, that cloſe *embaſſage* bore,
He rov'd at her, and told his ſecret care. *Spenſer.*

EMBA'TER, *ſ.* The hole or look-through to take aim by in a croſs-bow.

EMBAT'TILED, *part. adj.* in heraldry, indented like battlements:

Wearing a diademe *embattil'd* wide
With hundred turrets, like a turribant. *Spenſer.*

To EMBAT'TLE, *v. a.* To range in order or array of battle:

The Engliſh are *embattled*;
To horſe! you gallant princes, ſtrait to horſe! *Shakeſp.*

Embattl'd nations ſtrive in vain
Our hero's glory to reſtrain:
Streams arm'd with rocks, and mountains red with fire,
In vain againſt our force conſpire. *Prior.*

On their *embattl'd* ranks the waves return,
And overwhelm the war! *Milton.*

To EMBAT'TLE, *v. n.* To be ranged in battle array:

The night
Is ſhiny, and they ſay we ſhall *embattle*
By the ſecond hour of the morn. *Shakeſpeare.*

EM'BAUL, a town of Africa, in the kingdom of Damel. Lat. 15. 15. N. lon. 15. 37. W. Greenwich.

To EMBA'Y, *v. a.* [from *baigner*, Fr. to bathe.] To bathe; to wet; to waſh. *Not uſed:*

Every ſenſe the humour ſweet *embay'd*,
And, ſlumb'ring ſoft, my heart did ſteal away. *Spenſer.*

[From *bay*.] To incloſe in a bay; to land lock:

If the invading fleet
Be not inſhelter'd and *embay'd*, they are drown'd. *Shakeſp.*

To EMBEL'LISH, *v. a.* [*embellir*, Fr.] To adorn; to beautify; to grace with ornaments; to decorate.—That which was once the moſt beautiful ſpot of Italy, covered with palaces, *embelliſhed* by emperors, and celebrated by poets, has now nothing to ſhew but ruins. *Addiſon.*

How much more beauteous had the fountain been,
Embelliſh'd with her firſt created green;
Where cryſtal ſtreams through living turf had run,
Contented with an urn of native ſtone. *Dryden.*

EMBEL'LISHMENT, *ſ.* Ornament; adventitious beauty; decoration; adfcititious grace; any thing that confers the power of pleaſing:

Culture the wild licentious ſavage
With wiſdom, diſcipline, and liberal arts,
Th' *embelliſhments* of life. *Addiſon.*

EM'BER-DAYS, certain days obſerved by the church at four different ſeaſons of the year; viz, the Wedneſday, Friday, and Saturday, next after Quadrageſima Sunday, or the firſt Sunday in Lent; the next after Whitſunday; after Holyrood or Holycroſs, the 14th day of September; and after St. Lucy, the 13th day of December. The name is derived from *embers* or aſhes, which it is ſuppoſed were ſtrewed on the head, on theſe ſolemn occaſions.

EM'BER WEEKS, thoſe weeks in which the Ember-days fall. Ember-weeks are now chiefly noticed on account of the ordination of prieſts and deacons; becauſe the canon appoints the Sundays next after the Ember-weeks for the ſolemn times of ordination; though the biſhops, if they pleaſe, may ordain on any Sunday or holiday.

EMBERI'ZA, *ſ.* the BUNTING; in ornithology, a genus of birds belonging to the order of paſſeres. The bill is conical, and the mandibles recede from each other towards the baſe; the inferior mandible has the ſide narrowed inwards; the upper, with a hard knob within. This genus contains no leſs than ſeventy-four ſpecies, beſides many varieties, ſome or other of which are found in all parts of the known world. They are as follow:

1. Emberiza nivalis, the ſnow bunting. The bleak mountains of Spitzbergen, the Lapland Alps, the ſhores of Hudſon's-bay, and perhaps countries ſtill more northerly, are, during the ſummer months, the favourite abodes of this bird. The exceſſive ſeverity of theſe inhoſpitable climates, changes part of its plumage into white in winter. It has a pleaſing variety of appearance from a diverſified intermixture of white, black, and ferruginous; and the combinations of theſe colours are affected by the ſeaſon, and by the temperature of the countries they inhabit. In winter, the head, the neck, the coverts of the wings, and all the under part of the body, are in the male white as ſnow, with a light and almoſt tranſparent tint of ferruginous on the head only; the back is black; the quills of the wings, and of the tail, partly black, partly white. In ſummer, the head, the neck, the under part of the body, and even the back, are ſtained with tranſverſe ferruginous waves of various intenſity, but never ſo deep as in the female, of which it is the predominant colour, and diſpoſed in longitudinal ſtripes. In ſome

ſubjects

ſubjects the neck is cinereous, the back cinereous variegated with brown; a purple tinge round the eyes; a reddiſh caſt on the head, &c. The colour of the bill is alſo variable; ſometimes yellow, ſometimes cinereous at the baſe, and generally black at the point. In all, the noſtrils are round, ſomewhat prominent, and covered with ſmall feathers; the tongue is a little forked; the eyes are ſmall and black; the legs black. Theſe birds leave the mountains when the ſnows and froſts will not permit them to procure their food; and they return in ſpring to their icy ſummits. Though they do not always hold the ſame route, they are commonly ſeen in Sweden, in Saxony, in Lower Sileſia, in Poland, in Red Ruſſia, and in Podolia. They are very rare in the ſouth of Germany, and almoſt entirely unknown in Swiſſerland and Italy. In the time of their paſſage they keep conſtantly along the roads, picking up ſmall ſeeds, and every ſort of grain. This is the proper ſeaſon for catching them. They are valued for the ſingularity of their plumage, and the delicacy of their fleſh. This bird is found in the northern parts of Great Britain, and is called in Scotland *ſnowflake*, appearing in great flocks in the ſnowy ſeaſon, and ſuppoſed to be the certain forerunner of hard weather. A few breed in the ſame places with the ptarmigans. They are found in all the northern latitudes, without exception, as far as our navigators have been able to penetrate; even beyond Spitzbergen, upon remote fields of ice, and in large flocks: what can be found there for food, is difficult to determine, as they are granivorous birds, and the only ſpecies of the genus found in that frozen climate. In America they advance no farther to the ſouth than Nova Scotia, never being found at New York. The more northward they are found, the whiter the plumage becomes. Theſe birds are of the ſize of the chaffinch. They probably breed in Spitzbergen, and certainly in Greenland, where they make their neſts in the fiſſures of the mountain rocks, employing graſs for the outſide, feathers for the inſide, and the down of the arctic fox for lining. They lay five white eggs ſpotted with brown. They ſing ſweetly, ſitting on the ground. In autumn, when they iſſue from their frozen retreats, they gradually and ſucceſſively viſit all the northern parts of Europe. They enter Britain by the north of Scotland; at firſt they are lean, but ſoon grow fat and delicious; the Highlands abound with them. They appear at Hudſon's-bay in April, retire northward in May to breed, and pay another viſit in September. They live in vaſt flocks, feed on graſs, ſeeds, &c. and are eaſily caught. Their colour, being produced by the degree of cold to which they are expoſed, is neceſſarily variable.

There are three other varieties of this ſpecies: the firſt has the whole of the white parts tinged with yellow; and the throat and fore part of the neck marked with very ſmall brown ſpots; but agrees with the preceding in all other reſpects. In the ſecond variety almoſt the whole of the head, the upper part of the neck, back, rump, tail, and wing-coverts, are yellowiſh white; round the bill, and all the under parts, blackiſh. The other variety is called the pied bunting: the eye-lids are black, the irides are white; the head, throat, and neck, white; but at the lower part of the neck are three circles, the upper one of a lead-coloured blue, the next white, and the loweſt blue: on the breaſt is a denticulated blueiſh mark; wing-coverts and quills white, with a mixture of greeniſh yellow in ſome places, and black in others: the eight middle tail-feathers, white; the legs and claws fleſh-colour. This variety was found in the county of Eſſex.

2. Emberiza muſtelina, the tawny bunting: a ſize larger than the preceding; length near ſeven inches: bill yellow, tip black; crown of the head tawny; throat almoſt white, changing to a dull yellow near the breaſt, which, with the under parts, is white daſhed with yellowiſh marks; the back and ſcapular feathers are black, edged with pale reddiſh brown: rump, and upper tail-coverts, half white half yellow: the four middle tail-feathers are duſky black, fringed with white; the three outer ones on each ſide white, marked with a duſky ſpot on the outer web; but the third on both webs at the tip. This ſpecies is ſometimes met with in the northern parts of England, but not often.

3. Emberiza montana, the mountain bunting: bill ſhort, and black at the tip, the reſt yellow; forehead dark cheſnut; hind part of the head and cheeks lighter; the back aſh-coloured, ſpotted with black; the throat white; breaſt and belly waved with flame-colour; the ſetting-on of the wings grey; the five firſt feathers blackiſh brown, the reſt white, the point of each daſhed with brown; the three outer tail-feathers white, the reſt dark brown. This is ſometimes found in Yorkſhire and Northamptonſhire.

4. Emberiza hyemalis, the black bunting: bill white; head, throat, neck, back, ſcapulars, rump, and upper tail-coverts, black, inclining to lead-colour; from the breaſt to the vent white; quills and tail black: thoſe in the Britiſh and Leverian Muſeums have the tip of the bill black; the fore part of the neck lead-coloured, and the two outer tail feathers with ferruginous margins. They viſit Virginia and Carolina in winter only, chiefly in ſnowy weather; and are called the chuck bird.

5. Emberiza hortulana, the ortolan: this delicate bird is ſmaller than the yellow-hammer; bill yellowiſh; head and neck cinereous olive; round the eyes yellowiſh; throat the ſame, bordered on each ſide with a cinereous line; back and ſcapulars browniſh cheſnut, mixed with black in the middle of the feathers, inclining moſt to cheſnut towards the rump; the under parts very pale rufous; wing-feathers brown, deepeſt in the middle; ſome have rufous and others grey edges; tail deep brown, with rufous edges, except the outer feather, which is edged with white, and the inner part of the next tipped with white. The female differs in having the head and neck inclining to aſh-colour, marked with ſmall black lines down the ſhaft of each feather; in other reſpects like the male. Theſe birds are found in ſeveral parts of Europe, but are not met with in England; they are common in France and Italy, and in ſome parts of Germany and Sweden, migrating from one to the other in ſpring and autumn; and in their paſſage are caught in numbers, and fatted for the table. This is done eaſily, by incloſing the birds in a dark room, ſetting before them plenty of oats and millet, with which they ſoon grow ſo fat, that they would die from that cauſe alone, did not their feeders kill them in time, for the ſake of emolument. Their fleſh is ſaid to be one of the moſt exquiſite morſels yet known, being as it were a lump of rich fat; and the birds arrived at this ſtate will often weigh three ounces each. They are very common in the ſouth of Ruſſia, and in Siberia, as far as the river Ob; but they never go far to the north. This bird will ſing, and has been kept for that purpoſe. The note is not unlike that of our yellow-hammer, but finer and ſweeter. In ſome parts it makes the neſt in a low hedge; in others, on the ground. It is carelefsly conſtructed, not unlike that of the lark. The female lays four or five greyiſh eggs, and in general has two broods in a year. It frequents oat-fields, of which it ſeems very fond, ſoon growing exceeding fat, and ſufficiently ſo for the table; but never reckoned ſo delicious as when fattened artificially.

There are four varieties of the ortolan: the firſt is all over of a ſtraw-colour, except the edge of the wing and the quills, which are white; the bill and legs reddiſh. The ſecond is wholly white, as pure as that of the ſwan. The third differs but little from the common ſpecies, except in the tail, which is almoſt wholly white. In the fourth variety the whole body is blackiſh, except the head and neck, which incline to green; the bill red; the legs cinereous. Buffon alſo mentions a further variety, which had the throat yellow mixed with grey, a grey breaſt, and a rufous belly.

6. Emberiza Sinenſis, the Chineſe bunting: bill pale rufous; irides yellow; top of the head, and all the upper parts of the body, of a reddiſh rufous colour, with yellowiſh edges; the leſſer wing-coverts very light yellow; the ſecond quills deep brown, edged with rufous grey; the prime quills umber-colour, edged with dull yellow; the throat, breaſt, belly, and vent, fine yellow; down the middle of the belly a longitudinal ſtreak of brown; the tail is alſo of this colour, edged with grey. Found in the ſouthern provinces of China, in the months of October, November, and December.

7. Emberiza citrinella, the yellow-hammer: length ſix inches and a quarter; bill duſky; irides hazel; crown of the head in ſome of a beautiful pale, and in others of a full yellow; nape greeniſh; cheeks yellow; over the eyes a browniſh ſtripe, paſſing backwards; the hind part of the neck, and upper parts of the body, are blackiſh down the ſhaft, rufous on the ſides, and fringed with grey; rump pale tawny; chin, and under parts, yellow, inclining to reddiſh on the breaſt, and daſhed with duſky on the ſides; the wings are reddiſh brown, olive or duſky, mixed, and edged chiefly with grey; the tail brown, a little forked; the two middle feathers edged with grey, the others outwardly with olive, except at the ends, where the margin is grey; the outermoſt are edged with white; and a ſpot of white juſt at the tip. The female is much duller in colour, and has very little yellow about the head. This is one of the moſt common of our Britiſh birds, known every where to make a neſt compoſed of hay, or ſtraw mixed with a little moſs, dried leaves, and ſtalks, very ill put together, and lined with hair or wool; generally on the ground, though now and then in a low buſh. The eggs in general five or ſix in number, marked with brown or blackiſh irregular ſtreaks, with here and there a blotch. This bird has more than one brood in a year. It is reckoned with us of little value; its note trifling, and is therefore never kept in a cage; though in ſpring the male has a ſort of ſong, conſiſting of ſeven notes; ſix of the firſt are of equal tones, and pretty quick; the laſt ſharper than the others; and continued to the length at leaſt of three of the firſt. Olina ſays, that they partly imitate the warble of the chaffinches, with which they aſſociate. Friſch relates that they adopt ſomething of the ſong of the canary, when they hear it young; and Aldrovandus ſpeaks of its fine warble; which would imply that in more favourable climes their notes improve. This bird is found throughout Europe, and feeds both on grain and inſects. The fleſh, for the table, does not deſerve commendation, when caught at large, as it is bitter; but how it might improve if fatted like the ortolan, is not certain. Buffon conſiders it in this reſpect very nearly allied to the ortolan; and in Italy, where they eat all ſmall birds without diſtinction, they are thought to be very good.

8. Emberiza miliaria, the common bunting: ſize of the yellow-hammer, but ſtouter in the body: bill pale brown; general colour of the plumage pale olive brown, with a blackiſh daſh down the ſhaft of each feather, which is fringed on the edge with rufous; under parts plain yellowiſh white, daſhed on the ſides with duſky; quills duſky, with yellowiſh edges; tail-feathers the ſame, and forked. The female differs little, except in paleneſs of colour. This is alſo common in England, but much leſs ſo than the laſt; and in winter unites with them in large flocks. The female builds the neſt three or four inches from the ground, on ſome tuft of decayed herbage or dead plant, and lays five or ſix eggs. During the time of the hen's ſitting, the male is ſeen on ſome bare branch of an adjacent tree; uttering a tremulous kind of note, three or four times repeated. At the end of harveſt they are caught in nets; and, from their ſimilar plumage, are ſold for larks to the ignorant; and, indeed, by the better informed they paſs by the name of bunting larks. Though theſe birds remain the whole year in England, yet we find them named as migratory on the continent. In France they are rarely ſeen in winter, departing with the ſwallow; and are ſaid to be more plenty about Rome than elſewhere. They are common throughout Germany, the ſouthern parts of Ruſſia, Sweden, and Denmark, but not in Siberia.

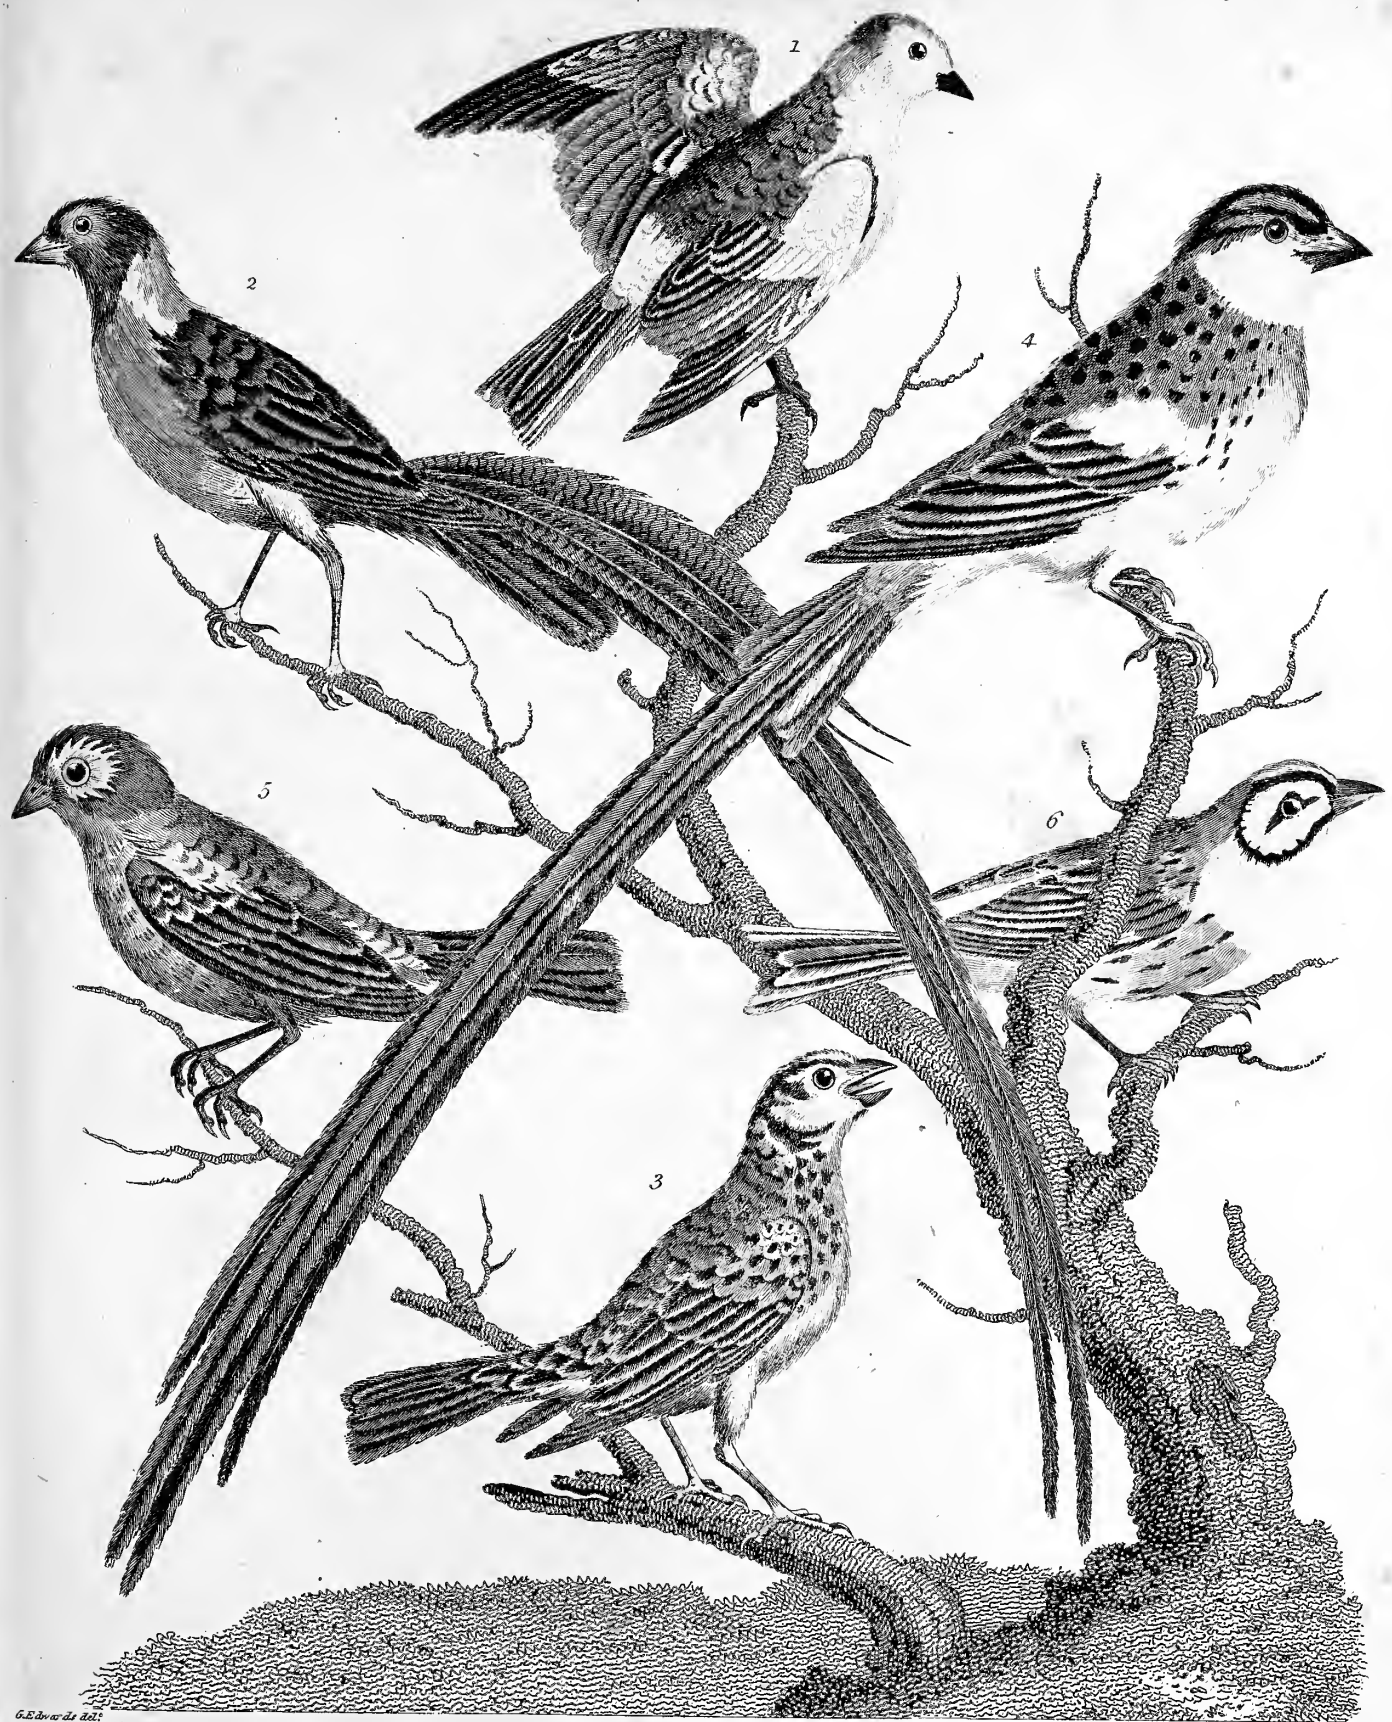
9. Emberiza ſchœniclus, the reed bunting: ſize of the yellow-hammer; bill brown; irides hazel; the head, throat, fore part of the neck, and breaſt, black; on each ſide of the neck a pale ſtreak, which paſſes backward, encircling the back part of the neck as a ring; the upper parts of the body and wings browniſh red, with a ſtreak of black down the ſhafts; the lower part of the breaſt and belly white, ſtreaked with duſky on the ſides; the eight middle tail-feathers black; the two middle ones edged with rufous. In young birds the black on the head is mixed with brown. The female has the head and neck partly of the ſame colour as the upper parts of the body; otherwiſe is marked like the male, though more dull. This bird frequents the marſhy grounds in England, eſpecially where reeds grow; between four of which it faſtens its neſt, two or three feet above the water. It is compoſed of dry graſs ſtalks, and lined within with the ſoft down of the reed; the eggs are four or five in number, of a bluiſh white, marked with irregular purpliſh veins, moſt conſpicuous at the large end. Its reſort is for the moſt part near the water; and it is likely that it feeds on the ſeeds of the reed, like the bearded titmouſe. With us they remain the whole year, but in ſome parts of the continent they are migratory. In Lorraine numbers are ſeen paſſing on their paſſage to other parts, both in ſpring and autumn, though ſome few ſtay there the whole year. The extreme limits of their peregrination are between Sweden and Italy. In ſpring the male ſits perched on a reed, and has a pleaſing kind of warbling ſong. It is frequently heard to ſing in the night, as well as day. There is a variety of the reed bunting, with the head and neck duſky black; upper parts of the body brown; wing-coverts incline to aſh colour; prime quills duſky, edged with cinereous; ſecondaries duſky, the outer webs brown; the ſix middle tail-feathers duſky; the two outer ones wholly white, fringed with duſky near the tip; under parts of the body pale. Found at the Cape of Good Hope.

10. Emberiza Provincialis, the muſtachio bunting: length little more than four inches: bill duſky; upper parts not unlike the reed ſparrow; through the eye a ſtreak of white paſſes on each ſide of the neck; under the eye a large patch of black; chin white; on each ſide the throat is a ſtreak of black; the breaſt and ſides pale brown, ſpotted with black; the reſt of the under parts white; acroſs the middle of the wings a bar of white; quills and tail duſky, edged with rufous; legs pale brown. Inhabits Provence; feeds on grain, and perches often. In April it is ſaid to ſing agreeably. It is called there chic-gavotte, and chic-mouſtache.

11. Emberiza Leſbia, the Leſbian bunting: very ſimilar to the laſt, but has not the black ſpot under the eye; having, inſtead of it, only three narrow black bands, the ſpaces between which are white; it is alſo white round the eye; the breaſt, rump, and ſides, are not ſpotted with duſky; the tail-feathers are white, except the two middle, which are duſky, edged with rufous. This alſo inhabits Provence, and differs in not being in ſong till June; it is more rare than the laſt, and very wild; and from ſetting up a ſcream on the approach of any of the birds of prey, it is called chic de Mitilene. The Greeks in the iſland of Leſbos, or Metelin, are ſaid to uſe this inſtinct of the Leſbian bunting to advantage, by placing one of theſe birds among their poultry in their yards, in a ſtrong cage; by which means the fowls there kept are ſooner adviſed of the approach of the hawk, or other bird of prey, than by any other method.

12. Emberiza Lotharinica, the Lorraine bunting: bill browniſh fleſh colour; upper parts of the head, neck, and body, rufous, daſhed with black; ſides of the head pale;

EMBERIZA.



1. The Snow Bunting. 2. The Paradise Bunting in Summer. 3. The same Bird in Winter. 4. The variegated Bunting. 5. The painted Bunting. 6. The Ortolan.

London. Published as the Act directs. Sept.r 26 1803 by J.Wilkes.

pale; through the eye a ſtreak of black; from the baſe of the lower mandible, and round the chin, riſing to the ears, another ſtreak of black; the under parts, as far as the breaſt, pale aſh-colour, dotted with black; from thence to the vent deep rufous; leſſer wing-coverts pale aſh-colour; the others rufous and black mixed; the two middle tail-feathers rufous; the others part black and part white; legs brown. The female is not ſo large as the male; bill black at the point; upper parts much like the male; no black ſtreaks on the ſide of the head; but inſtead, a whitiſh trace over the eye, and a patch of rufous beneath it; the under parts are white, which paſſes backwards on each ſide of the neck, like a half colour. Inhabits Lorraine.

13. Emberiza Ludovicia, the Louiſianian bunting: bill rufous, ſpotted with black; the head, throat, and fore part of the neck, pale rufous; the top of the head is ſurrounded with a wreathed irregular ſtreak of black, ſomewhat like a horſe-ſhoe; beneath the eye is a ſtreak, and ſeveral leſſer markings of black; the upper parts of the body rufous, daſhed with black; the lower part of the back, the rump, and upper tail-coverts, black; breaſt and ſides rufous; belly, thighs, and under the tail, rufous white; greater wing-coverts black, with rufous edges. Inhabits Louiſiana.

14. Emberiza pſittacea, the parrot bunting: ſize of a ſparrow: length eleven inches and a half: general colour a greyiſh aſh; the baſe of the bill ſurrounded with pale red; wings yellow and pale red mixed; the tail the colour of the body; the two middle feathers much longer than the others, and tipped with cheſnut. Inhabits Braſil.

15. Emberiza paradiſæa, the paradiſe bunting: ſize of the hedge-ſparrow: the bill lead-colour; irides hazel; the head, chin, and fore part of the neck, back, wings, and tail, black; neck behind pale orange; breaſt, and upper part of the belly, a full orange; lower belly, and thighs, white; vent black; the two middle tail-feathers are four inches in length, very broad, and ending in a long thread; the two next are thirteen inches in length, very broad in the middle, narrower at the end, and rather pointed; from the middle of the ſhaft of this laſt ariſes another long thread; the reſt of the tail-feathers are only two inches and a quarter long; the two middle long ones are placed ſomewhat vertically, and appear undulated acroſs, and are more gloſſy than the others; the legs fleſh-colour. The female is wholly of a deep brown, almoſt black; but does not gain the full plumage under three years. This ſpecies moults twice in a year. The male is deſtitute of the long tail-feathers ſix months out of twelve; it moults in November, when it firſt loſes them, and the plumage is of a mixed black and reddiſh colour, and the head ſtreaked black and white. It moults again late in the ſpring, when it receives the ſummer plumage; but the tail-feathers are ſcarcely complete till June, though they fall again in November. The females, when young, are nearly like the males in their winter dreſs. This bird is common about Angola, and other parts of Africa; and is called *la veuve*, or widow bird, from the colour. But Edwards gives another reaſon for the name—being a corruption of Whidah, a fort in Africa, in the neighbourhood of which they are very common. Whidah bird, and widow bird, are ſounds very ſimilar. They are often brought into Europe, where they ſell for a great price, and frequently live many years, being in general lively active birds.

16. Emberiza ſerena, the dominican bunting: ſmaller than the preceding: bill red; upper part of the head black, the crown rufous white; the back part of the neck, beneath the head, is rufous white, which paſſes forwards to join with the under parts, all of which, from the chin, and beneath the eyes, are alſo rufous white; the hind part of the neck, and back, are black, edged with white; inner wing-coverts white; reſt of the wing black; the quills edged with white; the tail is black; the two middle feathers are pointed at the ends, and are more than two inches longer than the others, all of which leſſen in length as they are placed outwardly; three of them, next to the middle feathers, have white tips, and the two outer ones are white on the inſide, and pale rufous without. The female is of an uniform brown colour; and the feathers of the tail are all of equal lengths, the two middle ones not being longer than the others. This ſpecies moults twice in the year, like the preceding; and, like that, loſes, for a time, its long tail-feathers.

17. Emberiza vidua, the widow bunting: ſize ſomewhat leſs than a ſparrow: bill red; head, and all the upper parts, of a greeniſh black; ſides of the head, and under parts, white, the black forming an half collar; acroſs the wing-coverts is a band of white; the quills are fringed with brown; the tail-feathers are twelve in number; four of theſe very long, the two middle ones being ten inches and a half in length, and the next on each ſide nine inches; the others even; the long ones are wholly black; the others black on the outer webs, and white within; the two colours obliquely divided, having moſt white on the outer feathers; legs black. Native of India.

18. Emberiza principalis, the variegated bunting: bill red; the upper parts of the head and body are black and rufous mixed, the black occupying the middle of each feather; the ſides of the head, and under parts, are white, except the breaſt, which is of a pale rufous; the leſſer wing-coverts are white, the greater black, with rufous edges; the tail is compoſed of twelve feathers; the two middle ones exceed the others by five inches and a half; the next on each ſide are one inch ſhorter, theſe are deep black; the others, which are ſhort, and of equal length, are of a dull brown colour, margined with pale brown, and marked each with a white ſpot at the inner web; legs fleſh-colour. Edwards obſerves, that this bird ſoon recovers the long feathers after moulting, contrary to the Whidah, or paradiſe bird, which is often half a year without them. This ſpecies is found at Angola, and generally throughout India.

19. Emberiza regia, the royal bunting: ſize of a linnet: bill red; upper parts of the plumage black; ſides of the head, and round the neck, rufous; the hind part of the neck is ſpotted with black; lower part of the thighs and vent black; the four middle tail-feathers are ten inches long, and are webbed only about two inches at the ends; the reſt of them are ſimple ſhafts, with ſcarcely the leaſt perceivable rudiment of a web; the others are ſhort and black. The female is brown, and has not the long tail-feathers. Theſe birds moult twice a-year, and in the winter the male is very little ſuperior to a linnet in colour, having the plumage nearly like it, only the grey a little brighter. It inhabits Africa, from the coaſts of which theſe birds are ſometimes imported into England.

20. Emberiza longicauda, the long-tailed bunting: a large ſpecies, ſize of a ſong thruſh; total length twenty inches; from the bill to the ſetting on of the tail only five. The bill is ſtrong and duſky; the noſtrils nearly hid in the feathers; the general colour of the plumage is deep gloſſy black; the leſſer wing-coverts are crimſon, below this a bed of white; ſome of the quills are white at the baſe, but hid when the wing is cloſed; the ſecond quills are as long as the prime ones; the tail is compoſed of twelve feathers, which hang ſideways, like thoſe on the ſides of a cock's tail; ſix of the middle ones are very long, but unequal in themſelves, the two longeſt are fifteen inches, the next on each ſide fourteen inches, and the next only eleven inches and a half; the others much ſhorter; the legs are brown, of the ſize of thoſe of a thruſh; claws long and hooked. This is indigenous to the Cape of Good Hope.

21. Emberiza Panayenſis, the Panayan bunting: ſize of a hedge-ſparrow: colour wholly black, except a large bright red ſpot on the breaſt; four of the tail-feathers are

are very long and pointed, hanging down like thoſe of the whidah, or paradiſe bird, and are all of a length. It inhabits the Iſle of Panay.

22. Emberiza Angolenſis, the Angola bunting: ſize of a finch: bill ſhort, like that of a bulfinch; top of the head and neck yellow; reſt of the body black; tail long. Salerne calls the breaſt fire-coloured, in his ſpecific deſcription of it, which ſuggeſts that it may have ſome reference to the laſt ſpecies. Native of Angola.

23. Emberiza Capenſis, the Cape bunting: bill duſky, upper part rufous yellow, varied with black; top of the head and neck grey and black mixed; ſides of the head and chin white, croſſed with two ſtreaks of black, the one through the eyes, the other beneath them; the under parts yellowiſh white; the leſſer wing-coverts rufous; the greater ones, quills, and tail, duſky, with rufous edges. Inhabits the Cape of Good Hope. There are three other varieties of this bird. In the firſt, the top of the head and ſides are yellowiſh white; over the eye from the noſtrils an arched ſtripe of black; behind the eye a ſecond; and from the lower mandible another, quite irregular; the lower part of the neck and back are brown; all the under parts yellow, inclining to red on the breaſt, and verging to white at the chin and vent. The ſecond variety has the upper parts rufous brown; the middle of the feathers duſky; the rump aſh-colour; the middle of the wing rufous longitudinally the whole way from the bend; the under parts of the body white; the head is not black, but only two black ſtreaks on the ſides; the tail wholly brown, edged with rufous. The third variety has the top of the head variegated with black and grey, and two ſtreaks of black in the ſame places as the preceding, but broader; ſides of the head grey, under parts dirty white; ſides of the body pale rufous. Buffon ſays this is common at Caycnne, where it is called *bonjour-commandeur*, from its cuſtom of ſinging at day-break.

24. Emberiza fuſca, the brown bunting: ſize of the yellow-hammer; bill fleſh-coloured; noſtrils covered with ſmall tufts of feathers; on the cheeks, and beneath the bill, are other tufts; head pale brown; back, wings, and breaſt, the ſame, ſpotted with darker brown; belly white; quills and tail brown, barred with deep brown; legs roſe-colour. Inhabits China.

25. Emberiza oryzivora, the rice bunting: ſize of the ſparrow; bill duſky; the fore part and ſides of the head, all the under parts, and the back, are black; the feathers on the head, back, and thighs, have rufous margins; the back part of the head and neck are plain rufous, but pale, or rather buff-colour; ſcapulars, and leſſer wing and upper tail-coverts, white; the reſt of the wing-feathers black, edged with brown; the quills edged with yellowiſh grey; the tail is black; in ſhape rather forked; all the feathers ending in a ſharp point; the tips brown. The female is of the ſame ſize and ſhape, but the general colour rufous, verging to brown. This ſpecies is migratory, but does not exceed the bounds of America. It is found in Cuba in flocks about September, and from thence they take their departure for Carolina, and ſo on to other parts, ſtaying in each only ſo long as the rice continues green; for when ripe they will not touch it. They appear in Rhode Iſland and New York at the end of April, or the ſecond week in May, frequenting the borders of fields, and living on inſects, &c. till the maize is fit for their palate; when they begin by pecking holes in the ſides of the huſks, and, after ſatiating themſelves, go on to another; which admits the rain, and ſpoils the plants. They continue there during the ſummer, and breed, returning as autumn approaches, to the ſouthward. They are frequently found mixed with the red-winged oriole, and are alſo ſeen with the blue jays. The males and females do not arrive together, the females come firſt. This ſpecies is known in America by the names of Bob Lincoln and *conquedle*; and is called by ſome the white-backed maize thief; but is ſaid to have a fine note. There is a variety of this ſpecies with the head, neck, body, and upper wing-coverts, olive brown; the under parts pale yellow; the rump and upper tail-coverts yellow, croſſed with lines of brown; the greater wing-coverts are black, edged with white. This is found in Louiſiana, and has all the habits of the preceding.

26. Emberiza cirlus, the cirl bunting: ſize of the yellow-hammer; bill brown; head olive green, with a duſky line down the ſhaft of each feather; ſide of the head yellow, with a daſh of black between the bill and eye; the hind part of the neck, back, and rump, brown; the feathers duſky in the middle; the under parts, from the chin, are yellow; the breaſt inclining to brown, and a few duſky ſtreaks on the ſides of the body; acroſs the throat a yellow band; the tail is brown, edged with grey, and a ſpot of white on the inner web for half the length. The female is not unlike the male on the upper parts; the under are yellow, ſtreaked with duſky, inclining to white at the chin and vent; in ſome the breaſt inclines to green. Theſe birds inhabit the warmer parts of France and Italy, and frequent newly ploughed lands, feeding on grain, worms, and inſects; they are often found among flocks of chaffinches.

27. Emberiza cia, the fooliſh bunting: bill duſky; head aſh-colour, ſpotted with black; the reſt of the upper parts rufous grey, with a blackiſh ſpot down the ſhaft of each feather, inclining moſt to rufous on the rump; ſides of the head grey; over the eyes a white ſtreak; and through the eyes, from the bill, a black one; the under parts of the body rufous, but almoſt white on the throat; breaſt inclining to cinereous; quills duſky, edged with white; tail black; the two outer feathers beyond the middle white. The female has a cinereous line on the crown, varied on the ſides with ferruginous and black. This ſpecies frequents the warmer parts of Europe, and chiefly inhabits in the mountainous diſtricts, where it is ſolitary; it has gained the name of fooliſh ſparrow, from being ſo tame as to be caught by any ſnare. It is found in the ſouth of Siberia, from the river Jeneiſe to the lake Baikal, but neither in Ruſſia nor the weſt of Siberia.

28. Emberiza quelea, the black-faced bunting: ſize of the houſe ſparrow; bill ſtout and red; forehead, throat, and checks, black; the reſt of the head and upper parts rufous grey; the middle of the feathers on the back and upper parts duſky; the under parts pale rufous, inclining to white on the breaſt and belly; quills and tail blackiſh, with cinereous margins; legs fleſh-coloured. The female wants the black about the head, otherwiſe like the male. Native of Africa. There is a variety of this bird with the head, neck, and under parts, red, inclining to rufous; the upper parts brown and duſky mixed; the forehead, between the bill and eye, and round the throat, black. Inhabits Senegal.

29. Emberiza textrix, the weaver bunting: ſize of a chaffinch; bill horn-colour; the plumage above reddiſh brown; over each eye, and down the middle of the crown, a ſtreak of yellow; ſides of the head mottled yellow and black; rump and under parts yellow; down the middle of the breaſt a black ſtreak, broad, and a little divaricated on the ſides. In winter the yellow colour diſappears, and the bird is wholly of a browniſh colour, like a ſparrow. This bird, like the weaver oriole, has the diſpoſition to interweave ſilk between the wires of its cage.

30. Emberiza rubra, the crimſon bunting: bill duſky; head, breaſt, rump, upper tail-coverts, and thighs, crimſon; hind part of the neck and back blackiſh and olive mixed, with here and there a daſh of crimſon; wings blackiſh, with pale edges; quills and tail black, edged with greyiſh green; lower part of the breaſt, belly, and vent, aſh-colour; legs fleſh-colour. Inhabits the Iſle of France.

31. Emberiza

31. Emberiza familiaris, the familiar bunting: the bill is pointed, ſtrait, narrow, and black; head, neck, and breaſt, aſh-coloured, the upper parts of the body aſh-colour ſpotted with brown; under the wings, and towards the tail, yellow; tail tipped with white. This was met with at Java, by Mr. Oſbeck, and was exceedingly familiar; for if the cage door was opened, it would jump upon the firſt perſon's hand that was offered; if any one whiſtled to it, it would ſing very ſweetly in return; if it ſaw a diſh of water, it went immediately and bathed itſelf. It fed on rice.

32. Emberiza flaveola, the yellow-faced bunting: ſize of a hedge ſparrow: forehead and throat yellow; general colour grey. Native place uncertain; but Linnæus ſays that it inhabits warm countries.

33. Emberiza amazona, the amazon bunting: ſize of a titmouſe: general colour brown; crown of the head yellow; baſe of the wings beneath, and vent, whitiſh. Inhabits Surinam.

34. Emberiza olivacea, the olive bunting: about the ſize of a wren; bill grey brown; the head, and upper parts of the body, olive green; throat orange; between the bill and eye a ſpot of yellow ſtretching over the eyes; fore part of the neck, and upper part of the breaſt, black; the under parts olive grey; edge of the wings yellow; quills brown, edged with olive green; tail of this laſt colour; legs brown. In the female the colours are leſs brilliant. Inhabits St. Domingo.

35. Emberiza paſſerina, the paſſerine bunting: ſize of the reed bird: head ferruginous aſh-colour; ſome of the feathers on the crown black; behind the eye a pale ſtreak, and on each from the chin a white line; back grey brown; the middle of each feather black; the fore part of the neck black, with the margins of the feathers pale; the under parts cinereous white, blotched with pale ferruginous on the ſides; wings, for the moſt part, ferruginous, with yellowiſh margins; tail a little forked, and black; the two middle feathers margined with ferruginous; the two outer ones are obliquely black and white, divided longitudinally; legs brown. The female is like the male, but wants the black head and chin. Inhabits Ruſſia; and is ſeen in great plenty along the Jaick in autumn, migrating in pairs to the ſouthward: the fleſh is accounted excellent.

36. Emberiza ferruginea, the ferruginous bunting: head, neck, breaſt, and ſides, ferruginous; belly white; wings ferruginous, with two white marks on the prime quills; tail the ſame. Inhabits Ruſſia.

37. Emberiza Americana, the American bunting: ſize of the yellow-hammer; bill brown; the upper parts of the plumage cinereous, ſtreaked with brown on the back: over the eye a ſtreak of yellow; and another, paſſing under the eye; chin white; on the throat a large triangular ſpot of black; breaſt, and middle of the belly, yellow: ſides, over the thighs, ſtreaked with duſky; greater wing-coverts tawny; quills and tail duſky, with pale edges; legs brown. The female is like the male above; but has no black ſpot on the throat, nor ſtreaks above the eye. Inhabits America.

38. Emberiza Braſilienſis, the Braſilian bunting: ſize of a ſparrow: bill and eyes black; the crown, throat, neck, and under parts, yellow; back, ſcapulars, wings, and tail, varied with greeniſh, yellow, and brown; legs brown. The female has not the gaudy colours of the male, being plain, like a ſparrow. They are natives of Braſil, and the male has an agreeable note.

39. Emberiza Mexicana, the Mexican bunting: bill pale; head, as far as the crown, ſides of the head, throat, and fore part of the neck, yellow; the upper parts brown, tending upwards to the eye in a point; the under parts dull white, ſpotted with brown; quills and tail edged with pale brown. Native of Mexico.

40. Emberiza militaris, the military bunting: head and back yellowiſh brown; breaſt, and lower part of the back, yellow; ſhoulders greeniſh; belly white; quills and tail brown; the outer edges yellowiſh at the tips. Found in the iſland of Malta.

41. Emberiza melanocephala, the black-headed bunting: ſize of the yellow-hammer: head black, extending to the middle of the neck; back rufous; throat, breaſt, belly, thighs, and rump, yellow; ſides of the breaſt inclined to rufous; quills brown, with whitiſh margins; tail plain brown, but paler than the quills.

42. Emberiza brumalis, the brumal bunting: forehead, and round the eyes, yellow; hind-head, neck, and ſides, cinereous; back yellowiſh brown; the under parts of the body and vent yellow; thighs whitiſh; quills brown, with yellow edges. This ſpecies is common about Tyrol, in Auſtria, where it is called *citrinello*; is frequently caught in November, and kept in a cage for its ſong.

43. Emberiza erythrophthalma, the towhe bunting: bill brown; irides red; head, throat, neck, back, wing-coverts, and rump, black; breaſt, belly, ſides, thighs, and under tail-coverts, dull red; middle of the belly white; quills and tail black, the firſt edged with white, the laſt a little forked; legs brown. The female is wholly brown, except on the breaſt, which has a ſlight tinge of red. This ſpecies inhabits Carolina, and frequents the moſt ſhady woods; viſits New York in the ſpring; has no ſong, but a kind of twittering note; and is a reſtleſs bird. It is called the American bulfinch.

44. Emberiza leucophrys, the white-crowned bunting: ſize of a chaffinch; bill fleſh-colour; on the crown a white ſtripe, which does not quite reach the bill; on each ſide of this is a ſtripe of black; over the eyes a line of white, which paſſes to the vertical ſtripe behind; neck cinereous, paleſt on the breaſt; back ferruginous brown; rump cinereous; wings brown; the outer edge of the prime quills very pale; the inſides cinereous; acroſs the wings two bands of white; the baſtard wing, and the under parts, are white; the breaſt aſh-colour; vent and thighs yellow; tail brown. The female is much like the male. This ſpecies inhabits Canada, and viſits Severn Settlement in June; it is alſo met with at Albany Fort in May; where it ſtays the ſummer, and departs in September. It makes its neſt in the bottom of willows, and lays three chocolate-coloured eggs; its chief food is ſeeds of graſs, worms, grubs, and other inſects.

45. Emberiza luctuoſa, the wreathed bunting: ſize of the titmouſe; bill black; a white line goes from the forehead to the nape, where it ends; in the middle of each wing is a white ſpot; the forehead, breaſt, belly, rump, and vent, are white; the reſt of the plumage is black.

46. Emberiza aureola, the yellow-breaſted bunting: bill tranſparent, except at the edge of the upper mandible, where it is blackiſh; forehead blackiſh, with a dark ſhade on the crown; hind head, nape, and between the wings, rufous; the feathers fringed with grey at the tips; back and rump hoary, and ſome of the ſhafts blotched with black; ſcapulars white; outer webs of the ſecond wing-coverts rufous; quills brown, with white edges; breaſt and belly yellow; acroſs the breaſt a ferruginous creſcent; under tail-coverts white; tail brown. The female has the crown blacker, and the margins of the feathers on the back more hoary; otherwiſe like the male. Inhabits the pine foreſts of Catharineſburgh. Alſo met with on the poplars and willows in the iſlands of the Irtiſh, and other rivers in Siberia and Kamtſchatka.

47. Emberiza Sandwichenſis, the Sandwich bunting: bill duſky; upper parts of the body brown; each feather daſhed down the ſhaft with darker brown; at the noſtrils ariſes a ſtreak of yellow, which paſſes over the eyes to the hind-head; and from the gape is a dark one, paſſing under the eye; ſides of the head, between the ſtreaks, duſky; the under parts of the body duſky white, daſhed with brown; the middle of the belly plain duſky white; quills brown, with paler edges; tail brown; legs duſky. This

was met with at Oonalaſhka, and Sandwich Sound, by our late voyagers.

48. Emberiza Oonalaſhka, the Oonalaſhka bunting: length ſeven inches; upper parts of the body and tail pale brown, with a rufous tinge; the under parts duſky white, daſhed with blackiſh, as in the laſt deſcribed: the middle of the belly plain duſky white. Brought from Oonalaſhka, with the preceding ſpecies.

49. Emberiza atricapilla, the black-crowned bunting: ſize of the preceding; bill ſhort and duſky; crown of the head a fine yellow; forehead, and through the eyes, black, paſſing to the hind head, which is aſh-coloured; the upper parts of the body are reddiſh brown, marked down the middle of each feather with dark brown; coverts and quills fringed on the edges with a paler colour; rump pale olive brown; chin duſky white; throat, breaſt, and belly, aſh-colour, marked down the middle of the laſt with pale yellowiſh buff-colour; tail even at the end, and of a plain brown; legs brown. Inhabits the Sandwich Iſlands.

50. Emberiza pithyornus, the pine bunting: ſize of the yellow-hammer; bill dull white; head faſciated; firſt a broadiſh hoary ſtreak down the middle, and on each ſide a black one meeting at the hind head; below this the nape is hoary; through the eyes a rufous ſtripe; below it, on the cheeks, a triangular ſpot of white, and on the temples one of black of the ſame figure; ſides of the neck, and throat, ferruginous; on the breaſt a large triangular ſpot; middle of the belly hoary; ſides rufous; vent whitiſh; back and rump rufous; the coverts, and ſecond quills, brown, edged with rufous; greater quills, and tail, blackiſh, with white margins. The female is wholly varied with grey and pale rufous; bottom of the belly duſky white; the reſt as in the male. Gmelin found this ſpecies at Aſtracan, and on the ſhores of the river Don, among the reeds. It is alſo met with in the pine foreſts of Siberia; and from the Uralian chain quite to the Lena; but it does not viſit Ruſſia, though ſometimes found in winter about the Caſpian ſea.

51. Emberiza cinerea, the cinereous bunting: bill pale brown; upper part of the head chefnut, with a daſh of brown down the middle of each feather; the reſt of the upper parts the ſame, but more inclined to grey; the rump wholly grey; upper and under tail-coverts rufous white; the under parts duſky white, marked with chefnut ſpots; quills, and tail, brown, edged with reddiſh grey; legs pale brown. The female is much more inclined to grey. Inhabits America, migrating from the north into New York in March, and reſts in flocks upon the lower branches of the red cedars.

52. Emberiza cœrulea, the blue bunting: ſmaller than the preceding; crown dull rufous; the upper parts of the neck, and body, mixed rufous and blue; beneath, the ſame, but the rufous colour pale; greater coverts, quills, and tail, brown, with the outer edges rufous; legs brown. Inhabits Canada.

53. Emberiza purpura, the mazarine bunting: bill deep lead-colour; the general plumage fine purple blue; the top of the head deepeſt; greater quills brown, edged with mazarine blue; tail brown, with a light tinge of blue; legs brown. The female differs from the male, being much like the linnet in colour. The male is like the female in moulting-time, and is only blue when in full plumage. It may alſo at that time be known from the female, as the edge of the wing is of a deep mazarine blue, whereas in the female it is greeniſh brown. This ſpecies inhabits Carolina, where it is called by ſome *the parſon*, by others *the biſhop*. It is chiefly found in the inner parts, an hundred and fifty miles from the ſea, and frequents the mountains. Is ſaid to ſing like our linnet. The Spaniards at Mexico call it, *azul lexos*, or far-fetched blue-bird. It is common at New York; comes the beginning of April, and frequents the orchards when in bloom; but principally feeds on millet.

54. Emberiza ciris, the painted bunting: ſize of a hedge-ſparrow; bill grey brown; irides hazel; head and neck violet; round the eyes red; upper part of the back, and ſcapulars, yellow green; the lower part, rump, and all beneath, red; the leſſer wing-coverts violet brown, with a tinge of red; the greater of a dull greeniſh colour; quills brown, with the edges green and red; the tail is brown; the two middle feathers inclined to red, and the others margined outwardly with the ſame; legs brown. The female is dull green above, and beneath yellow green; quills brown, fringed with green; the tail is brown and green mixed. This bird varies exceedingly: neither ſex arrives at the full plumage till the third year. In the firſt, both male and female are brown: the male has the blue head the ſecond year, but the reſt of the plumage is blue green; the wings and tail are brown, edged with blue green. The female, at that time, inclines greatly to blue. Beſides this, they moult twice in the year. Hence it is not wonderful that ſcarcely any two birds are quite alike. They inhabit the warmer parts of Canada, and all the parts between that and Mexico, Braſil, Guiana, &c. At Carolina none are ſeen near inhabited parts, nor nearer than an hundred and fifty miles from the ſea. They build on the orange and citron-trees, but are found there only in ſummer. They feed on millet, ſuccory, and other ſeeds; and frequently are kept in cages in England. The Dutch breed theſe birds in Holland, like canary-birds. One variety of this bird has the under parts yellowiſh, except a ſmall ſpot of red on the breaſt, which only laſts for a time. The following moult it diſappears, and, inſtead of it, the whole under ſide is whitiſh; and the male greatly reſembles the female. It is, perhaps, this variety which cauſed Linnæus to ſay that the female is blue all over, except the belly, which is white. The Spaniards call theſe birds by the name of *maripoſa*; the Engliſh, *nonpareil*.

55. Emberiza quadricolor, the four-coloured bunting: ſmaller than the preceding; bill duſky; head, and neck, blue; back, wings, and end of the tail, green; upper part of the tail, and its coverts, and the middle of the belly, red; the breaſt, and lower part of the belly, brown; legs fleſh-colour. Inhabits Java.

56. Emberiza cyanopis, the blue-faced bunting: leſs than a hedge-ſparrow; bill lead-colour; the plumage on the upper parts green; lower part of the back, and rump, rufous; upper tail-coverts red; the forehead, cheeks, and throat, fine blue, gradually changing into rufous towards the breaſt, which, with the belly, thighs, and ſides, are of this laſt colour; but the middle of the belly is red; the quills are brown, with green edges; the tail-feathers brown, except the two middle ones, which are green, and all of them fringed with red; legs grey. Native of Java.

57. Emberiza viridis, the green bunting: ſize of our greenfinch; bill greeniſh brown; upper parts of the bird green; the under, white; quills and tail blue, with white ſhafts; legs black. Inhabits the Eaſt Indies.

58. Emberiza Platenſis, the Plata bunting: length eight inches; bill cinereous, convex, and pointed; irides chefnut; the upper parts of the plumage greeniſh brown, verging to yellow, and marked with a few traces of black on the back; the edge of the wing bright yellow; quills, and outer tail-feathers, edged with the ſame; the under parts of the body cinereous white; legs lead-colour. Native of Buenos Ayres, on the river Plata in South America.

59. Emberiza Borboniæ, the Bourbon bunting: this is the ſize of a yellow-hammer; bill brown; the whole plumage of an high rufous red colour, except the wings and tail, which are duſky red; legs the ſame, but tinged with yellow. Inhabits the Iſle of Bourbon.

60. Emberiza calfat, the red-eyed bunting: bill, irides, and legs, roſe-colour; head black; all the upper parts of the body, wings, and tail, bluiſh aſh-colour; the laſt edged

edged with black; the throat black; breaſt and belly vinaceous; round the eyes naked, and of a roſe-colour; from the gape of the mouth to the hind-head a white ſtripe; the under tail-coverts, white. Native of the iſle of France, where it is called *gal-fat*, or *cal-fat*.

61. Emberiza chlorocephala, the green-headed bunting; bill brown; head and neck, as far as the breaſt, dull olive green; back, and wing-coverts, duſky brown, mixed with black, paleſt on the rump; the reſt of the wings, breaſt, and belly, deep brown; tail brown, forked; legs yelloviſh. That figured in Brown's collection, was caught in Mary-le-bone fields, near London, by a bird catcher.

62. Emberiza griſea, the grey bunting: ſize of a lark; head grey; the reſt of the body pale grey; but the upper wing-coverts and breaſt are mixed with reddiſh; the quills and tail are white within; without grey, mixed with red. Inhabits Surinam, in South America; feeds on maize; and is ſaid to ſing as fine as the nightingale. The natives call it *gonambucho*.

63. Emberiza Surinamenſis, the Surinam bunting: about the ſize of a lark, and like it in colour; bill rather large, with a knob on the upper mandible, and the ſides of the lower one are higher than uſual, and angular; the chin, breaſt, and belly, are of a whitiſh yellow, ſpotted with oblong black ſpots on the breaſt. Native of Surinam.

64. Emberiza Maelbyenſis, the Maelby bunting: ſize of the yellow-hammer; bill and legs pale rufous; eyelids, ſpot between the bill and eye, the chin, upper part of the throat, and ſides of the neck and vent, duſky white; forehead, crown, lower part of the neck before, and upper part of the breaſt, bluiſh aſh-colour; lower part of the breaſt, belly, and thighs, ferruginous; back ferruginous, marked with acute black ſpots; wing-coverts black, edged with ferruginous; quills duſky, with pale ferruginous margins; tail-feathers, ten in number, black; the four outer ones, half way from the tips, white; the outer margins black. This was found in Sweden, at Maelby, a ſeat of count Carlſon, in Sodermanland.

65. Emberiza Aſiatica, the Aſiatic or Gaur bunting: a ſmall ſpecies; length four inches and a half; bill pale roſe-colour; head, neck, back, breaſt, and belly, cinereous, paleſt beneath; wings and tail brown, with paler edges; legs pale blue. Native of the Eaſt Indies, where it is called *gaur*, and was brought into England by lady Impey.

66. Emberiza puſilla, the dwarf bunting: above grey ferruginous, beneath whitiſh; throat ſpotted; head with alternate longitudinal teſtaceous and black bands. Inhabits the ſnowy mountains of Dauria, and is very ſmall.

67. Emberiza ruſtica, the ruſtic bunting: head black, with three longitudinal white bands; chin, body beneath, and two outmoſt tail-feathers each ſide, obliquely white; neck and ſhoulders ferruginous; back grey ferruginous; throat with teſtaceous ſpecks. Inhabits the woods of Dauria; ſize of the reed-bird.

68. Emberiza fucata, the ſtained bunting: general plumage grey ferruginous; ears with a round rufous ſpot; eyebrows, line beneath the eyes, and throat, white; chin ſurrounded with a brown ſpotted circle; crown, and part of the neck, hoary aſh; the ſhafts of the feathers brown. Inhabits the rocky parts of Siberia.

69. Emberiza ſpodocephala, the hoary bunting: the general caſt of the plumage is hoary; beneath pale ſtraw-colour; frontlet black; head and neck hoary aſh. Inhabits near the water-falls of Dauria; and is a ſmall ſpecies.

70. Emberiza chryſophrys, the golden-browed bunting: ſize of the yellow-hammer; general colour ferruginous; crown black; eyebrows citron, or gold-colour; from the middle of the crown to the nape a white band. Inhabits the Daurian Alps with the preceding.

71. Emberiza rutila, the flame-coloured bunting: ſize of the chaffinch; principal caſt of the plumage is blood-coloured rufous; beneath ſulphur; wings grey-ruſty. Inhabits Siberia.

72. Emberiza coccinea, the ſcarlet bunting: body above ſilvery, beneath crimſon; vent white; bill, head, and quill-feathers, black; hind-head and tail black-blue; ſize of a ſparrow. Inhabits the woods round Baden.

73. Emberiza Badenſis, the Baden bunting: general colour of the plumage olive, ſtreaked with blackiſh, beneath paler; chin orange; breaſt ſtreaked with blackiſh; bill above black, beneath yelloviſh; upper mandible with a ſingle obtuſe tooth in the middle; noſtrils feathered; tongue ſhort; quill-feathers ſixteen; tail-feathers twelve; legs yelloviſh; claws black. Native of Baden.

74. Emberiza ruficapilla, the brown-headed bunting: ſize of a hedge-ſparrow; top of the head, neck, and back, a lively brown; beneath cinereous; chin ferruginous; frontlet white, above reddiſh brown; tail black.

EM'BERS, *ſ.* [without a ſingular; æmyrna, Sax. aſhes; *einmyria*, Iſland. hot aſhes or cinders.] Hot cinders; aſhes not yet extinguiſhed:

He ſaid, and roſe, as holy zeal inſpires:
He rakes hot *embers*, and renews the fires. *Dryden.*

To EMBEZ'ZLE, *v. a.* [This word ſeems corrupted by an ignorant pronunciation from *imbecil.*] To appropriate by breach of truſt; to turn what is entruſted in his hands to his own uſe.—He had *embezzled* the king's treaſure, and extorted money by way of loan from all men. *Hayward.*—To waſte; to ſwallow up in riot:

When thou haſt *embezzl'd* all thy ſtore,
Where's all thy father left? *Dryden.*

EMBEZ'ZLEMENT, *ſ.* The act of appropriating to himſelf that which is received in truſt for another. The thing appropriated.

To EMBLA'ZE, *v. a.* [*blaſonner*, Fr.] To adorn with glittering embelliſhments:

Th' unfought diamonds
Would ſo *emblaze* the forehead of the deep,
And ſo beſtud with ſtars, that they below
Would grow inur'd to light. *Milton.*

To blazon; to paint with enſigns armorial:

He from the glittering ſtaff unfurl'd
Th' imperial enſign, ſtreaming to the wind,
With gems and golden luſtre rich *emblaz'd*,
Seraphic arms and trophies. *Milton.*

To EMBLA'ZON, *v. a.* [*blaſonner*, Fr.] To adorn with figures of heraldry; to grace with enſigns armorial. To deck in glaring colours; to ſet out pompouſly to ſhew.—We find Auguſtus, for ſome petty conqueſt, *emblazoned* by the poets to the higheſt pitch. *Hakewell.*

EMBLA'ZONRY, *ſ.* Pictures upon ſhields;

Him round
A globe of fiery ſeraphim inclos'd,
With bright *emblazonry* and horrent arms. *Milton.*

EM'BLEM, *ſ.* [*embleme*, Fr. *emblema*, Lat. εμβλημα, of εμβαλλω, G.] Inlay; enamel; any thing inſerted into the body of another. An occult repreſentation; an alluſive picture; a typical deſignation; hieroglyphic writing.—If you draw your beaſt in an *emblem*, ſhew a landſcape of the country natural to the beaſt. *Peacham.*

Gentle Thames,
Thy mighty maſter's *emblem*, in whoſe face
State meekneſs, heighten'd with majeſtic grace. *Denham.*

"Emblems (ſays Dr. Bryant) ſeem, in the firſt ages of the world, to have been ſimilar in moſt countries, and to have almoſt univerſally prevailed. The ſacred writers often alude to them; and they were retained even in the church of God. The ſymbols thus admitted were originally deviſed, to put people in mind of what had paſſed in the infancy of the world. The whole was deſigned as a diſplay of God's wiſdom and goodneſs: and to tranſmit to poſterity memorials of the preſervation of mankind.

Theſe ſymbols in ancient times were inſtead of writing; harmleſs, if not abuſed: and of great conſequence when directed to a proper purpoſe. Such were the Serpent, the Ark, the Iris, the Dove; together with many others, to which there are apparent alluſions in Scripture. Theſe were known to the Iſraelites before their deſcent into Egypt: being originally from that country beyond the flood, where their fathers of old reſided; and, when properly applied, they were as innocent as the elementary characters, by which the ſame hiſtories were in aftertimes recorded. The lifting up of the Serpent in the wilderneſs was an emblem of a prophetic deſignation, and as pertinent to the people, to whom it was exhibited, as the purport would have been, if expreſſed by letters, and written at length upon a tablet. It is true, that theſe ſymbols were at laſt perverted; and the memorials above-mentioned degenerated into idolatrous rites and worſhip. See the article EGYPT, p. 372 of this volume. It was accordingly the purpoſe of Providence, in its diſpenſation to the Iſraelites, to withdraw them from this idolatry of the Gentiles: and this was effected, not by denying them the uſe of thoſe characters, which were the current types of the world, and to which they had been conſtantly uſed, but by adapting the ſame to a better purpoſe, and defeating the evil by a contrary deſtination. Upon the reſting of the Ark upon Mount Baris, and the appearance of the Bow in the clouds, it pleaſed God to make a covenant with man, and to afford him ſome gracious promiſes. A memorial of this was preſerved in the Gentile world. They repreſented this under the type of an Ark; which they ſtiled *Barith*, in alluſion to the covenant. Some ages after, another covenant of a more peculiar nature was made by the Deity with the poſterity of Abraham: and a law was promulgated from mount Sinai. In conſequence of this, another Ark by divine appointment was framed, ſeemingly in oppoſition to the former; and this too was called the Ark of the covenant. This I mention, becauſe many perſons have been alarmed at finding ſometimes the ſame ſymbols among the Egyptians as were to be found in the ordinances of the Iſraelites. Both Spencer and Marſham have animadverted upon this: and ſeem to have carried their notions too far; for from them one might be induced to imagine, that the Law of Moſes was, in a manner, founded upon the rites of Egypt. But there is not the leaſt reaſon for ſuch a ſurmiſe. The religion of the two nations was eſſentially different: and, though ſome ſymbols were ſimilar, yet it does not follow, that they were borrowed from that quarter. They were many of them general types, of great antiquity, and known to the whole world."

To EM'BLEM, *v. a.* To repreſent in an occult or illuſive manner. *Not uſed.*—The primitive ſight of elements doth fitly *emblem* that of opinions. *Glanville.*

EMBLEMA'TIC, or EMBLEMA'TICAL, *adj.* Compriſing an emblem; alluſive; occultly repreſentative;

In the well-fram'd models,
With *emblematic* ſkill and myſtic order,
Thou ſhew'dſt where tow'rs on battlements ſhould riſe,
Where gates ſhould open, or where walls ſhould compaſs.
Prior.

Dealing in emblems; uſing emblems:

By tongue and pudding to our friends explain
What does your *emblematic* worſhip mean. *Prior.*

EMBLEMA'TICALLY, *adv.* In the manner of emblems; alluſively; with occult repreſentation.—Others have ſpoken *emblematically* and hieroglyphically, as to the Egyptians; and the phœnix was the hieroglyphic of the ſun. *Brown.*—He took a great ſtone, and put it up under the oak, *emblematically* joining the two great elements of maſonry. *Swift.*

EMBLEM'ATIST, *ſ.* Writers or inventers of emblems.—Theſe fables are ſtill maintained by ſymbolical writers, *emblematiſts*, and heralds. *Brown.*

EM'BLEMENTS, *ſ.* [from *emblavence de bled*, Fr. corn ſprung or put up above ground.] In law, the profits of ſown land: but the word is ſometimes uſed more largely, for any products that ariſe naturally from the ground, as graſs, fruit, &c. In ſome caſes, he who ſowed the corn ſhall have the emblements; and in others not: a leſſee at will ſows the land, he ſhall have the emblements; though if the leſſee determines the will himſelf, he ſhall not have them, but the leſſor. 5 *Rep.* 116. If leſſee at will ſows the land with grain, or other thing yielding annual profit, and the leſſor enters before ſeverance; yet the leſſee ſhall have it: but where the leſſee plants young fruit-trees, or other trees, or ſows the land with acorns, &c. he ſhall not have theſe: and if ſuch tenant by good huſbandry make the graſs to grow in greater abundance; or ſow the land with hay-ſeed, by which means it is increaſed, if the leſſor enters on the leſſee, the leſſee ſhall not have it, becauſe graſs is the natural profit of the ſoil. *Co. Lit.* 55.

Where tenant for life ſows the land, and dies, his executors ſhall have the emblements, and not the leſſor or him in reverſion; by reaſon of the uncertainty of the eſtate. *Cro. Eliz.* 463. And if a tenant for life plant hops, and dies before ſeverance, he in reverſion ſhall not have them, but the executors of tenant for life. *Cro. Car.* 515. If tenant for years ſow the ground, and die before ſeverance, the executor of the leſſee ſhall have the corn; and where leſſee for life leaſes for years, if the leſſee for years ſow the land, and after leſſee for life dies before ſeverance, the executor of leſſee for years ſhall have the emblements. 2 *Danv. Abr.* 765. So it is alſo if a man be tenant for the life of another; and *ceſtui que vie*, (he on whoſe life the land is held) dies after the corn ſown, the tenant *pur auter vie* ſhall have the emblements. The ſame is alſo the rule if a life-eſtate be determined by the act of law. Therefore, if a leaſe be made to huſband and wife during coverture, (which gives them a determinable eſtate for life,) and the huſband ſows the land, and afterwards they are divorced *à vinculo matrimonii*, the huſband ſhall in this caſe have the emblements; for the ſentence of divorce is the act of the law. 5 *Rep.* 116. But, if an eſtate for life be determined by the tenant's own act, (as by forfeiture for waſte committed; or if a tenant during widowhood, thinks proper to marry;) in theſe and ſimilar caſes, as in that of a tenant at will determining his own tenure, the tenants ſhall not be entitled to take the emblements. 1 *Inſt.* 55.

If tenant for years ſows ground, and before his corn is ſevered, the term which is certain expires; the leſſor or he in reverſion ſhall have the emblements; but he muſt firſt enter on the lands. 1 *Lil. Abr.* 511. A leſſee for life or years ſows the land, and after ſurrenders, &c. before ſeverance, the leſſor ſhall have the corn. 2 *Danv.* 764. If there be leſſee for years upon condition that, if he commit waſte, &c. his eſtate ſhall ceaſe; if he ſows the ground with corn, and after doth waſte, the leſſor ſhall have the corn. *Co. Lit.* 55. And where a lord enters on his tenant for a forfeiture, he ſhall have the corn on the ground. 4 *Rep.* 21.

Though if a feme copyholder for her widowhood ſows the land, and before ſeverance takes huſband, ſo that her eſtate is determined, the lord ſhall have the emblements; yet if ſuch a feme copyholder *durante viduitate*, leaſes for one year according to cuſtom, and the leſſee ſows the land, and afterwards the copyholder takes huſband, the leſſee ſhall have the corn. 2 *Danv.* 764. If a huſband holds lands for life, in right of his wife, and ſow the land, and after ſhe dies before ſeverance, he ſhall have the emblements. 1 *Nelſ. Abr.* 701. And where the wife hath an eſtate for years, life, or in fee, and the huſband ſows the land, and dieth, his executors ſhall have the corn. But if the huſband and wife are joint-tenants, though the huſband ſow the land with corn, and dies before ripe, the wife, and not his executors, ſhall have the corn, ſhe being the ſurviving joint-tenant. *Co. Lit.* 199. When a widow is endowed with lands ſown, ſhe ſhall have the emblements, and not the heir. And a tenant in dower may diſpoſe of corn ſown on the ground; or it may go to her executors, if ſhe die before ſeverance. 2 *Inſt.* 80. 81. And by the particular

provisions of 28 Hen. VIII. c. 11, if a parson sows his glebe, and dies, his executors shall have the corn: and such parson may by will dispose thereof. 1 *Rol. Abr.* 655.

If tenant by statute-merchant sows the land, and before severance a casual profit happens, by which he is satisfied, yet he shall have the corn. *Co. Lit.* 55. Lands sown are delivered in execution upon an extent, the person to whom delivered shall have the corn on the ground. 2 *Leon.* 54. And judgment was given against a person, and then he sowed the land, and brought a writ of error to reverse the judgment, but it was affirmed; and adjudged that the recoveror shall have the corn. 2 *Bulst.* 213. If a disseisor sows the land, and afterwards cuts the corn, but before it is carried away, the disseisee enters; the disseisee shall have the corn. *Dyer*, 31. 11 *Rep.* 52. A person seised in fee of land dies, having a daughter, and his wife *privement enseint* with a son; the daughter enters and sows the land, and before severance of the corn, the son is born; in this case the daughter shall have the corn, her estate being lawful, and defeated by the act of God; and it is for the public good that the land should be sown. *Co. Lit.* 55.

A man seised in fee-simple sows land, and then devises the land by will, and dies before severance; the devisee shall have the corn, and not the devisor's executors. *Cro. Eliz.* 61. If a person devises his lands sown, and says nothing of the corn, the corn shall go with the land to the devisee: and when a man seised of land, in fee or in tail, sows it, and dies without will, it goes to the executor, and not the heir. 10 *Edw.* IV. 1 *b.* 21 *Hen.* VI. 30 *a.* 37 *Hen.* VI. 35 *b.* A devisee for life dies, he in remainder shall have the emblements with the land. *Hob.* 132. Tenant in fee sows the land, and devises it to A. for life, remainder to B. for life, and dies; A. dies before severance, B. in remainer shall have the corn, and not the executor of the first tenant for life. *Cro. Elix.* 61. Where there is a right to emblements, ingress, egress, and regress, are allowed by law, to enter, cut, and carry them away, when the estate is determined. 1 *Inst.* 56.

EM'BLERS DE GENTZ, [Fr.] A stealing from the people: The word occurs in our old rolls of Parliament. Whereas divers murders, *emblers de gentz*, and robberies, are committed, &c. *Rot. Parl.* 21 *Edw.* III. *n* .62.

EM'BLICA, *s.* in botany. See PHYLLANTHUS.

EM'BLICHEIM, a town of Germany, in the circle of Westphalia, and county of Bentheim: ten miles north-north-west of Nienhus.

EM'BOLI, a town of European Turkey, in the province of Romania: a colony from Athens. It is called by the Christians *Christopolis*, but is little better than a heap of ruins: forty eight miles east of Saloniki.

EM'BOLISM, *s.* [εμβολισμος, Gr.] Intercalation; insertion of days or years to produce regularity and equation of time. As the Greeks used the lunar year, which contains only 354 days, that they might bring it to the solar year of 365 days, they had an *emboliſm* every two or three years, when they added a thirteenth lunar month.

EMBOLIS'MIC, *adj.* belonging to the intercalary; is chiefly used in speaking of the additional months inserted by chronologists to form the lunar cycle of 19 years. The 19 solar years consisting of 6939 days and 18 hours, and the 19 lunar years only making 6726 days, it was found necessary to intercalate or insert 7 lunar months, containing 209 days; which, with the four bissextile days happening in the lunar cycle, make 213 days, and the whole 6939 days, the same as the 19 solar years, which make the lunar cycle. In the course of nineteen years there are 228 common moons, and 7 emboliſmic moons, which are distributed in this manner, viz. the 3d, 6th, 9th, 11th, 14th, 17th, and 19th, years, are emboliſmic, and so contain 384 days each. And this was the method of computing time among the Greeks: though they did not keep regularly to it, the Jews did. The method of the Greeks was followed by the Romans till the time of Julius Cæsar. The emboliſmic months, like other lunar months, are sometimes of 30 days, and sometimes only 29 days. The emboliſmic epacts are those between 19 and 29; which are so called, because, with the addition of the epact 11, they exceed the number 30; or rather, because the years which have these epacts, are emboliſmic; having 13 moons each, the 13th being the emboliſmic.

EM'BOLUM, *s.* [from εμβαλλω, Gr. to cast out.] With anatomists, a term for the penis, because it ejects the semen.

EM'BOLUS, *s.* [εμβολος, Gr.] Any thing inserted and acting in another, as the sucker in a pump.—Our members make a sort of an hydraulic engine, in which a chemical liquor resembling blood is driven through elastic channels by an *embolus*, like the heart. *Arbuthnot.*

To EMBO'SS, *v. a.* [from *bosse*, Fr. a protuberance.] To form with protuberances; to cover with something rising into lumps or bunches:

Timon hath made his everlasting mansion
Upon the beached verge of the salt flood;
Which once a-day, with his *embossed* froth
The turbulent surge shall cover. *Shakespeare.*

To engrave with relief, or rising work, as the gilt paper covering children's books; which is called *embossed paper*.

Then o'er the lofty gate his art *emboss'd*
Androgeo's death, and off'rings to his ghost. *Dryden.*

[From *emboiſter*, Fr. to inclose in a box.] To inclose; to include; to cover:

The knight his thrillant spear again assay'd
In his brass-plated body to *emboss*. *Spenser.*

And in the way, as she did weep and wail,
A knight her met, in mighty arms *emboss'd*. *Fairy Queen.*

[*Emboscare*, Ital.] To inclose in a thicket:

Like that self-begotten bird
In th' Arabian woods *embost*. *Milton.*

To hunt hard.—When a deer is hard run, and foams at the mouth, he is said to be *embost*: a dog also, when he is strained with hard running, especially upon hard ground, will have his knees swelled, and then he is said to be *embost*, from *bosse*, French, a tumour. *Hanmer.*

Oh, he is more mad
Than Telamon for his shield; the boar of Thessaly
Was never so *embost*. *Shakespeare.*

EMBOSS'MENT, *s.* Any thing standing out from the rest; jut; eminence. Relief; rising work.—They are at a loss about the word pendentis; some fancy it expresses only the great *embossment* of the figure, others believe it hung off the helmet in alto relievo. *Addison.*

EMBOTH'RIUM, *s.* [so named by Forster, from εν and βοθριον, Gr. a little pit or hollow; the antheræ being placed in a hollow of the petal.] In botany, a genus of the class tetrandria, order monogynia, natural order proteæ. The generic characters are—Calyx: none. Corolla: petals four, linear, oblique; with the tip broader, roundish, concave, staminiferous; after fecundation revolute. Stamina: filaments four, very short, on each petal one or none; antheræ oblong, within the cavity of the petal, largish. Pistillum: germ linear, ascending, inflex; style none; stigma roundish, plane in front, behind concave, large. Pericarpium: follicle round, one-celled. Seeds: four or five ovate, compressed, with a winged membrane on one edge.—*Essential Character.* Corolla, four-petalled; antheræ sessile, sitting on the tips of the petals; follicle round.

Species. 1. Embothrium umbellatum: umbels axillary, very simple, peduncled; leaves oblong, veinless; antheræ sessile. A handsome shrub; flowers small and red, in solitary umbels. Native of New Caledonia.

2. Embothrium coccineum, or scarlet embothrium: thyrses terminating, sessile; antheræ pedicelled; leaves obovate, veined, oblong-ovate, ending in a cusp. The whole plant is smooth; stem shrubby; leaves scattered, having one nerve branching on both sides, on short petioles, dilated at the base, and reddish; buds red, with lanceolate,

ceolate, reflex ſcales; flowers in ſpikes, terminating; corolla ſcarlet, tubular-incurved, with an anther lying in the broad end of each of the four petals; ſeeds in the folliele imbricate, with a ſharp wing. Found in Terra del Fuego by Forſter, and in the Straits of Magellan by Commerſon, who named it *ixora*. Its common name is *catas*. Several other ſpecies have been obſerved in Peru and Chili.

3. Embothrium ſpecioſiſſimum, or beautiful embothrium. This is a magnificent ſhrub; a native of New Holland: it grows to the height of eight or ten feet, with ſeveral ſimple, wand-like, round, branches, clothed with numerous large, alternate, bright-green, leaves, from four to ſix inches long; obovate and blunt, but tipped with a ſmall point: they are more or leſs ſerrated on the ſides. The flowers grow in a very denſe ſimple head on the top of each branch, and the head is ſurrounded at the baſe with numerous lanceolate leaves, or rather bractes, conſtituting the involucre: theſe, as well as the flowers themſelves, are of a rich ſanguine red.

4. Embothrium ſilaifolium, or ſmallage-leaved embothrium. Native of New Holland. The ſtems, which are ſeveral, grow three or four feet high or more, and are upright, and alternately branched, and have alternate leaves, which in ſhape much reſemble thoſe of the Peucedanum ſilaus; the upper and lower leaves are, however, more ſimple: the flowers ſtand in a long looſe terminal ſpike, and are white, with the tips of the petals revolute.

To EMBOT'TLE, *v. a.* [*bouteille*, Fr.] To inelude in bottles; to bottle:

Stirom, firmeſt fruit
Embottled, long as Priamean Troy
Withſtood the Greeks, endures. *Philips.*

EMBOUL', a town of Africa, in the country of Senegal.

To EMBOW'EL, *v. a.* To put into bowels, as into the bowels of the earth. Dr. Johnſon has erroneouſly defined this word, "to eviſcerate; to deprive of the entrails; to exenterate." Mr. Burke in one inſtance has uſed the word in that manner. He writes thus in his Reflections:—"In England we have nôt yet been completely *embowelled* of our natural entrails." He was probably miſled by the earleſſneſs of Dr. Johnſon. See Disbowel.—*Spenſer* underſtood and uſed the word aright:

He, with his dreadful inſtrument of ire,
Thought ſure have pounded him to powder ſoft,
Or deep *embowell'd* in the earth entire.

Where the meaning is "put into the bowels of the earth."—In like manner the word is uſed by *Shakeſpeare*:

Imbowell'd will I ſee thee by and by;
Till then in blood by noble Percy lie. *Henry* IV.

Where the meaning is put into the bowels of the earth, or buried; and certainly not, as Johnſon ſuppoſes, exenterated. Of ſuch brutality prince Henry was incapable.—In like manner the word is uſed by *Milton*:

The roar
Embowell'd with outrageous noiſe the air,
And all her entrails tore.

Where the noiſe is metaphorically deſcribed as introdueing itſelf into the bowels of the air, and tearing them.—The paſſage from Philips is quaint and unclear: he talks of Minerals that the *embowell'd* earth diſplays; meaning, apparently, "minerals which within its bowels the earth diſplays." The other paſſage from *Shakeſpeare* I know not where to ſeek: if it occurred in Richard II. or Henry VIII. and related to the Lollards, or the Proteſtants, one might with propriety ſay,

The ſchools,
Embowell'd of their doctrine, have left off
The wholeſome lore.

Meaning the ſchools, or univerſities, "which have received into their bowels the new doctrines." And thus every one of Dr. Johnſon's caſes would be a precedent againſt his definition. *Monthly Mag.*

To EMBOW'ER, *v. n.* To bower:

But the ſmall birds, in their wide boughs *embowering*,
Chaunted their ſundry tunes with ſweet concert. *Spenſer.*

To EMBRA'CE, *v. a.* [*embraſſer*, Fr.] To hold fondly in the arms; to ſqueeze in kindneſs:

Embrace again, my ſons! be foes no more;
Nor ſtain your country with her children's gore. *Dryden.*

To ſeize ardently or eagerly; to lay hold on; to welcome; to accept willingly any thing offered.—They who are repreſented by the wiſe virgins, *embraced* the profeſſion of the Chriſtian religion. *Tillotſon.*

I take it, your own buſineſs calls on you,
And you *embrace* th' occaſion to depart. *Shakeſpeare.*

To comprehend; to take in: as, *Natural philoſophy* embraces *many ſciences*. To compriſe; to incloſe; to contain; to encompaſs; to encircle:

Low at his feet a ſpacious plain is plac'd,
Between the mountain and the ſtream *embrac'd*. *Denham.*

To admit; to receive.—If a man can be aſſured of any thing, without having examined, what is there that he may not *embrace* for truth? *Locke.*—To find; to take:

Fleance, his ſon,
Whoſe abſence is no leſs material to me
Than is his father's, muſt *embrace* the fate
Of that dark hour. *Shakeſpeare.*

To ſqueeze in a hoſtile manner. To tie; to faſten:

——They ſeiz'd at laſt
His courſer's bridle, and his feet *embrac'd* *Dryden.*

[From *imbracciare*, Ital.] To put on:

Who ſeeing him from far ſo fierce to prieke,
His warlike armes about him gan *embrace*. *Spenſer.*

To EMBRA'CE, *v. n.* To join in an embrace:

Let me *embrace* with old Vincentio;
And wander we to ſee thy honeſt ſon,
Who will of thy arrival be full joyous. *Shakeſpeare.*

EMBRA'CE, *ſ.* Claſp; fond preſſure in the arms; hug. An hoſtile ſqueeze; cruſh:

Thames, the moſt lov'd of all the ocean's ſons
By his old ſire, to his *embraces* runs. *Denham.*

EMBRA'CEMENT, *ſ.* Claſp in the arms; hug; embrace.—There cheriſhing one another with dear, though chaſte *embracements*, with ſweet, though cold kiſſes, it might ſeem that love was come to play him there without darts. *Sidney.*

Thus death becomes a rival to us all,
And hopes with foul *embracements* her to get,
In whoſe decay virtue's fair ſhrine muſt fall. *Sidney.*

Hoſtile hug; grapple.—Theſe beaſts, fighting with any man, ſtand upon their hinder feet, and ſo this did, being ready to give me a ſhrewd *embracement*. *Sidney.*—Comprehenſion.—Nor can her wide *embracements* filled be. *Davies.*—State of being contained; incloſure.—The parts in man's body eaſily reparable, as ſpirits, blood, and fleſh, die in the *embracements* of the parts hardly reparable, as bones, nerves, and membranes. *Bacon.*—Conjugal endearment.—I would freelier rejoice in that abſence, wherein he won honour, than in the *embracements* of his bed, where he would ſhew moſt love. *Shakeſpeare.*—Willing acceptance.—Both of them being God's inſtruments for the converſion of the Northumbrians to the *embracement* of Chriſtian religion. *Weever.*

EMBRA'CEOR, *ſ.* [*embraſour*, Fr.] In law, he that, when a matter is in trial between party and party, comes to the bar with one of the parties, having received ſome reward ſo to do, and ſpeaks in the caſe; or privately la-

bours the jury, or ſtands in the court to ſurvey and overlook them, whereby they are awed or influenced, or put in fear or doubt of the matter. 19 *Hen.* VII. c. 13. But lawyers, attorneys, &c. may ſpeak in the caſe for their clients, and not be embraccors: alſo the plaintiff may labour the jurors to appear in his own cauſe; but a ſtranger muſt not do it: for the bare writing a letter to a perſon, or parol requeſt for a juror to appear, not by the party himſelf, hath been held within the ſtatutes againſt embracery and maintenance. *Co. Lit.* 369. *Hob.* 294. If the party himſelf inſtruct a juror, or promiſe any reward for his appearance, then the party is likewiſe an embraceor. And a juror may be guilty of embracery, where he by indirect practices gets himſelf ſworn on the tales, to ſerve on one ſide. 1 *Lil.* 513. There are divers ſtatutes relating to this offence and maintenance. See the article MAINTENANCE.

EMBRA'CER, *ſ.* The perſon embracing.—Yet are they the greateſt *embracers* of pleaſure of any other upon earth; and they eſteem of pearls as pebbles, ſo they may ſatisfy their guſt, in point of pleaſure or revenge. *Howel.*
